

# Intel<sup>®</sup> Ethernet Controller E810

## Datasheet

### NEX Cloud Networking Group (NCNG)

#### PRODUCT FEATURES

##### General

- Support both 50Gb/s PAM4 and 25Gb/s NRZ (E810-CAM2/CAM1 only)
- Dynamic Device Personalization (DDP) with fully-programmable pipeline that can add or modify protocols on-demand, allowing for fast-paced innovations
- Application Device Queues (ADQ) feature to increase application predictability, reduce application latency, and improve application throughput
- Support both iWARP and RoCEv2 RDMA, selectable via software per port for low latency, high throughput workload
- Support for 8x10GbE connections for appliance designs (E810-CAM2 only)
- Optimized Tx-Scheduler for steady Tx traffic flow to avoid burst send and in-network congestion
- IEEE 1588 support for precision time measurement
- Enhanced Data Plane Development Kit (DPDK) for Network Functions Virtualization acceleration, advanced packet forwarding, and highly-efficient packet processing
- More resources to support higher density server virtualization deployments: 256 VFs, 768 VSIs
- Flat NVM structure with dual banks to facilitate Any-to-Any NVM update and allow rolling back to previously known good NVM when device cannot load from current active bank
- Extensive test and validation with ecosystem devices including switches, cables and transceivers for interoperability

##### Three SKUs

- E810-CAM2: 25x25mm; PCI Express v4.0/v3.0 x16/x8; 2x100Gb, 2x50Gb, 4x25Gb, 8x10Gb, 50Gb PAM4/25Gb NRZ SerDes
- E810-CAM1: 25x25mm; PCI Express v4.0/v3.0 x16/x8; 1x100Gb, 2x50Gb, 4x25Gb, 50Gb PAM4/25Gb NRZ SerDes
- E810-XXVAM2: 21x21mm; PCI Express v4.0/v3.0 x8; 1x50Gb, 2x25Gb, 25Gb NRZ SerDes

##### Storage Networking

- Data Center Bridging (DCB)
- Stateless L3/L4 offloads for iSCSI, NAS, NFS
- Server Message Block (SMB)

##### NFV and Network Virtualization Overlay (NVO) Support

- Dynamic Device Personalization (DDP) with programmable pipeline for flexible frame format support
- Intelligent Flow Direction: Receiver Side Scaling (RSS), Intel<sup>®</sup> Ethernet Flow Director, Application Device Queues (ADQ)
- Comprehensive Network Virtualization Overlay protocols support.
- vSwitch Assist
- QoS: Priority-based Flow Control (802.1Qbb); Enhanced Transmission Selection (802.1Qaz); Differentiated Services Code Point (DSCP)

##### Server Virtualization Support

- SR-IOV: 8 PFs, 256 VFs, 256 Queues per PF, 2K queue pairs total, 768 VSIs
- Adaptive VF driver
- Scalable IO Virtualization (768 VDEVs)
- Programmable Virtual Ethernet Bridging (VEB) with ACL
- Virtual Machine Device Queue (VMDq); Virtual Machine QoS (VMQoS)

##### Remote Direct Memory Access (RDMA)

- Both iWARP and RoCEv2 support selectable via software per port

##### Precision Clocks Synchronization

- IEEE 1588 v1 and v2 PTP/802.1AS

##### Management

- Firmware Management Protocol (FMP)
- MCTP over PCIe and SMBus/I<sup>2</sup>C
- PLDM over MCTP; PLDM Monitoring; PLDM Firmware Update; PLDM for RDE
- NET2BMC/OS2BMC

##### Security

- Hardware-based Root of Trust
- Authentication on Read and Power On; Allowlist approach on NVM update
- Built-in detection of firmware/critical setting corruption with automated device recovery

Revision 2.7  
March 2024  
613875-009

## Revision History

Revision	Date	Notes
2.7	March 11, 2024	<p>Updates include the following:</p> <ul style="list-style-type: none"> <li>Updated note following <a href="#">Table 2-5</a> in <a href="#">Section 2.2.3</a>, "NC-SI Interface Pins".</li> <li>Changed value of 25GBASE-SR/LR in SFP28 module with RS in <a href="#">Table 3-20</a>, "Supported Electrical Modes".</li> </ul>
2.6	May 23, 2023	<p>Updates include the following:</p> <ul style="list-style-type: none"> <li>Updated <a href="#">Table 1-2</a>, "Standards Supported by the E810".</li> <li>Added <a href="#">Section 3.2.5.4.2</a>, "Reference Input Changes".</li> <li>Updated <a href="#">Table 3-44</a>, "SyncE Commands" to add: <ul style="list-style-type: none"> <li>Get Input Frequency List (0x0C6C).</li> <li>Get Output Frequency List (0x0C6D).</li> </ul> </li> <li>Updated <a href="#">Table 3-55</a>, "Set CCU Input Configuration Command".</li> <li>Updated <a href="#">Table 3-59</a>, "Get CCU Input Configuration Command Response".</li> <li>Updated <a href="#">Section 3.2.6.7</a>, "Set CCU Output Configuration (0x0C64)".</li> <li>Updated <a href="#">Table 3-61</a>, "Set CCU Output Configuration Command".</li> <li>Updated <a href="#">Table 3-65</a>, "Get CCU Output Configuration Command Response".</li> <li>Added <a href="#">Section 3.2.6.14</a>, "Get Input Frequency List (0x0C6C)".</li> <li>Added <a href="#">Section 3.2.6.15</a>, "Get Output Frequency List (0x0C6D)".</li> <li>Updated <a href="#">Section 3.3.8.12.3</a>, "Phase Offset Compensation Lo (0x0002)".</li> <li>Updated <a href="#">Section 3.3.8.12.4</a>, "Phase Offset Compensation Hi (0x0003)".</li> <li>Updated <a href="#">Section 3.3.8.12.5</a>, "Max Phase Offset Compensation Lo (0x0004)".</li> <li>Updated <a href="#">Section 3.3.8.12.6</a>, "Max Phase Offset Compensation Hi (0x0005)".</li> <li>Updated <a href="#">Section 3.4.9.2</a>, "Intel Key Generation and Intel Code Signing System".</li> <li>Updated <a href="#">Table 3-115</a>, "NVM Write Completion (on ARQ)".</li> <li>Updated <a href="#">Table 3-125</a>, "NVM Write Activate Response".</li> <li>Updated <a href="#">Table 6-5</a>, "Module TypeID Table" to add FRU Data TLV (Module TypeID = 0x14F).</li> <li>Updated PLDM Header section register descriptions in the following sections: <ul style="list-style-type: none"> <li><a href="#">Section 6.2.1.19</a>, "PackageVersionString_0 (0x0012)" through <a href="#">Section 6.2.1.27</a>, "PackageVersionString_8 (0x001A)"</li> <li><a href="#">Section 6.2.1.35</a>, "ComponentImageSetVersionString_0 (0x0022)" through <a href="#">Section 6.2.1.43</a>, "ComponentImageSetVersionString_8 (0x002A)"</li> <li><a href="#">Section 6.2.1.100</a>, "FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_0 (0x0063)" through <a href="#">Section 6.2.1.115</a>, "FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_15 (0x0072)"</li> </ul> </li> <li>Updated NVM Content section: <ul style="list-style-type: none"> <li>Updated the Default NVM Value of the following fields in <a href="#">Section 6.3.34.4</a>, "Module Logging Enable [n=0] (0x0003)": <ul style="list-style-type: none"> <li>Module Link Topology Detection Warning Logging Enable (Bit 14)</li> <li>Module Link Topology Detection Normal Logging Enable (Bit 13)</li> <li>Module Link Management Warning Logging Enable (Bit 10)</li> <li>Module General Normal Logging Enable (Bit 1)</li> </ul> </li> <li>Updated the Default NVM Value of the following fields in <a href="#">Section 6.3.34.5</a>, "Module Logging Enable [n=1] (0x0004)": <ul style="list-style-type: none"> <li>Module MDIO Error Logging Enable (Bit 15)</li> <li>Module MDIO Warning Logging Enable (Bit 14)</li> <li>Module MDIO Normal Logging Enable (Bit 13)</li> <li>Module SDP Error Logging Enable (Bit 11)</li> <li>Module SDP Warning Logging Enable (Bit 10)</li> <li>Module SDP Normal Logging Enable (Bit 9)</li> <li>Module I2C Error Logging Enable (Bit 7)</li> <li>Module I2C Warning Logging Enable (Bit 6)</li> <li>Module I2C Normal Logging Enable (Bit 5)</li> <li>Module Dreadnought Lake Warning Logging Enable (Bit 2)</li> <li>Module Dreadnought Lake Normal Logging Enable (Bit 1)</li> </ul> </li> </ul> </li> </ul>

Revision	Date	Notes
2.6 (Continued)	May 23, 2023	<ul style="list-style-type: none"> <li>• Updated NVM Content section (continued):               <ul style="list-style-type: none"> <li>— Updated the Default NVM Value of the following fields in <a href="#">Section 6.3.34.6, “Module Logging Enable [n=2] (0x0005)”</a>:                   <ul style="list-style-type: none"> <li>• <i>Module DCBx Warning Logging Enable</i> (Bit 14)</li> <li>• <i>Module DCBx Normal Logging Enable</i> (Bit 13)</li> <li>• <i>Module LLDP Warning Logging Enable</i> (Bit 10)</li> <li>• <i>Module LLDP Normal Logging Enable</i> (Bit 9)</li> <li>• <i>Module HDMA Error Logging Enable</i> (Bit 7)</li> <li>• <i>Module HDMA Warning Logging Enable</i> (Bit 6)</li> <li>• <i>Module HDMA Normal Logging Enable</i> (Bit 5)</li> <li>• <i>Module Admin Queue Warning Logging Enable</i> (Bit 2)</li> <li>• <i>Module Admin Queue Normal Logging Enable</i> (Bit 1)</li> </ul> </li> <li>— Updated the Default NVM Value of the following fields in <a href="#">Section 6.3.34.7, “Module Logging Enable [n=3] (0x0006)”</a>:                   <ul style="list-style-type: none"> <li>• <i>Module Authentication Warning Logging Enable</i> (Bit 14)</li> <li>• <i>Module Authentication Normal Logging Enable</i> (Bit 13)</li> <li>• <i>Module NVM Warning Logging Enable</i> (Bit 10)</li> <li>• <i>Module NVM Normal Logging Enable</i> (Bit 9)</li> <li>• <i>Module DCB Warning Logging Enable</i> (Bit 2)</li> <li>• <i>Module DCB Normal Logging Enable</i> (Bit 1)</li> </ul> </li> <li>— Updated the Default NVM Value of the following fields in <a href="#">Section 6.3.34.8, “Module Logging Enable [n=4] (0x0007)”</a>:                   <ul style="list-style-type: none"> <li>• <i>Module Switch Warning Logging Enable</i> (Bit 14)</li> <li>• <i>Module Switch Normal Logging Enable</i> (Bit 13)</li> <li>• <i>Module Parser Warning Logging Enable</i> (Bit 10)</li> <li>• <i>Module Parser Normal Logging Enable</i> (Bit 9)</li> <li>• <i>Module IOSF Warning Logging Enable</i> (Bit 6)</li> <li>• <i>Module IOSF Normal Logging Enable</i> (Bit 5)</li> <li>• <i>Module VPD Warning Logging Enable</i> (Bit 2)</li> <li>• <i>Module VPD Normal Logging Enable</i> (Bit 1)</li> </ul> </li> <li>— Updated the Default NVM Value of the following fields in <a href="#">Section 6.3.34.9, “Module Logging Enable [n=5] (0x0008)”</a>:                   <ul style="list-style-type: none"> <li>• <i>Module Post Warning Logging Enable</i> (Bit 14)</li> <li>• <i>Module Post Normal Logging Enable</i> (Bit 13)</li> <li>• <i>Module ACL Warning Logging Enable</i> (Bit 10)</li> <li>• <i>Module ACL Normal Logging Enable</i> (Bit 9)</li> <li>• <i>Module TX Queue Management Warning Logging Enable</i> (Bit 6)</li> <li>• <i>Module TX Queue Management Normal Logging Enable</i> (Bit 5)</li> <li>• <i>Module Scheduler Warning Logging Enable</i> (Bit 2)</li> <li>• <i>Module Scheduler Normal Logging Enable</i> (Bit 1)</li> </ul> </li> <li>— Updated the Default NVM Value of the following fields in <a href="#">Section 6.3.34.10, “Module Logging Enable [n=6] (0x0009)”</a>:                   <ul style="list-style-type: none"> <li>• <i>Module SyncE Warning Logging Enable</i> (Bit 14)</li> <li>• <i>Module SyncE Normal Logging Enable</i> (Bit 13)</li> <li>• <i>Module Manageability Warning Logging Enable</i> (Bit 10)</li> <li>• <i>Module Manageability Normal Logging Enable</i> (Bit 9)</li> <li>• <i>Module Task Dispatcher Warning Logging Enable</i> (Bit 6)</li> <li>• <i>Module Task Dispatcher Normal Logging Enable</i> (Bit 5)</li> <li>• <i>Module Watchdog Warning Logging Enable</i> (Bit 2)</li> <li>• <i>Module Watchdog Normal Logging Enable</i> (Bit 1)</li> </ul> </li> </ul> </li> </ul>

Revision	Date	Notes
2.6 (Continued)	May 23, 2023	<ul style="list-style-type: none"> <li>• Updated NVM Content section (continued):               <ul style="list-style-type: none"> <li>— Updated the Default NVM Value of the following fields in <a href="#">Section 6.3.34.11, “Module Logging Enable [n=7] (0x000A)”</a>:                   <ul style="list-style-type: none"> <li>• <a href="#">Module Version Warning Logging Enable</a> (Bit 14)</li> <li>• <a href="#">Module Version Normal Logging Enable</a> (Bit 13)</li> <li>• <a href="#">Module PF Registration Warning Logging Enable</a> (Bit 10)</li> <li>• <a href="#">Module PF Registration Normal Logging Enable</a> (Bit 9)</li> <li>• <a href="#">Module Time Sync Warning Logging Enable</a> (Bit 6)</li> <li>• <a href="#">Module Time Sync Normal Logging Enable</a> (Bit 5)</li> <li>• <a href="#">Module Health Warning Logging Enable</a> (Bit 2)</li> <li>• <a href="#">Module Health Normal Logging Enable</a> (Bit 1)</li> </ul> </li> <li>— Updated register descriptions in the following sections:                   <ul style="list-style-type: none"> <li>• <a href="#">Section 6.3.39.3, “ComponentImageSetVersionString_0 (0x0002)”</a> through <a href="#">Section 6.3.39.18, “ComponentImageSetVersionString_15 (0x0011)”</a></li> </ul> </li> <li>— Changed the value of Bit 5 of <a href="#">Section 6.3.42.4, “Port Options 1[n] (0x0003 + 10*n, n=0...7)”</a> from <i>Reserved</i> to <i>No-FEC</i>.</li> <li>— Added the following sections to the map:                   <ul style="list-style-type: none"> <li>• <a href="#">Section 6.3.49, “LLDP Preserved 2 Section”</a></li> <li>• <a href="#">Section 6.3.50, “WA Enable TLV Section”</a></li> <li>• <a href="#">Section 6.3.51, “FRU Data Section”</a></li> <li>• <a href="#">Section 6.3.52, “SyncE DPLL Input Settings Section”</a></li> </ul> </li> <li>— Added LCB auto-load workaround (Bits 4:3) to <a href="#">Section 6.3.61.28, “Features Enable (0x0022)”</a>.</li> <li>— Updated table in <a href="#">Section 6.3.76, “Extended ML Header Section”</a> to add:                   <ul style="list-style-type: none"> <li>• CPK PCIe Config Group 1 Hash Low (Word Offset 0x0018)</li> <li>• CPK PCIe Config Group 1 Hash High (Word Offset 0x0018)</li> </ul> </li> <li>— Added <a href="#">Section 6.3.76.25, “CPK PCIe Config Group 1 Hash Low (0x0018)”</a>.</li> <li>— Added <a href="#">Section 6.3.76.26, “CPK PCIe Config Group 1 Hash High (0x0019)”</a>.</li> </ul> </li> <li>• Added <a href="#">Section 7.8.10.1, “Shared Resources”</a>.</li> <li>• Updated table in <a href="#">Table 7-22, “Switch Configuration Admin Commands (0x02xx)”</a> to add Change Resource Ownership Type command (0x020B).</li> <li>• Updated <a href="#">Section 7.8.12.2.2, “Set Port Parameters (0x0203)”</a> to add Byte 22, “Loopback Mode”.</li> <li>• Updated Return Value/VFID (Bytes 6-7) in <a href="#">Table 7-33, “Allocate Resource Response”</a>.</li> <li>• Updated descriptions of Bits 14-15 of Offset 0-1 in <a href="#">Table 7-34, “Resource Description Table Entry”</a>.</li> <li>• Updated <a href="#">Section 7.8.12.2.5, “Free Resource (0x0209)”</a>.</li> <li>• Updated <a href="#">Section 7.8.12.2.6, “Get Allocated Resource Descriptors (0x020A)”</a>.</li> <li>• Added <a href="#">Section 7.8.12.2.7, “Change Resource Ownership Type (0x020B)”</a>.</li> <li>• Updated description of <i>Allow Loopback</i> field in <a href="#">Table 7-50, “Add VSI Command Buffer”</a>.</li> <li>• Updated <a href="#">Section 7.8.12.6.3, “Remove Switch Rules (0x02A2)”</a>.</li> <li>• Updated <a href="#">Section 8.3.4.3.6.5, “Move Scheduling Elements (0x0408)”</a>.</li> <li>• Updated <a href="#">Table 8-38, “Move Scheduling Elements Buffer per Sibling Group”</a> to add 2-bit <i>Mode</i> field.</li> <li>• Redefined Bits 27-28 in Byte 3 of 1588 (0x0046) capability in <a href="#">Table 9-50, “Resources Recognized by This Version of the Command”</a>.</li> <li>• Added the following capabilities to <a href="#">Table 9-50, “Resources Recognized by This Version of the Command”</a>:               <ul style="list-style-type: none"> <li>— OROM Update in Recovery Mode (0x0090)</li> <li>— RDMA RoCEv2 LAG (0x0092)</li> </ul> </li> <li>• Updated <a href="#">Section 9.7.5.1, “Transmit Timestamp”</a>.</li> <li>• Added note related to DCBx ETS Configuration TLV in <a href="#">Section 9.8.4.2, “Supported TLV”</a>.</li> <li>• Updated <a href="#">Table 9-70, “LLDP Admin Queue Commands”</a> to add Execute Pending LLDP MIB command (0x0A0B).</li> <li>• Added <i>Pending Event Enable</i> field to Configure LLDP MIB Change Event command. See <a href="#">Section 9.8.5.2.2.2, “Configure LLDP MIB Change Event (0x0A01)”</a>.</li> <li>• Updated <a href="#">Section 9.8.5.2.2.1, “LLDP MIB Change Event”</a>.</li> <li>• Updated <i>Return Value/VFID</i> field in <a href="#">Table 9-77, “Add LLDP TLV Response”</a>.</li> <li>• Updated <i>Return Value/VFID</i> field in <a href="#">Table 9-79, “Update LLDP TLV Response”</a>.</li> </ul>

Revision	Date	Notes
<p>2.6 (Continued)</p>	<p>May 23, 2023</p>	<ul style="list-style-type: none"> <li>• Updated <i>Return Value/VFID</i> field in Table 9-90, "Set Local LLDP MIB Response".</li> <li>• Added Section 9.8.5.2.2.12, "Execute Pending LLDP MIB (0x0A0B)".</li> <li>• Updated Table 10-29, "LAN Tx-Queue Context in the QTXCOMM_CNTX Array".</li> <li>• Updated Table 10-32, "Tx-Queue Handling Admin Queue Commands" to add Move RDMA Queue Sets command.</li> <li>• Added Section 10.5.5.8.5, "Move RDMA Queue Sets (0x0C34)".</li> <li>• Updated Table 12-16, "OEM Commands Summary" to add the following commands: <ul style="list-style-type: none"> <li>— Get Status (0x062)</li> <li>— SyncE Status change Event (0x083)</li> </ul> </li> <li>• Added Section 12.6.4.20, "Get Status (Intel Command 0x62)".</li> <li>• Added Section 12.6.4.22, "SyncE Status Change Event (Intel OEM NC-SI AEN 0x83)".</li> <li>• Updated Table 12-55, "Get MCTP Version Support Returned Value".</li> <li>• Updated Table 12-56, "Get Message Type Support Response".</li> <li>• Added Section 12.7.8, "SPDM over MCTP".</li> <li>• Updated Table 12-66, "GetPLDMVersion Command and Response".</li> <li>• Updated Table 12-68, "GetPLDMCommand Command and Response".</li> <li>• Updated Table 12-75, "PollForPlatformEventMessage Command and Response".</li> <li>• Updated table in Section 12.8.3.3.4.2, "Controller Composite State Sensor PDR".</li> <li>• Updated table in Section 12.8.3.3.4.3, "Plug Composite State Sensor PDR".</li> <li>• Updated Table 12-95, "PDRs Corresponding to Supported Schemas" to add the following PDRs: <ul style="list-style-type: none"> <li>— PCIeDevice</li> <li>— NetworkAdapterMetrics</li> <li>— PortMetrics</li> <li>— NetworkDeviceFunctionMetrics</li> </ul> </li> <li>• Updated Figure 12-14, "ACD Profile PDRs and Links".</li> <li>• Updated table in Section 12.8.3.3.8.1, "NetworkAdapter PDR".</li> <li>• Updated table in Section 12.8.3.3.8.5, "Port PDR".</li> <li>• Updated table in Section 12.8.3.3.8.6, "NetworkDeviceFunction PDR".</li> <li>• Added Section 12.8.3.3.8.7, "PCIeDevice PDR".</li> <li>• Updated table in Section 12.8.3.3.8.8, "PCIeFunctions PDR".</li> <li>• Added Section 12.8.3.3.8.10, "NetworkAdapterMetrics PDR".</li> <li>• Added Section 12.8.3.3.8.11, "PortMetrics PDR".</li> <li>• Added Section 12.8.3.3.8.12, "NetworkDeviceFunctionMetrics PDR".</li> <li>• Updated table in Section 12.8.3.3.10.1, "NetworkAdapter.ResetSettingsToDefault Action PDR".</li> <li>• Updated table in Section 12.8.3.3.10.2, "Port.Reset Action PDR".</li> <li>• Updated Section 12.8.6.1.2, "UPDATE, REPLACE Operation Guidelines".</li> <li>• Updated Table 12-102, "RDE Commands Summary Table" to add SelectRegistryVersion command.</li> <li>• Updated Table 12-103, "Handle per Resource".</li> <li>• Updated Table 12-104, "URI per Resource".</li> <li>• Updated table in Section 12.8.6.3.12, "RDEOperationInit (0x10)".</li> <li>• Updated Table 12-105, "Resources Parameters".</li> <li>• Updated table in Section 12.8.6.3.17, "RDEOperationKill (0x15)".</li> <li>• Updated Section 12.8.6.5.3.1, "Port v1.6.0".</li> <li>• Updated Section 12.8.6.5.3.4, "NetworkAdapter v1.7.0".</li> <li>• Updated Section 12.8.6.5.3.5, "NetworkDeviceFunction v1.3.3".</li> <li>• Added Section 12.8.6.5.3.10, "NetworkAdapterMetrics".</li> <li>• Added Section 12.8.6.5.3.11, "PortMetrics".</li> <li>• Added Section 12.8.6.5.3.12, "NetworkDeviceFunctionMetrics".</li> <li>• Updated Table 15-4, "Set Health Status Configuration Command and Response".</li> <li>• Updated Section 15.4.1.1, "Supported Failure Scenarios by Firmware".</li> <li>• Updated Table 16-8, "E810-CAM2/CAM1 MAX Power - PCIe Gen 4 and PCIe Gen 3".</li> <li>• Updated Table 16-9, "E810-CAM2/CAM1 Typical Active Power - PCIe Gen 4 and PCIe Gen 3".</li> <li>• Updated Table 16-33, "Supported Flash Parts".</li> </ul>

Revision	Date	Notes
2.5	November 21, 2022	<p>Updates include the following:</p> <ul style="list-style-type: none"> <li>• Updated <a href="#">Table 1-1, "E810 Features Summary"</a>.</li> <li>• Updated <a href="#">Table 1-2, "Standards Supported by the E810"</a>.</li> <li>• Added <a href="#">Section 3.2.5, "SyncE Flows"</a>.</li> <li>• Added <a href="#">Section 3.2.6, "SyncE Commands"</a>.</li> <li>• Updated <a href="#">Table 3-90, "128-Bit Word Extended PHY Capabilities"</a>.</li> <li>• Updated <a href="#">Table 3-91, "64-Bit Word Extended PHY Capabilities"</a>.</li> <li>• Updated <a href="#">Table 3-98, "External Topology Device NVM Section Format"</a>.</li> <li>• Updated <i>Node Type</i> field in <a href="#">Section 3.3.8.2.1, "Node Type and Section Length (0x0000)"</a>.</li> <li>• Updated <i>Node Part Number</i> field in <a href="#">Section 3.3.8.2.4, "Node Part Number and Node Options (0x0003)"</a>.</li> <li>• Updated <i>I/O Type</i> and <i>I/O Function / I/O Number</i> fields in <a href="#">Section 3.3.8.3.2, "I/O Type and Driving Interface (0x0001 + n*2)"</a>.</li> <li>• Added <a href="#">Section 3.3.8.11, "Node Clock Configuration Header Section"</a>.</li> <li>• Added <a href="#">Section 3.3.8.12, "Node Clock Input Configuration Section"</a>.</li> <li>• Added <a href="#">Section 3.3.8.13, "Node Clock Output Configuration Section"</a>.</li> <li>• Added <a href="#">Section 3.3.8.14, "Node Recovered Clock Output Configuration Section"</a>.</li> <li>• Added <a href="#">Section 3.3.8.15, "Node Clock DLL Configuration Section"</a>.</li> <li>• Added <a href="#">Section 3.3.8.27, "Clock Controller Node"</a>.</li> <li>• Added <a href="#">Section 3.3.8.28, "Clock MUX Node"</a>.</li> <li>• Added <a href="#">Section 3.3.8.29, "GPS Node"</a>.</li> <li>• Added <a href="#">Section 3.3.9.4.6, "Generic Clock Mux"</a>.</li> <li>• Updated <a href="#">Section 3.4.1, "General Overview"</a>.</li> <li>• Updated <a href="#">Section 3-33, "Flash Wear-Out Protection Algorithm"</a>.</li> <li>• Updated <a href="#">Section 4-20, "Completion for the Done Alternate Write Command"</a>.</li> <li>• Updated <a href="#">Section 6-5, "Module TypeID Table"</a>.</li> <li>• Updated <a href="#">Section 6.2, "PLDM Header"</a>.</li> <li>• Updated NVM Content section: <ul style="list-style-type: none"> <li>– Updated table in <a href="#">Section 6.3.21.3, "Setup Options PCI Function[n] (0x0002 + 1*n, n=0...7)"</a>.</li> <li>– Added <a href="#">Section 6.3.48, "Tx-Scheduler Topology User Selection Section"</a>.</li> <li>– Updated <a href="#">Section 6.3.56, "CORER Registers Auto-Load Module Section"</a>.</li> <li>– Updated the Default NVM Value of <i>Max PF per Port</i> field in <a href="#">Section 6.3.61.9, "Max PF and VF per Port (0x0008)"</a>.</li> <li>– Updated description of the <i>HII Version Check For Seamless Update Enable</i> field in <a href="#">Section 6.3.61.28, "Features Enable (0x0022)"</a>.</li> <li>– Updated <a href="#">Section 6.3.64, "GFID Module Section"</a>.</li> <li>– Updated description of the <i>SMBus Connection Speed</i> field in <a href="#">Section 6.3.66.3, "SMBus Notification Timeout and Flags (0x0002)"</a>.</li> <li>– Added <i>MCTP Over PCIe Segmentation Enable</i> field to <a href="#">Section 6.3.66.12, "NC-SI over MCTP Configuration (0x000F)"</a>.</li> <li>– Updated <a href="#">Section 6.3.76, "Extended ML Header Section"</a>.</li> <li>– Updated the Default NVM Value of the <i>Device Blank NVM Device ID</i> field in <a href="#">Section 6.3.88.1, "Device Blank NVM Device ID (0x0000)"</a>.</li> <li>– Updated the Default NVM Value of the <i>Device Blank NVM Device ID</i> field in <a href="#">Section 6.3.113.1, "Device Blank NVM Device ID (0x0000)"</a>.</li> </ul> </li> <li>• Updated <a href="#">Table 7-22, "Switch Configuration Admin Commands (0x02xx)"</a> to add: <ul style="list-style-type: none"> <li>– Set VLAN Mode Parameters command (0x020C).</li> <li>– Get VLAN Mode Parameters command (0x020D).</li> <li>– Set DMA PASID IDX Map command (0x0214).</li> <li>– Get DMA PASID IDX Map command (0x0215).</li> </ul> </li> <li>• Updated description of Offset (Bytes) 0-1 in <a href="#">Table 7-26, "Get Switch Configuration – Port/VSI Element"</a>.</li> <li>• Updated description of the <i>Command Flags</i> field in <a href="#">Table 7-27, "Set Port Parameters Command"</a>.</li> <li>• Updated description of Offset (Bytes) 0-1 and added Offset (Bytes) 10-11 in <a href="#">Table 7-31, "Get Resource Allocation Response Buffer Entry"</a>.</li> <li>• Updated description of Offset (Bytes) 0-1 in <a href="#">Table 7-34, "Resource Description Table Entry"</a>.</li> </ul>

Revision	Date	Notes
2.5 (Continued)	November 21, 2022	<ul style="list-style-type: none"> <li>• Updated description of the <i>Resource</i> field in Table 7-38, "Get Allocated Resource Descriptors Command".</li> <li>• Updated description of the <i>Resource</i> field in Table 7-39, "Get Allocated Resource Descriptors Response".</li> <li>• Added Section 7.8.12.2.8, "Set VLAN Mode Parameters (0x020C)".</li> <li>• Added Section 7.8.12.2.9, "Get VLAN Mode Parameters (0x020D)".</li> <li>• Updated Table 7-50, "Add VSI Command Buffer".</li> <li>• Added Section 7.8.12.3.5, "Set DMA PASID IDX Map (0x0214)".</li> <li>• Added Section 7.8.12.3.6, "Get DMA PASID IDX Map (0x0215)".</li> <li>• Updated Table 7-179, "Segment Type Numbers".</li> <li>• Updated Table 7-180, "Global Metadata Segment".</li> <li>• Updated Section 7.11.5.3, "Configuration Data Segment": <ul style="list-style-type: none"> <li>— Updated Figure 7-35, Overview of the E810 Data Segments.</li> <li>— Updated Table 7-182, "E810 Data Segment".</li> </ul> </li> <li>• Updated the <i>Return Value/VFID</i> field description in Table 7-194, "Download Package Response".</li> <li>• Updated Table 7-283, "Flex Descriptor Table".</li> <li>• Updated Table 8-3, "CGD Configuration for Each Usage".</li> <li>• Updated Section 8.3.3, "Network Topologies in Tx-Scheduler".</li> <li>• Added Table 8-24, "Tx-Scheduler 5-Layer and 9-Layer Topologies".</li> <li>• Updated Table 8-25, "Scheduler Configuration Admin Queue Commands".</li> <li>• Added Section 8.3.4.3.6.11, "Set Tx-Scheduler Topology (0x0417)".</li> <li>• Added Section 8.3.4.3.6.12, "Get Tx-Scheduler Topology (0x0418)".</li> <li>• Updated Section 9.2.3.1, "Assumptions".</li> <li>• Updated Section 9.2.3.2.1, "PASID Context".</li> <li>• Updated Section 9.2.3.3, "Assignable Device Interface".</li> <li>• Updated Section 9.5.13.5, "Request Resource Ownership (0x0008)".</li> <li>• Updated Table 9-50, "Resources Recognized by This Version of the Command".</li> <li>• Updated Table 9-83, "Stop LLDP Agent Response".</li> <li>• Updated Table 9-85, "Start LLDP Agent Response".</li> <li>• Updated Section 10.4.2.2.3, "Programming Status Descriptor Write-Back Format".</li> <li>• Updated Section 10.4.3.3, "Configure No-Drop Policy Admin Command (0x00112)".</li> <li>• Updated Section 10.5.3.1.1, "Transmit Data Descriptor".</li> <li>• Removed Section 10.5.4.9, "Tx Time (SO_TXTIME) Overview Descriptors and Doorbells".</li> <li>• Updated Section 10.5.7, "Performance Consideration".</li> <li>• Updated Table 12-1, "System Manageability Features".</li> <li>• Updated Section 12.6.3.1, "NC-SI Link State Control".</li> <li>• Updated Table 12-15, "OEM-Specific Command Response Reason Codes" to add Reason Code 0x50A0 (Driver Conflict).</li> <li>• Updated Table 12-16, "OEM Commands Summary" to add the Config LLDP FW Agent command (0x26), <ul style="list-style-type: none"> <li>— Added Section 12.6.4.15, "LLDP Firmware Agent Configuration": <ul style="list-style-type: none"> <li>— Added Section 12.6.4.15.1, "Config LLDP FW Agent Command (Intel Command 0x26)".</li> <li>— Added Section 12.6.4.15.1.1, "Config LLDP FW Agent Response".</li> </ul> </li> </ul> </li> <li>• Added Controller Information Items to Table 12-40 related to Section 12.6.4.17.1.1, "Get Controller Information Response".</li> <li>• Updated Section 12.7.2.2, "PCIe Discovery Process".</li> <li>• Added note to Section 12.8.2.1.11, "SetSensorThresholds (0x13)".</li> <li>• Updated Section 12.8.3.3.6.1, "Thermal Sensors PDR".</li> <li>• Update Table 12-97, "Version Strings and Comparison Stamps".</li> <li>• Updated Section 12.8.6.5.3.4, "NetworkAdapter.v1.7.0".</li> <li>• Updated Section 12.8.6.5.3.7, "PCIeDevice.v1.4.0".</li> <li>• Updated Section 12.8.6.5.3.9, "PCIeFunction.v1.2.3".</li> </ul>

Revision	Date	Notes
2.5 (Continued)	November 21, 2022	<ul style="list-style-type: none"> <li>Updated DCB registers in Section 13.2.2.17, "PF - DCB Registers":               <ul style="list-style-type: none"> <li>Added Section 13.2.2.17.47, "DCB TLPM TC PFC Mapping - GLDCB_TLPM_TC2PFC (0x000A0194; RW)".</li> <li>Added Section 13.2.2.17.48, "DCB TC to PFC Mapping - GLRPB_TC2PFC (0x000AC040; RW)".</li> <li>Added Section 13.2.2.17.72, "DCB TC to PFC Mapping - GLDCB_TCUPM_TC2PFC (0x000BC34C; RW)".</li> <li>Updated Section 13.2.2.17.103, "DCB TC to PFC Mapping - GLDCB_TC2PFC (0x001D2694; RW)".</li> </ul> </li> <li>Updated PE registers in Section 13.2.2.28, "PF - Protocol Engine Registers":               <ul style="list-style-type: none"> <li>Added Section 13.2.2.28.53, "Critical Error Status and Control - GLPE_CRITERR (0x00534000; RW)".</li> </ul> </li> <li>Updated Manageability registers in Section 13.2.2.29, "PF - Manageability Registers":               <ul style="list-style-type: none"> <li>Updated Section 13.2.2.29.7, "Firmware Status - GL_MNG_FWSM (0x000B6134; RO)".</li> </ul> </li> <li>Updated Table 15-11, "Health Status Codes".</li> </ul>
2.4	March 20, 2022	<p>Updates include the following:</p> <ul style="list-style-type: none"> <li>Added Section 3.3.10.1, "Set GPIO by Function (0x06E6)".</li> <li>Added Section 3.3.10.2, "Get GPIO by Function (0x06E7)".</li> <li>Updated Table 4-27, "Resources per Configuration".</li> <li>Updated Table 4-28, "Resource Distribution".</li> <li>Updated MajorSchemaNameLength value in Section 12.8.3.3.8.6, "NetworkDeviceFunction PDR".</li> <li>Updated MajorSchemaNameLength value in Section 12.8.3.3.8.9, "PCIeFunction PDR".</li> <li>Updated AdditionalResourceID [0] value in Section 12.8.3.3.9.2, "EthernetInterface PDR".</li> <li>Updated ADJUST_H field description in Section 13.2.2.27.17, "Global TimeSync Shadow Adjust High - GLTSYN_SHADJ_H[n] (0x00088910 + 0x4*n, n=0...1; RW)".</li> </ul>
2.3	September 28, 2021	<p>Updates include the following:</p> <ul style="list-style-type: none"> <li>Updated description of <i>cc_cfg_valid</i> field in Section 11.5.2.3, "CQP Context".</li> <li>Corrected erroneous tolerance value in the table in Section 16.7.1, "Tolerance Information".</li> </ul>
2.2	July 8, 2021	<p>Updates include the following:</p> <ul style="list-style-type: none"> <li>Removed mezzanine card discussions, as mezzanine cards not supported with the E810. Affected sections include:           <ul style="list-style-type: none"> <li>Section 3.3.1, "Overview"</li> <li>Section 3.3.2, "Link Topology Definition"</li> <li>Section 3.3.3, "Topology Structures"</li> <li>Section 3.3.3.4, "Link Topology Netlist"</li> <li>Section 3.3.5, "Link Topology Use Cases"</li> </ul> </li> <li>Added Section 3.3.4, "Link Default Override Mask NVM Section".</li> <li>Added Section 3.3.6, "Topology Device Loading and Programming".</li> <li>Added Section 3.3.7, "Block Access to External PHY During Its NVM Programming".</li> <li>Added two new Link Topology Admin Commands:           <ul style="list-style-type: none"> <li>Section 3.3.10.4, "Read/Write SFF EEPROM (0x06EE)"</li> <li>Section 3.3.10.5, "Program Topology Device NVM (0x06F2)"</li> </ul> </li> <li>Updated Section 3.4.9, "NVM Authentication Procedure" and the following subsections therein:           <ul style="list-style-type: none"> <li>Section 3.4.9.1, "Digital Signature Algorithm Details"</li> <li>Section 3.4.9.2, "Intel Key Generation and Intel Code Signing System"</li> </ul> </li> <li>Added Section 3.4.9.3, "Netlist Authentication During Update".</li> <li>Updated POR flow in Section 4.1.2.1.</li> <li>Updated CORER flow in Section 4.1.2.3.2.</li> <li>Added Section 4.5.5, "Port Enable and Disable from BIOS (HII)".</li> <li>Updated Section 6.2, "PLDM Header".</li> <li>Updated Section 6.3, "NVM Content".</li> <li>Updated Section 7.2.1, "Rx and Tx Pipeline Structure".</li> <li>Updated Section 7.8.5.3.5, "Forwarding Actions".</li> </ul>

Revision	Date	Notes
<p>2.2 (Continued)</p>	<p>July 8, 2021</p>	<ul style="list-style-type: none"> <li>• Modified list of AQ commands in Section 8.3.4.3.6, “Admin Queue Commands” and associated subsections.</li> <li>• Updated Section 9.2.1.3, “Virtualization Supported Features”.</li> <li>• Updated Section 9.2.2.2.1.1, “Tx Data Checks (GL_MDCK_TX_TDPU Register)”.</li> <li>• Updated Table 9-7, “Malicious Driver - Tx-Descriptor Checks (GL_MDCK_TDAT_TCLAN)”.</li> <li>• Modified list of generic firmware admin commands in Section 9.5.13, “Generic Firmware Admin Commands” and associated subsections.</li> <li>• Updated Table 9-50, “Resources Recognized by This Version of the Command”.</li> <li>• Added Section 9.5.13.9, “Set/Get Shared Driver Parameters (0x0C90)”.</li> <li>• Updated the <i>QINDEX</i> and <i>FLEX_VAL</i> descriptions in Quad Word 0 in Section 10.5.3.3, “FD Filter Programming Descriptor”.</li> <li>• Added Section 10.5.4.9, “Tx Time (SO_TXTIME) Overview Descriptors and Doorbells”.</li> <li>• Updated Table 10-29, “LAN Tx-Queue Context in the QTXCOMM_CNTX Array”.</li> <li>• Updated Section 10.5.7, “Performance Consideration”.</li> <li>• Updated Table 10-45, “Transmit Integrity Offload for Packet Types”.</li> <li>• Updated Table 11-1, “Protocol Engine Features”.</li> <li>• Updated Section 11.5.2.3, “CQP Context”.</li> <li>• Updated Table 11-19, “CQP Error Codes”.</li> <li>• Updated Section 11.6.3, “RoCEv2 QP Context Format”.</li> <li>• Updated Section 12.6.3.2, “Set Link Error Codes”.</li> <li>• Updated Section 12.6.4.1, “Overview”.</li> <li>• Updated Table 12-15, “OEM-Specific Command Response Reason Codes”.</li> <li>• Updated Table 12-16, “OEM Commands Summary”.</li> <li>• Added Get SFF Module Temperature command and related sections: <ul style="list-style-type: none"> <li>– Section 12.6.4.19, “SFF Module Temperature”</li> <li>– Section 12.6.4.19.1, “Get SFF Module Temperature Command (Intel Command 0x4B, Parameter 0x02)”</li> <li>– Section 12.6.4.19.1.1, “Get SFF Module Temperature Response”</li> </ul> </li> <li>• Updated Section 12.6.4.16.4, “Set BMC IP Address Command (Intel Command 0x40, Parameter 0x04)”.</li> <li>• Updated Table 12-40, “Controller Information Items”.</li> <li>• Updated Section 12.8, “PLDM Support”.</li> <li>• Updated Section 12.8.1.2.1, “GetPLDMVersion (0x03)”.</li> <li>• Updated Section 12.8.1.2.3, “GetPLDMCommand (0x05)”.</li> <li>• Updated Section 12.8.2.3, “PDR Dynamic Changes Flow”.</li> <li>• Updated Section 12.8.2.3.1.1, “QSFP/SFP Plug Events”.</li> <li>• Updated Section 12.8.2.3.1.2, “QSFP/SFP Unplug Events”.</li> <li>• Updated Section 12.8.3.1, “Sensors Numbering”.</li> <li>• Updated the <i>sensorID</i> value in the following sections: <ul style="list-style-type: none"> <li>– Section 12.8.3.2.3.1, “Controller Health State Data Structure”</li> <li>– Section 12.8.3.2.3.2, “Controller Configuration Data Structure”</li> <li>– Section 12.8.3.2.3.3, “Controller Configuration Change Data Structure”</li> <li>– Section 12.8.3.2.3.4, “Controller Thermal Trip State Data Structure”</li> </ul> </li> <li>• Added Section 12.8.3.2.3.5, “Firmware Version State Data Structure”.</li> <li>• Updated the <i>sensorID</i> value in the following sections: <ul style="list-style-type: none"> <li>– Section 12.8.3.2.4.1, “Plug Health State Data Structure”</li> <li>– Section 12.8.3.2.4.2, “Plug Presence State Data Structure”</li> <li>– Section 12.8.3.2.4.3, “Plug Thermal Trip State Data Structure”</li> <li>– Section 12.8.3.2.5.1, “Port Link Sensor”</li> </ul> </li> <li>• Updated <i>recordHandle</i> and <i>PLDMTerminusHandle</i> values in Section 12.8.3.3.1, “Terminus Locator PDR”.</li> <li>• Updated Section 12.8.3.3.2.1, “NIC Association PDR”.</li> <li>• Updated Section 12.8.3.3.2.2, “Controller Association PDR”.</li> <li>• Updated Section 12.8.3.3.2.3, “Connector Association PDR”.</li> <li>• Updated Section 12.8.3.3.2.4, “Pluggable Module Association PDR”.</li> <li>• Updated Section 12.8.3.3.3.1, “Communication Channel Entity Association PDR”.</li> <li>• Updated Section 12.8.3.3.4.1, “NIC Composite State Sensor PDR”.</li> <li>• Updated Section 12.8.3.3.4.2, “Controller Composite State Sensor PDR”.</li> </ul>

Revision	Date	Notes
2.2 (Continued)	July 8, 2021	<ul style="list-style-type: none"> <li>• Updated Section 12.8.3.3.4.3, "Plug Composite State Sensor PDR".</li> <li>• Updated Section 12.8.3.3.5.1, "Port Link State PDR".</li> <li>• Updated Section 12.8.3.3.6.1, "Thermal Sensors PDR".</li> <li>• Updated Section 12.8.3.3.6.2, "Pluggable Module Power Sensors PDR".</li> <li>• Updated Section 12.8.3.3.6.3, "Link Speed Sensors PDR".</li> <li>• Updated Section 12.8.3.3.7, "Redfish PDRs".</li> <li>• Updated Section 12.8.3.3.8, "ACD Profile PDRs and Links".</li> <li>• Updated Section 12.8.3.3.8.1, "NetworkAdapter PDR".</li> <li>• Updated Section 12.8.3.3.8.2, "NetworkInterface PDR".</li> <li>• Updated Section 12.8.3.3.8.3, "Ports PDR".</li> <li>• Updated Section 12.8.3.3.8.5, "Port PDR".</li> <li>• Updated Section 12.8.3.3.8.6, "NetworkDeviceFunction PDR".</li> <li>• Updated Section 12.8.3.3.8.9, "PCIeFunction PDR".</li> <li>• Added Section 12.8.3.3.10.2, "Port.Reset Action PDR".</li> <li>• Updated Section 12.8.5.2.1, "Package Versions" and added Table 12-97, "Version Strings and Comparison Stamps".</li> <li>• Updated Table 12-103, "Handle per Resource".</li> <li>• Updated Table 12-104, "URI per Resource".</li> <li>• Updated Section 12.8.6.2, "RDE Commands Summary" and added the following commands: <ul style="list-style-type: none"> <li>— Section 12.8.6.3.6, "GetOEMCount (0x06)"</li> <li>— Section 12.8.6.3.7, "GetOEMName (0x07)"</li> <li>— Section 12.8.6.3.8, "GetRegistryCount (0x8)"</li> <li>— Section 12.8.6.3.9, "GetRegistryDetails (0x9)"</li> <li>— Section 12.8.6.3.11, "GetMessageRegistry (0xB)"</li> </ul> </li> <li>• Updated Table 12-105, "Resources Parameters".</li> <li>• Updated Section 12.8.6.5.2, "Common Fields in All Schemas".</li> <li>• Updated Section 12.8.6.5.3, "ACD Schemas" and the following subsections therein: <ul style="list-style-type: none"> <li>— Section 12.8.6.5.3.1, "Port v1.6.0"</li> <li>— Section 12.8.6.5.3.2, "PortCollection"</li> <li>— Section 12.8.6.5.3.3, "NetworkInterface v1.2.0"</li> <li>— Section 12.8.6.5.3.4, "NetworkAdapter v1.7.0"</li> <li>— Section 12.8.6.5.3.5, "NetworkDeviceFunction v1.3.3"</li> <li>— Section 12.8.6.5.3.7, "PCIeDevice.v1.4.0"</li> </ul> </li> <li>• Added Section 12.8.6.5.5, "Generic Schemas" and the following subsections: <ul style="list-style-type: none"> <li>— Section 12.8.6.5.5.1, "Event"</li> <li>— Section 12.8.6.5.5.2, "NetworkDevice Registry v1.0.1"</li> </ul> </li> <li>• Updated Section 14.3.5.12, "Link Capabilities 2 Register (0xCC; RO)".</li> <li>• Updated Table 14-20, "Extended Capabilities List".</li> <li>• Updated Section 14.4.7.2, "Link Control 3 Register (0x1D4; RW)".</li> <li>• Updated Section 14.4.10.9, "16.0 GT/s Lane Equalization Control Register (0x230 - 0x23C; HWInit)".</li> <li>• Updated Section 15.1.1, "ECC Support and ECC Error Flow".</li> <li>• Added Section 15.3, "Device Diagnostics" and the following subsections: <ul style="list-style-type: none"> <li>— Section 15.3.1, "Firmware Logging Overview" <ul style="list-style-type: none"> <li>• Section 15.3.1.1, "NVM Default Firmware Log Configuration"</li> <li>• Section 15.3.1.2, "Persistent Crash Log"</li> </ul> </li> <li>— Section 15.3.2, "Health Status Commands" <ul style="list-style-type: none"> <li>• Section 15.3.2.1, "Set Health Status Configuration (0xFF20)"</li> <li>• Section 15.3.2.2, "Get Supported Health Status Codes (0xFF21)"</li> <li>• Section 15.3.2.3, "Get Health Status Event (0xFF22)"</li> <li>• Section 15.3.2.4, "Clear Health Status (0xFF23)"</li> </ul> </li> <li>— Section 15.3.3, "Health Status Codes"</li> </ul> </li> <li>• Updated Section 15.4.2.2.1.1, "Recovery Mode Admin Commands".</li> <li>• Updated Table 16-30, "Mechanical Load Limits".</li> <li>• Added Section 16.7.1, "Tolerance Information".</li> <li>• Updated Chapter 19, "Glossary and Acronyms".</li> </ul>

Revision	Date	Notes
2.1	January 22, 2021	Updates include the following: <ul style="list-style-type: none"><li>• Updated <a href="#">Table 1-1, "E810 Features Summary"</a> under the Security category.</li><li>• Added <a href="#">Section 1.4.12.1, "Protect, Detect, and Recover"</a>.</li><li>• Updated <a href="#">Table 1-2, "Standards Supported by the E810"</a> to add Security category.</li><li>• Updated <a href="#">Section 16.3.1.1, "Power On/Off Sequence"</a>.</li><li>• Updated <a href="#">Table 16-8, "E810-CAM2/CAM1 MAX Power - PCIe Gen 4 and PCIe Gen 3"</a>.</li><li>• Updated <a href="#">Section 16.5.5, "Reference Clock Specification"</a> to enhance HCSL and <math>V_{diff}</math> discussion.</li><li>• Updated <a href="#">Table 18-2, "E810 Thermal Specifications"</a>.</li></ul>
2.0	July 23, 2020	Second public release.
1.9 <sup>1</sup>	July 13, 2020	Initial public release.

## Contents

---

<b>Chapter 1 Introduction .....</b>	<b>27</b>
1.1 Overview .....	27
1.2 E810 Full Chip Block Diagram .....	30
1.3 Controller Core Block Diagram .....	31
1.3.1 LAN Traffic Tx Flow .....	31
1.3.2 LAN Traffic Rx Flow .....	32
1.3.3 Management Flows .....	32
1.4 Functional Blocks .....	33
1.4.1 Host Interface .....	33
1.4.2 Host Memory Objects .....	33
1.4.3 LAN Engine .....	34
1.4.4 Protocol Engine .....	34
1.4.5 Transmit Scheduler .....	34
1.4.6 Tx and Rx Modifiers .....	35
1.4.7 Ethernet Media Access Controller (MAC) .....	35
1.4.8 Packet Parser .....	36
1.4.9 VEB Switch (a.k.a. Binary Classifier) .....	36
1.4.10 Access Control Lists (ACLs) .....	36
1.4.11 Classification Filters .....	37
1.4.12 Embedded Management Processor (EMP) .....	37
1.4.13 Host Memory Cache (HMC) .....	38
1.4.14 Various Interfaces .....	38
1.5 Conventions .....	39
1.5.1 Numbers and Number Bases .....	39
1.5.2 Byte Ordering .....	39
1.6 Support Documents .....	41
<b>Chapter 2 Pin Interface .....</b>	<b>49</b>
2.1 Pin Descriptions .....	49
2.2 Pin Assignments and Descriptions .....	49
2.2.1 PCIe Interface Pins .....	50
2.2.2 Ethernet Interface Pins .....	52
2.2.3 NC-SI Interface Pins .....	54
2.2.4 SMBus Interface Pins .....	54
2.2.5 Serial Flash Memory Interface Pins .....	55
2.2.6 General Purpose I/O (GPIO) Pins .....	56
2.2.7 Miscellaneous Pins .....	57
2.2.8 Testability and Debug Pins .....	58
2.2.9 Reserved and No-Connect Pins .....	59
2.2.10 Power Supply Pins .....	60
2.2.11 Pull-Up and Pull-Down Resistors .....	61
2.3 Package Layout .....	62
<b>Chapter 3 Interconnects .....</b>	<b>67</b>
3.1 PCI Express (PCIe) .....	67
3.1.1 Features .....	67
3.1.2 Transaction Layer .....	68
3.1.3 Link Layer .....	78
3.1.4 Physical Layer .....	79
3.1.5 Error Events and Error Reporting .....	84
3.1.6 Performance and Statistics Counters .....	89
3.2 Ethernet Interconnect .....	93
3.2.1 Media Access Control (MAC) Layer .....	93

3.2.2	Physical Layer Interface .....	104
3.2.3	Link Management.....	111
3.2.4	Link Configuration Admin Commands.....	118
3.2.5	SyncE Flows .....	142
3.2.6	SyncE Commands .....	146
3.3	Link Topology .....	178
3.3.1	Overview .....	178
3.3.2	Link Topology Definition .....	179
3.3.3	Topology Structures .....	180
3.3.4	Link Default Override Mask NVM Section .....	189
3.3.5	Link Topology Use Cases .....	192
3.3.6	Topology Device Loading and Programming .....	194
3.3.7	Block Access to External PHY During Its NVM Programming.....	196
3.3.8	Topology Netlist.....	197
3.3.9	Topology Netlist Constraints and Conventions .....	258
3.3.10	Link Topology Admin Commands .....	262
3.4	Non-Volatile Memory (NVM) .....	274
3.4.1	General Overview.....	274
3.4.2	External Flash.....	276
3.4.3	Shadow RAM .....	277
3.4.4	NVM Access Modes .....	279
3.4.5	NVM Update Flows .....	280
3.4.6	NVM Clients and Low-Level Interfaces.....	296
3.4.7	Flash Access Contention .....	297
3.4.8	NVM Access Procedures .....	298
3.4.9	NVM Authentication Procedure .....	301
3.4.10	NVM Access Admin Commands and Events .....	308
3.4.11	VPD Support.....	332
3.5	General Purpose I/O (GPIO) and LED .....	334
3.5.1	E810 I/O Widget SDP and LED .....	334
<b>Chapter 4</b>	<b>Initialization .....</b>	<b>337</b>
4.1	Reset Operation .....	337
4.1.1	Reset Sources.....	337
4.1.2	Hardware Reset Flows.....	342
4.1.3	Function-Level Reset Flows.....	346
4.2	Power-On and Reset .....	360
4.2.1	Auto-Load Shadow RAM .....	360
4.3	BIOS Initialization .....	368
4.3.1	Initial State .....	368
4.3.2	Non-Persistent Configuration .....	368
4.3.3	Network Boot .....	379
4.3.4	Device State.....	379
4.4	Driver Load .....	380
4.4.1	Introduction .....	380
4.5	Device/Port/Function Configuration .....	383
4.5.1	General .....	383
4.5.2	Disable Through Strapping Pins.....	383
4.5.3	Port and Device Disable .....	384
4.5.4	Function Disable .....	385
4.5.5	Port Enable and Disable from BIOS (HII) .....	386
4.5.6	Event Flow for Enable/Disable Ports and PCI Functions .....	387
4.6	Shared Resource Management .....	389
4.6.1	Resource Profiles.....	389
<b>Chapter 5</b>	<b>Power Management .....</b>	<b>393</b>

5.1	PCIe Power Management .....	393
5.1.1	Auxiliary Power Usage .....	393
5.1.2	PCIe Link Power Management .....	394
5.1.3	Power States .....	395
5.2	Network Interfaces Power Management .....	400
5.2.1	Low Power Link Up (LPLU) .....	400
5.3	Wake-Up .....	402
5.3.1	Advanced Power Management Wake-Up .....	402
5.3.2	ACPI Power Management Wake-Up .....	403
5.3.3	Wake-Up Filters .....	403
5.3.4	Wake-Up and Virtualization .....	404
5.3.5	Wake-Up Flows .....	405
<b>Chapter 6</b>	<b>Non-Volatile Memory Map .....</b>	<b>407</b>
6.1	NVM Organization .....	407
6.1.1	NVM Map High Level .....	407
6.1.2	NVM Header .....	408
6.1.3	Structure of NVM Modules .....	411
6.1.4	NVM Integrity Checks by Software .....	422
6.1.5	Header of NVM Modules .....	422
6.1.6	Adaptive NVM Structures .....	426
6.2	PLDM Header .....	434
6.2.1	PLDM Header Section .....	434
6.3	NVM Content .....	490
6.3.1	NVM General Summary .....	490
6.3.2	SPI Descriptor Section .....	493
6.3.3	Init Module Section .....	494
6.3.4	PFA Header Section .....	515
6.3.5	PFA Features Module Section .....	515
6.3.6	Feature Configuration Padding Module Section .....	516
6.3.7	PFA Immediate Values Module Section .....	516
6.3.8	Immediate Fields Padding Module Section .....	517
6.3.9	PFA VPD Module Section .....	518
6.3.10	PFA MNG Filter Section .....	519
6.3.11	PFA PT Configuration 0 Section .....	520
6.3.12	PFA PT Configuration 1 Section .....	527
6.3.13	PFA PT Configuration 2 Section .....	532
6.3.14	PFA PT Configuration 3 Section .....	537
6.3.15	PFA PT Configuration 4 Section .....	542
6.3.16	PFA PT Configuration 5 Section .....	547
6.3.17	PFA PT Configuration 6 Section .....	552
6.3.18	PFA PT Configuration 7 Section .....	557
6.3.19	Original EETTrack ID Section .....	562
6.3.20	IBA Capabilities Module Section .....	563
6.3.21	PXE Setup Options Module Section .....	565
6.3.22	PXE Configuration Customization Options Module Section .....	567
6.3.23	PXE Version Module Section .....	570
6.3.24	VLAN Module Section .....	571
6.3.25	Boot Configuration Block Section .....	573
6.3.26	PBA Header Section .....	574
6.3.27	PBA Block Section .....	575
6.3.28	PCIR Registers PFA Auto-Load Module Section .....	577
6.3.29	POR Registers PFA Auto-Load Module Section .....	585
6.3.30	PSM Preserved Section .....	592
6.3.31	MinSrev Section .....	595
6.3.32	PF MAC Address Section .....	597

6.3.33	MNG MAC Address Section .....	600
6.3.34	FW Logging Defaults Section.....	602
6.3.35	1588 Parameters Section .....	609
6.3.36	MD Link Topology Section .....	612
6.3.37	LLDP Preserved Section.....	614
6.3.38	RDE Module Section .....	616
6.3.39	Identical Content as PLDM Header ComponentImageSetVersionString Section .....	617
6.3.40	Software Checksum Module Section.....	621
6.3.41	RDMA Control Section.....	622
6.3.42	Link Default Override Mask Section.....	623
6.3.43	RDE Ethernet MTU Section .....	629
6.3.44	Default DCB Parameters Section .....	630
6.3.45	Current DCB Parameters Section .....	631
6.3.46	HII Port Disable by Function Section .....	632
6.3.47	NetlistMinSrev Section .....	634
6.3.48	Tx-Scheduler Topology User Selection Section.....	635
6.3.49	LLDP Preserved 2 Section .....	636
6.3.50	WA Enable TLV Section .....	653
6.3.51	FRU Data Section .....	654
6.3.52	SyncE DPLL Input Settings Section .....	657
6.3.53	Padding Module Section .....	702
6.3.54	PCIR Type 1/2 Section .....	703
6.3.55	POR Type 1/2 Section .....	704
6.3.56	CORER Registers Auto-Load Module Section.....	705
6.3.57	Mailbox Register Auto-Load Module Section .....	752
6.3.58	GLOBR Registers Auto-Load Module Section.....	759
6.3.59	PE CORER Registers Section .....	774
6.3.60	Sideband Bus Auto-Load Section .....	775
6.3.61	EMP SR Settings Module Header Section.....	822
6.3.62	SR PF Allocations Section .....	830
6.3.63	LLDP Configuration Section.....	832
6.3.64	GFID Module Section .....	835
6.3.65	Manageability Module Header Section .....	843
6.3.66	Sideband Configuration Structure Section.....	848
6.3.67	OEM Section.....	853
6.3.68	Auto-Generated Pointers Module Section .....	854
6.3.69	NVM Image CSS Header Section .....	864
6.3.70	NVM Key and Signature Section .....	870
6.3.71	NVM Image Auth Header Section.....	871
6.3.72	SR1 - Should Be Copy of Shadow RAM: Section Clone .....	872
6.3.73	ML CSS Header Section.....	873
6.3.74	ML Key and Signature Section.....	879
6.3.75	ML Auth Header Section .....	880
6.3.76	Extended ML Header Section .....	882
6.3.77	ML Image Section .....	886
6.3.78	Analog PHY pre PLL Configuration Section.....	887
6.3.79	CSR Protected List Section .....	888
6.3.80	PCIe Analog Module Section .....	890
6.3.81	PCIR Registers Auto-Load Module Section.....	891
6.3.82	POR Registers Auto-Load Module Section.....	893
6.3.83	PCIR_PFA Auto-Load Allowlist Module Section .....	894
6.3.84	POR_PFA Auto-Load Allowlist Module Section .....	901
6.3.85	LVK Hashes Section.....	908
6.3.86	Recovery FW CSS Header Section.....	909
6.3.87	Recovery FW Key and Signature Section .....	915

6.3.88	Recovery FW Auth Header Section .....	916
6.3.89	DCB Rx Module Section .....	917
6.3.90	DCB Tx Module Section .....	917
6.3.91	QoS DCB Auto-Load Section .....	917
6.3.92	QoS no-DCB Auto-Load Section .....	917
6.3.93	Ext. CORER Registers Auto-Load Module Section .....	918
6.3.94	EMP Global Module Section .....	919
6.3.95	EMP Settings Module Header Section .....	924
6.3.96	DL Scripts Section .....	927
6.3.97	Allowlist Section .....	927
6.3.98	Analog PHY Configuration Section .....	927
6.3.99	Configuration Metadata Section .....	928
6.3.100	Control Pipe Package Section .....	928
6.3.101	EMP Image Section .....	929
6.3.102	RDE Dictionaries Section .....	929
6.3.103	External Topology Device Image 0 Section .....	930
6.3.104	External Topology Device Image 1 Section .....	932
6.3.105	External Topology Device Image 2 Section .....	934
6.3.106	External Topology Device Image 3 Section .....	936
6.3.107	NVM Provisioning Area Section .....	938
6.3.108	OROM Section .....	939
6.3.109	OROM Provisioning Area Section .....	946
6.3.110	Link Topology Netlist Raw Data Section .....	947
6.3.111	Link Topology Netlist CSS Header Section .....	948
6.3.112	Link Topology Netlist Key and Signature Section .....	954
6.3.113	Link Topology Netlist Auth Header Section .....	955
6.3.114	TLV Extension Provisioning Area Section .....	957
6.3.115	Link Topology Scratch Pad Area Section .....	957
6.3.116	FW Scratch Pad Area Section .....	958
6.3.117	Factory Settings Header Section .....	958
6.3.118	Factory Settings Area Section .....	960
6.3.119	Guarded Zone Section .....	960
<b>Chapter 7</b>	<b>Packet Processing .....</b>	<b>961</b>
7.1	Introduction .....	961
7.2	FlexiPipe Processing Pipeline .....	962
7.2.1	Rx and Tx Pipeline Structure .....	962
7.2.2	Pipeline Virtualization .....	964
7.3	Priority Resolver .....	964
7.3.1	MDID Override .....	965
7.3.2	Programming the Priority Resolver .....	965
7.4	FlexActions .....	966
7.5	Extractor .....	967
7.5.1	Programming the Extraction Logic .....	967
7.6	Receive Descriptor Builder .....	969
7.6.1	Overview .....	969
7.6.2	Legacy Descriptor Format .....	970
7.6.3	Flex Descriptor Format .....	971
7.6.4	RXDID Descriptor Builder Profiles .....	975
7.6.5	Receive Flex Queue Context .....	977
7.6.6	Timestamp Overlay .....	978
7.6.7	Field Extraction into the Flex Descriptor .....	979
7.6.8	Pointers to Location of Interest .....	980
7.7	Programmable Parser .....	981
7.7.1	Introduction .....	981
7.8	Switch (Binary Classifier) .....	987

7.8.1	Features .....	987
7.8.2	Binary Classifier (Switch) Block Diagram .....	989
7.8.3	Control Domain and Profile Selection .....	990
7.8.4	Ingress Pre-Processing.....	991
7.8.5	Switching Engine.....	992
7.8.6	Egress Post Processing Actions.....	1005
7.8.7	Manageability Filtering .....	1008
7.8.8	Virtual Station Interfaces .....	1009
7.8.9	Classifier Performance .....	1011
7.8.10	Resource Allocation .....	1011
7.8.11	Binary Classifier Configuration .....	1015
7.8.12	Software Programming Model .....	1017
7.9	ACL (Ternary Classifier) .....	1068
7.9.1	Overview .....	1068
7.9.2	ACL Programming .....	1083
7.9.3	ACL Operation and Management .....	1089
7.9.4	ACL Configuration Example.....	1132
7.10	Receive Classification Filters .....	1134
7.10.1	Introduction .....	1134
7.10.2	Block Diagram .....	1142
7.10.3	Profile Chooser .....	1143
7.10.4	Input Sets Generator.....	1144
7.10.5	Switch Filters.....	1145
7.10.6	ACL Filters .....	1145
7.10.7	Hash Filter .....	1145
7.10.8	Flow Director (FD) Filter.....	1148
7.10.9	Protocol Engine (PE) Filters.....	1153
7.10.10	Hash Functions .....	1156
7.10.11	Receive Filters Admin Commands.....	1159
7.10.12	Filter Clearing Commands and Flows.....	1164
7.10.13	Default Extractor Configuration .....	1168
7.11	Packages and Configuration .....	1172
7.11.1	Introduction .....	1172
7.11.2	Overriding the Default Package .....	1173
7.11.3	Endianness.....	1173
7.11.4	Version Numbers .....	1173
7.11.5	Package Format .....	1174
7.11.6	Section Type Enumeration.....	1179
7.11.7	Segment Metadata Section .....	1184
7.11.8	Segment Security Manifest .....	1185
7.11.9	Package Configuration Admin Commands .....	1189
7.11.10	Uniform TCAM Key Encoding.....	1194
7.11.11	Ownership Configuration .....	1195
7.11.12	Common Packet Profile Commands.....	1196
7.11.13	Parser Configuration .....	1213
7.11.14	HIF Block Programming .....	1234
7.11.15	RDPU Block Configuration.....	1236
7.12	L2 Packet Processing .....	1238
7.12.1	CRC Handling .....	1238
7.12.2	L2 Padding .....	1238
7.12.3	L2 Tag Handling.....	1238
7.12.4	VLAN Handling.....	1249
7.12.5	Outer Tag Handling .....	1252
7.12.6	User Priority Bits (802.1p) Handling.....	1253
<b>Chapter 8</b>	<b>Quality of Service (QoS) .....</b>	<b>1257</b>

8.1	E810 Usage Models: Number of Ports and Number of Congestion Domains .....	1257
8.2	E810 QoS and DCB Support .....	1258
8.2.1	Receive Path QoS .....	1258
8.2.2	Transmit Path QoS .....	1263
8.2.3	Tx-Pipe Overview .....	1264
8.2.4	Tx-Pipe QoS Next Level of Details .....	1265
8.2.5	DCB Admin Commands .....	1279
8.2.6	LLDP/DCBx Admin Commands .....	1283
8.3	Transmit Scheduling .....	1284
8.3.1	Hierarchical Scheduling .....	1284
8.3.2	Hierarchical Scheduling Concept .....	1285
8.3.3	Network Topologies in Tx-Scheduler .....	1299
8.3.4	Flows .....	1311
<b>Chapter 9</b>	<b>Device Services .....</b>	<b>1347</b>
9.1	Interrupts .....	1347
9.1.1	Interrupt Signaling .....	1347
9.1.2	Interrupt Causes .....	1350
9.1.3	Interrupt Linked List .....	1356
9.1.4	Interrupt Moderation .....	1358
9.2	Virtualization .....	1360
9.2.1	Overview .....	1360
9.2.2	SR-IOV Implementation .....	1365
9.2.3	Scalable I/O and PASID .....	1372
9.3	Host Memory Cache .....	1374
9.3.1	Host Memory Usage .....	1374
9.3.2	Object Caches .....	1381
9.3.3	Private Memory Space Profiles .....	1381
9.3.4	Host HMC Resource Partitioning .....	1383
9.3.5	Default HMC Profile Equations .....	1383
9.3.6	Function Private Memory Space .....	1386
9.3.7	Populating HMC Backing Pages .....	1389
9.3.8	De-Populating HMC Backing Pages .....	1391
9.3.9	Special Cases for Protocol Engine Objects .....	1391
9.3.10	HMC Error Reporting .....	1392
9.4	Quad Hash Host Memory Cache .....	1396
9.4.1	Cache Replication .....	1396
9.4.2	Function Private Memory Space Configuration .....	1396
9.4.3	Populating HMC Backing Pages .....	1397
9.4.4	Register Naming in Quad Hash HMC Relative to PE HMC .....	1398
9.5	Control Queues .....	1399
9.5.1	Preface .....	1399
9.5.2	Queue Structure .....	1400
9.5.3	Initialization .....	1403
9.5.4	Driver Unload and Queue Shutdown .....	1405
9.5.5	Command Descriptions .....	1406
9.5.6	Firmware Command Fetch and Verification .....	1409
9.5.7	Mailbox and Sideband Command Fetch and Verification .....	1410
9.5.8	Non-Completion Events .....	1410
9.5.9	Error Handling .....	1411
9.5.10	Error Codes .....	1411
9.5.11	Command Opcodes .....	1413
9.5.12	CSR-Based Firmware Admin Queue for Tools .....	1413
9.5.13	Generic Firmware Admin Commands .....	1416
9.5.14	Mailbox Commands .....	1431
9.6	Statistics .....	1434

9.6.1	Counter Implementation .....	1434
9.6.2	Statistics Sample Points .....	1435
9.6.3	Statistics Consistency Rules.....	1438
9.6.4	Supported MIBs .....	1438
9.6.5	Interface Statistics at VSIs and Logical Interfaces.....	1438
9.6.6	RDMA/RoCE Statistics .....	1443
9.7	TimeSync (IEEE1588 and 802.1AS) .....	1444
9.7.1	Overview .....	1444
9.7.2	Time Synchronization - Background.....	1445
9.7.3	1588 Clock and Timer Registers .....	1448
9.7.4	Programming the 1588 Timers.....	1450
9.7.5	Timestamp Indication .....	1455
9.7.6	Synchronized Auxiliary Events .....	1457
9.7.7	Synchronization with Host Timer .....	1458
9.7.8	Interrupts .....	1459
9.7.9	1588 Initialization Flow .....	1459
9.7.10	Software Timer .....	1459
9.8	LLDP Protocol .....	1460
9.8.1	Introduction .....	1460
9.8.2	Scope.....	1460
9.8.3	LLDP Agent .....	1460
9.8.4	LLDP Processing.....	1461
9.8.5	Initialization and Configuration.....	1465
<b>Chapter 10 LAN Engine .....</b>		<b>1485</b>
10.1	Introduction .....	1485
10.2	Queues Allocation and Management .....	1485
10.2.1	LAN Receive Queue Allocation .....	1485
10.2.2	LAN Transmit Queue Allocation .....	1489
10.2.3	Dynamic Queue Allocation in Rx and Tx.....	1490
10.2.4	LAN Transmit Completion Queue and Doorbell Queue Allocation .....	1491
10.3	Steering Tag and Processing Hint Support for LAN Engine Traffic (TPH) .....	1492
10.4	LAN Receive Data-Path .....	1492
10.4.1	Receive Packet in System Memory.....	1492
10.4.2	LAN Receive Descriptors.....	1494
10.4.3	LAN Receive Queue (Ring).....	1500
10.4.4	Stateless Receive Offloads.....	1510
10.5	LAN Transmit Data-Path .....	1515
10.5.1	LAN Transmit Introduction.....	1515
10.5.2	Transmit Packets in System Memory.....	1515
10.5.3	Descriptors and Doorbells.....	1516
10.5.4	LAN Transmit - Advanced Features .....	1525
10.5.5	Transmit Configuration .....	1534
10.5.6	Packet Transmission .....	1553
10.5.7	Performance Consideration .....	1557
10.5.8	Stateless Transmit Offloads .....	1557
<b>Chapter 11 Protocol Engine .....</b>		<b>1567</b>
11.1	Protocol Engine Overview .....	1567
11.2	Features .....	1568
11.3	Functional Description .....	1571
11.3.1	Packet Classification and the PE .....	1571
11.4	Verbs Programming Model .....	1573
11.4.1	Verbs from a System View .....	1573
11.4.2	iWARP State Management .....	1597
11.4.3	RoCEv2 State Management .....	1601

11.4.4	Exception Queues .....	1604
11.4.5	Completion Event Queue (CEQ) Entry Format.....	1606
11.4.6	Asynchronous Event Queue (AEQ) Entry Format .....	1606
11.4.7	AE Codes .....	1609
11.4.8	Steering Tag (STag) and Processing Hint Support for PE Traffic (TPH) .....	1615
11.5	Resource Management .....	1615
11.5.1	PE Initialization .....	1618
11.5.2	Control QP (CQP) Operation.....	1621
11.5.3	CQP SQ Descriptor Format .....	1631
11.6	RDMA Functionality .....	1688
11.6.1	iWARP Q2 Area .....	1688
11.6.2	iWARP QP Context Format .....	1689
11.6.3	RoCEv2 QP Context Format .....	1703
11.6.4	RDMA QP Completion Codes .....	1707
11.6.5	RDMA CQ Entry Formats .....	1707
11.6.6	RDMA Descriptor Formats.....	1710
11.7	UD/UDA Functionality .....	1727
11.7.1	UD/UDA Descriptor Formats .....	1727
11.8	UDA Functionality .....	1735
11.8.1	Transmit UDA Hardware Acceleration .....	1735
11.8.2	Receive UDA Hardware Filtering and Acceleration .....	1736
11.8.3	UDA Programming Interface .....	1739
11.8.4	UDA QP Context Format .....	1742
11.8.5	UDA CQ Entry Formats.....	1747
11.8.6	UDA QP Completion Error Codes.....	1747
11.8.7	UDA QP Asynchronous Error Codes .....	1748
11.8.8	UDA Descriptor Formats.....	1748
11.9	Protocol Engine Statistics .....	1749
11.9.1	Summary.....	1749
11.10	SR-IOV Protocol Engine Functionality .....	1752
11.11	NVM RDMA Register Initialization .....	1753
<b>Chapter 12 System Manageability .....</b>		<b>1755</b>
12.1	Features .....	1755
12.2	Pass-Through Functionality .....	1756
12.2.1	Supported Topologies .....	1757
12.2.2	Pass-Through Packet Routing.....	1757
12.3	Components of the Sideband Interface .....	1758
12.3.1	Physical Layer.....	1758
12.3.2	Logical Layer .....	1759
12.4	Packet Filtering .....	1766
12.4.1	Manageability Receive Filtering .....	1766
12.4.2	L2 Filters.....	1767
12.4.3	L3/L4 Filtering .....	1768
12.4.4	Flexible 144-Byte Filter .....	1770
12.4.5	Configuring Manageability Filters .....	1773
12.4.6	Filtering Programming Interfaces.....	1777
12.4.7	Possible Configurations .....	1779
12.4.8	Determining Manageability MAC Address .....	1780
12.5	OS-to-BMC Traffic .....	1781
12.5.1	Overview .....	1781
12.5.2	Filtering .....	1782
12.5.3	Blocking Network-to-BMC Flow.....	1782
12.5.4	OS-to-BMC and Flow Control.....	1783
12.5.5	Statistics.....	1783
12.5.6	OS-to-BMC Enablement .....	1783

12.5.7	SMBus Troubleshooting .....	1784
12.6	Network Controller Sideband Interface (NC-SI) PT Interface .....	1787
12.6.1	Overview .....	1787
12.6.2	NC-SI Standard Support .....	1791
12.6.3	External Link Control via NC-SI .....	1794
12.6.4	NC-SI Mode - Intel-Specific Commands .....	1796
12.6.5	Basic NC-SI Workflows .....	1873
12.6.6	Asynchronous Event Notifications (AENs) .....	1877
12.6.7	Querying Active Parameters .....	1877
12.6.8	Resets .....	1877
12.6.9	Advanced Workflows .....	1878
12.7	Management Component Transport Protocol (MCTP) .....	1881
12.7.1	MCTP Overview .....	1881
12.7.2	MCTP over PCIe .....	1886
12.7.3	MCTP over SMBus .....	1888
12.7.4	NC-SI over MCTP .....	1889
12.7.5	PLDM over MCTP .....	1892
12.7.6	OEM Commands .....	1892
12.7.7	MCTP Programming .....	1892
12.7.8	SPDM over MCTP .....	1898
12.8	PLDM Support .....	1901
12.8.1	PLDM Base Implementation .....	1901
12.8.2	PLDM Monitoring and Control Support .....	1906
12.8.3	PLDM Monitoring and Control Generic Structures .....	1929
12.8.4	PLDM Firmware Update Commands .....	1964
12.8.5	PLDM Firmware Update Flow .....	1971
12.8.6	RDE Support .....	1976
12.9	Host Isolate Support .....	2020
12.10	OCP NIC 3.0 Support .....	2021
12.10.1	Support for FAN_ON_AUX Pin .....	2021
<b>Chapter 13 Programming Interface .....</b>		<b>2023</b>
13.1	Introduction .....	2023
13.1.1	Access Mechanisms .....	2023
13.1.2	Memory BAR .....	2026
13.1.3	The MSI-X BAR .....	2028
13.1.4	CSR Organization and Mapping .....	2029
13.1.5	Register Conventions .....	2030
13.1.6	Register Field Attributes .....	2031
13.2	Device Registers - PF .....	2033
13.2.1	BAR0 Registers Summary .....	2033
13.2.2	Detailed Register Descriptions - PF BAR0 .....	2092
13.2.3	BAR3 Registers Summary .....	2518
13.2.4	Detailed Register Descriptions - PF BAR3 .....	2518
13.3	Device Registers - VF .....	2520
13.3.1	VF Registers Mapping in the PF Space .....	2520
13.3.2	BAR0 Registers Summary .....	2523
13.3.3	Detailed Register Descriptions - VF BAR0 .....	2526
13.3.4	BAR3 Registers Summary .....	2535
13.3.5	Detailed Register Descriptions - VF BAR3 .....	2535
<b>Chapter 14 PCIe Programming Interface .....</b>		<b>2537</b>
14.1	Overview .....	2537
14.1.1	Functions Mapping .....	2537
14.1.2	Supported Features .....	2538
14.2	PCI Configuration Space .....	2539

14.2.1	Register Attributes .....	2539
14.2.2	Reset Rules .....	2540
14.2.3	PCI Configuration Space Summary .....	2541
14.2.4	Sharing Among PCI Functions .....	2541
14.2.5	Mandatory PCI Configuration Registers - Except BARs .....	2543
14.2.6	Mandatory PCI Configuration Registers - BARs .....	2547
14.3	Capabilities in PCI Configuration Space .....	2549
14.3.1	PCI Power Management Capability .....	2549
14.3.2	MSI Capability .....	2552
14.3.3	MSI-X Capability .....	2554
14.3.4	VPD Capability .....	2558
14.3.5	PCIe Capability Structure .....	2559
14.4	PCIe Extended Configuration Space .....	2574
14.4.1	Advanced Error Reporting (AER) Capability .....	2575
14.4.2	Serial Number .....	2581
14.4.3	Alternate Routing ID Interpretation (ARI) Capability Structure .....	2583
14.4.4	SR-IOV Capability Structure .....	2585
14.4.5	TPH Requester Capability .....	2592
14.4.6	ACS Extended Capability Structure .....	2594
14.4.7	Secondary PCI Express Extended Capability .....	2596
14.4.8	Data Link Feature Extended Capability .....	2598
14.4.9	PASID Capability .....	2599
14.4.10	Physical Layer 16.0 GT/s Capability .....	2601
14.4.11	Lane Margining at the Receiver Capability .....	2603
14.5	Virtual Functions .....	2605
14.5.1	Overview .....	2605
14.5.2	Mandatory Configuration Space .....	2608
14.5.3	PCI and PCIe Capabilities .....	2611
<b>Chapter 15 Reliability, Diagnostics, and Testability .....</b>		<b>2617</b>
15.1	Reliability .....	2617
15.1.1	ECC Support and ECC Error Flow .....	2617
15.2	Link Loopback Operations .....	2618
15.3	Device Diagnostics .....	2618
15.3.1	Firmware Logging Overview .....	2618
15.3.2	Health Status Commands .....	2621
15.3.3	Health Status Codes .....	2625
15.4	Firmware Recovery Mode .....	2627
15.4.1	Overview .....	2627
15.4.2	Recovery Flows .....	2628
15.4.3	Operation Mode Software Identification .....	2630
<b>Chapter 16 Electrical/Mechanical Specification .....</b>		<b>2631</b>
16.1	<b>Introduction</b> .....	2631
16.2	Operating Conditions .....	2631
16.2.1	Absolute Maximum Ratings .....	2631
16.2.2	Recommended Operating Conditions .....	2631
16.3	Power Delivery .....	2632
16.3.1	Power Supply Specification .....	2632
16.3.2	In-Rush Current .....	2635
16.4	Power Dissipation .....	2636
16.4.1	Max Power (TDP) - E810-CAM2/CAM1 .....	2636
16.4.2	Typical Power - E810-CAM2/CAM1 .....	2637
16.4.3	Max Power (TDP) - E810-XXVAM2 .....	2639
16.4.4	Typical Power - E810-XXVAM2 .....	2639
16.5	DC/AC Specification .....	2641

16.5.1	Digital I/O DC Specifications .....	2641
16.5.2	Digital I/F AC Specifications .....	2642
16.5.3	PCIe Interface AC/DC Specification .....	2648
16.5.4	Network Interface AC/DC Specification .....	2648
16.5.5	Reference Clock Specification .....	2648
16.6	Package Characteristics .....	2650
16.6.1	Mechanical Configuration .....	2650
16.6.2	Heat Sink Mechanical Load Limits .....	2650
16.6.3	Thermal .....	2651
16.6.4	Electrical .....	2651
16.7	Package Mechanical Drawings .....	2652
16.7.1	Tolerance Information .....	2652
16.7.2	E810-CAM2/CAM1 .....	2652
16.7.3	E810-XXVAM2 .....	2655
16.8	Devices Supported .....	2658
16.8.1	Flash .....	2658
<b>Chapter 17 Design Guidelines .....</b>		<b>2659</b>
17.1	Introduction .....	2659
17.2	Defined Topologies .....	2660
17.2.1	E810 Host Topology Overview .....	2661
17.2.2	Configuration Topologies .....	2664
17.2.3	Supported Link Modes and Breakout Modes .....	2667
17.2.4	Supported Modules .....	2667
17.3	E810 Ethernet Signal Descriptions .....	2668
17.3.1	E810 High-Speed Serial .....	2668
17.3.2	E810 Management Connections .....	2669
17.3.3	E810 SDP[0:7] (GPIO) Connections .....	2670
17.3.4	E810 SDP[8:19] (LED) Connections .....	2671
17.3.5	E810 SDP[20:23] (IEEE 1588) Connections .....	2672
17.4	Signal Descriptions .....	2672
17.4.1	High-Speed Serial .....	2672
17.4.2	SFP and QSFP I/O Module Connections .....	2674
17.4.3	Reset, Interrupt, and Present .....	2676
17.4.4	Management Interfaces .....	2677
17.5	LED Configuration and Behavior .....	2678
17.5.1	Default LED Behavior - Discrete LED Implementation .....	2678
17.6	Electrical Specifications .....	2680
17.6.1	Pull-Up/Pull-Down Requirements .....	2680
<b>Chapter 18 Thermal Design Considerations .....</b>		<b>2681</b>
18.1	Introduction .....	2681
18.2	Measuring the Thermal Conditions .....	2681
18.3	Thermal Considerations .....	2682
18.4	Importance of Thermal Management .....	2682
18.5	Packaging Terminology .....	2683
18.6	Thermal Specifications .....	2684
18.7	Package Mechanical Attributes .....	2685
<b>Chapter 19 Glossary and Acronyms .....</b>		<b>2687</b>
<b>Appendix A Factory Parsing Program .....</b>		<b>2693</b>
A.1	General .....	2693
A.1.1	Supported Header Length .....	2693
A.2	Parse Graph .....	2693
A.3	PTYPEs .....	2696
A.4	Protocol IDs .....	2702
A.5	Frame Formats .....	2706

A.5.1	Layer 2 .....	2706
A.5.2	Layer 2.5 .....	2716
A.5.3	Layer 3 .....	2717
A.5.4	Layer 4 .....	2730
A.5.5	Tunneling and Overlay Networks .....	2734

# Chapter 1 Introduction

---

## 1.1 Overview

This document describes the external architecture (including device operation, pin descriptions, register definitions, and so on) for the Intel® Ethernet Controller E810 (E810), a dual-port 100 Gigabit Ethernet (GbE) Network Interface device.

This document is intended as a reference for architects, logic designers, firmware and software device driver developers, board designers, test engineers, or anyone else who might need specific technical or programming information about the E810.

The E810 is Intel's first multi-speed 100 GbE controller supporting rates between 100 Mb/s and 100 Gb/s. The E810's key objective is to enable a scalable Ethernet controller suitable for Enterprise, Cloud, and Communications Service Provider applications.

The key features supported in the E810 include two 100 Gigabit Ethernet ports, 100 Gigabit throughput performance, enhanced programmable packet processing pipeline, virtualization (enhanced SR-IOV support with up to 256 VFs and backward compatibility VF driver support), new features for the communications market (fine grained scheduler, transmit head drop support, adjustment of credits according to different headers, enhanced QoS, and enhanced burst control) and RDMA (iWARP and RoCEv2).

Table 1-1 provides a summary of E810 features. For additional information on supported features, see the *Intel® Ethernet Controller E810 Feature Support Matrix*.

**Table 1-1. E810 Features Summary**

Category	Features
Host Interface	<ul style="list-style-type: none"><li>• Compliance with PCIe 4.0 specification.</li><li>• Concurrency for 256 non-posted requests.</li><li>• PCIe Gen4x16 lanes</li></ul>
Network Interface	<ul style="list-style-type: none"><li>• Speeds at 2x100 GbE, 2x50 GbE, 4x25 GbE, 8x10 GbE, 8x1 GbE, and 8x100 Mb/s.</li></ul>
Performance	<ul style="list-style-type: none"><li>• 100 Gb/s throughput (for each Tx and Rx).</li><li>• Up to 80 Mpps for Tx and 90 Mpps for Rx.</li><li>• 100 Gb/s single queue performance.</li></ul>

**Table 1-1. E810 Features Summary [continued]**

Category	Features
Software Interface	<ul style="list-style-type: none"> <li>• Base mode VF compatibility.</li> <li>• Tx/Rx-Queues:               <ul style="list-style-type: none"> <li>– 16K Tx-Queues.</li> <li>– 2K Rx-Queues.</li> <li>– Dynamic allocation of queues to functions and VSIs.</li> </ul> </li> <li>• Interrupts:               <ul style="list-style-type: none"> <li>– 2048 interrupts vectors, allocated in a flexible manner to queues and other causes.</li> <li>– Multiple interrupt moderation schemes.</li> <li>– 20M interrupts per second.</li> </ul> </li> <li>• Control Queues (also known as Admin Queues):               <ul style="list-style-type: none"> <li>– Mailbox Queues for PF-VF and driver-driver.</li> <li>– Admin Queues for software-firmware control flows.</li> <li>– Sideband Queues for software to access IPs inside the E810.</li> </ul> </li> <li>• 256 Tx Doorbell (DB) Queues.</li> <li>• 512 Tx Completion Queues.</li> <li>• Quanta Descriptor (QD) Queue per Tx-Queue. Quanta information is also embedded in the Tx doorbell.</li> <li>• Programmable Rx-Descriptor fields.</li> </ul>
Packet Processing	<ul style="list-style-type: none"> <li>• General:               <ul style="list-style-type: none"> <li>– Stages of parsing, switching, ACLs, classification, and packet modification.</li> <li>– Programmable packet processing pipeline.</li> <li>– Multiple control domains.</li> <li>– Profile-based.</li> <li>– Programmable actions.</li> <li>– Propagation of priorities between stages.</li> </ul> </li> <li>• Parser:               <ul style="list-style-type: none"> <li>– Parses up to 504 bytes from packet header.</li> <li>– Parse Graph-based.</li> <li>– Session-based parsing.</li> <li>– Programmable parse engine.</li> </ul> </li> <li>• Binary Classifier (VEB Switch):               <ul style="list-style-type: none"> <li>– 768 switch ports (VSIs).</li> <li>– Programmable forwarding rules.</li> <li>– Storm control.</li> </ul> </li> <li>• ACLs:               <ul style="list-style-type: none"> <li>– 8K programmable TCAM entries.</li> <li>– Tiling capability to n*40-bit width.</li> </ul> </li> <li>• Classification Filters:               <ul style="list-style-type: none"> <li>– Hash-based statistical distribution.</li> <li>– Flow Director flow-based classification.</li> <li>– Flow-based identification of iWARP and RoCE flows.</li> <li>– Programmable rules.</li> </ul> </li> <li>• Modifier:               <ul style="list-style-type: none"> <li>– Insertion (Tx), removal (Rx), and modification of packet VLANs.</li> <li>– L3 and L4 checksums and CRC.</li> </ul> </li> </ul>
Virtualization	<ul style="list-style-type: none"> <li>• Host virtualization via VMQ and SR-IOV.</li> <li>• 256 SR-IOV Virtual Functions (VFs).</li> <li>• Stateless offloads for tunneled packets (network virtualization support).</li> <li>• Malicious VF protection.</li> </ul>

**Table 1-1. E810 Features Summary [continued]**

Category	Features
RDMA	<ul style="list-style-type: none"> <li>• iWARP and RoCE v2.</li> <li>• 256K Queue Pairs (QPs).</li> <li>• Send Queue Push Mode.</li> </ul> <p><b>Note:</b> RDMA is not supported when the E810 is configured for &gt;4-port operation.</p> <p><b>Note:</b> Userspace Direct Access (UDA) was intended to provide userspace access queues in a general way, but this feature is not supported in the E810. UDA is available only in the kernel and is limited to iWARP connection setup and error handling. UDA is not available in userspace.</p>
QoS	<ul style="list-style-type: none"> <li>• WFQ Transmit scheduler with nine programmable layers.</li> <li>• Pipeline sharing and starvation avoidance.</li> <li>• Up to 32 Congestion Domains in the Tx and Rx paths.</li> <li>• QoS via 802.1p PCP or Differentiated services DSCP value.</li> <li>• Rx packet buffer supports at least three no-drop flow control events, shared among ports.</li> </ul>
Communication	<ul style="list-style-type: none"> <li>• Packet shaping.</li> <li>• Packet drops/aging + reporting.</li> <li>• Reduced burstiness - jitter control.</li> <li>• Adjustment of credits per packet based on four different header types.</li> <li>• Concurrent Quanta Descriptors/Legacy Scheduling.</li> </ul>
Manageability	<ul style="list-style-type: none"> <li>• SMBus operating at up to 400 Kb/s.</li> <li>• DMTF-compliant NC-SI 1.1 Interface at 100 Mb/s.</li> <li>• PLDM Types 0, 2, 5, 6 for monitoring and control, firmware update, and Redfish device enablement.</li> <li>• MCTP over PCIe and SMBus.</li> <li>• Enterprise-level management schemes via local BMC.</li> </ul>
Power Management	<ul style="list-style-type: none"> <li>• Supports PCI power management states D0, D3hot, and D3cold.</li> <li>• APM WoL support in D0, D3hot, and D3cold.</li> </ul> <p><b>Note:</b> Energy Efficient Ethernet (EEE) is not currently supported in the E810. Some references might remain in this document in the event that it is enabled in the future.</p>
Time Synchronization	<ul style="list-style-type: none"> <li>• Timestamp with each Rx packet.</li> <li>• Selective timestamps for Tx packets.</li> <li>• IEEE 1588 support.</li> </ul>
Security	<ul style="list-style-type: none"> <li>• Authentication of firmware contents on load from NVM.</li> <li>• NIST.SP.800-193 compliant.</li> </ul>

## 1.2 E810 Full Chip Block Diagram

The E810 is based on a 100G Ethernet controller core block, which is used in multiple Intel products. Figure 1-1 illustrates the relationship between the controller core logic and the I/O and support functions that comprise the full E810 device.

**Figure 1-1. E810 Block Diagram**

In this document, references to the controller core are often abbreviated as “CPK”, for example, in register bit and NVM field definitions.

## 1.3 Controller Core Block Diagram

The controller core block diagram is depicted in Figure 1-2.

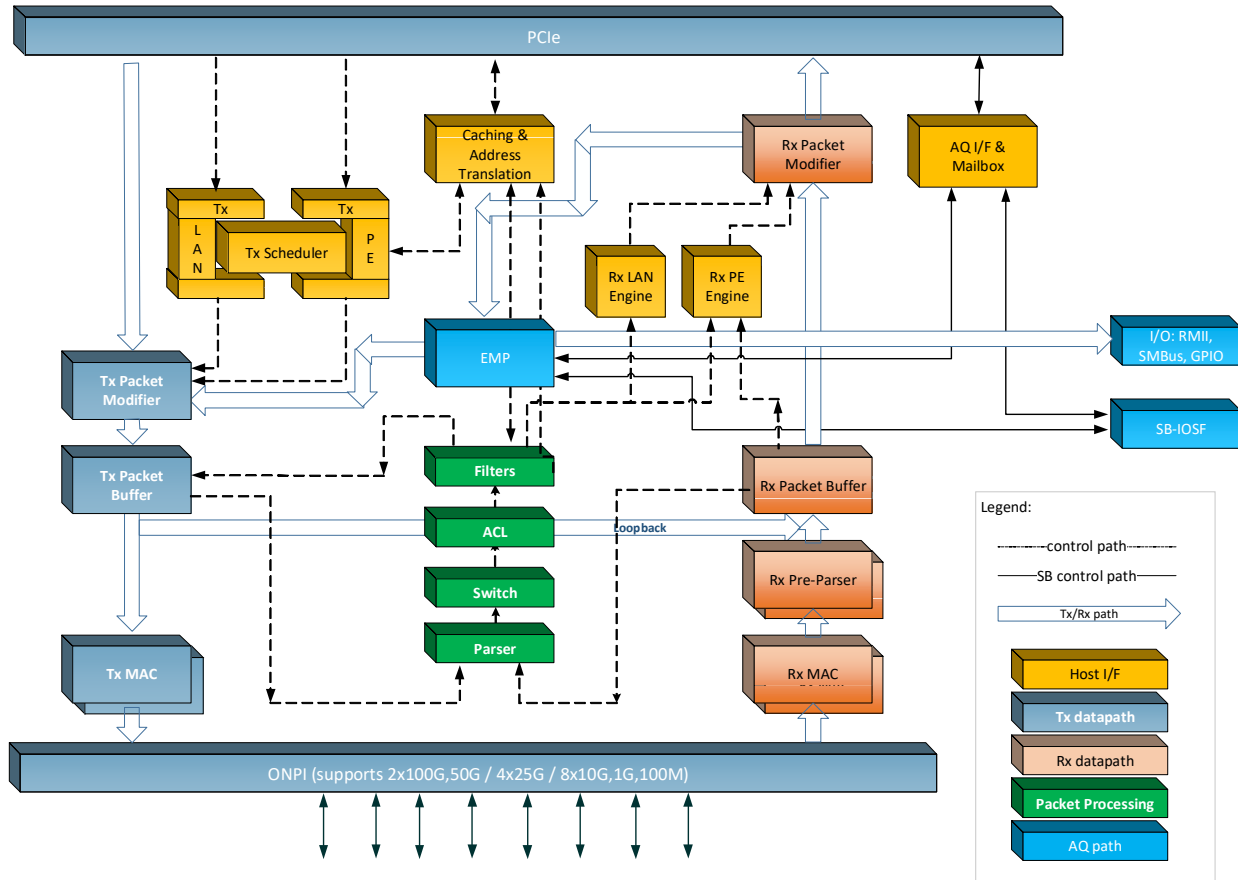

Figure 1-2. Controller Core Block Diagram

The following subsections describe the packet flows.

### 1.3.1 LAN Traffic Tx Flow

Transmission starts with a “doorbell” from software, indicating one packet or more is waiting in some transmit queue in host memory. If the queue is a LAN queue, the doorbell is registered with the internal Transmit Scheduler (Tx-Scheduler). If the queue is an RDMA queue, the request is registered with the Protocol Engine (PE) scheduler. When the PE scheduler selects a request, the request goes through RDMA protocol processing, at the end of which an internal request is issued to the Tx-Scheduler.

The Tx-Scheduler is responsible for pacing traffic to the network ports. It guarantees bandwidth allocation among requesters, does rate limiting where needed, and paces packets to avoid congestion later in the network.

Once the Tx-Scheduler selects a transmit queue (either from LAN or from RDMA), it services some amount of transmit data (called a "quanta"). Packet data is read from host memory and any packet processing or packet manipulation takes place. These can include partial parsing of the packet, performing Transmit Segmentation Offload (TSO), calculating relevant checksums and CRCs, L2 header manipulations UP enforcement, and inner protocol TTL decrement.

The packet is then passed to the Packet Processing Pipeline, where it queries the on-die switch to identify its destinations. A packet can be forwarded locally to a Host destination (for example VM-VM communication) or to an on-board BMC. The packet also goes through the ACL block, where permissions are checked, and might alter the forwarding decisions made in the switch.

The LAN Controller then forwards the packet to one of the LAN ports and/or to the Receive path. If the destination port is busy, the packet is stored in a local Transmit Buffer. Transmission to a LAN port is done via a 802.3 MAC that interfaces an On-Chip Network Packet Interface (ONPI).

### 1.3.2 LAN Traffic Rx Flow

Packet reception starts when a packet arrives to any of the ONPI channels. The packet goes through initial processing in the 802.3 MAC and a parsing/processing unit. The parsing/processing unit does some checksum verifications on the packet. The packet is then stored in the on-die Receive Packet Buffer.

The packet header then goes through the Packet Processing stage, where it potentially goes through parsing, switching, ACLs, and classification. If the packet is identified as an RDMA packet, it is passed to the Protocol Engine for protocol processing. If the packet is a LAN packet, it is forwarded to the LAN Engine. Either engine then issues a command to the Rx Modifier. The Rx Modifier fetches the packet from the Receive Packet Buffer, completes any modifications, calculates any required checksums, posts the packet into the respective Host buffer, and terminates the transaction.

### 1.3.3 Management Flows

Other flows include traffic to or from a system level Baseboard Management Controller (BMC). The E810 serves as a network interface to the BMC. A packet is received from the BMC via PCIe, NC-SI, or SMBus. The Embedded Management Processor (EMP) unit generates a command into the Transmit Pipeline in a similar manner to the Transmit Scheduler as described above. The Tx Modifier fetches the packet from the management interface to be processed as any Host packet.

In a similar manner, a received packet can be forwarded to the BMC once the on-die switch identifies the BMC as its destination. The packet is then forwarded to the management interface to be sent to the BMC.

Host software can also forward a packet to a system BMC. During transmit packet processing, the on-die switch identifies that the destination for the packet is the BMC interface. The E810 then forwards the packet from the transmit path to the receive path as described above. The receive path then processes the packet and forwards it to the management interface to be sent to the BMC.

## 1.4 Functional Blocks

This section contains a short overview of the E810 functional units depicted in [Figure 1-2](#).

### 1.4.1 Host Interface

The E810 implements a Gen4x16 PCIe 4.0 compliant interface.

The E810 implements a PCIe Transaction layer. The E810's PCIe host interface implements up to eight Physical Functions (PFs), and up to 256 Virtual Functions (VFs). More details on the E810's PCIe features are provided in [Section 3.1](#), while [Chapter 14](#) describes the PCIe programming interface.

### 1.4.2 Host Memory Objects

The E810 operating system drivers set up a wide variety of host memory objects that are comprehended and manipulated by the E810. All objects are set up in the context of a PCI function.

Described below are the types of memory objects:

- **LAN Transmit (Tx) and Receive (Rx) Queues** — These are ring buffers for submitting commands to the Local Area Network (LAN) engine or posting packets that arrive from the network. Commands take the form of packets/data to be transmitted, descriptors for empty host memory buffers to be filled with received packets/data, and so on. Queues are typically mapped into OS kernel space (or userspace in the case of DSI driver). In a virtualized server, they can be assigned either to the VMM, or to VMs using SR-IOV. The E810 supports up to 16K Tx-Queues and 2K Rx-Queues that can be assigned to PFs or VFs as needed. The queues assigned to a particular PCI function can be used in these important ways:
  - For distributing packet processing work to the different processors in a multi-processor system. On the transmit side, this is done by simply dedicating an independent transmit queue for each CPU to use. On the receive side, packets are classified by the E810 under operating system control into groups of conversations. Each group of conversations is assigned its own receive queue and receiving processor. Microsoft Receive Side Scaling (RSS) is one popular example of this method. ATR using the Flow Director is another, more precise mechanism to direct Rx packets to queues.
  - For assigning Traffic Class (TC). Transmit queues assigned to different TCs are serviced at different rates by the E810 Transmit Scheduler. Receive queues assigned to different TCs can be serviced at different rates by a Quality of Service (QoS)-enabled operating system and its software device drivers.
  - To associate queues with VMs in VMDq1 or VMDq2 modes, saving packet processing and copying by the VMM
  - To associate DSI queues with different wireless operators, providing a degree of separation between the operators.
- **LAN Auxiliary structures in host memory** — These include:
  - Tx Completion Queues where write-back of transmit events can be done. The 512 Completion Queues allow coalescing of write-back information from multiple transmit queues into a small number of Completion Queues, making it easier for software to collect write-back events.

- Tx Doorbell (DB) Queues are used by software to coalesce Tx doorbells (“Tail Write” events) to the device, reducing load on the CPUs. Software can write a Tx DB to one of the 256 DB Queues. Once in a while, software sends an indication (also called doorbell or Tail Write) to the device, indicating that a certain DB Queue has one or more Tx-Queues’ doorbells stored in it. The E810 then fetches the Tx-Queue DBs from host memory.
- Tx Quanta Descriptor (QD) Queues store auxiliary information on packets stored in Tx-Queues. The information assists the Transmit Scheduler by letting it know how much data is waiting for transmission in a given Tx-Queue. Each Tx-Queue has an associated QD queue.
- **Protocol Engine Queue Pairs (QPs)** — These are ring buffers (one Send Queue, one Receive Queue) for submitting commands to the Protocol Engine. Each Protocol Engine QP can be configured for either RDMA messages or for UDA packets. Commands on RDMA QPs take the form of RDMA messages to be transmitted, descriptors for empty host memory buffers to be filled with received RDMA messages, and so on. Commands on UDA QPs take the form of packets/data to be transmitted, descriptors for empty host memory buffers to be filled with received packets/data, and so on. Protocol Engine QPs are typically mapped into host userspace. In a virtualized server, they can be assigned either to the VMM, or to Virtual Machine userspace using SR-IOV. The E810 supports up to 262,144 Protocol Engine QPs, which are allocated to PFs and VFs as the E810 initializes and drivers load, and are fixed after that.
- **Control Queue (or Admin Queues (AQ)) Pairs** — AQs are used for communication between device drivers, and between a device driver and E810 embedded controllers. Each Admin Queue Pair maps one Admin Transmit Queue (ATQ) and one Admin Receive Queue (ARQ). The ATQ is a ring buffer used by the host driver for submitting commands. The ARQ conveys events to host driver that are not an immediate result of an ATQ command. The host driver posts empty buffers to the ARQ, and the E810 fills them with events. For more details on AQs, see [Section 9.5](#).

### 1.4.3 LAN Engine

The LAN engine implements the host programming interface for traditional LAN traffic in both virtualized and non-virtualized scenarios. The E810 implements 768 VSIs (virtual ports) used to distribute traffic to PCI physical functions and virtual functions. These VSIs can connect to the host via 16K Tx-Queues and 2K Rx-Queues.

### 1.4.4 Protocol Engine

The Protocol Engine implements iWARP and RoCEv2 RDMA capability. The Protocol Engine offloads protocol processing from the host, places received data payloads directly into user buffers with no host CPU involvement, and eliminates user-kernel context switching when performing I/O by mapping the RDMA programming interface directly into application address space.

The Protocol Engine implements the latest RDMA features, including Send Queue Push Mode.

### 1.4.5 Transmit Scheduler

The Transmit Scheduler (Tx-Scheduler) determines the order and timing of packets sent to the network. It receives requests (“doorbells”) from LAN and RDMA queues and schedules these for transmission. A scheduling decision allows a given “quanta” of bytes or packets from a given queue or set of queues to be fetched from host memory and sent to the network.

The main capabilities of the Tx-Scheduler are:

- Hierarchical scheduling tree — Scheduling decisions are done by selecting a Queue node while taking in consideration the state of its branch in each layer of the tree. Layers of the tree represent entities that define scheduling attributes, and can be a queue, a set of queues, a VSI, a PCI function, a Traffic Class, a network port, and more. Layers can also represent a network topology, scheduling to prevent congestion in nodes further down the network.
- Scheduling based on Weighted Fair Queuing (WFQ), Strict Priority (SP), and Hybrid algorithms.
- Minimum bandwidth guarantee via Dual-Rate Shapers.
- Rate limiting, including shared rate limiters.
- High-performance fine-grained and accurate scheduling.
- Fully-configurable, flexible topology, including on-the-fly configuration.
- Each scheduler node can be stopped via software-based or hardware-based flow control mechanisms.

For more detail on E810 transmit scheduler features and operation, see [Section 8.3](#).

## 1.4.6 Tx and Rx Modifiers

The Tx and Rx modifiers perform operations on packet contents in the Tx and Rx pipelines, respectively. The modifiers perform updates to packet headers, such as insertion and removal of L2 tags (for example, VLAN), and calculation (and split in Rx) of header and payload checksums (insertion on Tx and validation on Rx). The Tx modifier also performs TCP Segmentation Offload (TSO).

## 1.4.7 Ethernet Media Access Controller (MAC)

The E810 integrates IEEE Std 802.3 compliant Ethernet MACs that operate at 100 Mb/s, 1 GbE, 10 GbE, 25 GbE, 50 GbE, and 100 GbE. A total of eight MACs map to the following speeds:

- Two MACs operating at all speeds from 100 GbE and lower.
- Additional two MACs operating at all speeds from 25 GbE and lower.
- Additional four MACs operating at all speeds from 10 GbE and lower.

Therefore, the E810 supports port configurations of 2x100 GbE, 2x50 GbE, 4x25 GbE, 8x10 GbE, 8x1 GbE, and 8x100 Mb/s.

All E810 MACs support transmission and reception of jumbo frames of up to 9728 bytes, and 802.3x flow control frames or 802.3bd priority-based flow control frames. See [Section 3.2.1.5](#) for details.

The E810 implements a set of control signals for the PHY:

- Five independent interfaces for connection to external PHYs. Each interface can be either a Management Data Input/Output (MDIO) or Inter-integrated Circuit (I<sup>2</sup>C) interface. These enable host software or E810 firmware to control connected external PHYs, including the ability to read and write PHY registers.
- Eight SDP signals to be used as general purpose I/O. SDPs are typically used to exchange information with or to control external devices (such as PHY devices) under E810 software driver or firmware control. See [Section 3.5.1](#) for more details.

- Three LED indications for maximum 4-ports configuration (total of 12 pins). Each of the LED outputs can be individually configured to select which particular event, state, or activity it indicates. In addition, each LED can be individually configured for output polarity and for blinking versus non-blinking (steady-state) indications. See [Section 3.5.1](#) for more information.

Details on how they are typically connected and used are described in [Section 3.2.3](#).

Admin Queue commands are provided for software device driver control over the integrated PHYs.

## 1.4.8 Packet Parser

The E810 provides a software programmable Parser capable of supporting a wide range of well-known and proprietary protocols. The Parser examines ingress traffic, retrieves search parameters from the packet and from associated packet context, and then generates additional context based on certain packet attributes. This context is further used by other packet processing modules in the pipeline to associate the packet with a profile, a flow, an action, and so on.

The Parser supports a large set of native frame formats that are common in various networking applications. These formats are provided by the E810 out-of-the-box, not requiring any additional installation or programming. Additional frame formats can be programmed per usage.

## 1.4.9 VEB Switch (a.k.a. Binary Classifier)

The VEB switch identifies packet destinations for both Tx and Rx, for traffic to/from Host and to/from a manageability port (BMC). For Tx packets, it determines whether the packet goes to an external ONPI port, to a local destination either in the host or to the BMC (via loopback), or to both. For packets arriving from ONPI or from the loopback path, it selects a local destination. A local destination is named a "VSI" and is associated with a PCI function or with an EMP buffer.

The switch makes its forwarding decision based on a set of programmable rules, such as VLAN tag, a destination MAC Address, or a combination of such. Basic forwarding rules are loaded from NVM, and additional rules can be programmed per usage. Dedicated rules identify management traffic to be forwarded to a Baseband Management Controller (BMC).

The switch supports replication of broadcast and multicast packets to multiple VSIs. It also supports mirroring of both Tx and Rx packets. As any other stage in the processing pipeline, the switch generates statistics and can also insert metadata into the pipeline (potentially reaching the Rx-Descriptor).

## 1.4.10 Access Control Lists (ACLs)

The packet processing pipeline in the E810 provides a programmable Ternary Classifier stage for implementing functions such as Access Control List (ACL), IP Longest Prefix Match (LPM), statistics collection, and so on. The Ternary Classifier is SDN/NFV-enabled, supporting a wide range of network protocols, both standard-based and proprietary. The architecture is fully-programmable, protocol-agnostic, and action-agnostic, capable of adapting to future protocol headers and use cases.

The Ternary Classifier is located following the switch in the packet processor pipeline, as illustrated in [Figure 1-2](#). Since the architecture of the Ternary Classifier is protocol-agnostic and action-agnostic, it can be programmed to serve as a switch extension and thus provide packet forwarding based on programmable rules, augmenting the capabilities of the switch.

## 1.4.11 Classification Filters

Following forwarding decision in the switch and ACLs stages, the Classification filters perform fine-grain classification of receive packets. The following capabilities are provided:

- **Hash-based classification** — Determines a destination queue in host memory through a hash function over fields in the packet headers. Several hash functions are supported, such as Microsoft RSS.
- **Flow Director** — Provides flow-level classification of packets, including association with a queue in host memory. The E810 provides on-die classification of 16K different flows.
- **Protocol Engine Quad-Hash classification** — Identifies flows to be offloaded in the on-die Protocol Engine.

The Classification Filters are programmable as are other stages in the Packet Processing Pipeline.

## 1.4.12 Embedded Management Processor (EMP)

The Embedded Management Processor (EMP) unit handles all management duties that cannot be performed by the E810's device drivers, and must be carried out on-chip. This includes performing parts of the E810 power-on sequence, handling AQ commands, initializing E810 Ethernet ports, participating in various fabric configuration protocols like DCBx and other Link Layer Discovery Protocol (LLDP) protocols, filling configuration requests received on one of the E810's BMC management interfaces like NC-SI, and handling special configuration requests received off an Ethernet port.

### 1.4.12.1 Protect, Detect, and Recover

Zero Trust is a security design strategy centered on the belief that organizations, by default, should not automatically trust anything or anybody inside or outside its perimeters and instead must verify anything and everything trying to connect and gain admittance to its systems before granting access. The Intel® Ethernet 800 Series EMP implements a design philosophy of platform resiliency with three attributes compliant with the NIST Cyber Security Framework, including NIST SP 800-193 Platform Firmware Resiliency Guidelines: Protect, Detect, and Recover.

Intel® Ethernet 800 Series uses signed firmware updates and hardware Root of Trust to protect and verify critical device settings with built-in detection of corruption, and automated device recovery to ensure the device safely returns to its originally programmed state. For details, [Section 3.4.9, "NVM Authentication Procedure"](#) and [Section 15.4, "Firmware Recovery Mode"](#).

### 1.4.13 Host Memory Cache (HMC)

The E810's quad hash lookup and Protocol Engine use host memory as a backing store for a variety of context objects. The Host Memory Cache (HMC) is responsible for caching and managing these context objects.

For each RDMA connection, the Protocol Engine uses a QP Context object (TCP/IP connection context that stores, for example, TCP sequence numbers) and Inbound RDMA Read Queue (IRRQ) objects that buffer inbound RDMA Read Requests until their associated Read Responses are scheduled for transmit. For each RDMA Memory Region, the Protocol Engine uses a Memory Region Table Entry (MRTE) object to store region boundary and access rights information, and a set of Physical Buffer List Entry (PBLE) objects to store virtual-to-physical address translations for this region. These and many more Protocol Engine context objects are detailed in [Chapter 11](#).

General information on HMC operation and configuration is provided in [Section 9.3](#).

### 1.4.14 Various Interfaces

#### 1.4.14.1 Shared Serial Flash Interface

The E810 accesses the NVM via an SPI interface. The NVM device is required for storage of device firmware, device configuration parameters, identifiers that vary per adapter (like MAC Addresses), and register overrides that auto-load automatically after reset. The E810 assumes that at least 10 MB of the NVM are dedicated for these configurations.

More information on the shared serial Flash interface is available in [Section 3.4](#).

#### 1.4.14.2 SMBus Interface

SMBus is an optional interface for pass-through and/or configuration traffic between an external BMC and the E810. The E810's SMBus interface supports standard SMBus at 100 KHz and 400 KHz. Refer to [Section 12.3.1.1](#) for an additional description of the SMBus interface, and [Section 2.2.4](#) for the pin descriptions.

#### 1.4.14.3 NC-SI Interface

NC-SI is an optional interface for pass-through and/or configuration traffic between an external BMC and the E810. Refer to [Section 12.3.1.2](#) for an additional description of the NC-SI interface, [Section 2.2.3](#) for the pin descriptions, and [Section 12.6](#) for NC-SI programming.

#### 1.4.14.4 High-Speed SDPs

On top of the eight SDPs and 12 LEDs slow interfaces accessible via the internal sideband Link, there are also four single-ended high-speed SDPs directly controlled by the E810 controller core. In addition, one differential output is directly connected to the internal clock control unit to create a high-precision clock signal. These SDPs are used for applications like IEEE 1588 that requires more precise timing of the SDPs transitions. See [Section 9.7.6.1](#) for details.

## 1.5 Conventions

### 1.5.1 Numbers and Number Bases

Hexadecimal numbers are written with a 0x prefix (like 0xFFFF or 0x1234ABDF). Binary numbers are written with a lowercase 'b' suffix (like 1001b or 10b). Decimal numbers are indicated without any suffix or using a lowercase 'd' suffix (like 4500d).

### 1.5.2 Byte Ordering

This section defines the internal organization of registers and memory structures that span multiple bytes. A few conventions to start with are:

- **Network Order** — Ethernet always transmits multiple-bytes fields with the Most Significant (MS) byte first.
- **Endian Notation** — Defines how a logical entity (such as a MAC Address) is stored in a given structure (like register or descriptor). Two options exist:
  - Little Endian (LE) notation — The MS byte of the logical entity is mapped to the highest byte address of the structure.
  - Big Endian (BE) notation — The MS byte of the logical entity is mapped to the lowest byte address of the structure.

Following are some examples:

#### Example 1:

A 32-bit counter is equal 0x01234567 (such as the sequence number in the TCP header). The counter is transferred on the wire as: 01 23 45 67 where 01 is the first byte on the wire and 67 is the last byte.

LE registers store this counter as (in bytes) as follows:

0x01 — Highest byte address  
0x23  
0x45  
0x67 — Lowest byte address

BE registers store this counter as (in bytes) as follows:

0x67 — Highest byte address  
0x45  
0x23  
0x01 — Lowest byte address

#### Example 2:

An L2 type register that holds the value of IPv4 header is equal 0x0800. The field is transferred on the wire as: 08 00 where 08 is the first byte on the wire.

LE registers store this counter as (in bytes) as follows:

0x08 — Highest byte address  
0x00 — Lowest byte address

BE registers store this counter as (in bytes) as follows:

- 0x00 — Highest byte address
- 0x08 — Lowest byte address

### Example 3:

A 48-bit Ethernet MAC Address equals 0x00112348A9BE. The Ethernet MAC Address is transferred on the wire as: 00 11 23 48 A9 BE where 00 is the first byte on the wire.

LE registers store this counter as (in bytes) as follows:

- 0x00 — Highest byte address
- 0x11
- 0x23
- 0x48
- 0xA9
- 0xBE — Lowest byte address

BE registers store this counter as (in bytes) as follows:

- 0xBE — Highest byte address
- 0xA9
- 0x48
- 0x23
- 0x11
- 0x00 — Lowest byte address

The following rules determine the Endian-ness of E810 structures:

- The general rule is that all structures are defined in LE notation unless defined otherwise. These structures include:
  - Registers.
  - AQ commands.
  - Structures in host memory (including any type of descriptors).
  - NVM.
  - LAN and PE contexts.
- The following structures are in BE notation:
  - Host memory buffers that are received or transmitted.
  - Any structures that contains a MAC Address (see exception for field vector).
  - Quad hash context programming registers (GL\_SWT\_LOFV\_PE, GL\_SWT\_LOFV\_SW and EMP\_SWT\_LOFV) are each defined in LE, while register 'n' is mapped to words  $(63 - 2 * 'n')$  and  $(62 - 2 * 'n')$  in the field vector.
  - IP Addresses in Protocol Engine host memory.
- The following structures have a mixed notation:
  - Field vector is presented in mixed BE/LE notation: Words are ordered in BE notation and bytes within the words are presented in LE notation.
  - Type-Length-Value (TLV) structures are stored in the NVM in mixed BE/LE notation: Words are ordered in BE notation and bytes within the words are presented in LE notation.

## 1.6 Support Documents

Table 1-2 lists industry standards relevant to the E810.

**Table 1-2. Standards Supported by the E810**

Category	Description
ARP	<b>Title:</b> "RFC 826: An Ethernet Address Resolution Protocol (ARP)", November 1982 <b>Document:</b> <a href="https://www.ietf.org/rfc/rfc0826.txt">https://www.ietf.org/rfc/rfc0826.txt</a> <b>Description:</b> Protocol to convert IP Addresses to Ethernet addresses.
Base	<b>Title:</b> "RFC 1071: Computing the Internet Checksum", September 1988 <b>Document:</b> <a href="https://www.ietf.org/rfc/rfc1071.txt">https://www.ietf.org/rfc/rfc1071.txt</a> <b>Description:</b> This RFC describes how to compute the Internet checksums used in IP, TCP and UDP.
Base	<b>Title:</b> "RFC 1180: A TCP/IP Tutorial", January 1991 <b>Document:</b> <a href="https://www.ietf.org/rfc/rfc1180.txt">https://www.ietf.org/rfc/rfc1180.txt</a> <b>Description:</b> Bare bones tutorial of TCP/IP protocol suite: ARP, IP and TCP and Upper Layer Protocols (ULPs). This is included for informative purposes only.
Base	<b>Title:</b> "RFC 1936: Implementing the Internet Checksum in Hardware", April 1996 <b>Document:</b> <a href="https://www.ietf.org/rfc/rfc1936.txt">https://www.ietf.org/rfc/rfc1936.txt</a> <b>Description:</b> Techniques for efficiently implementing the Internet checksum in hardware.
DCB	<b>Title:</b> "DCB Capability Exchange Protocol Base Specification", Revision 1.01 <b>Document:</b> <a href="https://www.ieee802.org/1/files/public/docs2008/az-wadkar-dcbxcapability-exchange-discovery-protocol-1108-v1.01.pdf">https://www.ieee802.org/1/files/public/docs2008/az-wadkar-dcbxcapability-exchange-discovery-protocol-1108-v1.01.pdf</a> <b>Description:</b> Defines CEE DCBx, a pre-standard version of the DCB Capability Exchange Protocol.
DCB	<b>Title:</b> "Priority Grouping for DCB Networks (Enhanced Transmission Selection)", Revision 1.01 <b>Document:</b> <a href="https://www.ieee802.org/1/files/public/docs2008/az-wadkar-etsproposal-0608-v1.01.pdf">https://www.ieee802.org/1/files/public/docs2008/az-wadkar-etsproposal-0608-v1.01.pdf</a> <b>Description:</b> Defines CEE ETS, a pre-standard version of the DCB Enhanced Transmission Selection Protocol
Ethernet	<b>Title:</b> "IEEE Standard for Ethernet" (IEEE Std 802.3-2018) <b>Document:</b> Available from <a href="https://standards.ieee.org/getieee802">https://standards.ieee.org/getieee802</a> <b>Description:</b> Specifies the Ethernet MAC and PHY layers up to 400 Gb/s. Includes these now superseded docs (among many others): 802.3ae (10 Gb/s base spec), 802.3an (10GBASE-T), 802.3ap (backplane Ethernet, KX, KX4, KR), 802.3ba (100G), 802.3by (25G), 802.3bs (200G/400G), and more.
Ethernet	<b>Title:</b> "IEEE Standard for Ethernet – Amendment 3: Media Access Control Parameters for 50 Gb/s and Physical Layers and Management Parameters for 50 Gb/s, 100 Gb/s, and 200 Gb/s Operation" (IEEE Std 802.3cd-2018) <b>Document:</b> Available from <a href="https://standards.ieee.org/getieee802">https://standards.ieee.org/getieee802</a> <b>Description:</b> Defines Ethernet MAC for 50 GbE and PHY layers for 50G/100G/200G based upon 50Gb/s PAM4 electrical and optical signaling.
Ethernet	<b>Title:</b> "Part 3: Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer Specifications – Amendment 8: MAC Control Frame for Priority-based Flow Control" (IEEE P802.3bd-2011) <b>Document:</b> Available from <a href="https://standards.ieee.org/getieee802">https://standards.ieee.org/getieee802</a> <b>Description:</b> Defines a MAC control frame to support 802.1Qbb priority-based flow control.
Ethernet	<b>Title:</b> "IEEE Standard for Local and Metropolitan Area Networks – Media Access Control (MAC) Bridges" (IEEE Std 802.1D-2004) <b>Document:</b> Available from <a href="https://standards.ieee.org/getieee802">https://standards.ieee.org/getieee802</a> <b>Description:</b> Base specification for Ethernet bridging.
Ethernet	<b>Title:</b> "IEEE Standards for Local and Metropolitan Area Networks - Media Access Control (MAC) Bridges and Virtual Bridged Local Area Networks" (IEEE Std 802.1Q-2011) <b>Document:</b> Available from <a href="https://standards.ieee.org/getieee802">https://standards.ieee.org/getieee802</a> <b>Description:</b> Ethernet VLAN-aware bridge specification.
Ethernet	<b>Title:</b> "IEEE Standard for Local and metropolitan area networks— Link Aggregation" (IEEE Std 802.1AX-2008) <b>Document:</b> Available from <a href="https://standards.ieee.org/getieee802">https://standards.ieee.org/getieee802</a> <b>Description:</b> Logic and protocols that enable aggregation of one or more Ethernet links into a single logical link. Until recently, link aggregation was defined in the 802.3 specification, but in the 2008 version it was moved to 802.1.

**Table 1-2. Standards Supported by the E810 [continued]**

Category	Description
Ethernet	<p><b>Title:</b> "Media Access Control (MAC) Bridges and Virtual Bridged Local Area Networks — Amendment17: Priority-based Flow Control" (IEEE P802.1Qbb-2011)</p> <p><b>Document:</b> Available from <a href="https://standards.ieee.org/getieee802">https://standards.ieee.org/getieee802</a></p> <p><b>Description:</b> Priority-based Flow Control (PFC) is one of the specifications that comprise DCB. PFC enables flow control per TC on IEEE 802 point-to-point full duplex links. This is achieved by a mechanism similar to the IEEE 802.3 Annex 31B PAUSE, but operating on individual priorities.</p>
Ethernet	<p><b>Title:</b> "Media Access Control (MAC) Bridges and Virtual Bridged Local Area Networks — Amendment 21: Edge Virtual Bridging" (IEEE P802.1Qbg-2012)</p> <p><b>Document:</b> Available from <a href="https://standards.ieee.org/getieee802">https://standards.ieee.org/getieee802</a></p> <p><b>Description:</b> EVB is one of the specifications that comprise DCB. EVB defines many of the virtual switching features on end stations like the E810. This includes definition of things like S-channels, which enable the multiplexing of multiple virtual channels on a single physical LAN, VSIs, VEBs, VEPAs, and so on. It also defines new management infrastructure for administering the new features.</p>
Ethernet	<p><b>Title:</b> "Virtual Bridged Local Area Networks — Bridge Port Extension" (IEEE P802.1BR/D3.3)</p> <p><b>Document:</b> Available from <a href="https://standards.ieee.org/getieee802">https://standards.ieee.org/getieee802</a></p> <p><b>Description:</b> BPE is a dedicated specification describing the bridge port extender element. It specifies the use of E-channels and a multicast replication service to extend bridge ports across multiple physical or virtual devices.</p>
Ethernet	<p><b>Title:</b> "IEEE Standard for Local and metropolitan area networks — Station and Media Access Control Connectivity Discovery" (IEEE Std 802.1AB-2009)</p> <p><b>Document:</b> Available from <a href="https://standards.ieee.org/getieee802">https://standards.ieee.org/getieee802</a></p> <p><b>Description:</b> Defines Link Layer Discovery Protocol (LLDP) that enables a server to advertise its identity, capabilities, and interconnections to other entities on an Ethernet fabric.</p>
Ethernet	<p><b>Title:</b> "IEEE Standard for a Precision Clock Synchronization Protocol for Networked Measurement and Control Systems" (IEEE Std 1588-2008)</p> <p><b>Document:</b> Available from <a href="https://standards.ieee.org/getieee802">https://standards.ieee.org/getieee802</a></p> <p><b>Description:</b> Defines a protocol that enables precise synchronization of clocks in systems communicating via packet networks.</p>
Ethernet	<p><b>Title:</b> "SFF-8436 Specification for QSFP+ 4X 10 Gb/s Pluggable Transceiver", Revision 4.9, 8/31/2018</p> <p><b>Document:</b> Available from <a href="https://www.snia.org/technology-communities/sff/specifications">https://www.snia.org/technology-communities/sff/specifications</a></p> <p><b>Description:</b> Defines the Quad Small Form Factor Pluggable (QSFP+) module mechanicals, electrical interface and pin-out, and so on.</p>
Ethernet	<p><b>Title:</b> "SFF-8431 SFP+ 10 Gb/s and Low Speed Electrical Interface", Revision 4.1, 7/6/2009"</p> <p><b>Document:</b> Available from <a href="https://www.snia.org/technology-communities/sff/specifications">https://www.snia.org/technology-communities/sff/specifications</a></p> <p><b>Description:</b> Defines the SERDES Framing Interface (SFI) high speed electrical interface to a Small Form-factor Pluggable (SFP+) optical module. Also defines the SFP+ management interface.</p>
Ethernet	<p><b>Title:</b> "RMII™ Specification", Revision 1.2, 3/20/1998</p> <p><b>Document:</b> <a href="https://ebook.pldworld.com/_eBook/-Telecommunications,Networks-/TCP/IP/RMII/rmii_rev12.pdf">https://ebook.pldworld.com/_eBook/-Telecommunications,Networks-/TCP/IP/RMII/rmii_rev12.pdf</a></p> <p><b>Description:</b> Reduced pin count interface used in place of IEEE standard Media Independent Interface (MII). The E810 has an Reduced Media Independent Interface (RMII) based interface for its NC-SI connection.</p>
Ethernet	<p><b>Title:</b> Serial-GMII Specification, rev 1.8, 11/2/2005, published by Cisco Systems</p> <p><b>Document:</b> <a href="ftp://ftp-eng.cisco.com/smii/sgmii.pdf">ftp://ftp-eng.cisco.com/smii/sgmii.pdf</a></p> <p><b>Description:</b> Reduced pin count interface used in place of IEEE standard Gigabit Media Independent Interface (GMII).</p>
Ethernet	<p><b>Title:</b> "Ethernet Alliance, Ethernet Jumbo Frames", Version 0.1, 11/12/2009</p> <p><b>Document:</b> <a href="https://ethernetalliance.org/wp-content/uploads/2011/10/EA-Ethernet-Jumbo-Frames-v0-1.pdf">https://ethernetalliance.org/wp-content/uploads/2011/10/EA-Ethernet-Jumbo-Frames-v0-1.pdf</a></p> <p><b>Description:</b> Document describing jumbo frames. Included for informative purposes only.</p>
Ethernet	<p><b>Title:</b> "Extended Frame Sizes for Next Generation Ethernets"</p> <p><b>Document:</b> <a href="https://staff.psc.edu/mathis/MTU/AlteonExtendedFrames_W0601.pdf">https://staff.psc.edu/mathis/MTU/AlteonExtendedFrames_W0601.pdf</a></p> <p><b>Description:</b> Document describing jumbo frames. Included for informative purposes only.</p>
Ethernet	<p><b>Title:</b> "Extended Ethernet Frame Size Support", November 1999</p> <p><b>Document:</b> <a href="https://www.ietf.org/proceedings/48/1-D/kaplan-isis-ext-eth-02.txt">https://www.ietf.org/proceedings/48/1-D/kaplan-isis-ext-eth-02.txt</a></p> <p><b>Description:</b> Document describing jumbo frames. Included for informative purposes only.</p>

**Table 1-2. Standards Supported by the E810 [continued]**

Category	Description
Ethernet (DCB)	<p><b>Title:</b> "Virtual Bridged Local Area Networks — Amendment 18: Enhanced Transmission Selection for Bandwidth Sharing Between Traffic Classes" (IEEE P802.1Qaz-2011)</p> <p><b>Document:</b> Available from <a href="https://standards.ieee.org/getieee802">https://standards.ieee.org/getieee802</a></p> <p><b>Description:</b> ETS is one of the specifications that comprise DCB. ETS enables arbitration of bandwidth between TCs. This specification also defines Data Center Bridging Exchange (DCBx) protocol. DCBx enables configuration of DCB features onto an Ethernet LAN.</p>
Ethernet/IP	<p><b>Title:</b> "RFC 894: A Standard for the Transmission of IP Datagrams over Ethernet Networks", April 1984</p> <p><b>Document:</b> <a href="https://www.ietf.org/rfc/rfc894.txt">https://www.ietf.org/rfc/rfc894.txt</a></p> <p><b>Description:</b> This specifies the method for transmitting IP datagrams over Ethernet.</p>
Ethernet/IP	<p><b>Title:</b> "RFC 1042: A Standard for the Transmission of IP Datagrams over IEEE 802 Networks", February 1988</p> <p><b>Document:</b> <a href="https://www.ietf.org/rfc/rfc1042.txt">https://www.ietf.org/rfc/rfc1042.txt</a></p> <p><b>Description:</b> This specifies the method for transmitting IP datagrams over IEEE 802.3 networks. Obsoletes: RFC 948</p>
IP	<p><b>Title:</b> "RFC 791: Internet Protocol", September 1981</p> <p><b>Document:</b> <a href="https://www.ietf.org/rfc/rfc0791.txt">https://www.ietf.org/rfc/rfc0791.txt</a></p> <p><b>Description:</b> Base specification for IPv4.</p>
IP	<p><b>Title:</b> "RFC 815: IP Datagram Reassembly Algorithms", July 1982</p> <p><b>Document:</b> <a href="https://www.ietf.org/rfc/rfc0815.txt">https://www.ietf.org/rfc/rfc0815.txt</a></p>
IP	<p><b>Title:</b> "RFC 2460: Internet Protocol, Version 6 (IPv6) Specification", December 1998</p> <p><b>Document:</b> <a href="https://www.ietf.org/rfc/rfc2460.txt">https://www.ietf.org/rfc/rfc2460.txt</a></p> <p><b>Description:</b> Base specification for IPv6. Obsoletes RFC 1883.</p>
IP	<p><b>Title:</b> "RFC 2474: Definition of the Differentiated Services Field (DS Field) in the IPv4 and IPv6 Headers", December 1998</p> <p><b>Document:</b> <a href="https://tools.ietf.org/html/rfc2474">https://tools.ietf.org/html/rfc2474</a></p> <p><b>Description:</b> Obsoletes RFC 1349, 1455.</p>
IP	<p><b>Title:</b> "RFC 2710: Multicast Listener Discovery (MLD) for IPv6", October 1999</p> <p><b>Document:</b> <a href="https://www.ietf.org/rfc/rfc2710.txt">https://www.ietf.org/rfc/rfc2710.txt</a></p> <p><b>Description:</b> Specifies the protocol used by an IPv6 router to discover the multicast listeners on its directly attached links. MLD is derived from version 2 of IPv4's Internet Group Management Protocol, IGMPv2. This is an important standard for power management.</p>
IP	<p><b>Title:</b> "RFC 3810: Multicast Listener Discovery Version 2 (MLDv2) for IPv6", June 2004</p> <p><b>Document:</b> <a href="https://www.ietf.org/rfc/rfc3810.txt">https://www.ietf.org/rfc/rfc3810.txt</a></p> <p><b>Description:</b> Updates RFC 2710. This is an important standard for power management.</p>
IP	<p><b>Title:</b> "RFC 2873: TCP Processing of the IPv4 Precedence Field", June 2000</p> <p><b>Document:</b> <a href="https://www.ietf.org/rfc/rfc2873.txt">https://www.ietf.org/rfc/rfc2873.txt</a></p> <p><b>Description:</b> Corrects a conflict between TCP as defined in RFC 793 and DiffServ in handling of the IPv4 precedence field.</p>
IP	<p><b>Title:</b> "RFC 4861: Neighbor Discovery for IP version 6 (IPv6)", September 2007</p> <p><b>Document:</b> <a href="https://www.ietf.org/rfc/rfc4861.txt">https://www.ietf.org/rfc/rfc4861.txt</a></p> <p><b>Description:</b> IPv6 nodes use neighbor discovery to discover each other's presence, to determine each other's link-layer addresses, to find routers, and to maintain reachability information. This is an important standard for power management. Obsoletes RFC 2461.</p>
Mgmt	<p><b>Title:</b> "System Management Bus (SMBus) Specification", v3.0, December 20, 2014</p> <p><b>Document:</b> Available from <a href="https://smbus.org/specs/">https://smbus.org/specs/</a></p> <p><b>Description:</b> A two-wire interface for communication of management information, based on the principles of operation of I<sup>2</sup>C.</p>
Mgmt	<p><b>Title:</b> "DSP0218: Platform Level Data Model (PLDM) for Redfish Device Enablement", Version 1.1.0, November 2, 2021</p> <p><b>Document:</b> <a href="https://www.dmtf.org/sites/default/files/standards/documents/DSP0218_1.1.0.pdf">https://www.dmtf.org/sites/default/files/standards/documents/DSP0218_1.1.0.pdf</a></p> <p><b>Description:</b> Specifies RDE protocol.</p>

**Table 1-2. Standards Supported by the E810 [continued]**

Category	Description
Mgmt	<p><b>Title:</b> "DSP0222: Network Controller Sideband Interface (NC-SI) Specification", Version 1.1.0, September 23, 2015  <b>Document:</b> <a href="https://dmtf.org/sites/default/files/standards/documents/DSP0222_1.1.0.pdf">https://dmtf.org/sites/default/files/standards/documents/DSP0222_1.1.0.pdf</a>  <b>Description:</b> Standardizes the sideband communication interface between a NIC (the E810) and a BMC.</p>
Mgmt	<p><b>Title:</b> "DSP0236: Management Component Transport Protocol (MCTP) Base Specification", Version 1.3.0, November 24, 2016  <b>Document:</b> <a href="https://dmtf.org/sites/default/files/standards/documents/DSP0236_1.3.0.pdf">https://dmtf.org/sites/default/files/standards/documents/DSP0236_1.3.0.pdf</a>  <b>Description:</b> Specifies MCTP protocol.</p>
Mgmt	<p><b>Title:</b> "DSP0237: Management Component Transport Protocol (MCTP) SMBus/I<sup>2</sup>C Transport Binding Specification", Version 1.0.0, May 21, 2017  <b>Document:</b> <a href="https://dmtf.org/sites/default/files/standards/documents/DSP0237_1.1.0.pdf">https://dmtf.org/sites/default/files/standards/documents/DSP0237_1.1.0.pdf</a>  <b>Description:</b> Describes the binding of MCTP over SMBus.</p>
Mgmt	<p><b>Title:</b> "DSP0238: Management Component Transport Protocol (MCTP) PCIe VDM Transport Binding Specification", Version 1.0.2, December 7, 2014  <b>Document:</b> <a href="https://dmtf.org/sites/default/files/standards/documents/DSP0238_1.0.1.pdf">https://dmtf.org/sites/default/files/standards/documents/DSP0238_1.0.1.pdf</a>  <b>Description:</b> Describes the binding of MCTP over PCIe.</p>
Mgmt	<p><b>Title:</b> "DSP0239: Management Component Transport Protocol (MCTP) IDs and Codes", Version 1.2.0, August 28, 2012  <b>Document:</b> <a href="https://dmtf.org/sites/default/files/standards/documents/DSP0239_1.2.0.pdf">https://dmtf.org/sites/default/files/standards/documents/DSP0239_1.2.0.pdf</a>  <b>Description:</b> Describes constants used by MCTP specifications.</p>
Mgmt	<p><b>Title:</b> "DSP0240: Platform Level Data Model (PLDM) Base Specification", Version 1.0.0, April 23, 2009  <b>Document:</b> <a href="https://www.dmtf.org/sites/default/files/standards/documents/DSP0240_1.0.0.pdf">https://www.dmtf.org/sites/default/files/standards/documents/DSP0240_1.0.0.pdf</a>  <b>Description:</b> PLDM base specification including the PLDM command format and PLDM control commands.</p>
Mgmt	<p><b>Title:</b> "DSP0241: Platform Level Data Model (PLDM) over MCTP Binding Specification", Version 1.0.0, April 23, 2009  <b>Document:</b> <a href="https://www.dmtf.org/sites/default/files/standards/documents/DSP0241_1.0.0.pdf">https://www.dmtf.org/sites/default/files/standards/documents/DSP0241_1.0.0.pdf</a>  <b>Description:</b> Describes the binding of PLDM over MCTP.</p>
Mgmt	<p><b>Title:</b> "DSP0245 Platform Level Data Model (PLDM) IDs and Codes Specification", Version 1.2.0, November 24, 2016  <b>Document:</b> <a href="https://www.dmtf.org/sites/default/files/standards/documents/DSP0245_1.2.0.pdf">https://www.dmtf.org/sites/default/files/standards/documents/DSP0245_1.2.0.pdf</a>  <b>Description:</b> Constants used for PLDM commands.</p>
Mgmt	<p><b>Title:</b> "DSP0248: Platform Level Data Model (PLDM) for Platform Monitoring and Control Specification", Version 1.2.0, September 9, 2019  <b>Document:</b> <a href="https://www.dmtf.org/sites/default/files/standards/documents/DSP0248_1.2.0.pdf">https://www.dmtf.org/sites/default/files/standards/documents/DSP0248_1.2.0.pdf</a>  <b>Description:</b> Contains the description of PDT, sensors and affecters used in PLDM.</p>
Mgmt	<p><b>Title:</b> "DSP0249: Platform Level Data Model (PLDM) State Set Specification", Version 1.0.0, March 16, 2009  <b>Document:</b> <a href="https://www.dmtf.org/sites/default/files/standards/documents/DSP0249_1.1.0.pdf">https://www.dmtf.org/sites/default/files/standards/documents/DSP0249_1.1.0.pdf</a>  <b>Description:</b> Defines the enums and states used by PLDM.</p>
Mgmt	<p><b>Title:</b> "DSP0254: PLDM NIC Modeling", Version 1.0.0, December 18, 2019  <b>Document:</b> <a href="https://www.dmtf.org/sites/default/files/standards/documents/DSP0254_1.0.0.pdf">https://www.dmtf.org/sites/default/files/standards/documents/DSP0254_1.0.0.pdf</a>  <b>Description:</b> Defines PLDM data structures for modeling a NIC using PLDM for Monitoring and Control.</p>
Mgmt	<p><b>Title:</b> "DSP0261: NC-SI Over MCTP Specification", Version 1.1.0, March 21, 2015  <b>Document:</b> <a href="https://www.dmtf.org/sites/default/files/standards/documents/DSP0261_1.1.0.pdf">https://www.dmtf.org/sites/default/files/standards/documents/DSP0261_1.1.0.pdf</a>  <b>Description:</b> Describes the encapsulation of NC-SI packets in MCTP.</p>
Mgmt	<p><b>Title:</b> "DSP0267: Platform Level Data Model (PLDM) For Firmware Update Specification", Version 1.0.0, November 24, 2016  <b>Document:</b> <a href="https://www.dmtf.org/sites/default/files/standards/documents/DSP0267_1.0.0.pdf">https://www.dmtf.org/sites/default/files/standards/documents/DSP0267_1.0.0.pdf</a>  <b>Description:</b> Defines messages and data structures for updating firmware.</p>
MPLS	<p><b>Title:</b> "RFC 3031: Multiprotocol Label Switching Architecture", January 2001  <b>Document:</b> <a href="https://datatracker.ietf.org/doc/rfc3031/">https://datatracker.ietf.org/doc/rfc3031/</a>  <b>Description:</b> MPLS architecture.</p>

**Table 1-2. Standards Supported by the E810 [continued]**

Category	Description
MPLS	<b>Title:</b> "RFC 3032: MPLS Label Stack Encoding", January 2001 <b>Document:</b> <a href="https://datatracker.ietf.org/doc/rfc3032/">https://datatracker.ietf.org/doc/rfc3032/</a> <b>Description:</b> MPLS header.
PCI	<b>Title:</b> "PCI Local Bus Specification", Revision 3.0, February 3, 2004 <b>Document:</b> Available from <a href="http://www.pcisig.com">www.pcisig.com</a> <b>Description:</b> Compliant with select sections, such as Appendix I Vital Product Data.
PCI	<b>Title:</b> "PCI Hot-Plug Specification", Revision 1.1, June 20, 2001 <b>Document:</b> Available from <a href="http://www.pcisig.com">www.pcisig.com</a> <b>Description:</b> Defines how PCI add-in cards are installed and removed while the system is running.
PCI	<b>Title:</b> "PCI Firmware Specification", Revision 3.0, June 20, 2005 <b>Document:</b> Available from <a href="http://www.pcisig.com">www.pcisig.com</a> <b>Description:</b> Defines the firmware interface for managing PCIe systems in a host computer. Describes the format, contents, and code entry points for Expansion ROMs.
PCI	<b>Title:</b> "PCI Express Base Specification", Revision 3.1a, December 7, 2015 <b>Document:</b> Available from <a href="http://www.pcisig.com">www.pcisig.com</a> <b>Description:</b> Contains the technical details of the PCIe architecture, protocol, link layer, physical layer, and software interface.
PCI	<b>Title:</b> "PCI Express Card Electromechanical Specification", Revision 3.0, July 21, 2013 <b>Document:</b> Available from <a href="http://www.pcisig.com">www.pcisig.com</a> <b>Description:</b> Mechanical and electrical specifications for an Evo card form factor.
Power Mgmt	<b>Title:</b> "Magic Packet Technology", November 1995 <b>Document:</b> <a href="http://support.amd.com/TechDocs/20213.pdf">http://support.amd.com/TechDocs/20213.pdf</a> <b>Description:</b> Defines a method for waking up a sleeping networked PC using a specific Ethernet frame (a Magic packet).
Power Mgmt	<b>Title:</b> "PCI Bus Power Management Interface Specification", Revision 1.2, March 3, 2004 <b>Document:</b> Available from <a href="http://www.pcisig.com">www.pcisig.com</a> <b>Description:</b> Defines a standard set of PCI peripheral power management hardware interfaces and behavioral policies.
Power Mgmt	<b>Title:</b> "Advanced Configuration and Power Interface Specification", Revision 4.0a, April 5, 2010 <b>Document:</b> <a href="http://www.acpi.info/DOWNLOADS/ACPIspec40a.pdf">http://www.acpi.info/DOWNLOADS/ACPIspec40a.pdf</a> <b>Description:</b> Defines standard interfaces to enable robust OS-directed motherboard device configuration and power management.
Power Mgmt	<b>Title:</b> "Standard ECMA-393: proxZZy for sleeping hosts" 2 <sup>nd</sup> Edition, June 2012 <b>Document:</b> <a href="http://www.ecma-international.org/publications/files/ECMA-ST/ECMA-393.pdf">www.ecma-international.org/publications/files/ECMA-ST/ECMA-393.pdf</a> <b>Description:</b> Defines a low-power proxy that handles key network tasks for a high-power device, thus allowing the high-power device to sleep when not in active use.
RDMA	<b>Title:</b> "RFC 5040: A Remote Direct Memory Access Protocol Specification", October 2007 <b>Document:</b> <a href="http://www.ietf.org/rfc/rfc5040.txt">http://www.ietf.org/rfc/rfc5040.txt</a> <b>Description:</b> LLP is DDP, connects directly to the Host CPU/OS via the E810 System Interface.
RDMA	<b>Title:</b> "RFC 5041: Direct Data Placement over Reliable Transports", October 2007 <b>Document:</b> <a href="http://www.ietf.org/rfc/rfc5041.txt">http://www.ietf.org/rfc/rfc5041.txt</a> <b>Description:</b> LLP is MPA, ULP is RDMAP. DDP protocol provides information to place incoming data directly into a ULP receive buffer without intermediate buffers.
RDMA	<b>Title:</b> "RFC 5044: Marker PDU Aligned Framing for TCP Specification", October 2007 <b>Document:</b> <a href="http://www.ietf.org/rfc/rfc5044.txt">http://www.ietf.org/rfc/rfc5044.txt</a> <b>Description:</b> LLP is TCP, ULP is DDP. MPA is a framing protocol that enables the preservation of ULP record boundaries.
RDMA	<b>Title:</b> "RFC 7306: Remote Direct Memory Access (RDMA) Protocol Extensions", June 2014 <b>Document:</b> <a href="https://tools.ietf.org/html/rfc7306">https://tools.ietf.org/html/rfc7306</a> <b>Description:</b> Specifies extensions to the IETF Remote Direct Memory Access Protocol (RDMAP) as specified in RFC 5040.

**Table 1-2. Standards Supported by the E810 [continued]**

Category	Description
RDMA	<p><b>Title:</b> "RDMA Protocol Verbs Specification (Version 1.0)", April 2003  <b>Document:</b> <a href="http://rdmaconsortium.org/home/draft-hilland-iwarp-verbs-v1.0-RDMAC.pdf">rdmaconsortium.org/home/draft-hilland-iwarp-verbs-v1.0-RDMAC.pdf</a>  <b>Description:</b> Verbs describe the Host application/OS interface to an RNIC. This interface is implemented as a combination of the RNIC system interface, its associated firmware, and host software. It provides access to the RNIC queuing and memory management resources, as well as the underlying networking layers.</p>
RDMA	<p><b>Title:</b> "InfiniBand Architecture Specification Annex A17: RoCEv2" September 2, 2014  <b>Document:</b> Available from <a href="https://www.infinibandta.org/ibta-specifications-download/">https://www.infinibandta.org/ibta-specifications-download/</a>  <b>Description:</b> This document is an annex to Volume 1 release 1.2.1 of the InfiniBand Architecture.</p>
RDMA	<p><b>Title:</b> "InfiniBand Architecture Specification Volume 1", Release 1.3, March 3, 2015 (subset of this spec that applies to RoCEv2)  <b>Document:</b> Available from <a href="https://www.infinibandta.org/ibta-specifications-download/">https://www.infinibandta.org/ibta-specifications-download/</a>  <b>Description:</b> The InfiniBand Architecture Specification describes a first order interconnect technology for interconnecting processor nodes and I/O nodes to form a system area network.</p>
Security	<p><b>Title:</b> "NIST SP 800-198: Platform Firmware Resiliency Guidelines", May 2018  <b>Abstract:</b> <a href="https://csrc.nist.gov/publications/detail/sp/800-193/final">https://csrc.nist.gov/publications/detail/sp/800-193/final</a>  <b>Document:</b> <a href="https://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-193.pdf">https://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-193.pdf</a>  <b>Description:</b> Provides technical guidelines and recommendations supporting resiliency of platform firmware and data against potentially destructive attacks.</p>
Software	<p><b>Title:</b> Microsoft specification for "Receive Side Scaling" (RSS).  <b>Document:</b> <a href="https://docs.microsoft.com/en-us/windows-hardware/drivers/network/ndis-receive-side-scaling2">https://docs.microsoft.com/en-us/windows-hardware/drivers/network/ndis-receive-side-scaling2</a>  <b>Description:</b> RSS is a network driver technology that enables the efficient distribution of network receive processing across multiple CPUs in multiprocessor systems.</p>
SR-IOV	<p><b>Title:</b> "Single Root I/O Virtualization and Sharing Specification", Revision 1.1, January 20, 2010  <b>Document:</b> Available from <a href="http://www.pcisig.com">www.pcisig.com</a>  <b>Description:</b> The SR-IOV specification defines extensions to the PCIe specification that enable the VMs in a virtualized server to efficiently share PCI adapter hardware resources.</p>
Security	<p><b>Title:</b> Security Protocol and Data Model (SPDM) Specification  <b>Document:</b> <a href="https://www.dmtf.org/sites/default/files/standards/documents/DSP0274_1.1.1.pdf">https://www.dmtf.org/sites/default/files/standards/documents/DSP0274_1.1.1.pdf</a>  <b>Description:</b> The Security Protocol and Data Model (SPDM) Specification defines messages, data objects, and sequences for performing message exchanges between devices over a variety of transport and physical media.</p>
Security	<p><b>Title:</b> Security Protocol and Data Model (SPDM) over MCTP Binding Specification.  <b>Document:</b> <a href="https://www.dmtf.org/sites/default/files/standards/documents/DSP0275_1.0.0.pdf">https://www.dmtf.org/sites/default/files/standards/documents/DSP0275_1.0.0.pdf</a>  <b>Description:</b> SPDM is designed to be an effective interface and data model that enables efficient access to low-level security capabilities and operations. SPDM over MCTP binding defines the format of SPDM messages transported over MCTP.</p>
Statistics	<p><b>Title:</b> "RFC 2819: Remote Network Monitoring Management Information Base", May 2000  <b>Document:</b> <a href="http://www.ietf.org/rfc/rfc2819.txt">http://www.ietf.org/rfc/rfc2819.txt</a>  <b>Description:</b> Defines objects for managing remote network monitoring devices. Includes the popular packet size histogram counters. Obsoletes RFC 1757.</p>
Statistics	<p><b>Title:</b> "RFC 2863: The Interfaces Group MIB", June 2000  <b>Document:</b> <a href="http://www.ietf.org/rfc/rfc2863.txt">http://www.ietf.org/rfc/rfc2863.txt</a>  <b>Description:</b> Describes objects used for managing network interfaces. Obsoletes RFC 2233.</p>
Statistics	<p><b>Title:</b> "RFC 4022: Management Information Base for the Transmission Control Protocol (TCP)", March 2005  <b>Document:</b> <a href="http://www.ietf.org/rfc/rfc4022.txt">http://www.ietf.org/rfc/rfc4022.txt</a>  <b>Description:</b> IP version-independent TCP MIB. Obsoletes RFC 2012, 2452.</p>
Statistics	<p><b>Title:</b> "RFC 4113: Management Information Base for the User Datagram Protocol (UDP)", June 2005  <b>Document:</b> <a href="http://www.ietf.org/rfc/rfc4113.txt">http://www.ietf.org/rfc/rfc4113.txt</a>  <b>Description:</b> Objects for managing implementations of UDP. Obsoletes RFC 2013, 2454.</p>
Statistics	<p><b>Title:</b> "RFC 4293: Management Information Base for the Internet Protocol (IP)", April 2006  <b>Document:</b> <a href="http://www.ietf.org/rfc/rfc4293.txt">http://www.ietf.org/rfc/rfc4293.txt</a>  <b>Description:</b> IP version-independent IP MIB. Obsoletes RFC 2011, 2465, 2466.</p>

**Table 1-2. Standards Supported by the E810 [continued]**

Statistics	<p><b>Title:</b> "Microsoft NDIS 6.0 OID_GEN_STATISTICS"</p> <p><b>Document:</b> <a href="https://docs.microsoft.com/en-us/windows-hardware/drivers/network/oid-gen-statistics">https://docs.microsoft.com/en-us/windows-hardware/drivers/network/oid-gen-statistics</a></p> <p><b>Description:</b> Adapter statistics counters defined by Microsoft for NDIS 6.0.</p>
TCP	<p><b>Title:</b> "RFC 793: Transmission Control Protocol", September 1981</p> <p><b>Document:</b> <a href="http://www.ietf.org/rfc/rfc0793.txt">http://www.ietf.org/rfc/rfc0793.txt</a></p> <p><b>Description:</b> Base specification for TCP.</p>
TCP	<p><b>Title:</b> "RFC 813: Window and Acknowledgment Strategy in TCP", July 1982</p> <p><b>Document:</b> <a href="http://www.ietf.org/rfc/rfc813.txt">http://www.ietf.org/rfc/rfc813.txt</a></p>
TCP	<p><b>Title:</b> "RFC 896: Congestion Control in IP/TCP Internetworks", January 6, 1984</p> <p><b>Document:</b> <a href="http://www.ietf.org/rfc/rfc896.txt">http://www.ietf.org/rfc/rfc896.txt</a></p> <p><b>Description:</b> Defines the Nagle algorithm, which specifies delaying transmission of small amounts of data when there are Acknowledgments (ACKs) outstanding.</p>
TCP	<p><b>Title:</b> "RFC 1323: TCP Extensions for High Performance", May 1992</p> <p><b>Document:</b> <a href="http://www.ietf.org/rfc/rfc1323.txt">http://www.ietf.org/rfc/rfc1323.txt</a></p> <p><b>Description:</b> Defines the TCP window scale and timestamp options, Round Trip Time Measurement (RTTM) and Protect Against Wrapped Sequences (PAWS). Obsoletes RFC 1072, 1185.</p>
TCP	<p><b>Title:</b> "RFC 2525: Known TCP Implementation Problems", March 1999</p> <p><b>Document:</b> <a href="http://www.ietf.org/rfc/rfc2525.txt">http://www.ietf.org/rfc/rfc2525.txt</a></p> <p><b>Description:</b> This RFC describes implementation issues with various historical TCP/IP stacks. While it is included here for informative purposes only, it does serve as a good check list to avoid known problems. The E810 Protocol Engine is designed to support its recommendations.</p>
TCP	<p><b>Title:</b> "RFC 2923: TCP Problems with Path MTU Discovery", September 2000</p> <p><b>Document:</b> <a href="http://www.ietf.org/rfc/rfc2923.txt">http://www.ietf.org/rfc/rfc2923.txt</a></p> <p><b>Description:</b> Discusses problems with existing RFC 1191 implementations that should be avoided. Serves as an implementation checklist.</p>
TCP	<p><b>Title:</b> "RFC 2988: Computing TCP's Retransmission Timer", November 2000</p> <p><b>Document:</b> <a href="http://www.ietf.org/rfc/rfc2988.txt">http://www.ietf.org/rfc/rfc2988.txt</a></p> <p><b>Description:</b> Defines the standard algorithm that TCP senders are required to use to compute and manage their retransmission timer.</p>
TCP	<p><b>Title:</b> "RFC 3390: Increasing TCP's Initial Window", October 2002</p> <p><b>Document:</b> <a href="http://www.ietf.org/rfc/rfc3390.txt">http://www.ietf.org/rfc/rfc3390.txt</a></p> <p><b>Description:</b> Specifies an optional standard for TCP to increase the permitted initial window from one or two segments to roughly 4 KB. Obsoletes RFC 2414. Updates RFC 2581.</p>
TCP	<p><b>Title:</b> "RFC 3465: TCP Congestion Control with Appropriate Byte Counting (ABC)", February 2003</p> <p><b>Document:</b> <a href="http://www.ietf.org/rfc/rfc3465.txt">http://www.ietf.org/rfc/rfc3465.txt</a></p> <p><b>Description:</b> This experimental RFC defines a small modification to the way TCP increases its congestion window. Instead of increasing cwnd by a constant amount for each acknowledgment, cwnd is increased based on the number of previously unacknowledged bytes each ACK covers.</p>
TCP	<p><b>Title:</b> "RFC 3782: The NewReno Modification to TCP's Fast Recovery Algorithm", April 2004</p> <p><b>Document:</b> <a href="http://www.ietf.org/rfc/rfc3782.txt">http://www.ietf.org/rfc/rfc3782.txt</a></p> <p><b>Description:</b> Update the fast recovery algorithm that is run after three duplicate ACKs have been received. Changes to the CWND during fast recovery, scheduling additional fast retransmitted packets if the received ACKs do not acknowledge all the data when fast recovery was entered. Obsoletes RFC 2582.</p>
TCP	<p><b>Title:</b> "RFC 5681: TCP Congestion Control", September 2009</p> <p><b>Document:</b> <a href="http://www.ietf.org/rfc/rfc5681.txt">http://www.ietf.org/rfc/rfc5681.txt</a></p> <p><b>Description:</b> TCP slow start, congestion avoidance, fast retransmit, and fast recovery algorithms. Obsoletes RFC 2581.</p>
Test	<p><b>Title:</b> "IEEE Standard Test Access Port and Boundary-Scan Architecture" (IEEE Std 1149.1-2001)</p> <p><b>Document:</b> Available from <a href="http://standards.ieee.org/getieee802">http://standards.ieee.org/getieee802</a></p> <p><b>Description:</b> Defines a standard interface through which instructions and test data are communicated to an integrated circuit for component- and circuit board-level testing.</p>

**Table 1-2. Standards Supported by the E810 [continued]**

Category	Description
Tunneling	<p><b>Title:</b> "RFC 7637: NVGRE: Network Virtualization using Generic Routing Encapsulation", September 2015  <b>Document:</b> <a href="http://datatracker.ietf.org/doc/draft-sridharan-virtualization-nvgre/?include_text=1">http://datatracker.ietf.org/doc/draft-sridharan-virtualization-nvgre/?include_text=1</a>  <b>Description:</b> MAC in Generic Routing Encapsulation (GRE) over IP encapsulation.</p>
Tunneling	<p><b>Title:</b> "RFC 7348: Virtual eXtensible Local Area Network (VXLAN): A Framework for Overlaying Virtualized Layer 2 Networks over Layer 3 Networks", August 2014  <b>Document:</b> <a href="http://datatracker.ietf.org/doc/draft-mahalingam-dutt-dcops-vxlan/?include_text=1">http://datatracker.ietf.org/doc/draft-mahalingam-dutt-dcops-vxlan/?include_text=1</a>  <b>Description:</b> MAC in UDP encapsulation.</p>
UDP	<p><b>Title:</b> "RFC 768: User Datagram Protocol", August 28, 1980  <b>Document:</b> <a href="http://www.ietf.org/rfc/rfc0768.txt">http://www.ietf.org/rfc/rfc0768.txt</a>  <b>Description:</b> Base specification for UDP.</p>

## Chapter 2 Pin Interface

### 2.1 Pin Descriptions

This section provides detailed descriptions of E810 signal pins, grouped by function.

- A “\_N” following the signal name indicates that the signal is active-low.
- Signal names with a suffix of “\_p” and “\_n” refer to differential signals.

The buffer types are listed in [Table 2-1](#).

**Table 2-1. Buffer Types**

Buffer	Description
In	Input is a standard input-only signal.
Out (O)	Totem Pole Output (TPO) is a standard active driver.
t/s	Tri-state is a bi-directional, tri-state input/output pin.
o/d	Open drain enables multiple devices to share as a wire-OR.
A-in	Analog input signals.
A-out	Analog output signals.
A-Inout	Bi-directional analog signals.
HCSL-in	High-Speed Current Steering Logic input signal.
NCSI-in	NC-SI input signal.
NCSI-out	NC-SI output signal.
Pu	Internal pull-up resistor.
Pd	Internal pull-down resistor.
clkobs	Clock observation output.
JTAG	1.8 V JTAG I/O.

### 2.2 Pin Assignments and Descriptions

The E810 is available in two package options:

- The 25x25 mm, 668-pin, Flip-Chip Ball Grid Array (FCBGA) package contains all the signals needed to implement the maximum product configuration. In particular, 16 lanes of PCIe and eight lanes of Ethernet PMD are exposed. Products based on the Intel® Ethernet Controller E810-CAM1 and the Intel® Ethernet Controller E810-CAM2 use this package.
- The 21x21 mm, 456-pin, Flip-Chip Ball Grid Array (FCBGA) package contains the signals needed to implement eight lanes of PCIe and two lanes of Ethernet PMD for the dual-port 25 GbE or single-port 50 GbE implementation. Products based on the Intel® Ethernet Controller E810-XXVAM2 use this package.

The following sections provide the signal names, pin/ball assignments and signal descriptions. The AC/DC electrical specifications for the signals are described in [Chapter 16](#).

## 2.2.1 PCIe Interface Pins

This section provides the pin assignment for PCIe interface signals.

**Table 2-2. PCIe Interface Pins**

Signal	Ball # CAM2/CAM1	Ball # XXVAM2	Type	Description
PE_CLK_p PE_CLK_n	N47 N45	H40 G39	HCSL-in	PCIe Differential Reference Clock In. A 100 MHz differential clock input. This clock is used as the reference clock for the PCIe Tx/Rx circuitry and by the PCIe core PLL to generate clocks for the PCIe core logic.
PET_0_p PET_0_n	L39 L41	E39 E37	A-out	PCIe Serial Data Output. A serial differential output pair running at 16 GT/s, 8 GT/s, 5 GT/s, or 2.5 GT/s. This output carries both data and an embedded clock that is recovered along with data at the receiving end.
PET_1_p PET_1_n	J39 J41	C35 C33	A-out	Same as previous.
PET_2_p PET_2_n	G39 G41	C29 C27	A-out	Same as previous.
PET_3_p PET_3_n	E45 D44	C23 C21	A-out	Same as previous.
PET_4_p PET_4_n	E41 D40	C17 C15	A-out	Same as previous.
PET_5_p PET_5_n	E37 D36	E11 D10	A-out	Same as previous.
PET_6_p PET_6_n	E33 D32	E7 D6	A-out	Same as previous.
PET_7_p PET_7_n	E29 D28	E3 D2	A-out	Same as previous.
PET_8_p PET_8_n	E25 D24	N/A	A-out	Same as previous.
PET_9_p PET_9_n	E21 D20	N/A	A-out	Same as previous.
PET_10_p PET_10_n	E17 D16	N/A	A-out	Same as previous.
PET_11_p PET_11_n	E13 D12	N/A	A-out	Same as previous.
PET_12_p PET_12_n	E9 D8	N/A	A-out	Same as previous.
PET_13_p PET_13_n	E5 D4	N/A	A-out	Same as previous.
PET_14_p PET_14_n	G9 G7	N/A	A-out	Same as previous.
PET_15_p PET_15_n	J9 J7	N/A	A-out	Same as previous.
PER_0_p PER_0_n	L45 L47	C39 B38	A-in	PCIe Serial Data Input. A serial differential input pair running at 16 GT/s, 8 GT/s, 5 GT/s, or 2.5 GT/s. This output carries both data and an embedded clock that is recovered along with data at the receiving end.
PER_1_p PER_1_n	J45 J47	A35 A33	A-in	Same as previous.
PER_2_p PER_2_n	G45 G47	A29 A27	A-in	Same as previous.

**Table 2-2. PCIe Interface Pins [continued]**

Signal	Ball # CAM2/CAM1	Ball # XXVAM2	Type	Description
PER_3_p PER_3_n	B44 A43	A23 A21	A-in	Same as previous.
PER_4_p PER_4_n	B40 A39	A17 A15	A-in	Same as previous.
PER_5_p PER_5_n	B36 A35	B12 A11	A-in	Same as previous.
PER_6_p PER_6_n	B32 A31	B8 A7	A-in	Same as previous.
PER_7_p PER_7_n	B28 A27	B4 A3	A-in	Same as previous.
PER_8_p PER_8_n	B24 A23	N/A	A-in	Same as previous.
PER_9_p PER_9_n	B20 A19	N/A	A-in	Same as previous.
PER_10_p PER_10_n	B16 A15	N/A	A-in	Same as previous.
PER_11_p PER_11_n	B12 A11	N/A	A-in	Same as previous.
PER_12_p PER_12_n	B8 A7	N/A	A-in	Same as previous.
PER_13_p PER_13_n	B4 A3	N/A	A-in	Same as previous.
PER_14_p PER_14_n	G3 G1	N/A	A-in	Same as previous.
PER_15_p PER_15_n	J3 J1	N/A	A-in	Same as previous.
PE_WAKE_N	R47	Y40	o/d	Wake. Pulled to 0b to indicate that a Power Management Event (PME) is pending and the PCIe link should be restored. Defined in the PCIe specifications. 3.3 V tolerant even when device is not powered.
PE_RST_N	R45	W39	In	Power and Clock Good Indication. Indicates that power and PCIe reference clock are within specified values. Defined in the PCIe specifications. Also called PCIe Reset and PERST#.

## 2.2.2 Ethernet Interface Pins

This section provides the pin assignments for Ethernet interface signals.

**Table 2-3. Ethernet Interface Pins**

Signal	Ball # CAM2/CAM1	Ball # XXVAM2	Type	Description
REFCLKIN_p REFCLKIN_n	M2 M4	G1 H2	HCSL-in	156.25MHz HCSL differential clock input
RX_L0_p RX_L0_n	AF44 AE45	AA17 AA19	A-in	Serial Data Input for Ethernet PMD lane 0. A serial differential input pair running at up to 26.5625 GBaud. An embedded clock present in this input is recovered along with the data. This lane is used as a receive pair for one of the Ethernet ports. See <a href="#">Section 3.2.2</a> for lane to port mapping
RX_L1_p RX_L1_n	AF38 AF40	AA23 AA25	A-in	Same as previous, Lane 1.
RX_L2_p RX_L2_n	AF32 AF34	N/A	A-in	Same as previous, Lane 2.
RX_L3_p RX_L3_n	AF26 AF28	N/A	A-in	Same as previous, Lane 3.
RX_L4_p RX_L4_n	AF20 AF22	N/A	A-in	Same as previous, Lane 4.
RX_L5_p RX_L5_n	AF14 AF16	N/A	A-in	Same as previous, Lane 5.
RX_L6_p RX_L6_n	AF8 AF10	N/A	A-in	Same as previous, Lane 6.
RX_L7_p RX_L7_n	AF2 AF4	N/A	A-in	Same as previous, Lane 7.
TX_L0_p TX_L0_n	AG47 AF48	AC17 AC19	A-out	Serial Data Output for Ethernet PMD Lane 0. A serial differential output pair running at up to 26.5625 GBaud. This output carries both data and an embedded clock that is recovered along with data at the receiving end. This lane is used as a transmit pair for one of the Ethernet ports for one of the Ethernet ports. See <a href="#">Section 3.2.2</a> for lane to port mapping
TX_L1_p TX_L1_n	AH42 AH44	AC23 AC25	A-out	Same as previous, Lane 1.
TX_L2_p TX_L2_n	AH36 AH38	N/A	A-out	Same as previous, Lane 2.
TX_L3_p TX_L3_n	AH30 AH32	N/A	A-out	Same as previous, Lane 3.
TX_L4_p TX_L4_n	AH24 AH26	N/A	A-out	Same as previous, Lane 4.
TX_L5_p TX_L5_n	AH18 AH20	N/A	A-out	Same as previous, Lane 5.
TX_L6_p TX_L6_n	AH12 AH14	N/A	A-out	Same as previous, Lane 6.
TX_L7_p TX_L7_n	AH6 AH8	N/A	A-out	Same as previous, Lane 7.

**Table 2-4. External Ethernet PHY Control - MDIO/I<sup>2</sup>C Interface Pins**

Signal	Ball # CAM2/CAM1	Ball # XXVAM2	Type	Description
MDIO0_SDA0	AC45	AC33	T/s, o/d, Pu	Management Data, when configured as an MDIO interface. Bi-directional signal for serial data transfers between the E810 and the PHY management registers. <b>Note:</b> Tri-state buffer, requires an external pull-up device. I <sup>2</sup> C Data, when configured as 2-wire management interface. Stable during the high period of the clock (unless it is a start or stop condition). <b>Note:</b> Open drain buffer requires an external pull-up device. Mapping of MDIO/I <sup>2</sup> C interfaces is controlled by the topology netlist stored in NVM.
MDC0_SCL0	AB38	W33	O, o/d, Pu	Management Clock, when configured as an MDIO interface. Clock output for accessing the PHY management registers. MDC clock frequency is set to 2.4 MHz (default). I <sup>2</sup> C Clock, when configured as 2-wire management. One clock pulse is generated for each data bit transferred. Mapping of MDIO/I <sup>2</sup> C interfaces is controlled by the topology netlist stored in NVM. <b>Note:</b> This I/O operates as an open drain buffer, and therefore requires an external pull-up device.
MDIO1_SDA1	AB42	AA33	T/s, o/d, Pu	Same as above.
MDC1_SCL1	Y38	R31	O, o/d, Pu	Same as above
MDIO2_SDA2	AB48	AC37	T/s, o/d, Pu	Same as above.
MDC2_SCL2	AA39	U33	O, o/d, Pu	Same as above
MDIO3_SDA3	AA45	AA37	T/s, o/d, Pu	Same as above.
MDC3_SCL3	AB40	Y34	O, o/d, Pu	Same as above
MDIO4_SDA4	Y48	Y38	T/s, o/d, Pu	Same as above.
MDC4_SCL4	Y40	V34	O, o/d, Pu	Same as above

**Note:** If an I<sup>2</sup>C interface clock/data pair is disconnected, the pins must be pulled up either by an external pull-up resistor or by enabling the internal pull-up.

## 2.2.3 NC-SI Interface Pins

This section provides the pin assignment for NC-SI signals.

**Table 2-5. NC-SI Interface Pins**

Signal	Ball # CAM2/CAM1	Ball # XXVAM2	Type	Description
NCSI_CLK_IN	U39	U37	NCSI-In, Pu	NC-SI Reference Clock Input. Synchronous clock reference for receive, transmit, and control interface. It is a 50 MHz clock $\pm 100$ ppm.
NCSI_CRS_DV	U45	T40	NCSI-Out, Pu	Carrier Sense/Receive Data Valid (CRS/DV).
NCSI_RXD_0 NCSI_RXD_1	V46 Y42	U39 N33	NCSI-Out, Pu	Receive Data. Data signals to the BMC.
NCSI_TX_EN	V42	V40	NCSI-In, Pu	Transmit Enable.
NCSI_TXD_0 NCSI_TXD_1	V40 W41	V38 T34	NCSI-In, Pu	Transmit Data. Data signals from the BMC.
NCSI_ARB_IN	U41	T38	NCSI-In, Pu	NC-SI Hardware Arbitration Input. If GL_MNG_HWARB_CTRL.NCSI_ARB_EN is cleared, this pin is internally pulled up.
NCSI_ARB_OUT	Y46	P34	NCSI-Out, Pu	NC-SI Hardware Arbitration Output.

**Note:** If NC-SI is disconnected, external pull-downs should be used for the NCSI\_CLK\_IN and NCSI\_TX\_EN signals, while the NCSI\_TXD[1:0] signals should be pulled up to 3.3 V.

## 2.2.4 SMBus Interface Pins

This section provides the pin assignment for the SMBus interface signals.

**Table 2-6. SMBus Interface Pins**

Signal	Ball # CAM2/CAM1	Ball # XXVAM2	Type	Description
SMBCLK	AC41	AA31	o/d	SMBus Clock. One clock pulse is generated for each data bit transferred. 3.3 V tolerant when device is not powered.
SMBD	AA37	W31	o/d	SMBus Data. Stable during the high period of the clock (unless it is a start or stop condition). 3.3 V tolerant when device is not powered.
SMBALRT_N	AC39	AC31	o/d	SMBus Alert. Acts as an interrupt pin of a secondary device on the SMBus. 3.3 V tolerant when device is not powered.

**Note:** If the SMBus is disconnected, an external pull-up should be used for the SMBCLK and SMBD pins.

## 2.2.5 Serial Flash Memory Interface Pins

This section provides the pin assignment for SPI signals for connectivity to Flash memory devices.

**Table 2-7. Serial Flash Memory Interface Pins**

Signal	Ball # CAM2/CAM1	Ball # XXVAM2	Type	Description
FLSH_SI	W1	U1	t/s, Pu	Serial data output that should be connected to the Serial Input (SI) of the SPI serial Flash memory. With the dual and quad SPI commands, the SI Pin becomes I/O0 in conjunction with other pins providing a 4-bit wide data path to the Flash device. To maintain consistency with the SPI nomenclature, the SI (I/O0) pin is referenced as the SI pin unless specifically addressing the Dual-I/O and Quad-I/O modes in which case it is referenced as I/O0.
FLSH_SO	AA1	W1	In, Pu	Serial data input that should be connected to the Serial Output (SO) from the SPI serial Flash memory. With the dual and quad SPI commands, the SO Pin becomes I/O1 in conjunction with other pins providing a 4-bit wide data path to the Flash device. To maintain consistency with the SPI nomenclature, the SO (I/O1) pin is referenced as the SO pin unless specifically addressing the Dual-I/O and Quad-I/O modes in which case it is referenced as I/O1.
FLSH_IO2 FLSH_IO3	Y2 U1	V2 R1	t/s, Pu	FLSH_IO2 and FLSH_IO3 are only used for quad SPI instructions, providing a 4-bit wide data path to the Flash device.
FLSH_SCK	V2	T2	t/s, Pu	Flash serial clock operates at 50 MHz.
FLSH_CE_N	AB2	Y2	t/s, Pu	Flash chip select output.

## 2.2.6 General Purpose I/O (GPIO) Pins

This section provides the pin assignment for GPIO signals. The E810 has a total of 24 GPIO pins that can be configured as Software Definable Pins (SDPs), LED drivers or dedicated hardware functions for connecting to external PHYs or IEEE 1588 auxiliary devices. The E810 offers the flexibility to configure any of the GPIO pins to different modes and associated with different ports as described in [Section 3.5](#).

The GPIO pins fall into two categories:

- **GPIO/SDP/LED:** These general purpose software definable pins are driven via the internal I/O expander (the I/O Widget). The terms GPIO and SDP are used somewhat interchangeably in this document. Application of these pins is defined by the link topology netlist. Refer to the reference design section for supported mapping.
- **Direct Timing GPIO:** The E810 has a total of five direct, low latency, GPIOs that can be used for accurate timing applications such as 1588. Four of these GPIOs are single ended, one a differential output. These pins are controlled directly by the controller core to minimize delay and jitter for timing applications.

**Table 2-8. GPIO/SDP/LED Interface Pins**

Signal	Ball # CAM2/CAM1	Ball # XXVAM2	Type	Description
SDP0	V4	T4	t/s, Pu	General purpose 3.3 V I/Os. Can be used to connect LEDs, low speed optical module interfaces, external PHY control, or other similar usages. The SDP pins can also be configured for use as external interrupt sources. Refer to the reference design section for supported uses.
SDP1	T10	P6		
SDP2	U3	R3		
SDP3	U7	V4		
SDP4	U11	R7		
SDP5	W3	U3		
SDP6	Y4	AA1		
SDP7	V10	U7		
SDP8	U9	W3		
SDP9	W7	AA3		
SDP10	W9	V8		
SDP11	V8	Y4		
SDP12	Y8	AB4		
SDP13	W11	R9		
SDP14	AA3	AC3		
SDP15	Y10	U9		
SDP16	AA7	AC5		
SDP17	AB4	AB6		
SDP18	V38	W37		
SDP19	W39	R33		

**Table 2-9. Direct Timing GPIO Interface Pins**

Signal	Ball # CAM2/CAM1	Ball # XXVAM2	Type	Description
SDP20	AC1	AA9	t/s, Pu	General purpose 3.3 V I/Os for 1588 synchronized timing applications. The pins can also be configured for use as external interrupt sources.
SDP21	AA9	W7		
SDP22	AB8	AA7		
SDP23	AC3	AC9		
CLK_OUT_P CLK_OUT_N	P4 P2	M2 L1	clkobs	0.8 V differential output for 1588 synchronized timing applications.

## 2.2.7 Miscellaneous Pins

This section provides the pin assignment for other miscellaneous signals.

**Table 2-10. Miscellaneous Pins**

Signal	Ball # CAM2/CAM1	Ball # XXVAM2	Type	Description
LAN_PWR_GOOD	AA11	Y10	In, Pu	LAN Power Good. A 3.3 V input signal. A transition from low-to-high initializes the E810 into operation. If not used (POR_BYPASS = 0b), an internal Power-on-Reset (POR) circuit triggers the E810 power-up. If the internal POR circuit is used to trigger device power-up, this signal should be connected to 3.3 V. By default, internal POR should be used.
POR_BYPASS	AD2	AB10	In, Pu	Bypass indication as to whether or not to use the internal POR or the LAN_PWR_GOOD pin. 0b = The E810 uses both the internal POR circuit and the LAN_PWR_GOOD pin; the device is held in reset as long as the POR is active or LAN_PWR_GOOD is low. By default, this pin should be pulled down to VSS and the internal POR used unless the power supply sequencing timing requirements, as defined in <a href="#">Chapter 16</a> could not be met. 1b = The E810 disables the internal POR circuit and uses the LAN_PWR_GOOD pin as a POR indication.
AUX_PWR	AD4	AB12	In, Pu	Auxiliary Power Available. When set, indicates that auxiliary power is available and the E810 should support the D3 <sub>COLD</sub> power state if enabled to do so. This pin is latched at the rising edge of LAN_PWR_GOOD.
MAIN_PWR_OK	AC7	AC11	In, Pu	Main Power OK. Indicates that platform main power is up. Must be connected externally.
PCI_DIS_N	AB10	Y8	In, Pu	This pin is a strapping pin latched while LAN_PWR_GOOD or PE_RST_N or in-band PCIe reset are asserted. If this pin is not connected or driven high during initialization, all PCI functions as configured from NVM are enabled. If this pin is asserted/driven low during initialization, all PCI functions that are allowed to be disabled as configured in NVM are disabled (see <a href="#">Section 4.5</a> for details).
DEV_DIS_N	AC9	W9	In, Pu	This pin is a strapping option pin latched while LAN_PWR_GOOD or PE_RST_N or in-band PCIe reset are asserted. This pin can be either used as a device disable or for disabling the LAN ports and associated functions based on NVRAM configuration (see <a href="#">Section 4.5</a> for details). If this pin is not connected or driven high during initialization, all the LAN ports and associated functions as configured from NVRAM are enabled for normal operation. If this pin is asserted/driven low during initialization, the LAN ports and associated functions as configured from NVRAM are disabled. Asserting this pin disables the entire device if all the LAN ports are configured to be disabled. When the entire device is disabled, the PCIe link is in L3 state, the PHY is in power down mode, and the output buffers are tri-stated. (see <a href="#">Section 4.5</a> for details).
SENSOR_THERM_IN SENSOR_THERM_OUT	M10 M8	J7 J5	Analog	Thermal Diode for use with the integrated thermal sensor. Use with an external thermal sensor is not validated.
OBS_CORE_VDD OBS_CORE_VSS	T24 R23	P22 N21		Power supply observation pins.

## 2.2.8 Testability and Debug Pins

This section provides the pin assignment for JTAG testability interface signals. Note that the JTAG 1.8 V I/Os internal pull-up/pull-down are not enabled until after core VDD is applied. Therefore, for stable power up, external pull-up/pull-down resistors are required as indicated. Access to the JTAG pins is need for advanced debug. Refer to [Section 17, "Design Guidelines"](#) for recommended debug connections.

**Table 2-11. Testability and Debug Pins**

Signal	Ball # CAM2/CAM1	Ball # XXVAM2	Type	Description
JTCK	R41	K38	JTAG, In, Pu	JTAG Clock Input. Connect pull up resistor to 1.8V for normal operation.
JTDI	P38	K36	JTAG, In, Pu	JTAG Data Input. Connect pull up resistor to 1.8V for normal operation.
JTDO	P42	J37	JTAG, Out	JTAG Data Output. 1.8 V
JTMS	N39	K34	JTAG, In, Pu	JTAG TMS Input. Connect pull up resistor to 1.8 V for normal operation.
JRST_N	R37	L37	JTAG, In, Pd	JTAG Reset Input. 1.8 V I/O. Active low reset for the JTAG port. Connect pull down resistor to VSS for normal operation.
TAP_SEL	P40	L39	JTAG, In, Pd	1.8V I/O. 0b = JTAG interface is connected to Intel TAP. 1b = JTAG interface is connected to manufacturing TAP.
UARTTXD	AA47	AA39	t/s, Pu	Multi-function pin. RSVD pins. UART interface for EMP firmware debug. Transmit data output. This pin can also be configured as an additional SDP from the I/O Widget (IOW).
UARTRXD	AA41	AB38	t/s, Pu	Multi-function pin. RSVD pins. UART interface for EMP firmware debug. Receive data input. This pin can also be configured as an additional SDP from the IOW.
UARTCTS	AB46	Y32	t/s, Pd	Multi-function pin. RSVD pins. UART interface for EMP firmware debug. Clear to send input. This pin can also be configured as an additional SDP from the IOW.
UARTRTS	AC47	AB34	t/s, Pu	Multi-function pin. RSVD pins. UART interface for EMP firmware debug. Request to send output. This pin can also be configured as an additional SDP from the IOW.

## 2.2.9 Reserved and No-Connect Pins

This section provides the pin assignment for reserved and no-connect pins. [Table 2-12](#) and [Table 2-13](#) contain the reserved and no-connect pins for the E810-CAM2/CAM1 and E810-XXVAM2, respectively.

**Table 2-12. Reserved and No-Connect Pins (E810-CAM2/CAM1)**

Signal	Ball # CAM2/CAM1	Description
RSVDN37_VDDH RSVDR39_VDDH	N37 R39	Reserved pins. Connect pull up resistor to 1.8 V for normal operation.
RSVDN41_VSS	N41	Reserved pin. Connect pull down resistor to VSS for normal operation.
RSVDN7_NC RSVDN11_NC RSVDP8_NC RSVDP10_NC RSVDR7_NC RSVDR9_NC RSVDR11_NC RSVDT2_NC RSVDT4_NC RSVDT8_NC RSVDT38_NC RSVDT40_NC RSVDT42_NC RSVDT46_NC RSVDT48_NC RSVDU47_NC RSVDV48_NC RSVDW33_NC RSVDW45_NC RSVDW47_NC RSVDAA35_NC	N7 N11 P8 P10 R7 R9 R11 T2 T4 T8 T38 T40 T42 T46 T48 U47 V48 W33 W45 W47 AA35	Reserved pins. Leave unconnected for normal operation.

**Table 2-13. Reserved and No-Connect Pins (E810-XXVAM2)**

Signal	Ball # XXVAM2	Description
RSVDJ33_VDDH RSVDM40_VDDH	J33 M40	Reserved pins. Connect pull up resistor to 1.8 V for normal operation.
RSVDK40_VSS	K40	Reserved pin. Connect pull down resistor to VSS for normal operation.
RSVDH6_NC RSVDK4_NC RSVDK6_NC RSVDL5_NC RSVDL7_NC RSVDL33_NC RSVDM6_NC RSVDM34_NC RSVDM38_NC RSVDN5_NC RSVDN7_NC RSVDN9_NC RSVDN37_NC RSVDN39_NC RSVDP4_NC RSVDP38_NC RSVDP40_NC RSVDR13_NC RSVDR37_NC RSVDR39_NC RSVDAB40_NC	H6 K4 K6 L5 L7 L33 M6 M34 M38 N5 N7 N9 N37 N39 P4 P38 P40 R13 R37 R39 AB40	Reserved pins. Leave unconnected for normal operation.

## 2.2.10 Power Supply Pins

This section provides the pin assignment for power supply pins. The electrical specifications for the power supply pins are defined in [Section 16.3](#). [Table 2-14](#) and [Table 2-15](#) contain the power supply pins for the E810-CAM2/CAM1 and E810-XXVAM2, respectively.

**Table 2-14. Power Supply Pins (E810-CAM2/CAM1)**

Signal	Ball # CAM2/CAM1	Type	Description
VDDIO33	P12, P14, T12, T14, T34, T36, V12, V14, V34, V36, Y12, Y14, Y34, Y36	3.3 V	Digital power supply for 3.3 V I/O.
VDDH18	M12, M14, P34, P36	1.8 V	Digital 1.8 V power supply.
AVDDH	Y20, Y22, Y24	1.1 V	Analog power supply for Ethernet SerDes interfaces.
AVDD_ETH	AB14, AB16, AB18, AB20, AB22, AB24, AB26, AB28, AB30, AB32, AB34, AD12, AD14, AD16, AD18, AD20, AD22, AD24, AD26, AD28, AD30, AD32, AD34, AD36	0.9 V	Analog power supply for Ethernet SerDes interfaces.
AVDD_PCIE	F14, F16, F18, F20, F22, F24, F26, F28, F30, F32, F34, H16, H18, H20, H22, H24, H26, H28, H30, H32, K22, K24, K26, K28, K30	0.9 V	Analog power supply for PCIe SerDes interfaces.
AVDD_PLL	AA19, AA23	0.9 V	PLL power supply.
VDD	K20, K32, M16, M18, M20, M22, M24, M26, M28, M30, M32, P16, P18, P20, P22, P24, P26, P28, P30, P32, T16, T18, T20, T22, T26, T28, T30, T32, V16, V18, V20, V22, V24, V26, V28, V30, V32, Y16, Y18, Y26, Y28, Y30, Y32	0.8 V	Digital core logic power supply.
PLLVDD	J17, K18	0.8 V	
VSSA	A5, A9, A13, A17, A21, A25, A29, A33, A37, A41, A45, B2, B6, B10, B14, B18, B22, B26, B30, B34, B38, B42, B46, B48, C1, C3, C5, C7, C9, C11, C13, C15, C17, C19, C21, C23, C25, C27, C29, C31, C33, C35, C37, C39, C41, C43, C45, C47, D2, D6, D10, D14, D18, D22, D26, D30, D34, D38, D42, D46, D48, E1, E3, E7, E11, E15, E19, E23, E27, E31, E35, E39, E43, E47, F2, F4, F6, F8, F10, F12, F36, F38, F40, F42, F44, F46, F48, G5, G11, G13, G15, G17, G19, G21, G23, G25, G27, G29, G31, G33, G35, G37, G43, H2, H4, H6, H8, H10, H12, H14, H34, H36, H38, H40, H42, H44, H46, H48, J5, J11, J13, J15, J21, J23, J25, J27, J29, J31, J33, J35, J37, J43, K2, K4, K6, K8, K10, K12, K34, K36, K38, K40, K42, K44, K46, K48, L35, L37, L43, M34, M36, M38, M40, M42, M44, M46, M48, W21, W23, AA15, AA17, AA21, AA25, AA27, AA29, AA31, AA33, AB12, AB36, AC11, AC13 AC15, AC17, AC19, AC21, AC23, AC25, AC27, AC29, AC31, AC33, AC35, AC37, AD8, AD10, AD38, AD40, AD42, AD44, AD46, AD48, AE1, AE3, AE5, AE7, AE9, AE11, AE13, AE15, AE17, AE19, AE21, AE23, AE25, AE27, AE29, AE31, AE33, AE35, AE37, AE39, AE41, AE43, AE47, AF6, AF12, AF18, AF24, AF30, AF36, AF42, AF46, AG1, AG3, AG5, AG7, AG9, AG11, AG13, AG15, AG17, AG19, AG21, AG23, AG25, AG27, AG29, AG31, AG33, AG35, AG37, AG39, AG41, AG43, AG45, AH4, AH10, AH16, AH22, AH28, AH34, AH40, AH46	0 V	Analog power supply ground.
PLLGND	J19, K16	0 V	
VSS	K14, L1, L3, L5, L7, L9, L11, L13, L15, L17, L19, L21, L23, L25, L27, L29, L31, L33, M6, N1, N3, N5, N9, N13, N15, N17, N19, N21, N23, N25, N27, N29, N31, N33, N35, N43, P6, P44, P46, P48, R1, R3, R5, R13, R15, R17, R19, R21, R25, R27, R29, R31, R33, R35, R43, T6, T44, U5, U13, U15, U17, U19, U21, U23, U25, U27, U29, U31, U33, U35, U37, U43, V6, V44, W5, W13, W15, W17, W19, W25, W27, W29, W31, W35, W37, W43, Y6, Y44, AA5, AA13, AA43, AB6, AB44, AC5, AC43, AD6	0 V	Digital power supply ground.

**Table 2-15. Power Supply Pins (E810-XXVAM2)**

Signal	Ball # XXVAM2	Type	Description
VDDIO33	M8, M10, M12, M30, M32, P8, P10, P12, P30, P32, T8, T10, T30, T32, V30, V32	3.3 V	Digital power supply for 3.3 V I/O.
VDDH18	H8, H10, H30, H32, K8, K10, K30, K32	1.8 V	Digital 1.8 V power supply.
AVDD	D14, D16, D18, D20, D22, D24, D26, D28, F18, F20, F22, F24, F26, F28, F30, U19, U21, W13, W15, W17, W19, W21, W23, W25, W27	0.9 V	Analog power supply for PCIe and Ethernet SerDes interfaces.
VDD	H12, H18, H20, H22, H24, H26, H28, K12, K14, K16, K18, K20, K22, K24, K26, K28, M14, M16, M18, M20, M22, M24, M26, M28, P14, P16, P18, P20, P24, P26, P28, T12, T14, T16, T18, T22, T24, T26, T28	0.8 V	Digital core logic power supply.
PLLVD	G15, H16	0.8 V	
VSSA	A5, A9, A13, A19, A25, A31, A37, B2, B6, B10, B14, B16, B18, B20, B22, B24, B26, B28, B30, B32, B34, B36, B40, C1, C3, C5, C7, C9, C11, C13, C19, C25, C31, C37, D4, D8, D12, D30, D32, D34, D36, D38, D40, E1, E5, E9, E13, E15, E17, E19, E21, E23, E25, E27, E29, E31, E33, E35, F2, F4, F6, F8, F10, F32, F34, F36, F38, F40, G19, G21, G23, T20, V12, V14, V16, V18, V20, V22, V24, V26, V28, Y14, Y16, Y18, Y20, Y22, Y24, Y26, Y28, AA13, AA15, AA21, AA27, AB14, AB16, AB18, AB20, AB22, AB24, AB26, AB28, AC15, AC21, AC27	0 V	Analog power supply ground.
PLLGND	G17, H14	0 V	
VSS	F12, F14, F16, G3, G5, G7, G9, G11, G13, G25, G27, G29, G31, G33, G35, G37, H4, H34, H36, H38, J1, J3, J9, J11, J13, J15, J17, J19, J21, J23, J25, J27, J29, J31, J35, J39, K2, L3, L9, L11, L13, L15, L17, L19, L21, L23, L25, L27, L29, L31, L35, M4, M36, N1, N3, N11, N13, N15, N17, N19, N23, N25, N27, N29, N31, N35, P2, P36, R5, R11, R15, R17, R19, R21, R23, R25, R27, R29, R35, T6, T36, U5, U11, U13, U15, U17, U23, U25, U27, U29, U31, U35, V6, V10, V36, W5, W11, W29, W35, Y6, Y12, Y30, Y36, AA5, AA11, AA29, AA35, AB2, AB8, AB30, AB32, AB36, AC7, AC13, AC29, AC35	0 V	Digital power supply ground.

## 2.2.11 Pull-Up and Pull-Down Resistors

Internal pull-up and pull-down values on 3.3 V I/O pins, where indicated:

- Min: 10 K $\Omega$
- Max: 20 K $\Omega$

Internal pull-up and pull-down values on 1.8 V JTAG I/O pins, where indicated:

- Min: 25 K $\Omega$
- Max: 50 K $\Omega$

## 2.3 Package Layout

Figure 2-1 and Figure 2-2 show a top view ball map of Intel® Ethernet Controller E810-CAM2/CAM1. Figure 2-3 and Figure 2-4 show a top view ball map of Intel® Ethernet Controller E810-XXVAM2. See Section 16.7 for package mechanical specifications.

## Chapter 3 Interconnects

---

### 3.1 PCI Express (PCIe)

#### 3.1.1 Features

The E810 supports Rev. 4.0 of the PCIe base specification.

In addition to the capabilities required by the PCIe specifications, the E810 also supports the following optional functionality as described in this section:

- All PCI functions are native PCIe functions.
- Physical Layer:
  - Support for 2.5GT/s, 5GT/s, 8GT/s, and 16GT/s
  - Interface width of 1, 4, 8, or 16 PCIe lanes
  - Full swing and half swing signaling
  - Lane reversal
- Transaction Layer mechanisms:
  - 64-bit and 32-bit memory address spaces
  - Removal of I/O BAR (optional)
  - Relaxed ordering
  - Flow control update timeout mechanism
  - ID-based ordering (IDO)
  - Packet sizes:
    - Maximum payload size: 512B
    - Maximum read request size: 4 KB
  - Extended tags:
    - 10-bit tag as completer
    - 8-bit tag as requester
  - Function-Level Reset (FLR).
- Reliability:
  - Advanced Error Reporting (AER)
  - End-to-End CRC (ECRC) generation and checking
  - Recovery from data poisoning
  - Completion timeout
- Power Management:
  - Wake capability

- DFT and DFM support for high-volume manufacturing.
- The E810 supports the following extended capabilities:
  - AER
  - Device Serial Number (DSN)
  - Alternative RID Interpretation (ARI)
  - Single Root I/O Virtualization (SR-IOV)
  - Access Control Services (ACS)
  - TLP Processing Hints (TPH)
  - Process Address Space ID (PASID)

Table 3-1 lists the new requirements for the PCIe interface in the E810.

**Table 3-1. PCIe Interface New Features**

Description
<p><b>General</b></p> <ul style="list-style-type: none"> <li>• Support PCIe base specification Ver. 4.0).</li> <li>• Support up to 8 PCI physical functions.</li> </ul> <p><b>Note:</b> The PCI functions can be used in different manners per usage (for example, allocated to Ethernet ports).</p>
<p><b>PCI and PCIe Capabilities</b></p> <ul style="list-style-type: none"> <li>• PASID support.</li> <li>• Gen4 support.</li> </ul>

## 3.1.2 Transaction Layer

### 3.1.2.1 Transactions Accepted by the E810

Table 3-2 lists the transactions accepted by the device and their attributes. See Section 3.1.2.8 for the number of credits provided per FC type.

**Table 3-2. Transaction Types Accepted by the Transaction Layer**

Transaction Type	FC Type	Tx Layer Reaction	Hardware Should Keep Data from Original Packet
Configuration Read Request	NPH	CPLH + CPLD	Requester ID, TAG, attribute.
Configuration Write Request	NPH + NPD	CPLH	Requester ID, TAG, attribute.
Memory Read Request	NPH	CPLH + CPLD	Requester ID, TAG, attribute.
Memory Write Request	PH + PD	-	-
IO Read Request	NPH	CPLH + CPLD	Requester ID, TAG, attribute.
IO Write Request	NPH + NPD	CPLH	Requester ID, TAG, attribute.
Read Completions	CPLH + CPLD	-	-
Message	PH + PD <sup>1</sup>	-	-

1. MCTP messages contain payload.

Flow Control types:

- CPLD — Completion Data Payload
- CPLH — Completion Headers
- NPD — Non-Posted Request Data Payload
- NPH — Non-Posted Request Headers
- PD — Posted Request Data Payload
- PH — Posted Request Headers

## 3.1.2.2 Size of Target Accesses

### 3.1.2.2.1 Memory Accesses

Rules for accesses to the CSR space (both memory BAR and MSI-X BAR):

#### Write accesses:

- CSR writes are 32-bit or 64-bit only.
- Zero-length writes have no internal impact (nothing written, no effect such as clear-by-write). The transaction is treated as a successful operation (no error event).
- Other accesses (partial writes, larger writes) are handled as completer abort. Data is dropped and an error is generated as per PCIe rules.

#### Read accesses:

- CSR reads are 32-bit or 64-bit only.
  - Note:** Some 64-bit reads are handled atomically, such as not interleaved with any other read requests. This applies mainly to reading counters, where all 64 bits need to be read simultaneously. Such registers are explicitly marked in their description.
- Partial reads with at least one byte disabled are handled internally as a full read. That is, any side effect of the full read (such as clear-by-read) is also applicable to partial reads. The completion on PCIe adheres to the specification rules regarding the number of bytes reported in the completion.
- Zero-length reads generate a completion, but the register is not accessed and undefined data is returned.
- Larger CSR read requests are handled as unsupported requests. The completion includes a UR status and an error is generated as per PCIe rules.

Rules for accessing the doorbell space in the memory BAR:

#### Write accesses:

- Write accesses are supported within the limit of the respective PCIe credits.
- A write access that crosses over into the Flash address space is handled as a completer abort.
- Zero-length writes have no internal impact (nothing written, no effect such as clear-by-write). The transaction is treated as a successful operation (no error event).

#### Read accesses:

- Read accesses are replied with stale data. No error indication is provided.

Rules for accessing the Flash space in the memory BAR or the Expansion ROM BAR:

**Write accesses:**

- Writes to Flash are silently ignored.

**Read accesses:**

- Reads to Flash are 32 bits wide.
- Partial reads with at least one byte disabled are handled internally as a full read. The completion on PCIe adheres to the specification rules regarding the number of bytes reported in the completion
- Zero-length reads generate a completion, but the Flash is not accessed and undefined data is returned.
- Larger CSR read requests are handled as completer abort. The completion includes a CA status and an error is generated as per PCIe rules.

### 3.1.2.3 I/O Accesses

Rules for accesses to the I/O BAR:

**Write accesses:**

- Write accesses are 32 bits wide.
- Zero-length writes have no internal impact (nothing written, no effect such as clear-by-write). The transaction is treated as a successful operation (no error event).
- Other accesses (partial writes, larger writes) are handled as completer abort. Data is dropped and an error is generated as per PCIe rules.

**Read accesses:**

- Reads to the I/O BAR are 32 bits wide.
- Partial reads with at least one byte disabled are handled internally as a full read. That is, any side effect of the full read (such as clear by read) is also applicable to partial reads. The completion on PCIe adheres to the specification rules regarding the number of bytes reported in the completion.
- Larger CSR read requests are handled as completer abort. The completion includes a CA status and an error is generated as per PCIe rules.
- See [Section 13.1.1.5](#) for more details.

#### 3.1.2.3.1 Messages

MCTP messages might contain a payload of up to 64 bytes.

### 3.1.2.4 Transactions Initiated by the E810

Table 3-3 lists the transactions initiated by the device and their attributes.

**Table 3-3. Transaction Types Initiated by the Transaction Layer**

Transaction Type	Payload Size	FC Type
Configuration Read Request Completion	DWord	CPLH + CPLD
Configuration Write Request Completion	-	CPLH
IO Read Request Completion	DWord	CPLH + CPLD
IO Write Request Completion	-	CPLH
Read Request Completion	DWord/QWord	CPLH + CPLD
Memory Read Request	-	NPH
Memory Write Request	≤ MAX_PAYLOAD_SIZE	PH + PD
Message	≤ 64 bytes <sup>1</sup>	PH + PD

1. MCTP messages contain payload.

Configuration values:

- MAX\_PAYLOAD\_SIZE - The value of the *Max Payload Size Supported* field in the Device Capabilities register is loaded from NVM.
  - Hardware default is 512B.
  - System software then programs the actual value into the *Max Payload Size* field of the Device Control register.
    - Non-ARI mode: If not all functions are programmed with the same value, the *Max Payload Size* used for all functions is the minimum value programmed among all functions.
    - ARI mode: *Max Payload Size* is determined solely by the setting in Function 0.
- MAX\_READ\_REQUEST\_SIZE - The E810 supports read requests of up to 4 KB.
  - The actual maximum size of a read request is defined as the minimum {4 KB, *Max Read Request Size* field in the Device Control Register}.
- Extended tags are supported for Memory Read Requests.
- Prefixes can be added to memory read and write requests when PASID is enabled.

**Note:** If Extended tags are not enabled, the performance of the device might degrade. To ensure usage of extended tags, all functions must enable them in the *Extended Tag Field Enable* field.

#### 3.1.2.4.1 Data Alignment

Requests must never specify an address/length combination that causes a memory space access to cross a 4 KB boundary. Therefore, the E810 breaks requests into 4 KB-aligned requests (if needed). This does not pose any requirement on software. However, if software allocates a buffer across a 4 KB boundary, hardware issues multiple requests for the buffer. Software should consider aligning buffers to a 4 KB boundary in cases where it improves performance.

The general rules for packet alignment are as follows. Note that these apply to all E810 requests:

- The length of a single request does not exceed the PCIe limit of *Max Payload Size* for write, and *Max Read Request Size* for read.
- A single request does not span across different memory pages as noted by the 4 KB boundary alignment previously mentioned.

If a request can be sent as a single PCIe packet and still meets the general rules for packet alignment, it is not broken at the cache line boundary, but rather is sent as a single packet. However, if any of the general rules require that the request be broken into two or more packets, the request is broken at the cache line boundary.

For requests with data payload, if the payload size is larger than (MAX\_PAYLOAD\_SIZE - CACHELINE\_SIZE), the request is broken into multiple TLPs starting at the first cache-line boundary following the (MAX\_PAYLOAD\_SIZE - CACHELINE\_SIZE) bytes. For example, if MAX\_PAYLOAD\_SIZE = 256B and CACHELINE\_SIZE = 64 bytes, a 1 KB request starting at address 0x...10 is broken into TLPs such that the first TLP contains 240 bytes of payload (since 240 bytes + 0x10 = 256 bytes is on the cache-line boundary).

The system cache line size is controlled by the GLPCI\_CNF2.CACHELINE\_SIZE bit, loaded from the NVM *Cache Line Size* field. Note that the Cache Line Size register in the PCI configuration space is not related to the GLPCI\_CNF2.CACHELINE\_SIZE and is solely for software use.

### 3.1.2.5 Messages

Table 3-4 lists the response to messages sent to the device. Unlisted messages are not supported by the device and are treated as unsupported requests.

**Table 3-4. Messages in the E810 (as a Receiver)**

Message Code [7:0]	Routing r2r1r0	Message	E810 Response
0x00	011b	Unlock	Silently drop.
0x14	100b	PM_Active_State_NAK	Accepted.
0x19	011b	PME_Turn_Off	Accepted.
0x40 0x41 0x43 0x44 0x45 0x47 0x48	100b	Ignored messages (used to be hot-plug messages)	Silently drop.
0x50	100b	Slot power limit support (has one DWord data)	Silently drop.
0x7E	000b 010b 011b 100b	Vendor_defined type 0	Drop and handle as an unsupported request.
0x7F	100b 000b	Vendor_defined type 1	Silently drop.
0x7F	010b 011b	Vendor_defined type 1. See <a href="#">Section 3.1.2.5.1</a>	Send to MCTP reassembly if Vendor ID = 0x1AB4 (DMTF) and VDM code = 0000b (MCTP). Otherwise, silently drop.

Table 3-5 lists the messages sent by the device.

**Table 3-5. Messages in the E810 (as a Transmitter)**

Message Code [7:0]	Routing r2r1r0	Message
0x20	100b	Assert INT A
0x21	100b	Assert INT B
0x22	100b	Assert INT C
0x23	100b	Assert INT D
0x24	100b	De-assert INT A
0x25	100b	De-assert INT B
0x26	100b	De-assert INT C
0x27	100b	De-assert INT D
0x30	000b	ERR_COR
0x31	000b	ERR_NONFATAL
0x33	000b	ERR_FATAL
0x18	000b	PM_PME
0x1B	101b	PME_TO_Ack
0x7F	000b 010b 011b	Vendor Defined Messages (VDM); see <a href="#">Section 3.1.2.5.1</a> .

### 3.1.2.5.1 VDM

The following vendor defined message is supported:

- DMTF
- MCTP

#### 3.1.2.5.1.1 MCTP VDMs

MCTP VDMs are supported as both master and target. The following header fields are involved (see [Section 12.7.2.1](#) for more details):

- Fmt — Set to 11b to indicate a 4-DWord header with data.
- Type:
  - [4:3] — Set to 10b to indicate a message.
  - [2:0] — Routing r2r1r0 = 000b, 010b or 011b.
- Traffic Class — Set to 000b.
- TLP Digest — Set to 0b (no ECRC).
- Error Present — Set to 0b.
- Attributes[1:0] — Set to 01b (no snoop).
- Tag field — Indicates this is an MCTP packet and the size of padding to DWord alignment added.
- Message code = 0x7F (Type 1 VDM).
- Destination ID — captures the target B/D/F for route by ID. Otherwise, reserved.
- Vendor ID = 0x1AB4 (DMTF).

### 3.1.2.6 Transaction Attributes

#### 3.1.2.6.1 Traffic Class (TC) and Virtual Channels (VC)

The E810 supports only TC = 0b and VC = 0b (default).

#### 3.1.2.6.2 TLP Processing Hints (TPH)

The E810 supports the TPH capability defined in the PCI Express specification. It does not support extended TPH requests.

Existence of a TPH is indicated on the PCIe link by setting the *TH* bit in the TLP header. Using the PCIe TLP Steering Tag (ST) and Processing Hints (PH) fields, the E810 can provide hints to the root complex about the destination (socket ID) and about data access patterns (locality in cache) when executing DMA memory writes or read operations.

The E810 exposes a PCIe TPH capability structure (see [Section 14.4.5](#)) with no steering table.

Required steps to enable TPH usage:

1. For a given function, the *TPH Requester Enable* field in the PCIe configuration TPH Requester Control register should be set to either 01b or 11b, and the *ST Mode Select* field should be set to one of the two supported values: 000b (No Table Mode) or 010b (Device Specific Mode). If this is not the case, the PF driver should not enable the TPH in the transmit and receive queue contexts.
2. Appropriate TPH *Enable* bits in the receive or transmit queue context should be set.
3. Processing hints should be programmed in the *GLTPH\_CTRL.Desc\_PH* and *GLTPH\_CTRL.Data\_PH* Processing Hints fields.
4. Steering information should be programmed in the *CPUID* fields in the receive or transmit queue context.

The Processing Hints and Steering Tags are set according to the characteristics of the traffic as listed in [Table 10-2](#).

**Note:** To enable TPH usage, all the memory reads are done without setting any of the byte enable bits.

##### 3.1.2.6.2.1 Steering Tag and Processing Hint Programming

Each type of DMA traffic uses a different policy to define how the steering tag (socket ID) and processing hints are generated:

- The policy for LAN traffic is described in [Section 10.3](#).
- The policy for offloaded traffic is described in [Section 11.4.8](#).
- Accesses to the Host Memory Cache do not use TPH hints.
- Accesses to the admin command queues do not use TPH hints.

##### 3.1.2.6.3 PASID Prefix

Memory read and write transactions can have a PASID prefix added if the transaction is related to a queue from a PASID-enabled VSIs and PASID is enabled in the system.

The PASID prefix is described as follows:

31	29	28	27	24	23	22	21	20	19	0
100	1	0001	E	P	Res	PASID[19:0]				

where:

- The *PASID[19:0]* value is extracted from the *VSI\_PASID.PASID[19:0]* field.
- E = Execute Privilege = 0
- P = Privileged Mode Requested = 0

The addition of the prefix is controlled by the *VSI\_PASID.EN[31]* bit if PASID is enabled in the PASID capability. See [Section 14.4.9](#) for more information.

### 3.1.2.7 Device Ordering Rules

The E810 meets the PCIe ordering rules as follows:

**Deadlock avoidance** — The E810 meets the PCIe ordering rules that prevent deadlocks:

- Posted writes overtake stalled read requests. This applies to both target and master directions. For example, if master read requests are stalled due to lack of credits, master posted writes are allowed to proceed. On the target side, it is acceptable to timeout on stalled read requests to allow later posted writes to proceed.
- Target posted writes overtake stalled target configuration writes.
- Completions overtake stalled read requests. This applies to both target and master directions. For example, if master read requests are stalled due to lack of credits, completions generated by the E810 are allowed to proceed.

**Consistency of data:**

- Descriptor/Data Ordering — The E810 insures that a Rx-Descriptor is written back on PCIe only after the data that the descriptor relates to is written to the PCIe link.
- Target NP read requests might pass target posted writes addressing different PCI functions.
- Completions for target reads (memory, I/O, configuration) do not pass previous posted requests. Here are some specific usages of this rule:
  - Flush following a reset (such as FLR, BME, D3 entry, VFE clear) — When the system issues a reset event, it needs to identify when the device stops sending new posted requests from the function(s) under reset. The completion to the config write of these reset events is sent after all requests/completions related to that function(s) are flushed out. The device is expected not to issue any new posted transactions from the function(s) under reset.
  - MSI and MSI-X Ordering Rules — System software can change the MSI or MSI-X tables during run-time. Software expects that interrupt messages issued after the table has been updated are using the updated contents of the tables.
    - Since software does not know when the tables are actually updated in the E810, a common scheme is to issue a read request to the MSI or MSI-X table after an update to the table (a PCI configuration read for MSI and a memory read for MSI-X). Software expects that any message issued following the completion of the read request is using the updated contents of the tables.
    - Once an MSI or MSI-X message is issued using the updated contents of the interrupt tables, any consecutive MSI or MSI-X message does not use the contents of the tables prior to the change.

**Independence between target and master accesses:**

- The acceptance of a target posted request does not depend upon the transmission of any TLP.
- The acceptance of a target non-posted request does not depend upon the transmission of a non-posted request.
- Accepting a completion does not depend upon the transmission of any TLP.

**3.1.2.7.1 Processing of Target Accesses**

The E810 meets the specification requirements regarding target accesses as described in [Section 3.1.2.7](#).

In addition, the following behaviors apply:

- Target accesses from different functions might be processed in a different order than the order in which they arrive.
- Completions that belong to requests from different PCI functions might be issued in a different order than the order of the respective requests.

**3.1.2.7.2 Relaxed Ordering**

The E810 takes advantage of the relaxed ordering rules in PCIe. By setting the relaxed ordering bit in the packet header, the E810 enables the system to optimize performance in the following cases:

- Relaxed ordering for LAN descriptor and data reads — When the E810 issues a read transaction, its split completion has no ordering relationship with the writes from the CPUs (same direction). It should be allowed to bypass the writes from the CPUs.
  - The `GLLAN_RCTL_1.RXDESCRDROEN` bit (loaded from NVM) enables relaxed ordering for Rx-Descriptor reads.
- Relaxed ordering for LAN Rx data writes — When the E810 issues Rx data writes, it also enables them to bypass each other in the path to system memory because software does not process this data until their associated descriptor writes are done.
  - The `GLLAN_RCTL_1.RXDATAWRROEN` bit (loaded from NVM) enables relaxed ordering for Rx data writes.
- The E810 does not relax ordering for the following requests:
  - LAN descriptor writes.
  - LAN Tx head write back.
  - Interrupt messages.
  - MCTP messages.
  - Protocol Engine traffic.
  - HMC requests.
  - EMP requests.
  - Any other requests not previously mentioned.

Relaxed ordering is globally enabled in the E810 by clearing the `GLPCI_CNF2.RO_DIS` bit, originally loaded from NVM. It is further controlled through the *Enable Relaxed Ordering* bit in the PCIe Device Control register (see [Section 14.3.5.5](#)).

### 3.1.2.7.3 ID-Based Ordering (IDO)

ID-based ordering was introduced in the PCIe rev. 2.1 specification. When enabled, the E810 sets IDO in all applicable TLPs defined in the PCIe specification. IDO is not set for MCTP packets.

IDO is enabled when all of the following conditions are met:

- IDO is not disabled from the NVM. Device default is enabled. The value loaded from the NVM is reflected in the GLPCI\_CAPSUP register.
- The PCIe *IDO Request Enable* bit (for requests) or the *IDO Completion Enable* bit (for completions) in the Device Control 2 register is set (see [Section 14.3.5.11](#)).

### 3.1.2.8 Flow Control

#### 3.1.2.8.1 Flow Control Rules

The E810 only implements the default Virtual Channel (VC0). A single set of credits is maintained for VC0.

**Table 3-6. Flow Control Credits Allocation**

Credit Type	Operations	Number of Credits (per Device)
Posted Request Header (PH)	Target write (one unit) Message (one unit)	96 header credit units.
Posted Request Data (PD)	Target write Message	288 data credits units.
Non-Posted Request Header (NPH)	Target read (one unit) Configuration read (one unit) Configuration write (one unit)	Four units (to enable concurrent target accesses).
Non-Posted Request Data (NPD)	Configuration write (one unit)	Four units.
Completion Header (CPLH)	Read completion (N/A)	Infinite (accepted immediately).
Completion Data (CPLD)	Read completion (N/A)	Infinite (accepted immediately).

Rules for FC updates:

- UpdateFC packets are sent immediately when a resource becomes available.
- The E810 follows the PCIe recommendations for frequency of UpdateFC FCPs.
- Specific rules apply in L0 or L0s link state. See the PCIe specification.

#### 3.1.2.8.2 Flow Control Timeout Mechanism

The E810 implements the optional flow control update timeout mechanism. See the PCIe specification.

### 3.1.2.9 End-to-End CRC (ECRC)

The E810 supports ECRC as defined in the PCIe specification. The following functionality is provided:

- Inserting ECRC in transmitted TLPs:
  - The E810 indicates support for inserting ECRC in the *ECRC Generation Capable* bit of the PCIe Configuration registers. This bit is loaded from the global *ECRC Generation Capable* NVM bit.
  - Inserting ECRC is enabled per function by the *ECRC Generation Enable* bit of the PCIe Configuration registers. VFs follow the behavior of their PF.
  - ECRC is not added to MCTP messages (per the MCTP specification).
- ECRC is checked on all incoming TLPs. A packet received with an ECRC error is dropped. Note that for completions, a completion timeout occurs later (if enabled).
  - The E810 indicates support for ECRC checking in the *ECRC Check Capable* bit of the PCIe Configuration registers. This bit is loaded from the global *ECRC Check Capable* NVM bit.
  - Checking of ECRC is enabled by the *ECRC Check Enable* bit of the PCIe Configuration registers. ECRC checking is done if enabled by at least one physical function (enablement is not done via VFs).
- ECRC errors are reported on all Physical Functions (PFs) enabled for ECRC checking.
- System software can configure ECRC independently per each physical function.

## 3.1.3 Link Layer

### 3.1.3.1 ACK/NAK Scheme

NAKs are sent as soon as identified.

ACKs are sent per Section 3.5.3.1 (Table 3-7, Table 3-8, and Table 3-9) in the *PCIe Base Specification*.

### 3.1.3.2 Supported DLLPs

The following DLLPs are supported by the E810 as a receiver:

- ACK
- NAK
- PM\_Request\_Ack
- InitFC1-P
- InitFC1-NP
- InitFC1-Cpl
- InitFC2-P
- InitFC2-NP
- InitFC2-Cpl
- UpdateFC-P
- UpdateFC-NP

- UpdateFC-Cpl

The following DLLPs are supported by the E810 as a transmitter:

- ACK
- NAK
- PM\_Enter\_L1
- PM\_Enter\_L23
- InitFC1-P
- InitFC1-NP
- InitFC1-Cpl
- InitFC2-P
- InitFC2-NP
- InitFC2-Cpl
- UpdateFC-P
- UpdateFC-NP

**Note:** UpdateFC-Cpl is not sent because of the infinite FC-Cpl allocation.

### 3.1.3.3 Transmit EDB Nullifying (End Bad)

A TLP might be signaled as EDB or poisoned if during its transmission from the device, an internal memory error is detected that might corrupt the TLP payload.

### 3.1.3.4 Retry Buffer

The retry buffer size is 8 KB.

## 3.1.4 Physical Layer

### 3.1.4.1 Link Speed

The E810 supports Gen 1 (2.5GT/s), Gen 2 (5GT/s), Gen 3 (8GT/s), and Gen 4 (16GT/s).

The following configuration controls link speed:

- PCIe *Supported Link Speeds* bit — Indicates the link speeds supported by the E810.
- PCIe *Current Link Speed* bit — Indicates the negotiated link speed.
- PCIe *Target Link Speed* bit — Used to set the target compliance mode speed when software is using the *Enter Compliance* bit to force a link into compliance mode. The default value is the highest link speed supported defined by the previous *Supported Link Speeds*.

The E810 does not initiate a hardware autonomous speed change.

The E810 supports entering compliance mode at the speed indicated in the *Target Link Speed* field in the PCIe Link Control 2 register (see [Section 14.3.5.13](#)). Compliance mode functionality is controlled via the PCIe Link Control 2 register.

### 3.1.4.2 Link Width

The E810 supports a maximum link width of x16, x8, x4, or x1.

The maximum link width supported is loaded from the NVM into the *Maximum Link Width* field of the PCIe Link Capabilities register (see [Section 14.3.5.7](#)). Hardware default is the x16 link.

During link configuration, the platform and the E810 negotiate on a common link width. The link width must be one of the supported PCIe link widths (x1, x4, x8, x16), such that:

- If maximum link width = x16, the E810 negotiates to either x16, x8, x4, or x1.
- If maximum link width = x8, the E810 negotiates to either x8, x4, or x1.
- If maximum link width = x4, the E810 negotiates to either x4 or x1.
- If maximum link width = x1, the E810 only negotiates to x1.

The E810 does not initiate a hardware autonomous link width change.

### 3.1.4.3 Lane Configurations

The E810 supports lane reversal and degraded modes.

The following general rules determine how the device reacts in different cases of lanes configuration:

- If lane 0 is found valid, the E810 does not initiate lane reversal. The Link Partner (LP) might initiate lane reversal (to end up with an optimal lane width) and the E810 consents with the lane reversal.
- If lane 0 is found invalid, the E810 initiates lane reversal. Lane reversal succeeds if the LP supports link reversal.
- If the lanes at both ends of the port (such as lanes 0 and 15 for x16, lanes 0 and 7 for x8, lanes 0 and 3 for x4, lane 0 for x1) are invalid, a link is not established.

**Note:** Some of the configurations or transitions assume lane reversal done by the LP. If the LP does not support a specific transition, the respective configuration is not provided on that system.

[Figure 3-1](#), [Figure 3-2](#), [Figure 3-3](#) and [Figure 3-4](#) depict the initial link width configuration and link degradation options. In [Figure 3-2](#) and [Figure 3-3](#), the upper part of the figures describe link options where the LP and the E810 are aligned. The bottom part of the figures describe link options where the LP and the E810 are reversed in order.

- [Figure 3-1](#) applies when both the LP or the E810 is physically set to x1.
- [Figure 3-2](#) applies when either the LP or the E810 is physically set to x4 and both are not physically set to x8.
- [Figure 3-3](#) applies when either the LP or the E810 is physically set to x8.
- [Figure 3-4](#) applies when either the LP or the E810 is physically set to x16.

Figure 3-1. Link Width Configurations for a x1 Port

Figure 3-2. Link Width Configurations for a x4 Port

Figure 3-3. Link Width Configurations for a x8 Port

Initial Configuration  
 LP 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15  
 Device 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15

Similar logic is applied when Initial Configuration is  
 LP 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15  
 Device 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Figure 3-4. Link Width Configurations for a x16 Port

### 3.1.4.4 Receiver Framing Requirements

This section applies to Gen 3 or Gen 4 operation only, and lists the optional capabilities defined in Section 4.2.2.3.3, “Receiver Framing Requirements” of the *PCIe Base Specification*.

The device implements the optional Gen3 receiver framing error checks other than:

- TLP Token length=0b
- Mixed order sets across lanes (which anyway ending up with recovery)

### 3.1.5 Error Events and Error Reporting

This section describes error reporting and advanced error reporting.

#### 3.1.5.1 General Description

PCIe defines two error reporting paradigms:

- Baseline capability
- Advanced Error Reporting (AER) capability.

The baseline error reporting capabilities are required of all PCIe devices, and define the minimum error reporting requirements. The AER capability is defined for more robust error reporting, and is implemented with a specific PCIe capability structure. Both mechanisms are supported by the E810, but the AER capability must be enabled in the NVM.

The *SERR# Enable* and the *Parity Error* bits from the Legacy Command register also take part in the error reporting and logging mechanism.

In a multi-function device, PCIe errors that are not related to any specific function within the device are logged in the corresponding status and logging registers of all functions in that device (see Section 6.2.4 in the *PCIe Base Specification*). [Figure 3-5](#) shows, in detail, the flow of error reporting in PCIe. See also [Figure 6-2](#) in the *PCIe Base Specification*.

Figure 3-5. Error Reporting Mechanism

### 3.1.5.2 Error Events

Table 3-7 lists the error events identified by the E810 and the response in terms of logging, reporting, and actions taken. Refer to the PCIe specification for the effect on the PCI Status register.

**Table 3-7. Response and Reporting of PCIe Error Events**

Error Name	Error Events	Default Severity	Action
<b>Physical Layer Errors</b>			
Receiver Error	8b/10b Decode Errors Packet Framing Error	Correctable Send ERR_CORR	TLP to Initiate NAK, Drop Data DLLP to Drop
<b>Data Link Errors</b>			
Bad TLP	Bad CRC Not Legal EDB Wrong Sequence Number	Correctable Send ERR_CORR	TLP to Initiate NAK, Drop Data
Bad DLLP	Bad CRC	Correctable Send ERR_CORR	DLLP to Drop
Replay Timer Timeout	REPLAY_TIMER expiration	Correctable Send ERR_CORR	Follow LL Rules
REPLAY NUM Rollover	REPLAY NUM Rollover	Correctable Send ERR_CORR	Follow LL Rules
Data Link Protocol Error	Violations of Flow Control Initialization Protocol	Uncorrectable Send ERR_FATAL	
Poisoned TLP Received	TLP With Error Forwarding	Uncorrectable ERR_NONFATAL Log Header	See section <a href="#">Section 3.1.5.4</a> for more details. If error is defined as non-fatal (default severity): <ul style="list-style-type: none"> <li>Treat as an advisory non-fatal error: Send an ERR_COR message.</li> </ul> If error is defined as fatal: <ul style="list-style-type: none"> <li>Send ERR_FATAL message.</li> </ul>
ECRC Check Failed	Failed ECRC check	Uncorrectable ERR_NONFATAL Log Header	See <a href="#">Section 3.1.2.9</a> for more details. If error is defined as non-fatal (default severity): <ul style="list-style-type: none"> <li>Send an ERR_NONFATAL message.</li> </ul> If error is defined as fatal: <ul style="list-style-type: none"> <li>Send ERR_FATAL message.</li> </ul>
Unsupported Request (UR)	Receipt of TLP with unsupported Request Type Receipt of an Unsupported Vendor Defined Type 0 Message Invalid Message Code Wrong Function Number Received TLP Outside BAR Address Range Receipt of a Request TLP during D3hot, other than Configuration and Message requests Reception of packet with unexpected PASID prefix Received Target Access with illegal data size per <a href="#">Section 3.1.2.2</a>	Uncorrectable ERR_NONFATAL Log header (including optional prefix)	Send Completion with UR. If error is defined as non-fatal (default severity): <ul style="list-style-type: none"> <li>Treat as an advisory non-fatal error: Send an ERR_COR message.</li> </ul> If error is defined as fatal: <ul style="list-style-type: none"> <li>Send ERR_FATAL message.</li> </ul>

**Table 3-7. Response and Reporting of PCIe Error Events [continued]**

Error Name	Error Events	Default Severity	Action
Completion Timeout	Completion Timeout Timer Expired	Uncorrectable ERR_NONFATAL	See <a href="#">Section 3.1.5.3</a> for more details. Log the header of the Request TLP that encountered the error. If error is defined as non-fatal (default severity): <ul style="list-style-type: none"> <li>• Treat as an advisory non-fatal error: Send an ERR_COR message.</li> </ul> If error is defined as fatal: <ul style="list-style-type: none"> <li>• Send ERR_FATAL message.</li> </ul>
Unexpected Completion	Received Completion Without a Request For It (Tag, ID, and so on)	Uncorrectable ERR_NONFATAL Log Header	Discard TLP. If error is defined as non-fatal (default severity): <ul style="list-style-type: none"> <li>• Treat as an advisory non-fatal error: Send an ERR_COR Message.</li> </ul> If error is defined as fatal: <ul style="list-style-type: none"> <li>• Send ERR_FATAL message.</li> </ul>
Receiver Overflow	Received TLP Beyond Allocated Credits	Uncorrectable ERR_FATAL	Receiver Behavior is Undefined
Flow Control Protocol Error	Minimum Initial Flow Control Advertisements Flow Control Update for Infinite Credit Advertisement	Uncorrectable ERR_FATAL	Receiver Behavior is Undefined
Malformed TLP (MP)	Data Payload Exceed Max_Payload_Size Received TLP Data Size Does Not Match Length Field TD field value does not correspond with the observed size PM Messages That Do Not Use TC0. Usage of Unsupported VC Target request crosses a 4KB boundary	Uncorrectable ERR_FATAL Log Header	Drop the Packet, Free FC Credits
Completion with Unsuccessful Completion Status		No Action (already done by originator of completion)	Free FC Credits (no credits for completions)

### 3.1.5.3 Completion Timeout Mechanism

The E810 supports completion timeout as defined in the PCIe specification.

The E810 controls the following aspects of completion timeout:

- Disabling or enabling completion timeout.
  - The PCIe *Completion Timeout Disable Supported* bit in the Device Capabilities 2 register (Section 14.3.5.10) is hard-wired to 1b to indicate that disabling completion timeout is supported.
  - The PCIe *Completion Timeout Disable* bit in Device Control 2 register (Section 14.3.5.11) controls whether completion timeout is enabled.
- A programmable range of timeout values.
  - The E810 supports all four ranges as programmed in the *Completion Timeout Ranges Supported* field of the Device Capabilities 2 register. The actual completion timeout value is written in the *Completion Timeout Value* field of Device Control 2 register.

The following sequence takes place when completion timeout is detected:

1. The appropriate message is sent on PCIe as listed in Table 3-7.
2. The affected queue or client takes action based on the nature of the original request:
  - If the original request was for Tx packet data, the request and any partial packet completions are dropped.
  - Else, the request is handled same way as malicious requests. An interrupt is issued to the respective PF.
3. Software might identify the source of the event (whether due to TLP poisoning, to a completion timeout, or an actual malicious event) by reading the error reporting counters or the performance and statistics counters.

### 3.1.5.4 Error Forwarding (TLP Poisoning)

If a TLP is received with an error-forwarding trailer, the packet is dropped and is not delivered to its destination.

The following sequence takes place when a poisoned TLP is received:

1. The appropriate message is sent on PCIe as listed in Table 3-7.
2. If the TLP is a completion, a completion timeout follows at some later time. Processing continues as described in Section 3.1.5.3.

System logic is expected to trigger a system-level interrupt to inform the operating system of the problem. Operating systems can then stop the process associated with the transaction, re-allocate memory to a different area instead of the faulty area, and so on.

### 3.1.5.5 Completion with Unsuccessful Completion Status

A completion arriving with unsuccessful completion status (either UR or CA) is dropped and not delivered to its destination. A completion timeout follows at some later time. Processing continues as described in Section 3.1.5.3.

### 3.1.5.6 Error Pollution

Error pollution can occur if error conditions for a given transaction are not isolated to the error's first occurrence. If the PHY detects and reports a receiver error, to avoid having this error propagate and cause subsequent errors at the upper layers, the same packet is not signaled at the data link or transaction layers. Similarly, when the data link layer detects an error, subsequent errors that occur for the same packet are not signaled at the transaction layer.

### 3.1.5.7 Blocking on Upper Address

The GLPCI\_UPADD register blocks master accesses from being sent out on PCIe if the TLP address exceeds some upper limit. Bits [31:1] correspond to bits [63:33] in the PCIe address space, respectively.

When a bit is set in GLPCI\_UPADD[31:1], any transaction in which the corresponding bit in its address is set is blocked and not sent over PCIe. If all register bits are cleared, there is no effect (TLPs are sent unconditionally).

Processing a blocked transaction:

- Write transaction:
  - The transaction is dropped.
- Read transaction:
  - The transaction is dropped.
  - Set the exceeded upper address limit (read requests) event in the PCIe errors register (see [Section 3.1.6](#)).
  - The affected queue or client takes action based on the nature of the original request. An interrupt is issued to the respective PF. See [Section 9.2.2.2.1](#).

## 3.1.6 Performance and Statistics Counters

The E810 incorporates counters to track the behavior and performance of the PCIe interconnect.

General characteristics of the counters:

- Software can reset, stop, or start the counters.

The counters are shared by all PCI functions (service mode of sharing).

### 3.1.6.1 Event Counters - Transaction Layer

Counters operate in one of the following modes:

- **Count mode** — The counter increments when the respective event occurred.
- **Leaky bucket mode** — The counter increments only when the rate of events exceeded a certain value. See [Section 3.1.6.1.2](#) for more details.

The list of events supported by the E810 are listed in [Table 3-8](#).

**Table 3-8. PCIe Statistic Events Encoding**

Event	Event Mapping (Hex)	Description
Cycles	0x00	Increment on each PCIe clock tick.
<b>Transaction Layer Events</b>		
Bad Request TLPs	0x10	Number of bad TLPs arriving to the transaction layer. These include: <ul style="list-style-type: none"> <li>Request caused UR.</li> <li>Request caused CA.</li> <li>Malformed TLP.</li> </ul>
Bad Completions	0x11	Number of bad completions received. These include: <ul style="list-style-type: none"> <li>Unexpected completion.</li> <li>UR status.</li> <li>CA status.</li> </ul>
Completion Timeout	0x12	Number of completion timeout events.
Poisoned TLP	0x13	Number of TLPs received with poisoned data.
ECRC Check	0x14	Number of TLPs that fail ECRC check.
<b>Link Layer Events</b>		
Retry Buffer Timeout	0x31	Number of replay events that happen due to timeout (does not count replay initiated due to NACK).
Retry Buffer Replay Roll-Over	0x32	Increment when a replay is initiated for more than three times.
<b>Physical Layer Events</b>		
Receive Error	0x50	Increment when one of the following occurs: <ul style="list-style-type: none"> <li>Decoder error occurred during training in the PHY. It is reported only when training ends.</li> <li>Decoder error occurred during link-up or till the end of the current packet (in case the link failed). This error is masked when entering/exiting EI.</li> </ul>

### 3.1.6.1.1 Count Mode

The following CSR fields control operation of the Count mode:

- Four 32-bit counters `GLPCI_GSCN_0_3` track events and increment on each occurrence of an event.
  - The four 32-bit counters can also operate in a two 64-bit mode to count long intervals or large payloads.
    - Registers `GLPCI_GSCN_0_3[0]` and `GLPCI_GSCN_0_3[1]` form the first 64-bit counter, while registers `GLPCI_GSCN_0_3[2]` and `GLPCI_GSCN_0_3[3]` form the second 64-bit counter.
    - The `GLPCI_GSCL_1_P.GIO_64_BIT_EN` selects between 32-bit and 64-bit modes.
- The `GLPCI_GSCL_1_P.GIO_COUNT_EN[3:0]` bits enable each of the four counters.
  - The enable bits for the two 64-bit counters are `GLPCI_GSCL_1_P.GIO_COUNT_EN_0` and `GLPCI_GSCL_1_P.GIO_COUNT_EN_2`, respectively.
- The `GLPCI_GSCL_1_P.GIO_COUNT_START` bit starts event counting of enabled counters.
- The `GLPCI_GSCL_1_P.GIO_COUNT_STOP` bit stops event counting of running counters.
- The `GLPCI_GSCL_1_P.GIO_COUNT_RESET` bit resets the event counters.

- The GLPCI\_GSCL\_2 associates an event with each of the four counters.
  - In 64-bit mode, the *GIO\_EVENT\_NUM\_[2,0]* fields are used.

### 3.1.6.1.2 Leaky Bucket Mode

Each of the counters can be configured independently to operate in a leaky bucket mode. When in leaky bucket mode, the following functionality is provided:

- One of four 16-bit Leaky Bucket Counters (LBC) is enabled via the *LBC\_ENABLE\_[3:0]* bits in the PCIe Statistic Control Register #1 (GLPCI\_GSCL\_1\_P).
- The LBC is controlled by the *GIO\_COUNT\_START*, *GIO\_COUNT\_STOP*, *GIO\_COUNT\_RESET* bits in the PCIe Statistic Control Register #1 (GLPCI\_GSCL\_1\_P).
- The LBC increments every time the respective event occurs.
- The LBC is decremented every  $T \mu\text{s}$  as defined in the *LBC\_TIMER\_N* field in the PCIe Statistic Control Register #5...#8 (GLPCI\_GSCL\_5\_8).
- When an event occurs and the value of the LBC meets or exceeds the threshold defined in the *LBC\_THRESHOLD\_N* field in the PCIe Statistic Control Register #5...#8 (GLPCI\_GSCL\_5\_8), the respective statistics counter increments, and the LBC counter is cleared to zero.

### 3.1.6.2 Event Counters - Link and Physical Layers

This section describes the performance events for the Link and Physical layers and how to manage the counters associated with these events.

Two events can be counted concurrently. The event counters include two sets of registers, each managing one event counter. Such pairs are documented as <register\_name>[1:0].

The following procedures manage the operation of the event counters (when writing to part of the register, ensure that other fields are written with their existing values):

#### Resetting the counters configuration:

1. Set the XPPERFCON.GRST bit.
2. Clear the XPPERFCON.GRST bit (otherwise the logic stays in reset)

#### Setting an event:

1. Write 0x0...0 to the XPPMCL[1:0] registers.
2. Set the XPPMR[1:0].CENS field to 0x1.
3. Set the XPPMR[1:0].CNTMD field to 0x1.
4. Set the XPPMER[1:0].XPRSCA field to 0x1.
5. Set the event according to [Table 3-9](#).

#### Starting a count:

1. Set the XPPERFCON.GCE bit

#### Stopping a count:

1. Clear the XPPERFCON.GCE bit

**Reading the count (note: reading the counter clears their values):**

1. Read the respective XPPMDH[1:0] and XPPMDL[1:0] register pair in a single 64-bit aligned access.

Table 3-9 defines the Link and Physical Layer events:

**Table 3-9. Link and Physical Layer Performance Events**

Event	Description	Register Field
Uncorrectable Errors	Counts the total number of Uncorrectable Errors.	XPPMER[1:0].CNTUCERR
Correctable Errors	Counts the total number of Correctable Errors.	XPPMER[1:0].CNTCERR
Tx L0s State Utilization	Counts the number of entries to L0s on the Tx lanes.	XPPMER[1:0].TXLOSU
Rx L0s State Utilization	Counts the number of entries to L0s on the Rx lanes.	XPPMER[1:0].RXLOSU
Link Utilization	Counts clocks that a port is receiving data. If one counter counts receiver errors and another counter counts Link Utilization, a bit error rate can be calculated.	XPPMER[1:0].LNKUTIL
Recovery State Utilization	Counts the number of entries to Recovery state.	XPPMER[1:0].RECOVERY
ASPM L1 State Utilization	Counts the number of entries to ASPM L1 state (that is, initiated by the device)	XPPMER[1:0].L1
SW L1 State Utilization	Counts the number of entries to L1 state initiated by software.	XPPMER[1:0].SWL1
Tx and Rx L0s Utilization	Counts number of events where both Tx and Rx are in L0s state.	XPPMER[1:0].RXLOSTXLOSU
NAK DLLP Received	Counts number of received NAK DLLPs.	XPPMER[1:0].NAKDLLP

### 3.1.6.2.1 Bandwidth Counters

The bandwidth counters measure total payload bytes transferred over the PCIe link. Counting is provided per each traffic type (posted, non-posted, completions) per direction (upstream, downstream).

The mechanisms described above hold for the bandwidth counters with the following differences:

**Setting an event:**

1. Set the XPPMR[1:0].CENS field to 0x1.
2. Set the XPPMR[1:0].EGS field to 0x2.
3. Set the XPPMER[1:0].FCCSEL field to the desired traffic type (posted, non-posted, completions, or all).
4. Set the XPPMER[1:0].TXRXSEL field to desired values.
5. Set the XPPMER[1:0].XPRSCA field to 0x1.
6. Set the XPPERFCON.GCE field to 0x1.

Registers fields used exclusively by the bandwidth counters:

- XPPMER[1:0].FCCSEL - Selects the desired traffic type (posted, non-posted, completions, or all).
- XPPMER[1:0].TXRXSEL - Selects between monitoring downstream traffic, upstream traffic, or both.

## 3.2 Ethernet Interconnect

### 3.2.1 Media Access Control (MAC) Layer

The E810 supports up to eight full-duplex Ethernet MAC ports compliant with IEEE Std802.3-2018 standard (Clause 4 and Annex 4A). The MAC ports can be configured to operate at different speeds, as explained in [Section 3.2.1.2](#).

Each MAC port is associated with a corresponding Media Access Unit (MAU) that provides the physical layer interfaces. The MAUs must be configured to operate with the appropriate physical layer protocols based on the MAC operating speed. Physical layers supported by the E810 for different speeds of operation are explained in [Section 3.2.2, “Physical Layer Interface”](#).

#### 3.2.1.1 MAC Features

Table 3-10 lists the E810 Ethernet port features.

**Table 3-10. Link Layer Ethernet Port Features**

Description
Ethernet Speed and Interfaces: <ul style="list-style-type: none"> <li>• 100 Gb/s: 2 ports of CGMII</li> <li>• 50 Gb/s: 2 ports of XLGMII</li> <li>• 25 Gb/s: 4 ports of XGMII (boosted to 25G)</li> <li>• 10 Gb/s: 8 ports over XGMII (supporting 10G,1G, 100M)</li> </ul>
The E810’s Maximum Transmit Unit Size (MTU) is 9728 - Ethernet header/CRC = 9728 - 18 = 9710 bytes (jumbo frames). MTU can be further reduced by additional header fields such as Virtual Local Area Network (VLAN) tag(s), and so on.
Full-duplex operation at all supported speeds.
Integrates support for IEEE Std 802.3 Clause 73 Auto-Negotiation for Backplane Ethernet (The auto-negotiation protocol is done by the PHY).

#### 3.2.1.2 MAC Speed Configuration

Table 3-11 lists the possible speed configurations available on each MAC port.

**Table 3-11. MAC Port and Possible Speed Configurations**

Port	100 Mb/s	1 Gb/s	10 Gb/s	25 Gb/s	50 Gb/s	100 Gb/s
MAC 0	Y	Y	Y	Y	Y	Y
MAC 1	Y	Y	Y	Y	Y	Y
MAC 2	Y	Y	Y	Y	N	N
MAC 3	Y	Y	Y	Y	N	N
MAC 4	Y	Y	Y	N	N	N
MAC 5	Y	Y	Y	N	N	N
MAC 6	Y	Y	Y	N	N	N
MAC 7	Y	Y	Y	N	N	N

When LAN ports are disabled in multi-port system configurations, corresponding PCIe functions must be disabled through the NVM or external disable pins. See [Section 4.4](#) for details on PCI function disable and LAN port disable functionality.

The link speed for each port can be controlled through NVM loaded settings or Link Configuration admin commands (see [Section 3.2.4](#)). In some physical interfaces, the final link speed is selected out of the pre-configured options, based on the link auto-negotiation protocol.

The maximum speed enabled depends on the number of enabled ports:

- 2 Ports setting:
  - Each port can be independently configured to 100/50/25/10/1 Gb, 100 Mb, or disabled.
  - In this setting, only Port0 and Port1 can be enabled.
- 4 Ports setting:
  - Each Port can be independently configured to 25/10/1 Gb, 100 Mb, or disabled.
  - In this setting, only Port0, Port1, Port2, Port3 can be enabled.
- 8 Ports setting:
  - Each Port can be independently configured to 10/1 Gb, 100 Mb, or disabled.
  - Some ports can be configured to 25 Gb, depending on other port’s configurations (see [Table 3-12](#)).
  - In this setting, all ports can be enabled.

**Note:** The ports maximal speed depends also on the maximal bandwidth SKU. The above speeds assumes 200G SKU.

**Note:** The number of ports and their speed affect the E810 pipe settings, such as TPB, RPB, DCB, and more. This is done using the adaptive NVM method, when the link topology is configured. See [Section 3.3.3.3](#).

[Table 3-12](#) illustrates the allowed port configurations when the E810 bandwidth is not limited by SKU setting (like 200G max bandwidth SKU).

**Table 3-12. Port Configurations**

Ports <sup>1</sup> / Configuration	P0	P1	P2	P3	P4	P5	P6	P7	
2 ports	100G	100G	-	-	-	-	-	-	2 ports (100G and below)
4 ports	25G	25G	25G	25G	-	-	-	-	4 ports (25G and below)
6 ports - 1	25G	25G	10G	10G	-	-	10G	10G	2x25G + 4x10G
6 ports - 2	10G	10G	25G	25G	10G	10G	-	-	2x25G + 4x10G
6 ports - 3	25G	10G	25G	10G	-	10G	-	10G	2x25G + 4x10G
6 ports - 4	10G	25G	10G	25G	10G	-	10G	-	2x25G + 4x10G
6 ports - 5	25G	10G	10G	25G	-	10G	10G	-	2x25G + 4x10G
6 ports - 6	10G	25G	25G	10G	10G	-	-	10G	2x25G + 4x10G
7 ports - 1	25G	10G	10G	10G	-	10G	10G	10G	1x25G + 6x10G
7 ports - 2	10G	25G	10G	10G	10G	-	10G	10G	1x25G + 6x10G
7 ports - 3	10G	10G	25G	10G	10G	10G	-	10G	1x25G + 6x10G

**Table 3-12. Port Configurations [continued]**

Ports <sup>1</sup> / Configuration	P0	P1	P2	P3	P4	P5	P6	P7	
7 ports - 4	10G	10G	10G	25G	10G	10G	10G	-	1x25G + 6x10G
8 ports	10G	10G	10G	10G	10G	10G	10G	10G	8 ports (10G and below)

1. Port numbers in this table refer to E810 port numbering. See [Section 3.2.2.3](#) for port mapping.

### 3.2.1.3 Transmit Padding

The minimum frame size for Ethernet as specified by IEEE Std 802.3 standard is 64 bytes. The E810 MAC pads, with zeros, Ethernet packets that are smaller than 64 bytes during transmit. In the E810, transmit packets arrive already padded to the MAC. Refer to the padding rules for transmitted and received packets and loop-back packets in [Section 7.12.2](#).

### 3.2.1.4 Jumbo Frame Support

The E810 MAC supports transmission and reception of frames of up to 9.5 KB (9728 bytes). Maximum receive and transmit frame size is configured through the *Max Frame Size* field in the Set MAC Config command (see [Section 3.2.4.1.2](#)).

### 3.2.1.5 Ethernet Flow Control (FC)

The E810 supports flow control (pause) as defined in 802.3x (IEEE Std 802.3-2008 Annex 31B), as well as the specific operation of asymmetrical flow control (asymmetric pause) defined by 802.3z (IEEE Std 802.3-2008 Annex 28B). The E810 also supports Priority Flow Control (PFC) as defined in IEEE P802.1Qbb, sometimes referred to as Class Based Flow Control or (CBFC), as part of the DCB architecture.

**Note:** An E810 port can either be configured to receive 802.3x Link Flow Control (LFC) packets or 802.1Qbb/802.3bd PFC packets. It does not support the reception of both types of packets simultaneously over the same port.

Flow control is implemented to reduce receive buffer overflows, which result in the dropping of received packets. Flow control also allows for local controlling of network congestion levels. This can be accomplished by sending an indication to a transmitting station of a nearly full receive buffer condition at a receiving station.

The implementation of asymmetric flow control allows for one link partner to send flow control packets while being allowed to ignore their reception (for example, not required to respond to PAUSE frames).

The following registers define the basic control functionality. Refer to the registers specified in [Section 8.2.4.4](#) for the other programming related to flow control. In Data Center Bridge (DCB) mode, some of the registers are duplicated per Traffic Class (TC), up to eight duplicate copies of the registers. If DCB is disabled, index [0] of each register is used.

### 3.2.1.5.1 MAC Control Frames and Reception of Flow Control Frames

#### 3.2.1.5.1.1 MAC Control Frame — Other Than FC

IEEE 802 reserved the EtherType value of 0x8808 for MAC control frames as listed in [Table 3-13](#). The MAC control frame format is specified in IEEE 802.3 Clause 31.

**Table 3-13. MAC Control Frame Format**

Field	Description
DA	The <i>Destination Address</i> field can be an individual or multicast (including broadcast) address. Permitted values for the <i>Destination Address</i> field can be specified separately for a specific control opcode such as FC packets.
SA	Port Ethernet MAC Address (6 bytes).
Type	0x8808 (2 bytes).
Opcode	The MAC control opcode indicates the MAC control function.
Parameters	The <i>MAC Control Parameters</i> field must contain MAC control opcode-specific parameters. This field can contain none, one, or more parameters up to a maximum of <code>minFrameSize = 20</code> bytes.
Reserved field = 0x00	The <i>Reserved</i> field is used when the MAC control parameters do not fill the fixed length MAC control frame.
CRC	4 bytes.

##### 3.2.1.5.1.1.1 MAC Control Frame Receive Identification

Packets with:

- MAC DA = 01-80-C2-00-00-01.
- EtherType value of 0x8808 are considered to be control frames.

##### 3.2.1.5.1.2 Structure of 802.3x FC Packets

802.3x FC packets are defined by the following three fields (see [Table 3-14](#)):

- A match on the 6-byte multicast address for MAC control frames, or a match to the station address of the device. The 802.3x standard defines the MAC control frame multicast address as 01-80-C2-00-00-01.
- A match on the *Type* field. The *Type* field in the FC packet is compared against an IEEE reserved value of 0x8808.
- A match of the MAC control *Opcode* field has a value of 0x0001.

Frame-based flow control differentiates XOFF from XON based on the value of the *PAUSE Timer* field. Non-zero values constitute XOFF frames while a value of zero constitutes an XON frame. Values in the *Timer* field are in units of pause quanta (slot time). A pause quanta lasts 64 byte times, which is converted in to an absolute time duration according to the line speed.

**Note:** XON frame signals the cancellation of the pause that was initiated by an XOFF frame. For example, a pause for zero pause quanta.

**Table 3-14. 802.3x Link Flow Control - Frame Formats**

Field	Description
DA	01_80_C2_00_00_01 (6 bytes).
SA	Port Ethernet MAC Address (6 bytes).
Type	0x8808 (2 bytes).
Opcode	0x0001 (2 bytes).
Time	XXXX (2 bytes).
Pad	42 bytes.
CRC	4 bytes.

### 3.2.1.5.1.2.1 802.3x Frame Receive Identification

Received frames that are identified as control frames (see [Section 3.2.1.5.1.1.1](#)) can further be classified as 802.3x if the frames opcode = 0x0001 as listed in [Table 3-14](#).

### 3.2.1.5.1.3 Priority Flow Control (PFC)

EEDC introduces support for multiple TCs assigning different priorities and bandwidth per TC. LFC stops all the TCs. PFC specified in IEEE P802.1Qbb enables more granular flow control on the Ethernet link in an EEDC environment, as opposed to the PAUSE mechanism defined in 802.3x. The PFC frame format is specified in IEEE P802.3bd.

**Table 3-15. Priority Flow Control - Frame Format**

Field	Description
DA	01_80_C2_00_00_01 (6 bytes).
SA	Port Ethernet MAC Address (6 bytes).
Type	0x8808 (2 bytes).
Opcode	0x0101 (2 bytes).
Priority Enable Vector	0x00XX (2 bytes).
Timer 0	XXXX (2 bytes).
Timer 1	XXXX (2 bytes).
Timer 2	XXXX (2 bytes).
Timer 3	XXXX (2 bytes).
Timer 4	XXXX (2 bytes).
Timer 5	XXXX (2 bytes).
Timer 6	XXXX (2 bytes).
Timer 7	XXXX (2 bytes).
Pad	26 bytes.
CRC	4 bytes.

**Table 3-16. Format of Priority Enable Vector**

	ms octet	ls octet
Priority enable vector definition	0	e[7]...e[n]...e[0]
e[n] =1 => time (n) valid e[n] =0 => time (n) invalid		

Each of the eight timers refers to a specific User Priority (UP). For example, Timer 0 refers to UP 0, and so on. The E810 binds a UP (and therefore the timer) to one of its TCs according to the UP-to-TC binding tables. Refer to the PRTDCB\_TUP2TC register (Section 13.2.2.17.104) for the binding of received PFC frames to Tx TCs, and to the PRTDCB\_RUP2TC register (Section 13.2.2.17.102) for the binding of transmitted PFC frames to Rx TCs.

When a PFC frame is formatted by the E810, the same values are replicated into every *Timer* field and *Priority Enable Vector* bit of all the UPs bound to the concerned TC. These values as configured in the PRTDCB\_RUP2TC register.

The following rule is applicable for the case of multiple UPs that share the same TC as configured in the PRTDCB\_TUP2TC register. When PFC frames are received with different timer values for the previous UPs, the traffic on the associated TC must be paused by the highest XOFF timer's value.

### 3.2.1.5.1.3.1 PFC Frame Receive Identification

Received frames that are identified as control frames (see Section 3.2.1.5.1.1.1) can further be classified as PFC if the frames opcode = 0x0101 as listed in Table 3-15.

### 3.2.1.5.1.4 Operation and Rules

The E810 operates in either LFC mode or in PFC mode. Enabling both modes concurrently is not allowed.

**Note:** LFC capability must be negotiated between link partners via the auto-negotiation process. PFC capability is negotiated via some higher level protocol (DCBx), and the resolution is usually provided to the software device driver by the EEDC management agent. It is the responsibility of the EMP to reconfigure the LFC settings after the auto-negotiation process is resolved.

Once the receiver has validated the reception of an XOFF or PAUSE frame, the device performs the following:

1. Increment the appropriate statistics register(s).
2. Initialize the pause timer based on the packet's PAUSE *Timer* field (overwriting any current timer's value).
  - In case of PFC, this is done per TC. If several UPs are associated with a TC, the device sets the timer to the maximum value among all enabled timer fields associated with the TC.
3. Disable packet transmission or schedule the disabling of transmission after the current packet completes.
  - In case of PFC, this is done per paused TC.

Resumption of transmission can occur under the following conditions:

- Expiration of the PAUSE timer.
  - In case of PFC, this is done per TC.

- Reception of an XON frame (a frame with its PAUSE timer set to 0b).
  - In case of PFC, this is done per TC.

Both conditions clear the relevant TXOFF status bits in the Transmit Flow Control Status (PRTDCB\_TFCS) register and transmission can resume. Hardware records the number of received XON frames.

### 3.2.1.5.1.5 Timing Considerations

When operating at 100 Gb/s line speed, the E810 does not begin to transmit a (new) frame more than 394 pause\_quantum after the reception of a valid XOFF frame that contains a non-zero value of pause\_time, as measured at the wires (a pause quantum is 512 bit times).

When operating at 50 Gb/s line speed, the E810 does not begin to transmit a (new) frame more than 394 pause\_quantum after the reception of a valid XOFF frame that contains a non-zero value of pause\_time, as measured at the wires (a pause quantum is 512 bit times).

When operating at 25 Gb/s line speed, the E810 does not begin to transmit a (new) frame more than 80 pause\_quantum after the reception of a valid XOFF frame that contains a non-zero value of pause\_time, as measured at the wires (a pause quantum is 512 bit times).

When operating at 10 Gb/s line speed, the E810 must not begin to transmit a (new) frame more than 60 pause quanta after receiving a valid XOFF frame, as measured at the wires. When connected to an external 10GBASE-KR PHY with FEC, or to an external 10GBASE-T PHY, the response time requirement increases to 74 pause quanta because of extra delays consumed by these external PHYs.

When operating at 1 Gb/s line speed, the E810 must not begin to transmit a (new) frame more than two pause quanta after receiving a valid XOFF frame, as measured at the wires.

The IEEE P802.1Qbb draft 2.3, specifies that the tolerated response time for priority XOFF frames is 614.4 ns (equivalent of 12 pause quanta at the link speed of 10 Gb/s). This extra budget in addition to the link delay is aimed to compensate for the fact that the decision to stop new transmissions from a specific TC must be taken earlier in the transmit data path than for the LFC case.

### 3.2.1.5.2 Transmitting PAUSE Frames

The E810 generates PAUSE packets to ensure there is enough space in its receive packet buffers to avoid packet drop. The E810 monitors the fullness of its receive FIFOs and compares it with the contents of a programmable threshold. When the threshold is reached, the E810 sends a PAUSE frame.

The E810 supports both LFC and PFC, but not both concurrently (at the same physical port). When DCB is enabled, it sends only PFC. When DCB is disabled, it sends only LFC.

**Note:** Similar to the reception of flow control packets previously mentioned, software can enable flow control transmission only after it is negotiated between the link partners (possibly by auto-negotiation).

#### 3.2.1.5.2.1 PFC

Like Rx flow control, Tx flow control operates in either a link 802.3x compliant mode or in PFC mode, but not in both at the same time.

The same flow control mechanism is used for PFC and for 802.3x flow control to determine when to send XOFF and XON packets. When PFC is used in the receive path, Priority PAUSE packets are sent instead of 802.3x PAUSE packets. The format of priority PAUSE packets is described in [Section 3.2.1.5.1.2.1](#).

A specific consideration for generating PFC packets:

- When a PFC packet is sent, the packet sets all the UPs that are associated with the relevant TC (UP-to-TC association in receive is defined in PRTDCB\_RUP2TC register).

### 3.2.1.5.2.2 Operation and Rules

At 10 Gb/s and lower speeds, the *TFCE* field in the Flow Control Configuration (PRTDCB\_FCCFG) register enables transmission of PAUSE packets as well as selects between the LFC mode and the PFC mode.

Refer to [Section 8.2.1.4.1](#) for the criteria used by the device for sending a XOFF frame to the neighbor. The E810 sends an additional PAUSE frame if it has previously sent one and the FIFO overflows. This is intended to minimize the amount of packets dropped if the first PAUSE frame did not reach its target.

From the time it has issued a PAUSE frame to the neighbor, the E810 starts counting down in an internal shadow counter used to mirror the pause timeout counter at the partner's end. When this internal counter reaches the value set, then, if the PAUSE condition is still valid (meaning that the buffer(s) fullness is still above the relevant watermarks), an XOFF message is sent again.

Once the receive buffer fullness reaches the relevant low watermarks, the E810 sends an XON message (a PAUSE frame with a timer value of zero). Refer to [Section 8.2.1.4.1](#) for the criteria used by the device for sending a XON frame to the neighbor.

### 3.2.1.6 Inter Packet Gap (IPG) Control and Pacing

The E810 can limit the packet transmission using one of the following:

- **Programmable fixed IPG extension, per port configuration** — The inter packet gap can be extended by fixed number of 16-bytes words, for all Tx packets. This configuration can enable connection through Bump On the Wire devices that need larger inter packet gap. The *TX\_IPG* field of the PRTMAC\_TX\_PACE[PRT] register specifies the number of 16-bytes words inserted between each consecutive packets.
- **Average data rate limitation, per port configuration** — The gap between packets can be extended in a way that the average data rate is lower than the link speed. This configuration might be used with PHYs that implements line speeds that can not be directly configured to the E810 (for example, 5 Gb/s), but can connect to the E810 with an interface with which the E810 can support its speed (for example, 10 Gb/s). Pacing rate is implemented by extending the IPG. The *TX\_PACE* field of register PRTMAC\_TX\_PACE[PRT] specifies the number of bits added to IPG for each 16 bytes that are transmitted. The total number of bits to be added is accumulated, and when the IPG is inserted between packets, the IPG is extended in 16-bytes granularity, according to the total number of accumulated bits, while the residual is kept to be added at the next gap between packets. To meet the IEEE 802.3 specifications, 12 bytes of minimal inter frame gap are always added to the IPG.

The following examples show how the *TX\_PACE* field can be calculated to achieve specific rate.

#### Example 1:

Assume all transmitted packets are in size of 64 bytes. To achieve a 5 Gb/s data rate when link rate is 10 Gb/s (50%) and packet length is 64 bytes (4 x 16-bytes words), programmers need to add an additional IPG, calculated as follows. The 64-byte packet is transmitted with 12 bytes IPG, and the bandwidth must be reduced by 50%, or add 1 byte for each transmitted byte or IPG byte. Therefore, for each packet 76 bytes must be added. As *TX\_PACE* is added in bit resolution for each of the 4 16-byte words of the packet, the programmer therefore should configure  $76 * 8 / 4 = 152$  bits in the *TX\_PACE* field. The multiplication by 8 is to translate bytes to bits and the division is to calculate the number of bits to be added per 16-byte word.

**Example 2:**

Now assume all transmitted packets are in size of 65 bytes. To achieve a 5 Gb/s data rate when link rate is 10 Gb/s and packet length is 65 bytes (5 x 16-byte words when rounded up) programmers must add an additional IPG of 65+12=77 bytes. Note that in these case, where the packet length counted in 16-byte words is not an integer, the *TX\_PACE* would be added also for a fraction of 16-bytes words transmitted. As *TX\_PACE* is added in bit resolution for each of the five 16-byte words of the packet, the programmer therefore should configure  $77*8/5=123.2$  in the *TX\_PACE* field. *TX\_PACE* should be rounded up to 124, to ensure transmission at a slightly lower speed, as a slightly higher speed might result in packet loss in some extreme case.

**Note:** For the two examples above, a fixed packet size is assumed. For the case of variable packet size, if transmission must be ensured in lower than the configured rate, choose the highest *TX\_PACE*, as calculated for all packet sizes. Table 3-17 shows the exact number of bits (rounded up to integer value) that needs to be added in order to reach 50% of the line rate.

**Table 3-17. Example of TX\_IPG Configuration to Achieve 50% of the Data Rate for Different Packet Sizes**

Packet Size	Added Bits per 16-Byte Word of the Packet (TX_IPG)
64	152
65	124
66	125
67	127
68	128
69	130
70	132
71	133
72	135
73	136
74	138
75	140
76	141
77	143
78	144
79	146
80	148
81	124
...	
1500	129

Assuming rate must be equal or less than 50% (for example, pacing to 5 Gb/s with line speed of 10 Gb/s), *TX\_IPG* should be configured to 152 bits.

Table 3-18 specifies the *TX\_IPG* configuration for different pacing speeds with average target rate in 10% steps, assuming evenly-distributed packet size.

**Table 3-18. Configurations for Different Pacing Speeds**

Pacing Speed (Percentage of Line Rate)	TX_IPG	Pacing Config Field (Bits 6:3) in the Set MAC Config Admin Command
100%	0	0000b
90%	17	1001b
80%	38	1000b
70%	66	0111b
60%	102	0110b
50%	152	0101b
40%	228	0100b
30%	355	0011b
20%	608	0010b
10%	1368	0001b
25%	456	1110b
93% (WAN)	12	1111b

### 3.2.1.7 MAC Speed Change at Different Power Modes

Auto-negotiation enables establishment of link speed at the Highest Common Denominator (HCD). During certain low power modes, power saving might be more important than link performance. The E810 supports an additional mode of operation, where it can configure the PHY to fixed speed, starting from the lowest speed and checking if the link can be up. This method sets the link speed to the Lowest Common Denominator (LCD) link speed. The link-up process enables the link to come up at any possible speed in cases where power is more important than performance. See further information in [Section 5.2.1](#).

### 3.2.1.8 MAC Errors

The E810’s MAC supports identification of the following erroneous packets:

- **L2 CRC Error** — Packet’s FCS check resulted in an error.
- **Undersized or Oversized Packets** — Received frame size is smaller than 64 bytes or larger than the configured max frame size, which was either loaded from the NVM or set using the Set MAC Config command (see [Section 3.2.4.1.2](#)).
- **Illegal Byte Error** — Indication that an illegal control byte was received on the interface. An illegal control byte is any value that is not legal. (See IEEE802.3 for legal symbols, such as /I/, /E/, /T/, /D/, /S/, /Seq/, or /LPI/).
- **Error Byte Error** — Indication that a packet was received with the error control byte (/E/) on the XGMII interface. Indicates that the PCS has encountered an error during the packet’s reception.
- **802.3 Length Error** — <Length> field information in the 802.3 header does not match the packet’s actual size.

Packets containing any one of the previous errors can be filtered by the device or forwarded to a pre-configured VSI based on the *SBP* flag in the PRT\_SBPVSI register.

**Note:** Packets shorter than 64 bytes are always filtered by the MAC layer and are not affected by the Store Bad Packets (SBP) configuration.

### 3.2.1.8.1 MAC Error Counters

Table 3-19 lists the different MAC error counters supported by the device.

**Table 3-19. MAC Error Counters**

Field	Description
CRC Error	Counts the number of packets received with CRC errors that are not fragments.
Illegal Bye Error	Counts the number of packets received with an illegal control byte on the CGMII/XLGMII interface.
Error Byte	Counts the number of packets that were received with an error control byte on the CGMII/XLGMII interface.
Receive Length Error	Counts the number of packets received with error in length field comparison in the 802.3 header.
Receive Undersize	Counts the number of packets with good CRC that are smaller than 64 bytes.
Receive Fragment	Counts the number of packets with bad CRC that are smaller than 64 bytes
Receive Oversize	Counts the number of packet that are larger than the configured max frame size.
MAC Short Packet Discard	Counts the number of packets smaller than 32 bytes that were discarded by the MAC layer.

## 3.2.2 Physical Layer Interface

### 3.2.2.1 Introduction

The E810 provides up to eight Ethernet port interfaces. The following sections describe the physical interfaces that the E810 can support and manage through firmware.

**Table 3-20. Supported Electrical Modes**

Speed	Mode	Spec	Comments
100G	CAUI-4	<ul style="list-style-type: none"> <li>IEEE 802.3 Annex 83D/83E</li> </ul>	<ul style="list-style-type: none"> <li>4x25G AUI used for chip-to-chip or chip-to-module connectivity. ### 3.2.2.2 MAC/PHY Interface

The E810 provides up to eight Ethernet ports, where there is a 1:1 mapping between the E810 MAC ONPI port and the PHY physical port. The interface modes are illustrated in the following diagrams.

#### 3.2.2.2.1 MAC/PHY Interface Mapping

Figure 3-6 illustrates the default MAC-to-PHY connectivity. The controller core contains eight Ethernet MACs. The MACs are grouped into two sets of four. Within each set of four, one MAC supports all rates up to 100G (MAC0 and MAC1), a second MAC supports all rates up to 25G (MACs2 and MAC3), and the remaining MACs (MAC4-MAC7) support up to 10G.

**Figure 3-6. E810 - MAC-PCS-SerDes Default Mapping**

Each set of four MACs is connected to a single PCS block that supports up to four ports. Within each PCS block is one PCS function (PCS0) that support all rates up to 100G, a second PCS function (PCS1) that supports rates up to 50G, and two PCS functions (PCS2/3) that support up to 10G.

When operating in dual port mode, MAC0 and MAC1 are connected to PCS0 of their respective PCS blocks, and the PCS distributes the data to up to four SerDes lanes needed for 4-lane modes, such as 100GBASE-CR4. This results in MAC0 utilizing SerDes lanes 0-3, while MAC1 utilizes SerDes lanes 4-7.

When operating in quad-port mode, only single lane per port modes are supported. MAC0 and MAC2 connect to PCS0 and PCS1 of the first PCS, while MAC1 and MAC3 connect to PCS0 and PCS1 of the second PCS block. Using the default PCS-to-SerDes mapping, this presents the data from MACs (0,2,1,3) on SerDes lanes 0, 1, 4, and 5 respectively.

To support a “breakout” mode where all four ports utilize the same SerDes quad, multiplexers in the PCS-to-SerDes path direct the data from both PCS blocks to a single SerDes quad. This mode allows a system design to support quad-port 25G in the same QSFP connector as a 100G port.

When working with lane rates of 50G, a 100G port is mapped to two lanes and 50G port is mapped to a single lane. As those rates are only supported by MAC0 and MAC1, both direct and breakout mappings are supported. While working at 100G port rates, the direct mapping maps MAC0 into lane0 and lane1, while MAC1 is mapped into lane4 and lane5. In 50G port rates, the direct mapping maps MAC0 to lane0 and MAC1 into lane4. In 50G port rates, additional breakout mapping can be applied, which maps MAC0 into lane0 and MAC1 into lane1.

The 50G “breakout” mode allows a system design to support two 50G ports using the same QSFP connector that was used when the port is configured to 100G.

### 3.2.2.3 Port and PMD Mapping

To manage the Ethernet links, E810 firmware must map the port number and PMD (SerDes lane) number along the way of the packet.

#### 3.2.2.3.1 Port and PMD Nomenclature

The term “Logical port” refers to an Ethernet port link as seen from the host perspective. A logical port is mapped to the E810 Ethernet MAC and to a PCIe physical function (PF). In addition, a logical port is mapped to a single or multiple PMD lanes of the internal PHY, depending on the PMD type. For link management admin commands or link topology commands, the E810 field refers to logical port.

E810 MAC port numbering might be different from logical port numbering, because of physical function mapping and the internal ONPI connection between the E810 controller core and the PHY.

#### 3.2.2.3.2 Port Mapping

**Table 3-21. Port Mapping**

E810				PHY		
Physical Function (PF) Mapping			MAC Number	ONPI Port Number	PMD Lane Number <sup>1</sup>	
2-Port Default	4-Port Default	8-Port Default			Single Lane	Multi Lane
0	0	0	0	0	0	<b>0,1,2,3</b>
	1	1	2	2	1	1
		2	4	4	2	2
		3	6	6	3	3
1	2	4	1	1	4	<b>4,5,6,7</b>
	3	5	3	3	5	5
		6	5	5	6	6
		7	7	7	7	7

1. Bold identifies the auto-neg PMD lane

**Note:** E810 Ports 0-3 support up to 25G. There is a need to map those ports using the same lanes that were used for 100G, for breakout configurations. This mapping is described in [Table 3-22](#).

**Table 3-22. Port Mapping (4x25G on the First Quad)**

Physical Function (PF)	E810 MAC Number	PHY ONPI Port Number	PMD Number
0	0	0	0
1	2	2	1
2	1	1	2
3	3	3	3

For 50G lane rates, E810 Ports 0-1 are mapped to lanes 0,1,4,5 using the following mapping:

**Table 3-23. Port Mapping (50G Lane Rates)**

Mode	Physical Function (PF)	E810 MAC Number	PHY ONPI Port Number	PMD Number <sup>1</sup>
2x100G	0	0	0	<b>0,1</b>
	1	1	1	<b>4,5</b>
2x50G	0	0	0	0
	1	1	1	4
2x50G Breakout	0	0	0	0
	1	1	1	2

1. Bold identifies the auto-neg PMD lane

### 3.2.2.3.3 Port Mapping - E810-XXVAM2 SKU

The E810-XXVAM2 product in the 21x21 mm package shares the same core features as the E810-CAM2/CAM1 products in the 25x25 mm package, with the exception of limited interfaces. The PCIe interface is limited to Gen4 x8, and the Ethernet interface limited to two ports maximum at 25G and lower speeds, or a single port of 50G, implemented as 2x25G SerDes (that is, 50GBASE-CR2).

**Table 3-24. Port Mapping - E810-XXVAM2**

Mode	Physical Function (PF)	E810 MAC Number	PHY ONPI Port Number	PMD Number <sup>1</sup>
2x25G	0	0	0	<b>0</b>
	1	1	1	<b>1</b>
1x50G	0	0	0	<b>0,1</b>

1. Bold identifies the auto-neg PMD lane

### 3.2.2.4 PHY Lane Mapping per Port Mode

In single-lane mode, there is a direct mapping between the PHY ONPI port and the PHY PMD lane. In multi-lane mode, a single PHY ONPI port is mapped to 2 or 4 PMD lanes. The E810 PHY Core supports multi-lane mode at port 0 and port 4. Port 0 can be mapped to PMD lanes 0-2 for a dual-lane mode, or lanes 0-3 for a 4-lane mode. Port 4 can be mapped to PMD lanes 2-3 for a dual-lane mode, or lanes 4-7 for a 4-lane mode.

**Table 3-25. E810 PMD Lane Mapping per Port Mode**

		Site #/PMD#/Supported PMD Rates								Port Mode	Notes/Limitations	
Site	Site 0				Site 1							
PMD	0*	1	2	3	4*	5	6	7				
QSFP Lane	1	2	3	4	1	2	3	4				
CFG1.1	50G		50G							2	<b>CFG1.1:</b> 4xSFP (2-port and 4-port modes) <b>Note:</b> The 4x SFP implementation also supports 2x50GBASE-R on PMD lane 0 and 2. This configuration multiplexes the Site 1 serial lanes to Site 0.	
	25G	25G	25G	25G						4		
	10G	10G	10G	10G						4		
	1G	1G	1G	1G						4		
	100M	100M	100M	100M						4		
CFG3.1	100G-R4									2	<b>CFG3.1:</b> 1xQSFP (2-port and 4-port modes, including breakout) <b>Note:</b> This configuration multiplexes the Site 1 serial lanes to Site 0. Site 0 configuration now effectively supports QSFP and QSFP breakout cables. Site 1 is disabled due to the internal multiplexing structure.	
	100G-R2									2		
	50G-R2		50G-R2							2		
	50G		50G							2		
	25G	25G	25G	25G						4		
	10G	10G	10G	10G						4		
	1G	1G	1G	1G						4		
	100M	100M	100M	100M						4		
CFG4.1	100G-R4				100G-R4						2	<b>CFG4.1:</b> 2xQSFP (2-port, 4-port, and 8-port modes) <b>Note:</b> CFG4.x is a superset of CFG3.x. A system designed with CFG4 can also use the breakout mode described in CFG3 on Site 0. <b>Note:</b> For the noted PMD lanes (Note 1), the configuration is only supported with topology resolution when breakout cables are plugged in. This would force the E810 to be configured in a 4-port/8-port mode.
	100G-R2				100G-R2						2	
	50G-R2				50G-R2						2

--------------------	------------------	-----	-----	---------

## 3.2.3 Link Management

### 3.2.3.1 Link Management Interfaces

The E810 supports either MDIO or I<sup>2</sup>C interfaces for control plane connection between the MAC (master side) and external PHY devices. The MDIO or I<sup>2</sup>C interfaces enable both MAC and firmware access to the PHY for monitoring and controlling of the PHYs functionality. E810 MDIO is compliant with the IEEE Std 802.3 Clause 45 as well as IEEE Std 802.3 Clause 22 frame formats and register address space for accessing legacy PHY devices. E810 I<sup>2</sup>C is compliant with the I<sup>2</sup>C bus specification.

Since I<sup>2</sup>C and MDIO interfaces requires 3.3 V pads, the I<sup>2</sup>C and MDIO controllers are not implemented within the E810. Instead they are placed in a widget. E810 firmware accesses the I<sup>2</sup>C and MDIO controllers via registers.

The E810 supports up to six management interfaces (one per port, in 2-port or 4-port configurations) to control external PHY devices. In configurations where the number of ports is higher than four, each management interface should be shared (that is, a single management interface for four ports). Depending on the PHY type to manage, the management interface can be configured for either MDIO or 2-wire management interface.

To manage multi-port PHYs, an I<sup>2</sup>C/MDIO interface can be configured to control a quad-port PHY, or two I<sup>2</sup>C/MDIO interfaces can be configured to control two dual-port PHYs. The PHY configuration registers for each port are mapped into the respective I<sup>2</sup>C/MDIO address space. In configurations in which the number of ports is higher than four, five E810 I<sup>2</sup>C/MDIO interfaces can be configured to control up to five quad-port PHYs. The sixth I<sup>2</sup>C/MDIO interface is usually shared between all devices and is used for PHYs, LED controllers, thermal sensor or other devices that can share the I<sup>2</sup>C or MDIO bus. The MDIO can be used for PHYs or other devices that can share the bus. The I<sup>2</sup>C bus is either replicated, using I<sup>2</sup>C port extender, or used for devices that can share the I<sup>2</sup>C bus. Alternatively, the I<sup>2</sup>C bus can be used by single I<sup>2</sup>C device.

**Note:** PHY mezzanine daughter cards are not supported in the E810.

The E810 provides hardware acceleration of MDIO accesses over the 2-wire management interface. The device driver manages the external devices using the admin commands (see [Section 3.2.4, “Link Configuration Admin Commands”](#)). The device driver does not have direct access to the MDIO bus except for diagnostic purposes. Firmware performs direct access to MDIO interface, using register read and write commands to the widget, for reading and writing to the PHY device as described in the paragraphs that follow.

[Figure 3-7](#) shows the a basic example of connectivity between the MAC and an external PHY/module for up to four ports.

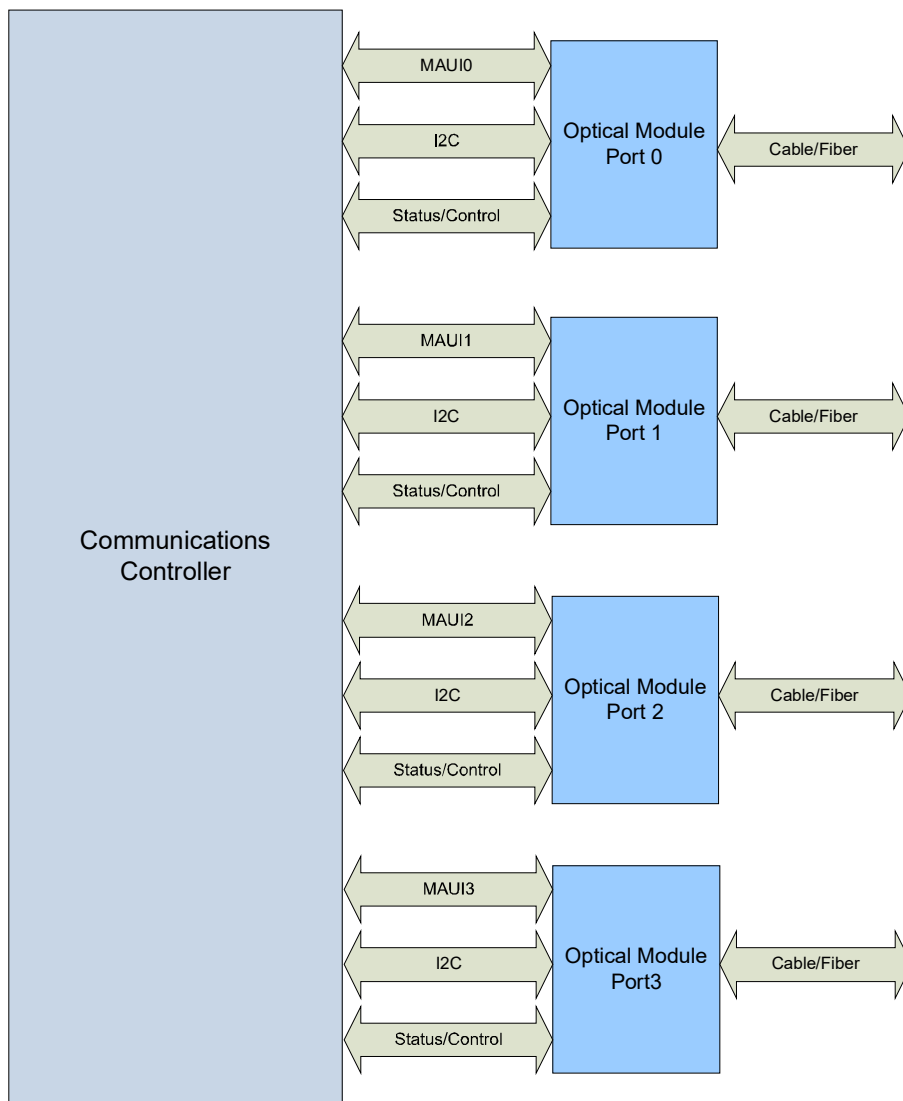

Figure 3-7. Basic PHY/Module Connectivity

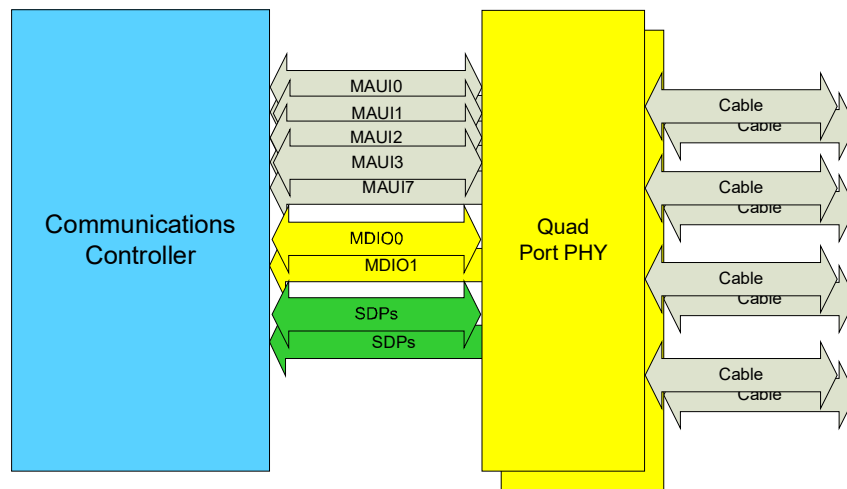

### 3.2.3.2 Link Management Topologies

The E810 supports MDIO and 2-wire management interface (I<sup>2</sup>C) for connectivity to external modules, re-timers, and PHYs (for example, SFP+ or QSFP+ optical and direct attached copper PHYs).

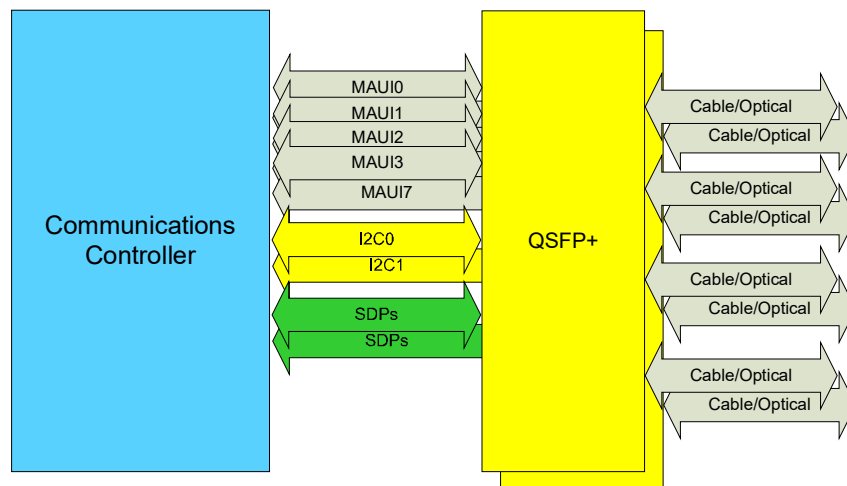

The E810 supports up to five management interfaces (one per port - for up to 4-port configurations) to control external PHY devices. Depending on the PHY type to manage these can be configured for either MDIO or 2-wire management interface.

The link topology is described using a netlist in NVM section (see [Section 3.3](#)).

[Figure 3-8](#) and [Figure 3-9](#) show the basic examples of connectivity between the MAC and an external module.

**Figure 3-8. Basic Example of Module Connectivity**

**Figure 3-9. Basic Example of Module Connectivity**

### 3.2.3.2.1 The E810's SFP+ Connectivity Scheme (Up to 4 Ports Topologies)

Figure 3-10 and Figure 3-11 illustrate the low speed digital signals used when connecting the E810 to SFP+ modules with topologies of up to four ports.

**Note:** The diagram illustrates the minimal connectivity required. Additional SDPs can be used to connect to the SFP+ module for direct hardware signaling (for example, *TX\_FAULT*). However, these are not mandatory and can be replaced with register access through the I<sup>2</sup>C management interface.

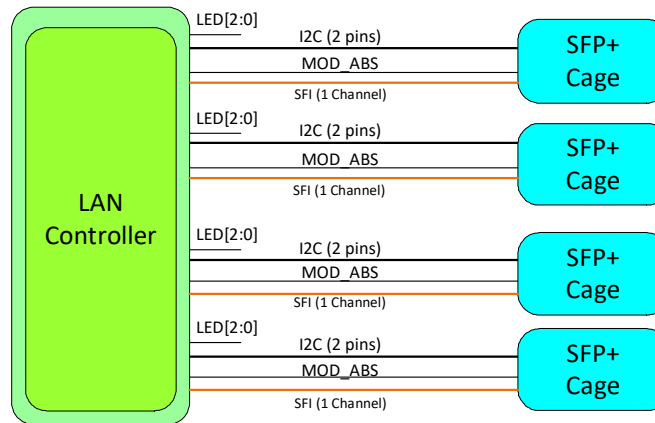

Figure 3-10. Quad 10G SFP+<sup>1</sup>

1. In 4-port configuration, the E810 provides up to 3 LEDs per port.

Figure 3-11. Quad 10G SFP+ with Re-driver PHY<sup>1</sup>

1. In 4 port configuration, the E810 provides up to 3 LEDs per port

### 3.2.3.2.2 The E810's QSFP+ Connectivity Scheme (Up to 8 Ports Topologies)

Figure 3-12 and Figure 3-13 illustrate the low speed digital signals used when connecting the E810 to QSFP+ modules.

**Note:** The diagrams illustrates the minimal connectivity required. Additional SDPs can be used to connect to the QSFP+ module for direct hardware signaling (for example, ResetL). However, these are not mandatory and can be replaced with register access through the I<sup>2</sup>C management interface.

The E810 also supports a mode where an SFP module is inserted in a QSP+ cage using a QSA module adapter.

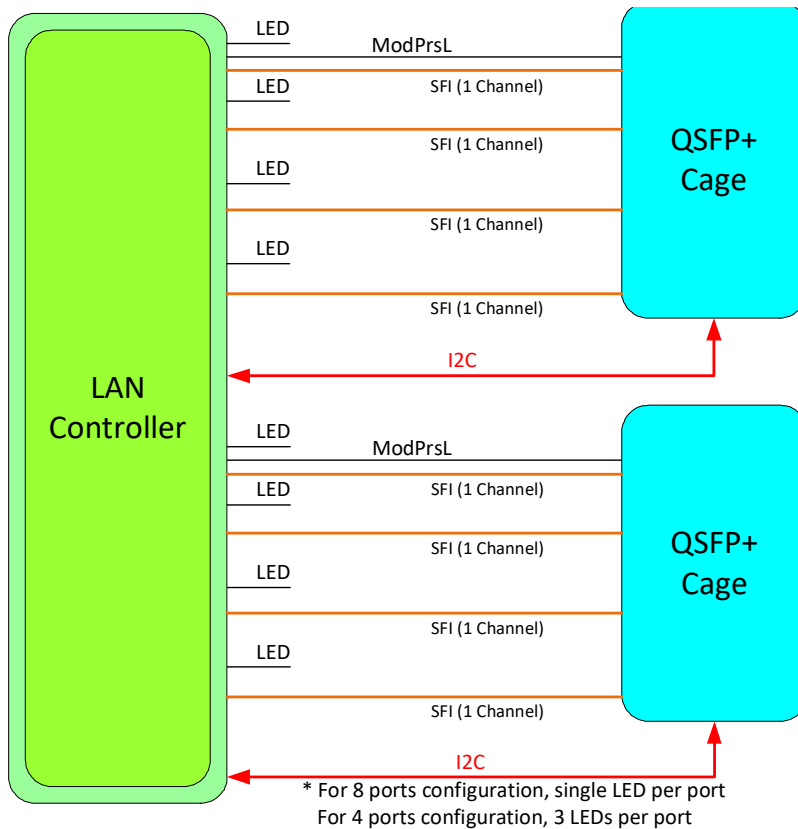

Figure 3-12. Octal 10GDual QSFP+

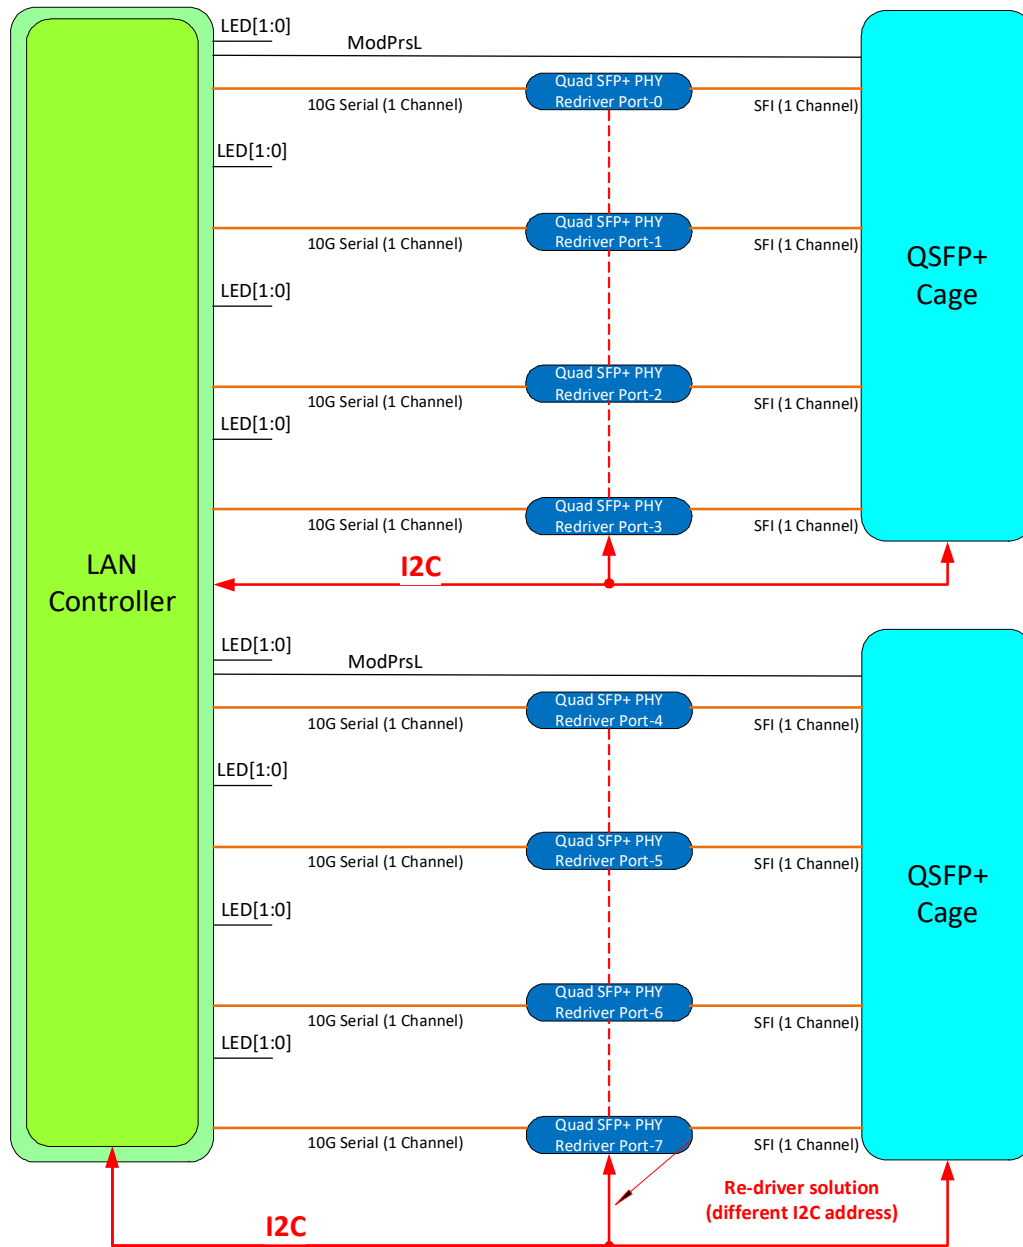

Figure 3-13. Octal 10GDual QSFP+ with Re-driver PHY

### 3.2.3.2.3 The E810's BASE-T Connectivity Scheme

Figure 3-14 illustrates the low speed digital signals used when connecting the E810 to BASE-T PHYs.

**Note:** The diagram illustrates the minimal connectivity required. Additional SDPs can be used to connect to the PHY for direct hardware signaling INT. However, these are not mandatory and can be replaced with register access through the MDIO management interface.

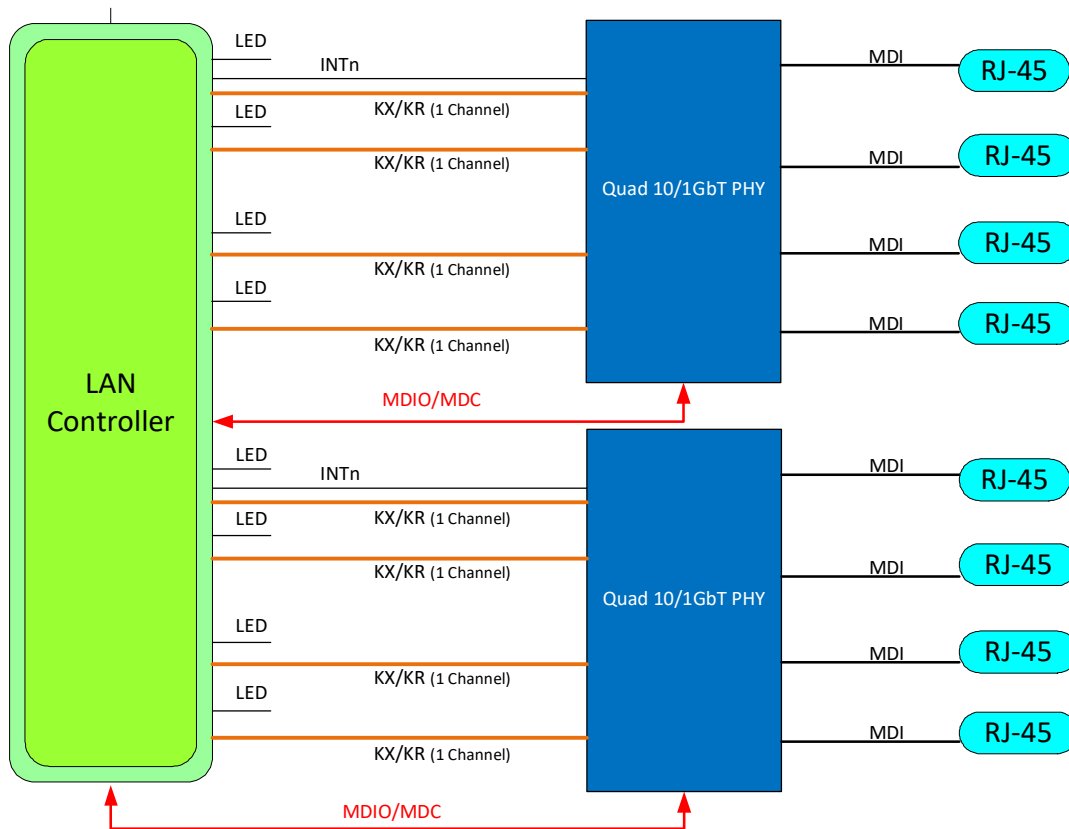

Figure 3-14. Octal 10GBASE-T/1GBASE-T

**Note:** The SFP+ module is shown with four SDP pins per port for dedicated hardware functions. The *TX\_Disable* bit of the SFP+ module is accessed by software through the I<sup>2</sup>C interface. Alternatively, one of the global GPIO pins can be connected to *TX\_Disable* pin.

**Note:** The SFP+ module is shown above with four SDPs. However, the minimum number of SDPs required is only one, which should be connected to the module's *Mod\_ABS* pin.

Furthermore, when connecting to a pluggable 1GBASE-T module, the minimum number of SDPs required is two, since an additional SDP is required for connecting to the module *Rx\_LOS* signal for accurate link state reporting to the link management firmware. There are, however, specific pluggable BASE-T modules that can be supported without *Rx\_LOS*. For specific model numbers please contact Intel support.

### 3.2.4 Link Configuration Admin Commands

The E810 supports the following admin commands for configuring and managing the link. Software should use the admin commands to configure the link. This includes configuring the MAC and internal/external PHY devices. The firmware provides link configuration and status services to the device driver based on these admin commands.

Software can use the Get Link Status command to find out the current status of the link.

**Table 3-26. Link Configuration Admin Commands (0x06xx)**

Command	Opcode	Description	Section Reference
Set PHY Config	0x0601	Sets various PHY configuration parameters on the port.	<a href="#">3.2.4.1.1</a>
Set MAC Config	0x0603	Sets various MAC configuration parameters on the port.	<a href="#">3.2.4.1.2</a>
Setup Link and Restart Auto-Negotiation <sup>1</sup>	0x0605	Sets up the link and restarts link establishment. This command applies the latest link configuration as configured with the <a href="#">Set PHY Config (0x0601)</a> command. The command also restarts the link establishment process. For links configured for auto-negotiation, it starts the auto-negotiation process. This operation could bring down the link. This command must be executed to allow the latest link parameters to take effect on the link.	<a href="#">3.2.4.1.3</a>
Get PHY Abilities	0x0600	Gets various PHY abilities supported on the port.	<a href="#">3.2.4.1.4</a>
Get Link Status	0x0607	Gets link status of the port.	<a href="#">3.2.4.1.5</a>
Link Status Event	0x0607	Firmware sends this asynchronous event notification to software when there is a change in status in any of the event causing conditions (such as link up/down or other link error conditions).	<a href="#">3.2.4.1.6</a>
Set Event Mask	0x0613	Sets event mask. Software can mask some or all of the link status event causing conditions.	<a href="#">3.2.4.1.7</a>

1. In SFP mode, the Setup Link and Restart Auto-Negotiation command must be executed by the device driver or any other change in link parameters to take effect on the link. This operation could disrupt the link since the link state might toggle while the link is re-initialized with the new parameters.

### 3.2.4.1 Link Configuration Commands

This section provides a detailed description of the link configuration admin commands and their structure.

#### 3.2.4.1.1 Set PHY Config (0x0601)

This command is used by the device driver to set the various PHY configuration parameters supported on the port.

This is an indirect command. Set PHY Config command parameters data structure is placed in the data buffer.

**Note:** This command must be followed by the [Setup Link and Restart Auto-Negotiation \(0x0605\)](#) command for any changes to the link parameters to actually take place. Some parameter settings might take effect immediately with this command execution, as specified below.

**Table 3-27. Set PHY Config Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0601	Command opcode.
Datalen	4-5	0x18	Length of the data buffer in bytes.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware. Error codes are documented in the response buffer description in <a href="#">Table 3-29</a> .
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16		Logical Port number. This field specifies the logical port number, and is ignored in the E810
Reserved	17-23	Reserved	Value 0x0.
Data Address High	24-27	Buffer Address	High bits of the buffer address.
Data Address Low	28-31	Buffer Address	Low bits of the buffer address.

In the E810, the command is indirect and contains a data buffer. The structure of the data buffer is described in [Table 3-28](#).

**Table 3-28. Set PHY Config Command Data Structure**

Name	Bytes.Bits	Value	Remarks
PHY Type	0-15	PHY Type	<p>128 bits PHY type (PHY capabilities) supported on port.</p> <p>128 bits structure, describing capabilities of the outermost PHY, with one bit per PHY capability. PHYs connected to the E810 might be capable of supporting multiple PHY types, indicated using the link topology netlist. The software driver uses this command to indicate the capabilities to enable.</p> <p>This structure is identical to the extended PHY capabilities structure, as described in <a href="#">Section 3.3.3.2.1</a>.</p> <p>This parameter is used by the device driver to set the various PHY capabilities to be supported on the port. The port can be configured for a subset of the actual PHY capabilities available on the port. The actual PHY capabilities available are read by the device driver using <a href="#">Get PHY Abilities (0x0600)</a> command.</p> <p>When the link establishment state machine (LESM) is enabled, the E810 tries one of the enabled PHY types that matches the media capabilities and selects this PHY capability when the link is up.</p> <p>When the LESM is disabled, this field should enable only a single value, and then the E810 is forced to operate in that selected mode.</p> <p>Some of the PHY capabilities might require the auto-negotiation feature, which might resolve some of the link parameters, such as speed and FEC, according to the negotiation result with the link partner.</p>
PAUSE Ability	16.0-16.1	Pause Ability	<p><b>Bit 16.0:</b> Tx Link Pause 0b = Disable PAUSE ability. 1b = Enable IEEE 802.3x Tx link PAUSE ability.</p> <p><b>Bit 16.1:</b> Rx Link Pause 0b = Disable PAUSE ability. 1b = Enable IEEE 802.3x Rx link PAUSE ability.</p> <p>Auto-negotiation might have to be restarted for this configuration to take effect over the link.</p> <p>This parameter is used by the device driver to set the IEEE 802.3x pause ability of the port. The E810's pause ability can be read using the <a href="#">Get PHY Abilities (0x0600)</a> or <a href="#">Get Link Status (0x0607)</a> commands. The device driver might disable the IEEE 802.3x link PAUSE ability using this command. If the link is already up and configured, the device driver needs to restart auto-negotiation, so the updated PAUSE ability could be advertised to the link partner for the setting to take effect on the link.</p> <p><b>Note:</b> When PFC is enabled, firmware turns off the PAUSE ability bits during auto-negotiation regardless of the setting used in the admin command. However, if PFC will be disabled in the future, the last setting of the PAUSE ability bits is used.</p>
Low Power Ability	16.2	Low Power Mode	<p><b>Bit 16.2:</b> Power Mode 0b = High Power mode. 1b = Low Power mode.</p> <p>QSFP+:</p> <ul style="list-style-type: none"> <li>This is ignored if NVM loaded &lt;Low Power Ability&gt; = Low Power.</li> </ul> <p>When QSFP+ is shared between multiple ports:</p> <ul style="list-style-type: none"> <li>Firmware sets the power mode based on the setting of the first (lower power number) port in the group and ignore the settings of the other ports in the group.</li> <li>The setting of Low Power Ability by one PF automatically changes the Low Power Ability of all PFs sharing the QSFP+. This can result in link loss on all ports.</li> <li>Firmware identifies which ports are sharing a QSFP+ by looking at the ModPresL SDP and seeing that it is shared between multiple ports.</li> </ul>
Enable Link	16.3	Enable Link	<p><b>Bit 16.3:</b> Link Enable 0b = Disable the link. 1b = Enable the link.</p> <p>Device driver should not force link down when port is being used for manageability or WoL.</p>

**Table 3-28. Set PHY Config Command Data Structure [continued]**

Name	Bytes.Bits	Value	Remarks
Reserved	16.4	Reserved	Reserved.
Enable Automatic Link Update	16.5	Enable Automatic Link Update	<p><b>Bit 16.5:</b> Automatic Link Update Enable</p> <p>0b = The device driver maintains the responsibility for sending the <a href="#">Setup Link and Restart Auto-Negotiation (0x0605)</a> command.</p> <p>1b = Firmware automatically executes the <a href="#">Setup Link and Restart Auto-Negotiation (0x0605)</a> command following this command.</p> <p>When automatic link update is enabled, the device driver should be aware that a link change event can occur following the <a href="#">Set PHY Config (0x0601)</a> command.</p>
LESM Enable	16.6	LESM Enable	<p><b>Bit 16.6:</b> LESM Enable</p> <p>1b = Enables the Link Establishment State Machine.</p>
Auto FEC Enable	16.7	Auto FEC Enable	<p><b>Bit 16.7:</b> Auto FEC Enable</p> <p>1b = Enables the automatic selection of FEC mode.</p>
Low Power Control	17	D3cold LPAN	<p><b>Bit 17.0:</b> D3cold LPAN</p> <p>0b = Disable D3cold low power auto-negotiation.</p> <p>1b = Enable D3cold low power auto-negotiation.</p> <p><b>Bit 17.3:</b> AN37 Enable - Clause 37 auto-negotiation enable.</p> <p>0b = AN37 disabled.</p> <p>1b = AN37 enabled on 1G links.</p> <p><b>Note:</b> The value of <i>AN37 Enable</i> bit should be propagated from <a href="#">Get PHY Abilities (0x0600)</a> output to <a href="#">Set PHY Config (0x0601)</a> input for all default Software and firmware flows.</p> <p><b>All other bits</b> = Reserved. Must be zero.</p>
EEE Capability Enable	18-19	EEE Capability	<p>Sets EEE capability for each PHY type supported on the port. One bit per PHY type. These capabilities refers to the outermost PHY connected to the E810 link. The following parameter indicates the bit number. Ignores values for unsupported PHY types.</p> <p>This structure is aligned with the "EEE options 1", in the link topology netlist. See <a href="#">Section 3.3.8.6.8</a>.</p> <p><b>Bit 18.0:</b> EEE is enabled for 100BASE-TX.</p> <p><b>Bit 18.1:</b> EEE is enabled for 1000BASE-T.</p> <p><b>Bit 18.2:</b> EEE is enabled for 10GBASE-T.</p> <p><b>Bit 18.3:</b> EEE is enabled for 1000BASE-KX.</p> <p><b>Bit 18.4:</b> EEE is enabled for 10GBASE-KR.</p> <p><b>Bit 18.5:</b> EEE is enabled for 25GBASE-KR</p> <p><b>Bit 18.7:</b> EEE is enabled for 50GBASE-KR2</p> <p><b>Bit 19.0:</b> EEE is enabled for 50GBASE-KR-PAM4</p> <p><b>Bit 19.1:</b> EEE is enabled for 100GBASE-KR4</p> <p><b>Bit 19.2:</b> EEE is enabled for 100GBASE-KR2-PAM4</p> <p><b>All other bits</b> = Reserved. Must be zero.</p> <p>This field is used by the device driver to enable the EEE capability of various PHY types supported on the port. The EEE capability of the E810 can be read by the <a href="#">Get PHY Abilities (0x0600)</a> command. The device driver might set EEE capability for a subset of PHY types supported by the E810.</p>
EEER	20-21	EEER Value	<p>Value to program the EEER register.</p> <p><b>Note:</b> The EEER register is changed immediately with the execution of this command.</p>

**Table 3-28. Set PHY Config Command Data Structure [continued]**

Name	Bytes.Bits	Value	Remarks
Link FEC Options	22	Link FEC Options	<p>Sets the FEC options to the link. This field is aligned with the FEC options in "Link options 0" of the topology netlist.</p> <p><b>Bit 22.0: FIRE_CODE_10_ABILITY Enable</b> Controls FEC capability advertisement for 10G KR. 0b = FEC disabled. 1b = FEC enabled (advertised).</p> <p><b>Bit 22.1: FIRE_CODE_10_REQUEST</b> Controls FEC capability request for 10G KR. 0b = FEC disabled. 1b = FEC Enabled (requested).</p> <p><b>Bit 22.2: RS_528_REQUEST</b> Controls RS FEC 528 capability request for 25G lanes KR/KR-S/KR1/CR/CR-S/CR1. 0b = FEC disabled. 1b = FEC Enabled (requested).</p> <p><b>Bit 22.3: FIRE_CODE_25_REQUEST</b> Controls KR FEC capability request for 25G lanes KR/KR-S/KR1/CR/CR-S/CR1. 0b = FEC disabled. 1b = FEC Enabled (requested).</p> <p><b>Bit 22.4: RS_544_REQUEST</b> Controls RS FEC 544 capability request for 25G/50G lanes KR/KR-S/KR1/CR/CR-S/CR1.</p> <p><b>Bit 22.5: No FEC:</b> Controls link enable when FEC is disabled 0b = Link not requested with FEC disabled. 1b = Link requested with FEC disabled.</p> <p><b>Bit 22.6: RS_528_ABILITY</b> Controls RS FEC ability advertisement for 25G KR1/CR1. 0b = FEC disabled. 1b = FEC enabled (advertised).</p> <p><b>Bit 22.7: FIRE_CODE_25_ABILITY</b> Controls KR FEC ability advertisement for 25G KR1/CR1. 0b = FEC disabled. 1b = FEC enabled (advertised).</p>
Module Compliance Enforcement	23.0		<p>0b = Lenient 1b = Strict</p>
Reserved	23.1-23.7	0x0	Reserved. Set to 0x0.

The following structure describes the response by firmware to the Set PHY Config command.

**Table 3-29. Set PHY Config Command Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0601	Command opcode.
Datalen	4-5		Length of the data buffer in bytes.
Return Value/VFID	6-7		Return value. 0 = No error. Command completed successfully. 1 = EPERM. Operation is not permitted. 12 = EBUSY. For example, when the command is called when a previous request to program or read the external topology device is ongoing. This code also returned when RDE operation is currently executed. 21 = EMODE. Operation not allowed in current device mode. This error is returned when the command is called with disable link, but the link is configured to be used for manageability. At this case, the link is not configured.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16		Logical Port number. This field specifies the logical port number, and is ignored in the E810.
Param0	17-19	Reserved	Zeroed by firmware,. Value is ignored.
Param1	20-23	Reserved	Must be 0x0. Value is ignored.
Data Address High	24-27	Buffer Address	High bits of the buffer address.
Data Address Low	28-31	Buffer Address	Low bits of the buffer address.

**Note:** When *Enable Automatic Link Update* is set to 1b, firmware sends a completion for the Set PHY Config command only after making all the necessary configuration changes and executing the [Setup Link and Restart Auto-Negotiation \(0x0605\)](#) command.

### 3.2.4.1.2 Set MAC Config (0x0603)

This command is used by the device driver to set the various MAC configuration parameters supported on the port. This status is indicated by the command response.

This is a direct command. The Set MAC Config command parameters data structure is placed in the command descriptor.

**Table 3-30. Set MAC Config Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0603	Command opcode.
Datalen	4-5	0x0	Must be 0x0. Value is ignored.
Return Value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Set MAC Config	16-31	See <a href="#">Table 3-31</a>	16-byte data structure that holds the Set MAC Config command parameters as listed in <a href="#">Table 3-31</a> .

[Table 3-31](#) lists the data structure of the Set MAC Config command parameters, such as max frame size, and so on.

**Table 3-31. Set MAC Config Command Data Structure**

Name	Bytes.Bits	Value	Remarks
Max Frame Size	0-1	Max Frame Size	16-bit value used to set the maximum frame size of the Ethernet frame on the port. This parameter is used by the device driver to set the maximum frame size on the port both for Rx and for Tx. This parameter should be set to the maximum expected L2 packet size. It is ~1.5 KB or ~9.5 KB depending if jumbo packets are expected on the link. The firmware should return ERANGE error when the value provided by the software is bigger than the maximal frame size supported by the MAC (9.5K). <b>Note:</b> The maximal frame size is checked on packets transmitted before the Ethernet CRC is appended to them. For received packets, the check is performed on the packet length that includes the Ethernet CRC.
Reserved	2.0-2.2	Reserved	Must be 0x0
Pacing config	2.3-2.7	Pacing Config	<b>Bits 2.6-2.3:</b> This is 4 bit field that allows configuring PACE parameter in the MAC to slow down the effective data rate. For data rate pacing, as defined in <a href="#">Table 3-18</a> . For Fixed IPG pacing, defines the number of 16-byte words added. <b>Bit 2.7:</b> Pacing Type 0b = Data rate pacing. 1b = Fixed IPG pacing.
Transmit Timer Priority	3	Transmit Timer Priority	This bitmap field selects the priority <n>, with one bit per priority. The priorities selected here are updated with the <i>Transmit Time Value</i> field and the <i>FC Refresh Threshold</i> field with the values provided in this command. For additional register description, see <a href="#">Section 3.2.1.5</a> .

**Table 3-31. Set MAC Config Command Data Structure [continued]**

Name	Bytes.Bits	Value	Remarks
Transmit Timer Value	4-5	Transmit Timer Value	This is the priority <n> timer value that is included in the XOFF frames being transmitted, where <n> is selected in the <i>Transmit Timer Priority</i> bitmap above. <n> = 0 is used for Link Level FC. For additional register description, see <a href="#">Section 3.2.1.5</a> .
FC Refresh Threshold	6-7	FC Refresh Threshold	This field represents priority <n> FC refresh threshold, that specifies how many slot time before the XOFF expires, a new XOFF is sent. <n> is selected in the <i>Transmit Timer Priority</i> bitmap above. When <n> = 0, the value is used for link level flow control. This value is used to calculate the actual refresh period for sending the next pause frame if conditions for a pause state are still valid. For additional register description, see <a href="#">Section 3.2.1.5</a> .
Auto Drop Blocking Packets	8.0		This bit controls the behavior when a no-drop packet is blocking a TC queue. 0b = The PF driver is notified. 1b = The blocking packet is dropped and then the PF driver is notified.
Reserved	8.1-15	Reserved	Must be 0x0.

The following data structure describes the response by firmware to the Set MAC Config command.

**Table 3-32. Set MAC Config Command Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0603	Command opcode.
Datalen	4-5	0x0	Must be 0x0. Value is ignored.
Return Value/VFID	6-7		Return value. 0x0 = Command success. Returns EPERM code if the operation is not permitted.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31	Reserved	Value 0x0.

### 3.2.4.1.3 Setup Link and Restart Auto-Negotiation (0x0605)

This command is used by the device driver to setup the link and execute previously-sent [Set PHY Config \(0x0601\)](#) commands, as well as restart the link establishment process. When the link is configured to auto-negotiation mode, the link establishment state machine also starts the auto-negotiation process over the link. This command must be executed for any change in link parameters, such as set link speed (and so on) to take effect.

This is a direct command.

**Table 3-33. Restart Auto-Negotiation Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0605	Command opcode.
Datalen	4-5	0x0	Must be 0x0. Value is ignored. 0 = No error. Command completed successfully. 20 = EMODE. Operation not allowed in current device mode. This error is returned when the command is called with disable link, but the link is configured to be used for manageability. At this case, the link is not configured.
Return Value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16		Logical Port number. This field specifies the logical port number, and is ignored in the E810.
Reserved	17	Reserved	Must be 0x0. Value is ignored.
Command Flags	18	Command	<b>Bit 18.1:</b> Restart Link 1b = Restart the link. <b>Bit 18.2<sup>1</sup>:</b> Enable Link 0b = Disable link. 1b = Enable link. <b>All other bits</b> = Reserved. Must be zero. This command might be executed automatically by firmware, following a <a href="#">Set PHY Config (0x0601)</a> command, with the <i>Enable Automatic Link Update</i> bit (16.5) set. In such a case, these bits are assigned by firmware as follows: Bit 18.1 is set to 1. <b>Note:</b> Bit 18.2 is copied from the <i>Enable Link</i> field in the Set PHY Config command.
Reserved	19-31	Reserved	Must be 0x0. Value is ignored.

1. Used by the device driver to enable/disable the link without modifying the other link settings. This is useful at POR when an application needs to have link powered down until the device driver loads.

The following structure describes the response by firmware to the Restart Auto-Negotiation command.

**Table 3-34. Restart Auto-Negotiation Command Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0605	Command opcode.
Datalen	4-5	0x0	Must be 0x0. Value is ignored.
Return Value/VFID	6-7		Return value. 0 = No error. Command completed successfully <sup>1</sup> . 12 = EBUSY. For example, when the command is called when a previous request to program or read the external topology device is ongoing. This code also returned when RDE operation is currently executed. 20 = EMODE. Operation not allowed in current device mode. This error is returned when the command is called with disable link, but the link is configured to be used for manageability. At this case, the link is not configured.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16		Logical Port number. This field specifies the logical port number, and is ignored in the E810.
Reserved	17-31	Reserved	Value 0x0.

1. Successful completion of this commands only means that firmware accepted the command and will act accordingly. For example, if the request is to enable the link, firmware will try to enable it. The link could be brought up after the command is successfully completed, or could stay down because of other link issues.

### 3.2.4.1.4 Get PHY Abilities (0x0600)

This command is used by the device driver to find out the various PHY abilities supported on the port. This is an indirect command.

**Table 3-35. Get PHY Abilities Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0600	Command opcode.
Datalen	4-5		Length of the response buffer in bytes. The software driver should supply a buffer with enough space to be filled by firmware
Return Value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16		Logical Port number. This field specifies the logical port number, and is ignored in the E810.
Reserved	17	Reserved	Must be 0x0. Value is ignored.
Param0	18-19	Command	<p>First command parameter.</p> <p><b>Bit 18.0:</b> Report Qualified Modules List of qualified modules is part of the response only when this bit is set to 1b.</p> <p><b>Bits 18.3-18.1:</b> Report Mode</p> <p>000b = <b>Report Topology Capabilities, without Media:</b> Report capabilities structure as read from the topology netlist in NVM or ID EEPROM. This report ignores the media that might be connected and limits the capabilities.</p> <p>001b = <b>Report Topology Capabilities, with Media:</b> Report capabilities as read from topology netlist in NVM and ID EEPROM, intersect with the media information, if exists.</p> <p>Examples:</p> <p>When the topology includes cage, but it is empty, it reports all possible module types and speeds, just like 00b report mode.</p> <p>When there is specific media connected (that is, a module is populated into the cage), it reports only modes speeds supported by the media or the module.</p> <p>010b = <b>Report Active Configuration:</b> Report the capabilities of the active configuration. The active configuration can be taken from the last software configuration, but it can be modified by firmware (for example, when a new module is inserted or NC-SI command is executed). When the <i>Override Enable</i> bit is set at the Link Default Override Mask PFA section, the capabilities are taken from the same PFA section.</p> <p>011b = <b>Report PHY Type and FEC Mode Capabilities:</b> Report PHY Type and FEC mode capabilities of the port based on Link Management analysis of the inserted media.</p> <p>100b = <b>Report Default Configuration:</b> This report mode returns the default configuration based on link topology netlist, "Link Default Override Mask" PFA section, relevant override bits in the PFA section and Strict or Lenient mode. The default configuration does not depend on the software configuration that might be applied using Set PHY Config admin command.</p> <p><b>All other bits</b> = Reserved.</p>
Reserved	20-23	Reserved	Must be 0x0. Value is ignored.
Data Address High	24-27	Buffer Address	High bits of the buffer address.
Data Address Low	28-31	Buffer Address	Low bits of the buffer address.

Table 3-36 lists the Get PHY Abilities response structure returned by firmware to the Get PHY Abilities command. The response, opcode, and Get PHY Abilities response data structure buffer address are placed in the descriptor. The Get PHY Abilities response data structure is placed in a buffer.

**Table 3-36. Get PHY Abilities Command Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See Section 9.5.5.2.1 for details.
Opcode	2-3	0x0600	Command opcode.
Datalen	4-5		Set by firmware according to the actual size of the response buffer.
Return Value/VFID	6-7		Return value. EINVAL = Invalid parameters (for example, buffer too small). EIO = Error while accessing the information. EAGAIN = PHY/module interface currently busy, retry.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16		Logical Port number. This field specifies the logical port number, and is ignored in the E810.
Reserved	17-23	Reserved	Reserved. Must be set to 0x0.
Data Address High	24-27	Buffer Address	Buffer address.
Data Address Low	28-31	Buffer Address	

Table 3-37 lists the format of the buffer content for the Get PHY Abilities reply.

**Table 3-37. Get PHY Abilities Command Response Data Structure**

Name	Bytes.Bits	Value	Remarks
PHY Type	0-15	PHY Type	See detailed description in Table 3-90.
Pause Ability	16.0:16.1	Pause Ability	<b>Bit 16.0:</b> Returns 1b if the port advertises IEEE 802.3x Tx link PAUSE ability. Otherwise, returns 0b. <b>Bit 16.1:</b> Returns 1b if the port advertises IEEE 802.3x Rx link PAUSE ability. Otherwise, returns 0b. This parameter can be used by the device driver to determine the IEEE 802.3x PAUSE abilities of the port.
Low Power Ability	16.2	Low Power Ability	<b>Bit 16.2:</b> Power Mode 0b = High Power mode. 1b = Low Power mode.
Link Mode	16.3	Link Mode	<b>Bit 16.3:</b> Link Mode 0b = Link is disabled. 1b = Link is enabled.
Reserved	16.4		Reserved.
Enable Module Qualification	16.5	Enable Module Qualification	<b>Bit 16.5:</b> Module Qualification Returns 1b if a external module or PHY qualification check is enabled.
LESM Enable	16.6	LESM Enable	<b>Bit 16.6:</b> LESM Returns 1b if the Link Establishment State Machine is enabled.
Auto FEC Enable	16.7	Auto FEC Enable	<b>Bit 16.7:</b> Auto FEC Returns 1b if the automatic selection of FEC mode is enabled.

**Table 3-37. Get PHY Abilities Command Response Data Structure [continued]**

Name	Bytes.Bits	Value	Remarks
Low Power Control / AN Modes	17	D3cold LPAN	<p><b>Bit 17.0:</b> D3cold LPAN 0b = D3cold low power auto-negotiation disabled. 1b = D3cold low power auto-negotiation enabled.</p> <p><b>Bit 17.1:</b> 0b = AN28 disabled. 1b = AN28 enabled.</p> <p><b>Bit 17.2:</b> 0b = AN73 disabled. 1b = AN73 enabled.</p> <p><b>Bit 17.3:</b> 0b = AN37 disabled. 1b = AN37 enabled on 1GF PHY Types.</p> <p><b>All other bits =</b> Reserved. Must be zero.</p> <p><b>Note:</b> The auto-negotiation enable bits are reserved when <a href="#">Get PHY Abilities (0x0600)</a> command is called with the <i>Report Active Configuration</i> parameter indicated, and firmware should return these bits as 0.</p>
EEE Capability	18-19	EEE Capability	<p>Reports EEE capability for each PHY type supported on the port. One bit per PHY type. These capabilities refers to the outermost PHY connected to the E810 link. The following parameter indicates the bit number.</p> <p>This structure is aligned with the "EEE options 1", in the link topology netlist. See <a href="#">Section 3.3.8.6.8</a>.</p> <p><b>Bit 18.0:</b> EEE is enabled for 100BASE-TX.  <b>Bit 18.1:</b> EEE is enabled for 1000BASE-T.  <b>Bit 18.2:</b> EEE is enabled for 10GBASE-T.  <b>Bit 18.3:</b> EEE is enabled for 1000BASE-KX.  <b>Bit 18.4:</b> EEE is enabled for 10GBASE-KR.  <b>Bit 18.5:</b> EEE is enabled for 25GBASE-KR  <b>Bit 18.7:</b> EEE is enabled for 50GBASE-KR2  <b>Bit 19.0:</b> EEE is enabled for 50GBASE-KR-PAM4  <b>Bit 19.1:</b> EEE is enabled for 100GBASE-KR4  <b>Bit 19.2:</b> EEE is enabled for 100GBASE-KR2-PAM4  <b>All other bits =</b> Reserved, Must be zero.</p>
EEER	20-21	EEER Value	Content of EEER register.
Current PHY ID/Vendor OUI	22-25	PHY ID/OUI	<p>This parameter is used by the device driver to find out the PHY/module ID connected on the port.</p> <p>If the E810 is connected to an external BASE-T PHY: This 4-byte field returns the {OUI, Manufacturer Model#, Revision ID} as defined in IEEE 802.3, 22.2.4.3.1 PHY Identifier (Registers 2 and 3).  <b>Bytes 23:22:</b> Register3.  <b>Bytes 25:24:</b> Register2.</p> <p>If the E810 is connected to an external module: This field returns the three-byte vendor OUI of the module (MSB is padded with zeros).</p>
Current PHY FW version	26-33	PHY Firmware Version	This 8-byte parameter indicates the external outermost PHY firmware version

**Table 3-37. Get PHY Abilities Command Response Data Structure [continued]**

Name	Bytes.Bits	Value	Remarks
Link FEC Options	34	Link FEC Options	<p>Returns the FEC options of the link. This field is aligned with the FEC options in "Link options 0" of the topology netlist. See <a href="#">Section 3.3.8.6.5</a>.</p> <p><b>Bit 34.0:</b> FIRE_CODE_10_ABILITY Enable Controls FEC capability advertisement for 10G KR. 0b = FEC Disabled. 1b = FEC Enabled (advertised).</p> <p><b>Bit 34.1:</b> FIRE_CODE_10_REQUEST Controls FEC capability request for 10G KR. 0b = FEC Disabled. 1b = FEC Enabled (requested).</p> <p><b>Bit 34.2:</b> RS_528_REQUEST Controls RS FEC 528 capability request for 25G KR/KR-S/KR1/CR/CR-S/CR1. 0b = FEC Disabled. 1b = FEC Enabled (requested).</p> <p><b>Bit 34.3:</b> FIRE_CODE_25_REQUEST Controls KR FEC capability request for 25G KR/KR-S/KR1/CR/CR-S/CR1. 0b = FEC Disabled. 1b = FEC Enabled (requested).</p> <p><b>Bit 34.4:</b> RS_544_REQUEST Controls RS FEC 544 capability request for 25G KR/KR-S/KR1/CR/CR-S/CR1.</p> <p><b>Bit 34.5:</b> No FEC Controls link enable when FEC is disabled. 0b = Link not allowed with FEC disabled 1b = Link allowed with FEC disabled</p> <p><b>Bit 34.6:</b> RS_528_ABILITY Controls RS FEC ability advertisement for 25G KR1/CR1. 0b = FEC Disabled. 1b = FEC Enabled (advertised).</p> <p><b>Bit 34.7:</b> FIRE_CODE_25_ABILITY Controls KR FEC ability advertisement for 25G KR1/CR1. 0b = FEC Disabled. 1b = FEC Enabled (advertised).</p>
Module Compliance Enforcement	35.0		<p>0b = Lenient 1b = Strict</p>
Reserved	35.1-35.7	Reserved	Reserved.
Current Module Extended Compliance Code	36	Extended Compliance Code	<p>Returns the extended compliance code of the module as defined in SFP+ (Address 0xA0, Byte 36) specification. This parameter is used by the device driver to find out the module type on the port when connected to external modules.</p>

**Table 3-37. Get PHY Abilities Command Response Data Structure [continued]**

Name	Bytes.Bits	Value	Remarks
Current Module Type	37-39	Module Type	<p>Returns the three-byte module ID.</p> <p>First byte: Module identifier. Defined by SFP+ (Address 0xA0, Byte 0) or QSFP+ (Address 128, page 0) specifications.</p> <p>Second byte: The following bits might be set to indicate the supported technologies: 0 = SFP+ Cu Passive 1 = SFP+ Cu Active 4 = 10G BASE-SR 5 = 10G BASE-LR Remaining bits are reserved.</p> <p>Third byte: GbE compliance code. Defined by SFP+ (Address 0xA0, Byte 6) or QSFP+ (Address 134, page 0) specifications.</p> <p>This parameter is used by the device driver to find out the module type on the port when connected to external modules. For example, the E810 might be connected to an SFP+ or QSFP+ optical or direct attached copper modules. The format of the module type returns the ID and Ethernet compliance code fields as defined in the SFP+ or QSFP+ specifications. There is no separate Ethernet compliance code for SFP+ copper modules. It is reported in a separate byte in SFP+ module. However, the E810 uses the unused bits in second byte to report SFP+ direct attach cables.</p>
Qualified Module Count	40		Number of qualified modules to be listed in the following bytes.
Reserved	41-47	Reserved	Reserved.
Qualified Module ID-n	48+n*32 - 79+n*32		<p>This is a list of qualified modules that are supported by the E810 and might be connected.</p> <p>The list contains a 24-byte field per module, based on IEEE Std 802.3 definition of device ID, containing:</p> <ul style="list-style-type: none"> <li>• Vendor OUI (3 bytes).</li> <li>• Reserved (1 bytes).</li> <li>• Vendor Part# (16 bytes).</li> <li>• Vendor Rev# (4 bytes).</li> <li>• Last 8bytes are reserved.</li> </ul>

### 3.2.4.1.5 Get Link Status (0x0607)

This command is used by the device driver to find out the link status of the port. Firmware returns link status = up when the link is available for transmission/reception. This command also returns other operating parameters of the link, such as negotiated speed, PHY type, and so on.

In the E810 this is an indirect command, and returns the Get Link Status information structure within the buffer.

**Table 3-38. Get Link Status Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0607	Command opcode.
Datalen	4-5		Length of the data buffer in bytes.
Return Value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16		Logical Port number. This field specifies the logical port number, and is ignored in the E810.
Reserved	17	Reserved	Must be 0x0. Value is ignored.
Command Flags	18-19	Command Flags	<p><b>Bits 18.1-18.0:</b></p> <p>00b = NOP — LSE notification value is not modified and Get Link Status response returns the most updated value of enable/disable.</p> <p>01b = Reserved.</p> <p>10b = Disable link status event notification to software.</p> <p>11b = Enable link status event notification to software.</p> <p>See <a href="#">Section 3.2.4.1.6</a> for details on LSE and enabling/disabling LSE events.</p> <p><b>All other bits</b> = Reserved. Must be 0x0. Value is ignored.</p>
Reserved	20-23	Reserved	Must be 0x0. Value is ignored.
Data Address High	24-27	Buffer Address	High bits of the buffer address.
Data Address Low	28-31	Buffer Address	Low bits of the buffer address.

The following structure describes the response by firmware to the Get Link Status command.

**Table 3-39. Get Link Status Command Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0607	Command opcode.
Datalen	4-5		Length of the data buffer in bytes.
Return Value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16		Logical Port number. This field specifies the logical port number, and is ignored in the E810.
Reserved	17	Reserved	Must be 0x0. Value is ignored.
Command Flags	18-19	Command Flags	<p><b>Bit 18.0:</b> LSE Enable Enable link status event notification to software. Firmware sets this bit to 1b to indicate that LSE is enabled, or sets to 0b if LSE is disabled. See <a href="#">Section 3.2.4.1.6</a> for further details on LSE and enabling/disabling LSE events.</p> <p><b>All other bits</b> = Reserved. Must be 0, value is ignored.</p>
Reserved	20-23	Reserved	Must be 0x0. Value is ignored.
Data Address High	24-27	Buffer Address	High bits of the buffer address.
Data Address Low	28-31	Buffer Address	Low bits of the buffer address.

[Table 3-40](#) lists the data structure of the Get Link Status command parameters, such as link up/down, negotiated/operating speed, fault conditions, and so on.

**Table 3-40. Get Link Status Command Response Data Structure**

Name	Bytes.Bits	Value	Remarks
Topology/Media Conflicts	0		<p>Topology and media conflict reporting.</p> <p><b>Bit 0.0:</b> Unresolved topology conflict detected. The mezzanine card topology does not match with the main board topology or multiple port options available, but the automatic conflict resolution bit is turned off.</p> <p><b>Bit 0.1:</b> Unresolved media conflict detects. The detected media does not match with the available topology options or media supports multiple port options, but the automatic conflict resolution bit is turned off.</p> <p><b>Bit 0.2:</b> LOM Topology netlist corrupted. The LOM topology netlist is corrupted and cannot be read from the NVM.</p> <p><b>Bit 0.3:</b> Reserved.</p> <p><b>Bit 0.4:</b> Topology netlist load detected Unreachable port.</p> <p><b>Bit 0.5:</b> Topology netlist load detected Underutilized port.</p> <p><b>Bit 0.6:</b> Topology netlist load detected Underutilized media.</p> <p><b>Bit 0.7:</b> Unsupported Media detected.</p>
Link Configuration Error	1		<p><b>Bit 1.0:</b> Link Configuration Error. Link Configuration Error was detected during attempt to bring the link up.</p> <p><b>Bit 1.1:</b> Reserved</p> <p><b>Bit 1.2:</b> Invalid Active Port Option This bit indicates that the active port option was pointing to invalid port option. This indication should appear until the user explicitly selects by calling Set Port Option the active port option.</p> <p><b>Bit 1.3:</b> Invalid Feature ID or Configuration ID This bit indicates that the port option in the netlist was pointing to Adaptive NVM feature ID or configuration ID that does not exist in the current Adaptive NVM table. This indication should appear until the user explicitly selects by calling Set Port Option a different active port option, or a new netlist or NVM image are loaded and the problem is solved.</p> <p><b>Bit 1.4:</b> Topology netlist lacks critical SDP or critical SDP is not configured properly This bit is set when TEMP_WARN_N SDP or TEMP_CRIT_N SDP or FAN_ON_AUX does not exist in the netlist or not configured properly and marked in NVM as must exist.</p> <p><b>Bit 1.5:</b> Module power unsupported Returns 1b if module required power is higher than the limit in the netlist. Returns 0b otherwise.</p> <p><b>Bit 1.6:</b> FW load not completed FW Download Enable requested within the topology netlist for a PHY in the PHY chain of the port but could not be completed. Several issues can cause this error, for example:</p> <ol style="list-style-type: none"> <li>1. There is no loadable image in the NVM for the PHY P/N.</li> <li>2. The PHY was not responding to the load commands, etc.</li> </ol> <p><b>Note:</b> This bit is set for all PFs that are controlling ports that are attached to the PHY. This bit is set/cleared on every attempt to load the PHY.</p> <p><b>Bit 1.7:</b> Invalid node max power limit Returns 1b if a Node max power limit was overridden by FW to NVM value or if sum of nodes is higher than board power limit. Returns 0b otherwise.</p> <p><b>All other bits = Reserved.</b></p>
Link Status	2.0	Function Link Status	<p><b>Bit 2.0:</b> Function Link Status Returns 1b if link status = up, or returns 0b if the link status = down. This parameter indicates if the Link is up and ready for data communication.</p>

**Table 3-40. Get Link Status Command Response Data Structure [continued]**

Name	Bytes.Bits	Value	Remarks
Link Fault	2.1:2.4	Link Fault	<p><b>Bit 2.1:</b> Returns 1b if PHY has detected a link fault condition. The fault could be anywhere in the PHY layer and either on transmit or receive local or remote fault.</p> <p>The following bits provide additional information about a link fault condition:</p> <p><b>Bit 2.2:</b> Returns 1b if a transmit link fault condition is detected, 0b otherwise.</p> <p><b>Bit 2.3:</b> Returns 1b if a receive link fault condition is detected, 0b otherwise.</p> <p><b>Bit 2.4:</b> Returns 1b if a remote fault condition detected, 0b otherwise.</p>
External Port Link Status	2.5	Port's Link Status	<p><b>Bit 2.5:</b> Port Link Status Returns 1b if link status = up, or returns 0b if the link status = down.</p>
Media Available	2.6	Media Available	<p><b>Bit 2.6:</b> Media Available Returns 1b if media is available for normal link communication, or returns 0b otherwise.</p> <p>This parameter is used by the device driver to find out if the media is available on the port. When connected to an external module, this command returns if the media is plugged in and is available for normal communication.</p> <p><b>Note:</b> This field is not relevant when connecting to an external BASE-T PHY or when connecting to a backplane.</p>
Signal Detect	2.7	Signal Detect	<p><b>Bit 2.7:</b> Signal Detect Returns 1b if a receive signal is detected by the PHY or module, or returns 0b otherwise.</p> <p>In the case of external PHYs, for example, this maps to the global signal detect function in the PHY and in some of the PHYs this maps to energy detect function on the link. In the case of external modules, this maps to the inverse of loss of signal function.</p>
AN Completed	3.0	An Completed	<p><b>Bit 3.0:</b> Auto-Negotiation Completed Returns 1b if auto-negotiation completed successfully, or returns 0b otherwise.</p> <p>This bit is valid only if the currently configured PHY type supports auto-negotiation and auto-negotiation is enabled.</p>
LP AN Ability	3.1	LP AN Ability	<p><b>Bit 3.1:</b> Link Partner Auto-Negotiation Ability Returns 1b if the link partner is able to perform auto-negotiation, or returns 0b otherwise.</p> <p>This bit is valid only if the PHY supports auto-negotiation and auto-negotiation is enabled.</p>
Parallel Detection Fault	3.2	Parallel Detection Fault	<p><b>Bit 3.2:</b> Parallel Detection Fault Returns 1b if the PHY detects parallel detection fault, or returns 0b otherwise.</p> <p>This bit is valid only if the PHY supports auto-negotiation with parallel detection enabled.</p>
FEC Enabled	3.3	FEC Enabled	<p><b>Bit 3.3:</b> FEC Enabled Returns 1b if FEC is enabled on the link, or returns 0b otherwise.</p> <p>For PHY types that supports auto-negotiation, FEC might be enabled on the link during auto-negotiation.</p>
Low Power State	3.4	Low Power State	<p><b>Bit 3.4:</b> Power Mode Returns the Low power configuration as set by the <a href="#">Set PHY Config (0x0601)</a> command 0b = High Power Mode 1b = Low Power Mode</p>

**Table 3-40. Get Link Status Command Response Data Structure [continued]**

Name	Bytes.Bits	Value	Remarks
Link Pause Status	3.5:3.6	Link Pause Status	<p><b>Bit 3.5:</b> Returns 1b if Tx link pause is enabled on the link during auto-negotiation, or returns 0b otherwise.</p> <p><b>Bit 3.6:</b> Returns 1b if Rx link pause is enabled on the link during auto-negotiation, or returns 0b otherwise.</p> <p>Link Pause status is reported when the current PHY type supports auto-negotiation.</p> <p>Link pause should be disabled if PFC is enabled on the link. Simultaneous operation of link pause and PFC is not supported.</p>
Qualified Module	3.7	Qualified Module	<p><b>Bit 3.7: Qualified Module</b> When the E810 is connected to an external SFP+/QSFP+ module and module qualification is required, this field indicates if the module is a qualified module whose OUI matches one of the pre-defined qualified modules.</p> <p>0b = Module was not found in pre-configured list of qualified modules. 1b = Module is qualified.</p>
PHY Temp Alarm	4.0	PHY Temp Alarm	<p><b>Bit 4.0: PHT Temp Alarm</b> Returns 1b if a temperature alarm condition is reported by the PHY, or returns 0b otherwise.</p> <p>Typically, an external PHY generates a temperature alarm condition by signaling a PHY interrupt to firmware. The temperature alarm feature should be enabled in the PHY to generate this condition.</p>
Excessive Link Errors	4.1	Excessive Link Errors	<p><b>Bit 4.1: Excessive Link Errors</b> Returns 1b if an excessive errors over the link condition is reported by the outermost PHY, or returns 0b otherwise</p>
Port Tx Suspended	4.2-4.3	Port Tx Suspended	<p><b>Bits 4.2-4.3: Port Tx Suspended</b> 00b = Port's Tx active. 01b = Port's Tx suspended and drained. 10b = Reserved. 11b = Port's Tx suspended and drained. Blocked TC pipe flushed.</p>
Reserved	4.4-4.7	Reserved	Reserved.
Loopback Enabled Status	5	Loopback Enabled Status	<p><b>Bit 5.0:</b> PHY local loopback enabled. <b>Bit 5.1:</b> PHY remote loopback enabled. <b>Bit 5.2:</b> MAC local loopback enabled. <b>Bit 5.3-5.5:</b> The PHY index of the PHY that is reported to perform loopback. <b>All other bits = Reserved.</b> This command reports the first PHY in the chain that perform loopback, starting at the outermost.</p>
Max Frame Size	6-7	Max Frame Size	Maximum frame size set on this port.
KR FEC Enabled	8.0	KR FEC Enabled	<p><b>Bit 8.0: KR FEC Enabled</b> Returns 1 if KR-FEC was negotiated on the link, or returns 0 otherwise. This field is reported when the current PHY type supports auto-negotiation.</p>
RS 528 FEC Enabled	8.1	RS 528 FEC Enabled	<p><b>Bit 8.1: RS 528 FEC Enabled</b> Returns 1 if RS-FEC 528 was negotiated on the link, or returns 0 otherwise. This field is reported when the current PHY type supports auto-negotiation.</p>
RS 544 FEC Enabled	8.2	RS 544 FEC Enabled	<p><b>Bit 8.2: RS 544 FEC Enabled</b> Returns 1 if RS-FEC 544 was negotiated on the link, or returns 0 otherwise. This field is reported when the current PHY type supports auto-negotiation.</p>

**Table 3-40. Get Link Status Command Response Data Structure [continued]**

Name	Bytes.Bits	Value	Remarks
Pacing Config	8.3-8.7	Pacing Config	<p><b>Bits 8.3-8.6:</b> This is 4-bit field that enables configuring an average rate pace parameter or fixed IPG pace parameter in the MAC to slow down the effective data rate as listed in <a href="#">Table 3-18</a>.</p> <p><b>Bit 8.7:</b> Specifies if the pacing is average rate or fixed IPG.</p>
External Device Power Class Ability	9.0-9.1	External Device Power Class	<p><b>Bits 9.0-9.1:</b> External Device Power Class Ability SFP/QSFP: This field contains the supported power ability of the connected module, as follows (bits order [1:0]): 00b = Power Class 1 Module (Low Power) 01b = Power Class 2 Module (High Power) 10b = Power Class 3 Module (High Power) 11b = Power Class 4+ Module (High Power)</p> <p><b>Note:</b> If QSFP Power Ability is High Power but &lt;Low Power State&gt; is Low Power then link is disabled.</p> <p>BASE-T (bit 9.0): 0b = Low and high power. 1b = High power only.</p>
External Device Power Ability	9.2-9.7	External Device Power Ability	Power requirement of the module in resolution of 0.5 W (rounded up).
Current Link Speed	10-11	Link Speed	<p>Returns operating link speed of the port. The PHY might be capable of many speeds but only one speed is enabled as result of configuration or auto-negotiation.</p> <p>This parameter is an 16-bit field, each bit corresponds to a link speed as follows. Only one bit is set at any given time.</p> <p><b>Bit 10.0:</b> 10 Mb/s <b>Bit 10.1:</b> 100 Mb/s <b>Bit 10.2:</b> 1000 Mb/s <b>Bit 10.4:</b> 5 Gb/s <b>Bit 10.5:</b> 10 Gb/s <b>Bit 10.6:</b> 20 Gb/s <b>Bit 10.7:</b> 25 Gb/s <b>Bit 11.1:</b> 50 Gb/s <b>Bit 11.2:</b> 100 Gb/s <b>Bit 11.3:</b> 200 Gb/s <b>All other bits</b> = Reserved, must be zero.</p> <p>This parameter is used by the device driver to find out the operating Link speed on the port. The link might be enabled at one of the link speeds due to the result of auto-negotiation/parallel detection or manually configured by firmware or software when auto-negotiation is disabled.</p> <p>Depending on the device MAC capabilities, some bits might not be set regardless of the PHY because the MAC does not support those speeds.</p>
Reserved	12-15	Reserved	Must be 0x0.
Current PHY type	16-31	PHY Type	<p>This field will have a single bit set to indicate the PHY type per the link's mode of operation. The firmware should report back only the current PHY types and speed, based on topology option or the latest result of the auto-negotiation.</p> <p>The bytes' encoding is identical to PHY type (PHY capabilities) found in <a href="#">Section 3.3.3.2.1</a>.</p> <p>Additionally, this field can set bit 127 in the structure to indicate that the link state is disabled, or bit 126 in the structure to indicate that PHY is in the auto-negotiation state.</p>

### 3.2.4.1.6 Link Status Event (0x0607)

The Link Status Event (LSE) is generated by firmware to the device driver when there is a change in status in any of the event causing conditions. Event causing conditions listed in [Table 3-41](#) can be individually masked from generating LSE by using the [Set Event Mask \(0x0613\)](#) command. The LSE share the same opcode, command structure and link status response data structure listed in [Table 3-39](#) and [Table 3-40](#). Firmware posts this data structure to the admin receive queue.

The LSE is disabled by default, unless explicitly enabled by software. Software enables an LSE by setting the *LSE Enable* bit when issuing [Get Link Status \(0x0607\)](#) command (see [Table 3-38](#)). Firmware disables the LSE immediately after generating an LSE and does not queue further events until LSE is explicitly enabled by software by the Get Link Status command. Firmware also indicates the LSE enabled status through the *LSE Enable* bit in the Get Link Status command response data structure (see [Table 3-39](#)).

The LSE is only generated by firmware to respective PF drivers, and it is software’s responsibility to communicate relevant link status change events to the VF through appropriate PF-to-VF communication mechanisms. Software is not expected to use any hardware link status interrupt mechanisms. Hardware link status change interrupts are provided only for diagnostic use. Hence, hardware link status interrupts to PFs and VFs should be disabled for normal operation. Software should use the AQ mechanism to get the link status change notifications using the Get Link Status command and LSE.

**Table 3-41. Reported Link Events**

Event	Description
Link Change	Link state change. For example, the link state changes from link up to link down.
Media Not Available	Event is reported when an external module is pulled out of its cage.
Link Fault	
PHY Temperature Alarm	Event is generated when an external PHY or module generates a temperature alarm interrupt.
Excessive Errors	
Signal Detect Condition	
Auto-Negotiation Completed	
Module Qualification Failure	When working with external modules, firmware might be enabled to perform a validation process where the module ID parameters are compared with a per-configured, NVM loaded, list of qualified modules. If, qualification check is enabled and connected module is not found in the list, then firmware terminates the link initialization process and then generates this event.
Port Tx Suspend	Indicates that the port’s Tx data path is temporarily suspended for configuration purposes.
Topology Conflict	Indicates a conflict in the topology netlist, when the port options of the mezzanine card do not match any available port option of the innermost PHY.
Media Conflict	Indicate a conflict in the media options, when the available options that are supported by the media do not intersect with the port options of the innermost to the outermost PHYs.

### 3.2.4.1.7 Set Event Mask (0x0613)

This command is used by the device driver to mask the event causing conditions of the link status event from firmware. The link status event is generated by firmware to the PF as described in [Section 3.2.4.1.6](#). This is a Direct command.

**Table 3-42. Set Event Mask Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0613	Command opcode.
Datalen	4-5	0x0	Must be 0x0. Value is ignored.
Return Value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16		Logical Port number. This field specifies the logical port number, and is ignored in the E810.
Reserved	17-23	Reserved	Value 0x0.
Event Mask	24-25	Event Mask	Masks the cause of LSE. The bit mask might be used to mask one or more event causing conditions. Set bit(s) to 1b to mask an event from causing LSE or set to 0b otherwise. The bits are cleared by default. <b>Bit 24.0:</b> Reserved. <b>Bit 24.1:</b> Mask link up/down condition. <b>Bit 24.2:</b> Mask media not available or module not present condition. <b>Bit 24.3:</b> Mask link fault condition. <b>Bit 24.4:</b> Mask PHY temperature alarm condition. <b>Bit 24.5:</b> Mask excessive errors over the link condition. <b>Bit 24.6:</b> Mask signal detect (asserted or de-asserted) condition. <b>Bit 24.7:</b> Mask auto-negotiation completed condition. <b>Bit 25.0:</b> Mask module qualification failure condition. <b>Bit 25.1:</b> Mask port Tx suspend. <b>Bit 25.2:</b> Mask Topology conflict. <b>Bit 25.3:</b> Mask media conflict. <b>Bit 25.4:</b> PHY FW load failed. <b>All other bits =</b> Reserved, Must be zero.
Reserved	26-31	Reserved	Must be 0x0. Value is ignored.

The following structure describes the response by firmware to the Set Event Mask command.

**Table 3-43. Set Event Mask Command Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0613	Command opcode.
Datalen	4-5	0x0	Must be 0x0. Value is ignored.
Return Value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16		Logical Port number. This field specifies the logical port number, and is ignored in the E810.
Reserved	17-31	Reserved	Must be 0x0. Value is ignored.

**Note:** When the user chooses the load the PHY firmware, the operation is triggered to start, but the command might return when the operation is run in the background. As long as the firmware is loading the PHY, it should block other commands as described below. As it is a debug command to recover the PHY, user should wait long enough for the operation to complete.

## 3.2.5 SyncE Flows

### 3.2.5.1 Overview

This section defines the system level SyncE clock management related flows, the assumptions they make, their dependencies and the different firmware and software entities involved. These flows include the configuration and monitoring of PHY recovered clock outputs, DPLLs, and their inputs and outputs.

The task of SyncE clock management is split between firmware and software. That is, the Link Manager and the **synce4l** application.

- The Link Manager provides an abstraction layer for the configuration and monitoring of PHY recovered clock outputs, DPLLs, and their inputs and outputs. It is responsible for initialization of the SyncE related inputs, outputs, and their configuration on the relevant link events. The managed PHY and DPLL devices, their management interfaces and clock connections as well as related configuration information are captured within the link topology netlist as Clock Controller Unit (CCU) nodes.
- The **synce4l** application is responsible for processing the Ethernet Synchronization Messaging Channel (ESMC) traffic. It uses the received ESMC packets to trace the source of recovered clocks, makes decisions on which ports to source recovered clock outputs from, assigns priorities for the DPLL inputs, and generates ESMC packets to advertise the resulting clock quality on the active ports.

The interface between the Link Manager and the **synce4l** application is defined in [Section 3.2.6](#).

### 3.2.5.2 Resets

When power is applied it is expected that all on board DPLL devices come out of reset with a default configuration loaded from their incorporated Flash. This configuration includes input and output buffer types, tolerance settings, bandwidth configuration, hysteresis settings, synthesizer frequencies, and so on. These devices are not reset by the init board activity and only the small subset of configuration is updated by the defined Link Manager flows.

When coming out of reset it is expected that all PHY devices have their recovered clock outputs disabled.

### 3.2.5.3 Initialization

During initialization all clock I/O connections need to be configured according to their corresponding Mode configuration from the link topology netlist. The Link Manager applies the initial configuration in the following order: first the PHY recovered clock outputs, second the DPLL clock reference inputs and last the DPLL clock outputs.

[Figure 3-15](#) illustrates the initialization loops implemented within the Link Manager.

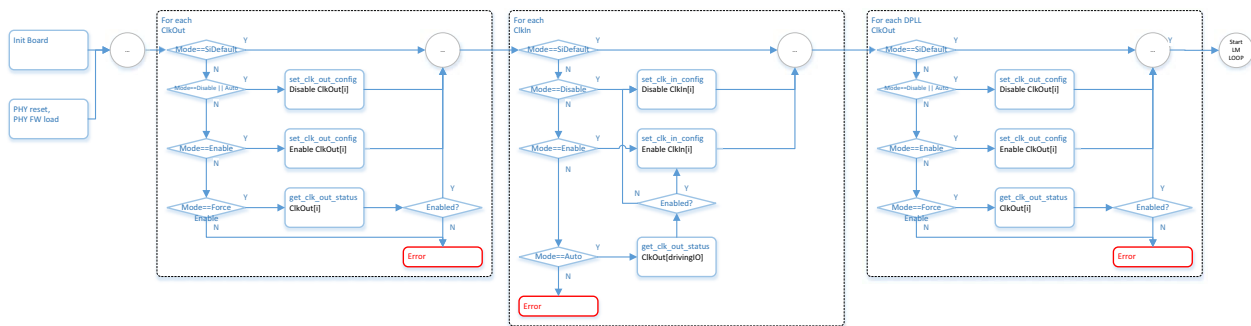

Figure 3-15. SyncE Initialization

**Note:** This initial configuration is carried out within the init board activity. However, the configuration of PHY recovered clock outputs is also triggered after every reset of the PHY (either part of the init flow, PHY FW load, or reset initiated via the Set PHY Debug command).

### 3.2.5.4 Configuration Flow

Once initialization is complete, the Link Manager attempts link on the relevant ports as configured by the link topology netlist. For each link that has been established, **synce4l** determines the quality of the clock they are traceable to, makes a decision on which of the ports to source recovered clocks from, and configures it via the SyncE commands. This information is then used by the Link Manager to configure the muxes and dividers in the path of the recovered clocks as well as the connected DPLL inputs.

Based on the quality of the clocks the ports are traceable to, **synce4l** also makes decisions on the priority of the DPLL inputs, and configures the DPLL to automatically switch between these sources (these may include recovered clocks as well as external or on-board GPS clocks) or instructs it to enter holdover or freerun on the high-precision local oscillator. The application monitors the status of the ports as well as the DPLL and this configuration is updated on every detected change in link status or clock quality. However, the change from one clock source to another is intended to happen automatically as the DPLL qualifies or disqualifies the configured inputs.

#### 3.2.5.4.1 Link Status Changes

When link status changes the configuration of associated reference clock outputs and the configuration of the reference clock inputs driven by them needs to be automatically updated. This update flow is triggered by a link status change detected based on get link status output regardless of the condition resulting in the link status change.

When a link up event is detected, if there is a recovered clock output associated with the port, the output is enabled and its divider is updated with the divider value stored in the netlist corresponding to the current baud rate. If there are any I/O connections captured in the netlist for this clock output, the connected clock input is enabled and its expected frequency is set based on the current baud rate and configured output divider value.

When a link down event is detected, any associated recovered clock outputs and potentially connected clock inputs are disabled.

Figure 3-16 illustrates the configuration applied in the event of link status changes.

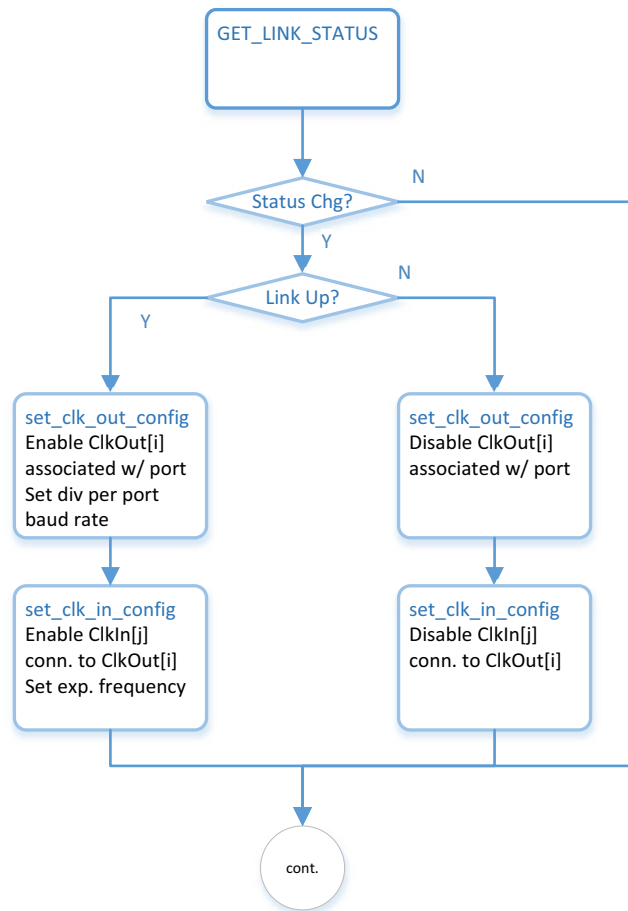

Figure 3-16. SyncE Link Status Changes

### 3.2.5.4.2 Reference Input Changes

The DPLL, for several reasons, might switch to a different reference input, or the frequency on the current active reference input might change. In such cases, the DPLL parameters might need to be re-configured.

The firmware detects the change of the validity of all reference clocks and their frequencies. If the validity has changed, it means DPLLs will start (or have already started) switching to another reference clock. Firmware checks if the current parameters are valid for the highest priority valid reference and its frequency (this is the reference clock the DPLLs try to lock on, already acquiring or already locked on).

If the parameters are not valid for the highest priority valid reference (and its frequency), firmware re-configures the DPLL to the correct parameters for the new reference frequency. If the parameters are valid for the highest priority valid reference and its frequency, firmware does nothing in this iteration of the polling loop.

**Note:** The input frequency might change without changing the reference clock when the port speed changes. In such case, there is no change in the reference clock (still the same clock) but the frequency changes, and the DPLL tries to lock to this new frequency. The parameters must be updated for this new frequency.

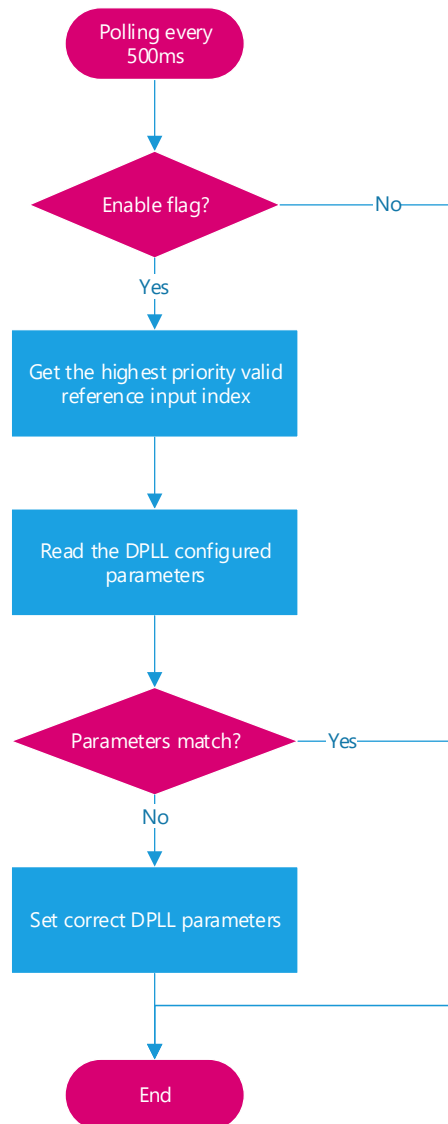

**Note:** There are two scenarios when the DPLL changes the reference clock:

1. The clock that the DPLL has been locked on is invalid
2. The higher priority clock became valid. For that reason, firmware needs to monitor all reference clocks (not only the clock the DPLL is/has been locked to).

**Note:** Different clocks might have the same frequency but different parameters. This is related to the type of the clock. Therefore, the parameters are mapped to both frequency and the input index. The input index identifies the clock.

The flow chart in [Figure 3-17](#) depicts the procedure. The procedure executes every 500 ms. Firmware starts by checking enable flag and continues only if it is set.

**Figure 3-17. SyncE Reference Input Changes**

## 3.2.6 SyncE Commands

### 3.2.6.1 Overview

The E810's Link Manager supports the following commands for configuring and managing the SyncE clocks associated with the PHY and Clock Controller (DPLL/Synthesizer/Divider) nodes within the link topology netlist. They provide control and status of available clock inputs, recovered clocks, associated cleanup PLLs and clock outputs.

The Link Manager provides SyncE clock configuration and status services to the software driver through these commands exposed as AQ Commands.

#### 3.2.6.1.1 SyncE Commands Summary

Table 3-44 summarizes the clock configuration commands. These commands can be used by software for SyncE clock configuration and maintenance purposes. Typically these commands are used for normal configuration operations.

**Table 3-44. SyncE Commands**

Command	Opcode	Description	Section Reference
Set PHY Recovered Clock Configuration	0x0630	Applies new configuration for the specified recovered clock output.	<a href="#">Section 3.2.6.2</a>
Get PHY Recovered Clock Configuration	0x0631	Returns the current configuration of the specified recovered clock output.	<a href="#">Section 3.2.6.3</a>
Get CCU Capabilities	0x0C61	Retrieves the clock configuration capabilities.	<a href="#">Section 3.2.6.4</a>
Set CCU Input Configuration	0x0C62	Applies new configuration for the specified clock input.	<a href="#">Section 3.2.6.5</a>
Get CCU Input Configuration	0x0C63	Returns the current configuration of the specified clock input.	<a href="#">Section 3.2.6.6</a>
Set CCU Output Configuration	0x0C64	Applies new configuration for the specified clock output.	<a href="#">Section 3.2.6.7</a>
Get CCU Output Configuration	0x0C65	Returns the current configuration of the specified clock output.	<a href="#">Section 3.2.6.8</a>
Get CCU DPLL Status	0x0C66	Returns the current status and configuration of the specified DPLL.	<a href="#">Section 3.2.6.9</a>
Set CCU DPLL Configuration	0x0C67	Applies new configuration for the specified DPLL.	<a href="#">Section 3.2.6.10</a>
Set CCU Reference Priority	0x0C68	Applies new priority configuration for the specified clock input.	<a href="#">Section 3.2.6.11</a>
Get CCU Reference Priority	0x0C69	Returns the current priority configuration of the specified clock output.	<a href="#">Section 3.2.6.12</a>
Get CCU Info	0x0C6A	Retrieves stepping and firmware versions from the clock controller node.	<a href="#">Section 3.2.6.13</a>
Get Input Frequency List	0x0C6C	Reads the list of allowed input frequencies on a specified input.	<a href="#">Section 3.2.6.14</a>
Get Output Frequency List	0x0C6D	Reads the list of allowed output frequencies on a specified output.	<a href="#">Section 3.2.6.15</a>

**Note:** All reserved fields within the command arguments must be 0.

### 3.2.6.2 Set PHY Recovered Clock Configuration (0x0630)

This command maps PHY lanes (PHY Port numbers) to the recovered clocks (PHY output).

#### 3.2.6.2.1 Set PHY Recovered Clock Configuration Command

Table 3-45 details the input arguments of the Set PHY Recovered Clock Configuration command.

**Table 3-45. Set PHY Recovered Clock Configuration Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.1 for details.
Opcode	2:3	0x0630	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
PHY Output Index	16		PHY reference clock output pin index.
PHY Port Number	17		The number of the PHY port associate with the specified output. <b>Note:</b> A value of 0xFF associates the output with the recovered clock of the PHY port that is assigned to the PF initiating the command.
Reserved	18.[7:1]	0	Reserved. Must be 0x0.
Output Enable	18.[0]		0b = Disable the recovered clock output. 1b = Enable the recovered clock output.
Reserved	19:29	0	Reserved. Must be 0x0.
Reserved	30:31.[15:11]	0	Reserved. Must be 0x0.
Node Handle Valid	30:31.[10]		The configuration is applied to the outermost PHY node (i.e. PHY[0]) in the PHY chain of the port associated with the PF the command is issued from. The netlist needs to capture two nodes for the outermost PHY device: one with Node Type of PHY and one with Node Type of CCU and a valid Node Parent section pointing to the corresponding former PHY node. The command uses the Node Handle of the latter, the node with Node Type of CCU. 0b = The configuration will be applied to the PHY node identified by the Node Handle input. Use Node Handle of CCU identified by Index=0 in link topology netlist. 1b = Use provided <i>Node Handle</i> .
Node Handle	30:31.[9:0]		The handle of the PHY node.

### 3.2.6.2.2 Set PHY Recovered Clock Configuration Command Response

Table 3-46 details the output arguments of the Set PHY Recovered Clock Configuration command.

**Table 3-46. Set PHY Recovered Clock Configuration Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.2 for details.
Opcode	2:3	0x0630	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
PHY Output Index	16		PHY reference clock output pin index.
PHY Port Number	17		The number of the PHY port associate with the specified output.
Reserved	18.[7:1]	0	Reserved. Must be 0x0.
Output Enable	18.[0]		0b = The recovered clock output is disabled. 1b = The recovered clock output is enabled.
Reserved	19:31	0	Reserved. Must be 0x0.

### 3.2.6.2.3 Set PHY Recovered Clock Configuration Command Errors

The following errors can be returned by the Set PHY Recovered Clock Configuration command:

**Table 3-47. Set PHY Recovered Clock Configuration Command Errors**

Error Code	Value	Description
OK	0	No error.
EPERM	1	The command is not allowed due to an unsecured netlist.
EBUSY	12	PHY/module interface currently busy, retry.
EINVAL	14	Invalid parameters. This error is reported when the parameter is either out of a valid range or it cannot be set in the PHY.

### 3.2.6.3 Get PHY Recovered Clock Configuration (0x0631)

This command reads the mapping of the PHY lanes to the recovered clocks.

#### 3.2.6.3.1 Get PHY Recovered Clock Configuration Command

Table 3-48 details the input arguments of the Get PHY Recovered Clock Configuration command.

**Table 3-48. Get PHY Recovered Clock Configuration Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.1 for details.
Opcode	2:3	0x0631	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
PHY Output	16		PHY reference clock output pin.
Reserved	17:29	0	Reserved. Must be 0x0.
Reserved	30:31.[15:11]	0	Reserved. Must be 0x0.
Node Handle Valid	30:31.[10]		<p>The configuration is applied to the outermost PHY node (i.e. PHY[0]) in the PHY chain of the port associated with the PF the command is issued from. The netlist needs to capture two nodes for the outermost PHY device: one with Node Type of PHY and one with Node Type of CCU and a valid Node Parent section pointing to the corresponding former PHY node. The command uses the Node Handle of the latter, the node with Node Type of the CCU.</p> <p>The configuration is retrieved from the PHY node identified by the <i>Node Handle</i> input.</p> <p>0b = The configuration will be applied to the PHY node identified by the Node Handle input. Use Node Handle of CCU identified by Index=0 in link topology netlist.</p> <p>1b = Use provided <i>Node Handle</i>.</p>
Node Handle	30:31.[9:0]		The handle of the PHY node.

### 3.2.6.3.2 Get PHY Recovered Clock Configuration Command Response

Table 3-49 details the output arguments of the Get PHY Recovered Clock Configuration command.

**Table 3-49. Get PHY Recovered Clock Configuration Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.2 for details.
Opcode	2:3	0x0631	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
PHY Output	16		PHY reference clock output pin.
PHY Port Number	17		The number of the PHY port (PHY lane) associate with the specified output.
Reserved	18.[7:1]	0	Reserved. Must be 0x0.
Output Enable	18.[0]		0b = The recovered clock output is disabled. 1b = The recovered clock output is enabled.
Reserved	19:29	0	Reserved. Must be 0x0.
Reserved	30:31.[15:11]	0	Reserved. Must be 0x0.
Node Handle Valid	30:31.[10]		0b = Use Node Handle of CCU identified by Index=0 in link topology netlist. 1b = Use provided <i>Node Handle</i> .
Node Handle	30:31.[9:0]		The handle of the PHY node.

### 3.2.6.3.3 Get PHY Recovered Clock Configuration Command Errors

The following errors can be returned by the Get PHY Recovered Clock Configuration command:

**Table 3-50. Get PHY Recovered Clock Configuration Command Errors**

Error Code	Value	Description
OK	0	No error.
EPERM	1	The command is not allowed due to an unsecured netlist.
EBUSY	12	PHY/module interface currently busy, retry.
EINVAL	14	Invalid parameters.

### 3.2.6.4 Get CCU Capabilities (0x0C61)

This command reads the capabilities of the CCU. If the value is not defined or cannot be evaluated, the value returned is 0xFF for 8-bit fields and 0xFFFF FFFF for 32-bit fields.

#### 3.2.6.4.1 Get CCU Capabilities Command

Table 3-51 details the input arguments of the Get CCU Capabilities command.

**Table 3-51. Get CCU Capabilities Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.2.1 for details.
Opcode	2:3	0x0C61	Command opcode.
Datalen	4:5	0x0018	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Reserved	16:23	0	Reserved. Must be 0x0.
Data Address High	24:27		Address of response buffer.
Data Address Low	28:31		Address of response buffer.

#### 3.2.6.4.2 Get CCU Capabilities Command Response

Table 3-52 details the output arguments of the Get CCU Capabilities command.

**Table 3-52. Get CCU Capabilities Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.2.2 for details.
Opcode	2:3	0x0C61	Command opcode.
Datalen	4:5	0x0018	Length of the data buffer in bytes.
Return Value	6:7		Return value.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Reserved	16:23	0	Reserved. Must be 0x0.
Data Address High	24:27		Address of data buffer.
Data Address Low	28:31		Address of data buffer.

**Table 3-53. Get CCU Capabilities Command Response Data Structure**

Name	Byte.[Bits]	Value	Remarks
Number of CCU Inputs	0		Number of CCU inputs in use.
Number of CCU Outputs	1		Number of CCU outputs in use.
PPS DPLL Index	2		Index of DPLL block of CCU that generates 1 Hz frequency to specific output. This index is used in the following commands to select a relevant DPLL block in the CCU chip.
SyncE DPLL Index	3		Index of DPLL block of CCU that generates 156.25 MHz frequency to specific output. This index is used in the following commands to select a relevant DPLL block in the CCU chip.
Maximum Input Frequency	4:7		Maximum input frequency supported.
Maximum Input Phase Adjustment	8:11		Maximum input phase adjustment in ps.
Maximum Output Frequency	12:15		Maximum output frequency supported.
Maximum Output Phase Adjustment	16:19		Maximum output phase adjustment in ps.
Node Part Number of CCU	20		Part Number stored in link topology netlist.
Reserved	21:23	0	Reserved. Must be 0x0.

### 3.2.6.4.3 Get CCU Capabilities Command Errors

The following errors can be returned by the Get CCU Capabilities command:

**Table 3-54. Get CCU Capabilities Command Errors**

Error Code	Value	Description
OK	0	No error.
EPERM	1	The command is not allowed due to an unsecured netlist.
EBUSY	12	PHY/module interface currently busy, retry.
EINVAL	14	Invalid parameters (for example, buffer too small).

### 3.2.6.5 Set CCU Input Configuration (0x0C62)

This command configures the specified reference clock input of a given CCU (DPLL) node. If the setting/capability is not supported in hardware or the value of the parameter is invalid (i.e., cannot be set in hardware), then return EINVAL (see errors in [Table 3-57](#)).

#### 3.2.6.5.1 Set CCU Input Configuration Command

[Table 3-55](#) details the input arguments of the Set CCU Input Configuration command.

**Table 3-55. Set CCU Input Configuration Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2:3	0x0C62	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Input Index	16		The index of the DPLL reference clock input to be configured.
Update Phase Delay	17.[7]		0b = The <i>Phase Delay</i> field is ignored and the input's current phase delay configuration is kept. 1b = The <i>Phase Delay</i> field is valid.
Update Frequency	17.[6]		0b = The <i>Frequency</i> field is ignored and the input's current frequency configuration is kept. 1b = The <i>Frequency</i> field is valid.
Reserved	17.[5:0]	0	Reserved. Must be 0x0.
Reserved	18.[7]	0	Reserved. Must be 0b.
ESync Enable	18.[6]		0b = Disable embedded sync. 1b = Enable embedded sync.
Input Enable	18.[5]		0b = Disable the clock input. 1b = Enable the clock input.
Reserved	18.[4:0]	0	Reserved. Must be 0x0.
Reserved	19	0	Reserved. Must be 0x0.
Frequency	20:23		Input frequency in Hz. If the <i>Any Frequency</i> field of 0x0C63 response is 0, this field accepts values that are present in the input frequency list. If the <i>Any Frequency</i> field of 0x0C63 response is 1, this field accepts any frequency that Firmware/DPLL supports. <b>Note:</b> Firmware and DPLL can support only discrete values for frequency and <i>Any Frequency</i> field is 1. When this AQC is called with unsupported frequency, EINVAL is returned.
Phase Delay	24:27		The phase delay to be configured represented as a signed value with 1 ps resolution.
Reserved	28:29	0	Reserved. Must be 0x0.
Reserved	30:31.[15:11]	0	Reserved. Must be 0x0.
Node Handle Valid	30:31.[10]		0b = Use Node Handle of CCU identified by Index=0 in link topology netlist. 1b = Use provided <i>Node Handle</i> .
Node Handle	30:31.[9:0]		The handle of the CCU node.

### 3.2.6.5.2 Set CCU Input Configuration Command Response

Table 3-56 details the output arguments of the Set CCU Input Configuration command.

**Table 3-56. Set CCU Input Configuration Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.2 for details.
Opcode	2:3	0x0C62	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Input Index	16		Input index as set in the request.
Reserved	17:31	0	Reserved. Must be 0x0.

### 3.2.6.5.3 Set CCU Input Configuration Command Errors

The following errors can be returned by the Set CCU Input Configuration command:

**Table 3-57. Set CCU Input Configuration Command Errors**

Error Code	Value	Description
OK	0	No error.
EPERM	1	The command is not allowed due to an unsecured netlist or when attempting to change the configuration of RO pins.
EBUSY	12	PHY/module interface currently busy, retry.
EINVAL	14	Invalid parameters. This error is reported when the parameter is either out of a valid range or it cannot be set in the DPLL.

### 3.2.6.6 Get CCU Input Configuration (0x0C63)

This command reads the current configuration of the specified reference clock input of a given CCU (DPLL) node.

#### 3.2.6.6.1 Get CCU Input Configuration Command

Table 3-58 details the input arguments of the Get CCU Input Configuration command.

**Table 3-58. Get CCU Input Configuration Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.1 for details.
Opcode	2:3	0x0C63	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Input Index	16		The index of the DPLL reference clock input.
Reserved	17:29	0	Reserved. Must be 0x0.
Reserved	18:[7]	0	Reserved. Must be 0b.
Reserved	30:31.[15:11]	0	Reserved. Must be 0x0.
Node Handle Valid	30:31.[10]		0b = Use Node Handle of CCU identified by Index=0 in link topology netlist. 1b = Use provided <i>Node Handle</i> .
Node Handle	30:31.[9:0]		The handle of the CCU node.

#### 3.2.6.6.2 Get CCU Input Configuration Command Response

Table 3-59 details the output arguments of the Get CCU Input Configuration command.

**Table 3-59. Get CCU Input Configuration Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.2 for details.
Opcode	2:3	0x0C63	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Input Index	16		Input index as set in the request.
ESync Capable	17.[7]		Indicates whether the input can accept a 1PPS sync signal embedded in the clock signal. 0b = Input cannot receive embedded sync signal. 1b = Input can receive embedded sync signal (1PPS embedded in 10 MHz).
ESync Fail	17.[6]		Embedded sync error. 0b = No embedded sync errors detected. 1b = Embedded sync error detected.

**Table 3-59. Get CCU Input Configuration Command Response [continued]**

Name	Byte.[Bits]	Value	Remarks
Reserved	17.[5]	0	Reserved. Must be 0b.
PFM Fail	17.[4]		Precise Frequency Monitor failure. 0b = No Precise Frequency Monitor failure detected. 1b = Precise Frequency Monitor failure detected.
GST Fail	17.[3]		Guard Soak Timer error. 0b = No Guard Soak Timer failure detected. 1b = Guard Soak Timer failure detected.
CFM Fail	17.[2]		Coarse Frequency Monitor error. 0b = No Coarse Frequency Monitor failure detected. 1b = Coarse Frequency Monitor failure detected.
SCM Fail	17.[1]		Single Cycle Monitor error. 0b = No single cycle monitor failure detected. 1b = The Single cycle monitor failed.
LOS	17.[0]		Loss of Signal 0b = No loss of signal detected. 1b = Loss of signal detected.
Reserved	18.[7]	0	Reserved. Must be 0b.
Recovered Clock	18.[6]		0b = Input does not originate from PHY recovered clock. 1b = Input originates from PHY recovered clock.
External Clock	18.[5]		0b = Input does not originate from External input. 1b = Input originates from External input.
GPS Clock	18.[4]		0b = Input does not originate from internal GPS. 1b = Input originates from internal GPS.
Reserved	18.[3:1]	0	Reserved. Must be 000b
Configurable	18.[0]		0b = This input is read only (input configuration comes from link topology netlist). 1b = Configuration of input is possible.
Any Frequency	19.[7]		0b = Only values that are in the input frequency list are allowed in the <i>Frequency</i> field in 0x0C62 AQC. 1b = Any frequency is allowed in the <i>Frequency</i> field in 0x0C62 AQC.
Reserved	19.[6:4]	0	Reserved. Must be 000b.
10MHz Support	19.[3]		0b = The input cannot accept a 10 MHz clock. 1b = The input can accept a 10 MHz clock.
1PPS Support	19.[2]		0b = 1PPS input is not supported. 1b = 1PPS input is supported.
Reserved	19.[1]	0	Reserved. Must be 0b.
Input Phase Delay Support	19.[0]		0b = Input phase delay adjustment is not supported. 1b = Input phase delay adjustment is supported.
Frequency	20:23		Configured Input Frequency in Hz.
Phase Delay	24:27		The phase delay to be configured represented as a signed value with 1 ps resolution.
Reserved	28.[7]	0	Reserved. Must be 0b.
ESync Enable	28.[6]		0b = Embedded sync signal is disabled. 1b = Embedded sync signal is enabled.
Input Enable	28.[5]		0b = Clock input is disabled. 1b = Clock input is enabled.

**Table 3-59. Get CCU Input Configuration Command Response [continued]**

Name	Byte.[Bits]	Value	Remarks
Reserved	28.[4:0]	0	Reserved. Must be 0x0.
Reserved	29	0	Reserved. Must be 0x0.
Driving Clock Number	30:31.[15:10]		The number of the connected clock output on the device pointed to by <i>Driving Node Handle</i> .
Driving Node Handle	30:31.[9:0]		Unique identifier of the node in the topology which the I/O is connected to.

### 3.2.6.6.3 Get CCU Input Configuration Command Errors

The following errors can be returned by the Get CCU Input Configuration command:

**Table 3-60. Get CCU Input Configuration Command Errors**

Error Code	Value	Description
OK	0	No error.
EPERM	1	The command is not allowed due to an unsecured netlist.
EAGAIN	8	PHY/module interface currently busy, retry.
EINVAL	14	Invalid parameters (for example, buffer too small).

### 3.2.6.7 Set CCU Output Configuration (0x0C64)

This command configures the output frequency, phase compensation, and embedded sync configuration of the specified clock output of a given CCU (DPLL) node. If the setting/capability is not supported in hardware or the value of the parameter is invalid (i.e., cannot be set in hardware), then return EINVAL (see errors in Table 3-63).

The following frequencies can be set for the ZL80032 DPLL on OUT0P, OUT0N, OUT1P, and OUT1N: 1PPS, 10 MHz, 25 Hz, 25 MHz and 100 MHz.

#### 3.2.6.7.1 Set CCU Output Configuration Command

Table 3-61 details the input arguments of the Set CCU Output Configuration command.

**Table 3-61. Set CCU Output Configuration Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.1 for details.
Opcode	2:3	0x0C64	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Output Index	16		The index of DPLL clock output.
Reserved	17.[7:5]	0	Reserved. Must be 000b.
Update SrcSel	17.[4]		0b = The <i>SrcSel</i> field is ignored and the current index of DPLL is kept. 1b = The <i>SrcSel</i> field is valid.
Update Phase Delay	17.[3]		0b = The <i>Phase Delay</i> field is ignored and the current phase delay configuration of output is kept. 1b = The <i>Phase Delay</i> field is valid.
Update Frequency	17.[2]		0b = The <i>Frequency</i> field is ignored and the output's current frequency configuration is kept. 1b = The value of the <i>Frequency</i> field is used to update the output's frequency configuration.
ESync Enable	17.[1]		0b = Disable embedded sync. 1b = Enable embedded sync.
Output Enable	17.[0]		0b = Disable the clock output. 1b = Enable the clock output.
Reserved	18.[7:5]	0	Reserved. Must be 000b.
DPLL Index (or SrcSel)	18.[4:0]		The index of the DPLL block to be configured.
Reserved	19	0	Reserved. Must be 0x0.
Frequency	20:23		Output frequency in Hz. If the <i>Any Frequency</i> field of 0x0C65 response is 0, this field accepts values that are present in the output frequency list. If the <i>Any Frequency</i> field of 0x0C65 response is 1, this field accepts any frequency that Firmware/DPLL supports. <b>Note:</b> Firmware and DPLL can support only discrete values for frequency and <i>Any Frequency</i> field is 1. When this AQC is called with unsupported frequency, EINVAL is returned.

**Table 3-61. Set CCU Output Configuration Command [continued]**

Name	Byte.[Bits]	Value	Remarks
Phase Delay	24:27		The phase delay to be configured represented as a signed value with 1 ps resolution.
Reserved	28:29	0	Reserved. Must be 0x0.
Reserved	30:31.[15:11]	0	Reserved. Must be 0x0.
Node Handle Valid	30:31.[10]		0b = Use Node Handle of CCU identified by Index=0 in link topology netlist. 1b = Use provided <i>Node Handle</i> .
Node Handle	30:31.[9:0]		The handle of the CCU node.

### 3.2.6.7.2 Set CCU Output Configuration Command Response

Table 3-62 details the output arguments of the Set CCU Output Configuration command.

**Table 3-62. Set CCU Output Configuration Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.2 for details.
Opcode	2:3	0x0C64	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Output Index	16		Output index as set in the request.
Reserved	17:31	0	Reserved. Must be 0x0.

### 3.2.6.7.3 Set CCU Output Configuration Command Errors

The following errors can be returned by the Set CCU Output Configuration command:

**Table 3-63. Set CCU Output Configuration Command Errors**

Error Code	Value	Description
OK	0	No error.
EPERM	1	The command is not allowed due to an unsecured netlist or when attempting to change the configuration of RO pins.
EBUSY	12	PHY/module interface currently busy, retry.
EINVAL	14	Invalid parameters. This error is reported when the parameter is either out of a valid range or it cannot be set in the DPLL.

### 3.2.6.8 Get CCU Output Configuration (0x0C65)

This command reads the current frequency, phase compensation and embedded sync configuration of the specified clock output of a given PHY or CCU (DPLL) node.

#### 3.2.6.8.1 Get CCU Output Configuration Command

Table 3-64 details the input arguments of the Get CCU Output Configuration command.

**Table 3-64. Get CCU Output Configuration Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.1 for details.
Opcode	2:3	0x0C65	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Output Index	16		The index of DPLL clock output.
Reserved	17:29	0	Reserved. Must be 0x0.
Reserved	30:31.[15:11]	0	Reserved. Must be 0x0.
Node Handle Valid	30:31.[10]		0b = Use Node Handle of CCU identified by Index=0 in link topology netlist. 1b = Use provided <i>Node Handle</i> .
Node Handle	30:31.[9:0]		The handle of the CCU node.

#### 3.2.6.8.2 Get CCU Output Configuration Command Response

Table 3-65 details the output arguments of the Get CCU Output Configuration command.

**Table 3-65. Get CCU Output Configuration Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.2 for details.
Opcode	2:3	0x0C65	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Output Index	16		Output index.
Reserved	17.[7:3]	0	Reserved. Must be 0x0.
ESync Ability	17.[2]		0b = The output cannot generate embedded sync. 1b = The output can generate embedded sync.
ESync Enable	17.[1]		0b = Embedded sync disabled. 1b = Embedded sync enabled.
Output Enable	17.[0]		0b = Clock output disabled. 1b = Clock output enabled.

**Table 3-65. Get CCU Output Configuration Command Response [continued]**

Name	Byte.[Bits]	Value	Remarks
Mode	18.[7:5]		Clock Output Mode configuration from link topology netlist. 000b = Disabled 001b = Enabled 010b = ForceEnabled 111b = SiDefault (i.e., Flash) All other values are reserved. <b>Note:</b> When the <i>Mode</i> is configured to <i>ForceEnabled</i> , all configuration attempts are denied and result in an error.
DPLL Index (or SrcSel)	18.[4:0]		DPLL block that is selected as source for the specified clock output ( <i>Output Index</i> ).
Reserved	19.[6:0]	0	Reserved. Must be 0x0.
Any Frequency	19.[7]		0b = Only values that are in the input frequency list are allowed in the <i>Frequency</i> field in 0x0C64 AQC. 1b = Any frequency is allowed in the <i>Frequency</i> field in 0x0C64 AQC.
Frequency	20:23		Configured Output Frequency in Hz.
Source Frequency	24:27		The synthesizer frequency feeding the divider associated with the clock output ( <i>Output Index</i> ) represented with a 1 Hz resolution (used to calculate the divider).
Reserved	28:29	0	Reserved. Must be 0x0.
Driving Clock Number	30:31.[15:10]		The index of the clock input on the node identified by <i>Driven Node Handle</i> to which the clock output is connected.
Driving Node Handle	30:31.[9:0]		The handle of the node to which the specified clock output is connected.

### 3.2.6.8.3 Get CCU Output Configuration Command Errors

The following errors can be returned by the Get CCU Output Configuration command:

**Table 3-66. Get CCU Output Configuration Command Errors**

Error Code	Value	Description
OK	0	No error.
EPERM	1	The command is not allowed due to an unsecured netlist or when attempting to change the configuration of RO pins.
EBUSY	12	PHY/module interface currently busy, retry.
EINVAL	14	Invalid parameters. This error is reported when the parameter is either out of a valid range or it cannot be set in the DPLL.

### 3.2.6.9 Get CCU DPLL Status (0x0C66)

This command configures the selected DPLL block within the selected CCU node.

#### 3.2.6.9.1 Get CCU DPLL Status Command

Table 3-67 details the input arguments of the Get CCU DPLL Status command.

**Table 3-67. Get CCU DPLL Status Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.1 for details.
Opcode	2:3	0x0C66	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
DPLL Index	16		The index of DPLL block.
Reserved	17:29	0	Reserved. Must be 0x0.
Reserved	30:31.[15:11]	0	Reserved. Must be 0x0.
Node Handle Valid	30:31.[10]		0b = Use Node Handle of CCU identified by Index=0 in link topology netlist. 1b = Use provided <i>Node Handle</i> .
Node Handle	30:31.[9:0]		The handle of the CCU node.

#### 3.2.6.9.2 Get CCU DPLL Status Command Response

Table 3-68 details the output arguments of the Get CCU DPLL Status command.

**Table 3-68. Get CCU DPLL Status Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.2 for details.
Opcode	2:3	0x0C66	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
DPLL Index	16		The index of DPLL block.
Reserved	17.[7]	0	Reserved. Must be 0b.
REF SW ESync	17.[6]		Reference Switch on ESync Fail 0b = DPLL does not switch reference on embedded sync failure. 1b = DPLL switches reference on embedded sync failure.
Fast Lock Enable	17.[5]		Fast Lock Enable 0b = Fast Lock is disabled. 1b = Fast Lock is enabled.

**Table 3-68. Get CCU DPLL Status Command Response [continued]**

Name	Byte.[Bits]	Value	Remarks
REF SW PFM	17.[4]		Reference Switch on Precision Frequency Monitor Fail 0b = DPLL does not switch reference on Precision Frequency Monitor failure. 1b = DPLL switches reference on Precision Frequency Monitor failure.
REF SW GST	17.[3]		Reference Switch on Guard Soak Timer Fail 0b = DPLL does not switch reference on Guard Soak Timer failure. 1b = DPLL switches reference on Guard Soak Timer failure.
REF SW CFM	17.[2]		Reference Switch on Coarse Frequency Monitor Fail 0b = DPLL does not switch reference on Coarse Frequency Monitor failure. 1b = DPLL switches reference on Coarse Frequency Monitor failure
REF SW SCM	17.[1]		Reference Switch on Single Cycle Monitor Fail 0b = DPLL does not switch reference of Single Cycle Monitor failure. 1b = DPLL switches reference of Single Cycle Monitor failure.
REF SW LOS	17.[0]		Reference Switch on Loss of Signal 0b = DPLL does not switch reference on Loss of Signal. 1b = DPLL switches reference on Loss of Signal.
PSL Hit	18.[7]		Phase Slope Limit Hit 0b = Phase has not hit the configured phase slope limit. 1b = Phase has hit the configured phase slope limit.
Reserved	18.[6]	0	Reserved. Must be 0b.
FL Hit	18.[5]		Frequency Limit Hit 0b = The frequency of the selected reference is within of the allowed pull-in/hold-in range. 1b = The frequency of the selected reference is outside of the allowed pull-in/hold-in range.
Reserved	18.[4:3]	0	Reserved. Must be 00b.
Holdover Ready	18.[2]		DPLL ready for holdover flag 0b = The DPLL is not ready for holdover. 1b = The DPLL is ready for holdover.
Holdover	18.[1]		DPLL Holdover state flag 0b = The DPLL is not in holdover. 1b = The DPLL is in holdover.
Lock	18.[0]		DPLL Locked state flag 0b = DPLL is not locked. 1b = DPLL is locked.
Mode	19.[7:5]		DPLL Mode 000b = FreeRun mode. 001b = Forced Holdover mode. 010b = Force Reference Lock mode. 011b = Automatic mode. 100b = Numerically Controlled Oscillator mode. All other values are reserved.
Clk Ref Sel	19.[4:0]		The Index of currently selected reference clock input.
Phase Offset High	20:23		Measured Phase Error The measured phase error relative to the currently selected reference clock input with a 0.01 ps resolution. Bits [31:16] - Reserved. Bits [15:0] - Offset to the current input in ps (high part).
Phase Offset Low	24:27		Measured Phase Error Offset to the current input in ps (low part)

**Table 3-68. Get CCU DPLL Status Command Response [continued]**

Name	Byte.[Bits]	Value	Remarks
EEC Mode	28		Configured clock quality level. 0xA = QL-EEC2/QL-ST3 0xB = QL-EEC1/QL-SEC 0xF = QL-DUS All other values are reserved.
Reserved	29:31	0	Reserved. Must be 0xo.

### 3.2.6.9.3 Get CCU DPLL Status Command Errors

The following errors can be returned by the Get CCU DPLL Status command:

**Table 3-69. Get CCU DPLL Status Command Errors**

Error Code	Value	Description
OK	0	No error.
EPERM	1	The command is not allowed due to an unsecured netlist.
EBUSY	12	PHY/module interface currently busy, retry.
EINVAL	14	Invalid parameters.

### 3.2.6.10 Set CCU DPLL Configuration (0x0C67)

This command configures the selected DPLL block within the selected CCU node. If the setting/capability is not supported in hardware, then return EINVAL (see errors in [Table 3-72](#)).

#### 3.2.6.10.1 Set CCU DPLL Configuration Command

[Table 3-70](#) details the input arguments of the Set CCU DPLL Configuration command.

**Table 3-70. Set CCU DPLL Configuration Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2:3	0x0C67	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
DPLL Index	16		The index of DPLL block.
Reserved	17.[7]	0	Reserved. Must be 0b.
REF SW ESync	17.[6]		Reference Switch on embedded sync failure. 0b = The DPLL does not switch references on embedded sync failures. 1b = When configured to automatic mode, the DPLL switches references on embedded sync failures.
Fast Lock Enable	17.[5]		Enable fast lock to 1PPS signals. Will increase loop bandwidth frequency of the DPLL to lock faster to 1PPS signals. 0b = Fast Lock disabled. 1b = Fast Lock enabled.
REF SW PFM	17.[4]		Reference Switch on Precision Frequency Monitor Fail 0b = The DPLL does not switch references on Precision Frequency Monitor failures. 1b = When configured to automatic mode, the DPLL switches references on Precision Frequency Monitor failures.
REF SW GST	17.[3]		Reference Switch on Guard Soak Timer Fail 0b = The DPLL does not switch references on Guard Soak Timer failures. 1b = When configured to automatic mode, the DPLL switches references on Guard Soak Timer failures.
REF SW CFM	17.[2]		Reference Switch on Coarse Frequency Monitor Fail 0b = The DPLL does not switch references on Coarse Frequency Monitor failures. 1b = When configured to automatic mode, the DPLL switches references on Coarse Frequency Monitor failures.
REF SW SCM	17.[1]		Reference Switch on Single Cycle Monitor Fail 0b = The DPLL does not switch references on Single Cycle Monitor failures. 1b = When configured to automatic mode, the DPLL switches references on Single Cycle Monitor failures.
REF SW LOS	17.[0]		Reference Switch on Loss of Signal 0b = The DPLL does not switch references on Loss of Signal detected. 1b = When configured to automatic mode, the DPLL switches references on Loss of Signal detected.
Reserved	18	0	Reserved. Must be 0b.

**Table 3-70. Set CCU DPLL Configuration Command [continued]**

Name	Byte.[Bits]	Value	Remarks
Mode	19.[7:5]		DPLL Mode 000b = FreeRun mode. 001b = Forced Holdover mode. 010b = Force Reference Lock mode. 011b = Automatic mode. 100b = Numerically Controlled Oscillator mode. All other values are reserved.
Clk Ref Sel	19.[4:0]		The Index of currently selected reference clock input. Will work only if forced reference lock mode is set.
Reserved	20:27	0	Reserved. Must be 0x0.
EEC Mode	28		Configured clock quality level to configure. 0xA = QL-EEC2/QL-ST3 0xB = QL-EEC1/QL-SEC 0xF = QL-DUS All other values are reserved.
Reserved	19	0	Reserved. Must be 0xo.
Reserved	30:31.[15:11]	0	Reserved. Must be 0x0.
Node Handle Valid	30:31.[10]		0b = The configuration is applied to the first CCU node in the netlist (i.e. CCU with index 0). 1b - The configuration is applied to the CCU node identified by the <i>Node Handle</i> input.
Node Handle	30:31.[9:0]		The handle of the CCU node.

### 3.2.6.10.2 Set CCU DPLL Configuration Command Response

Table 3-71 details the output arguments of the Set CCU DPLL Configuration command.

**Table 3-71. Set CCU DPLL Configuration Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.2 for details.
Opcode	2:3	0x0C67	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
DPLL Index	16		The index of DPLL block.
Reserved	17:31	0	Reserved. Must be 0b.

### 3.2.6.10.3 Set CCU DPLL Configuration Command Errors

The following errors can be returned by the Set CCU DPLL Configuration command:

**Table 3-72. Set CCU DPLL Configuration Command Errors**

Error Code	Value	Description
OK	0	No error.
EPERM	1	The command is not allowed due to an unsecured netlist.
EBUSY	12	PHY/module interface currently busy, retry.
EINVAL	14	Invalid parameters. This error is reported when the parameter is either out of a valid range or it cannot be set in the DPLL.

### 3.2.6.11 Set CCU Reference Priority (0x0C68)

This command configures the priority of the selected Input Index within a given DPLL block of CCU node.

#### 3.2.6.11.1 Set CCU Reference Priority Command

Table 3-73 details the input arguments of the Set CCU Reference Priority command.

**Table 3-73. Set CCU Reference Priority Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.1 for details.
Opcode	2:3	0x0C68	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
DPLL Index	16		The index of DPLL block.
Ref Index	17		The index of the reference input.
Ref Priority	18		The priority to be assigned to the reference clock input identified by <i>Ref Index</i> . A value of 0 denotes the highest priority. <b>Note:</b> A value of 0xFF results in removing the specified reference clock input from the list of allowed reference clock options for the specified DPLL block.
Reserved	19:29	0	Reserved. Must be 0x0.
Reserved	30:31.[15:11]	0	Reserved. Must be 0x0.
Node Handle Valid	30:31.[10]		0b = Use Node Handle of CCU identified by Index=0 in link topology netlist. 1b = Use provided <i>Node Handle</i> .
Node Handle	30:31.[9:0]		The handle of the CCU node.

### 3.2.6.11.2 Set CCU Reference Priority Command Response

Table 3-74 details the output arguments of the Set CCU Reference Priority command.

**Table 3-74. Set CCU Reference Priority Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.2 for details.
Opcode	2:3	0x0C68	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
DPLL Index	16		The index of the DPLL block copied from the request.
Ref Index	17		The index of the reference input copied from the request.
Ref Priority	18		Reference clock priority copied from the request
Reserved	19:31	0	Reserved. Must be 0x0.

### 3.2.6.11.3 Set CCU Reference Priority Command Errors

The following errors can be returned by the Set CCU Reference Priority command:

**Table 3-75. Set CCU Reference Priority Command Errors**

Error Code	Value	Description
OK	0	No error.
EPERM	1	The command is not allowed due to an unsecured netlist.
EBUSY	12	PHY/module interface currently busy, retry.
EINVAL	14	Invalid parameters. This error is reported when the parameter is either out of a valid range or it cannot be set in the DPLL.

### 3.2.6.12 Get CCU Reference Priority (0x0C69)

This command reads the currently configured priority of the selected reference clock for a given DPLL block within a given CCU (DPLL) node.

#### 3.2.6.12.1 Get CCU Reference Priority Command

Table 3-76 details the input arguments of the Get CCU Reference Priority command.

**Table 3-76. Get CCU Reference Priority Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.1 for details.
Opcode	2:3	0x0C69	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
DPLL Index	16		The index of DPLL block.
Ref Index	17		The index of the reference input.
Reserved	18:31	0	Reserved. Must be 0x0.

#### 3.2.6.12.2 Get CCU Reference Priority Command Response

Table 3-77 details the output arguments of the Get CCU Reference Priority command.

**Table 3-77. Get CCU Reference Priority Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.2 for details.
Opcode	2:3	0x0C69	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
DPLL Index	16		The index of the DPLL block copied from the request.
Ref Index	17		Reference pin index copied from the request.
Ref Priority	18		The priority to be assigned to the reference clock input identified by <i>Ref Index</i> . A value of 0 denotes the highest priority, and num_pins the lowest. <b>Note:</b> A value of 0xFF results in removing the specified reference clock input from the list of allowed reference clock options for the specified DPLL block - NEVER USE THIS.
Reserved	19:31	0	Reserved. Must be 0x0.

### 3.2.6.12.3 Get CCU Reference Priority Command Errors

The following errors can be returned by the Get Clock Controller Reference Priority command:

**Table 3-78. Get CCU Reference Priority Command Errors**

Error Code	Value	Description
OK	0	No error.
EPERM	1	The command is not allowed due to an unsecured netlist.
EBUSY	12	PHY/module interface currently busy, retry.
EINVAL	14	Invalid parameters.

### 3.2.6.13 Get CCU Info (0x0C6A)

This command retrieves information about the CCU. If a parameter is unsupported, it should contain 0xFFFF FFFF for 32-bit values or 0xFF for 8-bit values.

#### 3.2.6.13.1 Get CCU Info Command

Table 3-79 details the input arguments of the Get CCU Info command.

**Table 3-79. Set CCU Info Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2:3	0x0C6A	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Reserved	16:29	0	Reserved. Must be 0x0.
Reserved	30:31.[15:11]	0	Reserved. Must be 0x0.
Node Handle Valid	30:31.[10]		0b = Use Node Handle of CCU identified by Index=0 in link topology netlist. 1b = Use provided <i>Node Handle</i> .
Node Handle	30:31.[9:0]		The handle of the CCU node.

#### 3.2.6.13.2 Get CCU Info Command Response

Table 3-80 details the output arguments of the Get CCU Info command.

**Table 3-80. Set CCU Info Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2:3	0x0C6A	Command opcode.
Datalen	4:5	0	Length of the data buffer in bytes.
Return Value	6:7		Return value.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Manufacturer's Part Number	4:7.[31:0]		Reflects the Manufacturer's Part Number or Device ID retrieved from the device.
Custom Configuration Version	8:11.[31:0]		Reflects the Custom Configuration Version retrieved from the device.
FW Version	12:15.[31:0]		Reflects the Firmware Version retrieved from the device.
Node Part Number	16.[7:0]		Reflects the corresponding Node Part Number from the link topology netlist.
Device Revision	17.[7:0]		<b>Device Revision</b> Reflects the silicon stepping version retrieved from the device.
Reserved	30:31	0	Reserved. Must be 0x0.

### 3.2.6.13.3 Get CCU Info Command Errors

The following errors can be returned by the Get Clock Controller Info command:

**Table 3-81. Get Clock Controller Info Command Errors**

Error Code	Value	Description
OK	0	No error.
EPERM	1	The command is not allowed due to an unsecured netlist.
EBUSY	12	PHY/module interface currently busy, retry.
EINVAL	14	Invalid parameters.

### 3.2.6.14 Get Input Frequency List (0x0C6C)

The command reads the list of allowed input frequencies on a specified input.

#### 3.2.6.14.1 Get Input Frequency List Command

Table 3-82 details the input arguments of the Get Input Frequency List command.

**Table 3-82. Get Input Frequency List Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.1 for details. Driver must clear.
Opcode	2:3	0x0C6C	Command opcode.
Datalen	4:5	0x0020	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Input Index	16		Input index (pin).
Reserved	17:23	0	Reserved. Must be 0x0.
Data Address High	24:27		Address of response buffer.
Data Address Low	28:31		Address of response buffer.

#### 3.2.6.14.2 Get Input Frequency List Command Response

Table 3-83 details the output arguments of the Get Input Frequency List command.

**Table 3-83. Get Input Frequency List Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.2 for details.
Opcode	2:3	0x0C6C	Command opcode.
Datalen	4:5	0x0020	Length of the data buffer in bytes.
Return Value	6:7		Return value: EINVAL - Invalid parameters, e.g. buffer too small EBUSY - PHY/module interface currently busy, retry. EPERM - The command is not allowed due to an unsecured netlist.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Input Index	16		Input index (pin).
Length	17		The length of the frequency list.
Reserved	18:23	0	Reserved. Must be 0x0.
Data Address High	24:27		Address of response buffer.
Data Address Low	28:31		Address of response buffer.

**Table 3-84. Get Input Frequency List Command Response Data Structure**

Name	Byte.[Bits]	Value	Remarks
Input Frequency[0]	0:3		All input frequencies in Hz.
Input Frequency[1]	4:7		All input frequencies in Hz.
Input Frequency[2]	8:11		All input frequencies in Hz.
Input Frequency[3]	12:15		All input frequencies in Hz.
Input Frequency[4]	16:19		All input frequencies in Hz.
Input Frequency[5]	20:23		All input frequencies in Hz.
Input Frequency[6]	24:27		All input frequencies in Hz.
Input Frequency[7]	28:31		All input frequencies in Hz.
Input Frequency[8]	32:35		All input frequencies in Hz.
Input Frequency[9]	36:39		All input frequencies in Hz.
Input Frequency[10]	40:43		All input frequencies in Hz.
Input Frequency[11]	44:47		All input frequencies in Hz.
Input Frequency[12]	48:51		All input frequencies in Hz.
Input Frequency[13]	52:55		All input frequencies in Hz.
Input Frequency[14]	56:59		All input frequencies in Hz.

### 3.2.6.15 Get Output Frequency List (0x0C6D)

The command reads the list of allowed output frequencies on a specified output.

#### 3.2.6.15.1 Get Output Frequency List Command

Table 3-85 details the input arguments of the Get Output Frequency List command.

**Table 3-85. Get Output Frequency List Command**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.1 for details. Driver must clear.
Opcode	2:3	0x0C6D	Command opcode.
Datalen	4:5	0x0020	Length of the data buffer in bytes.
Return Value	6:7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Output Index	16		Output index (pin).
Reserved	17:23	0	Reserved. Must be 0x0.
Data Address High	24:27		Address of response buffer.
Data Address Low	28:31		Address of response buffer.

#### 3.2.6.15.2 Get Output Frequency List Command Response

Table 3-83 details the output arguments of the Get Output Frequency List command.

**Table 3-86. Get Output Frequency List Command Response**

Name	Byte.[Bits]	Value	Remarks
Flags	0:1		See Section 9.5.5.1.2 for details.
Opcode	2:3	0x0C6D	Command opcode.
Datalen	4:5	0x0020	Length of the data buffer in bytes.
Return Value	6:7		Return value: EINVAL - Invalid parameters, e.g. buffer too small. EBUSY - PHY/module interface currently busy, retry. EPERM - The command is not allowed due to an unsecured netlist.
Cookie High	8:11	Cookie	Opaque value copied by firmware into the completion of this command.
Cookie Low	12:15	Cookie	Opaque value copied by firmware into the completion of this command.
Input Index	16		Input index (pin).
Length	17		The length of the frequency list.
Reserved	18:23	0	Reserved. Must be 0x0.
Data Address High	24:27		Address of response buffer.
Data Address Low	28:31		Address of response buffer.

**Table 3-87. Get Output Frequency List Command Response Data Structure**

Name	Byte.[Bits]	Value	Remarks
Output Frequency[0]	0:3		All output frequencies in Hz.
Output Frequency[1]	4:7		All output frequencies in Hz.
Output Frequency[2]	8:11		All output frequencies in Hz.
Output Frequency[3]	12:15		All output frequencies in Hz.
Output Frequency[4]	16:19		All output frequencies in Hz.
Output Frequency[5]	20:23		All output frequencies in Hz.
Output Frequency[6]	24:27		All output frequencies in Hz.
Output Frequency[7]	28:31		All output frequencies in Hz.
Output Frequency[8]	32:35		All output frequencies in Hz.
Output Frequency[9]	36:39		All output frequencies in Hz.

Output Frequency[11]	44:47		All output frequencies in Hz.
Output Frequency[12]	48:51		All output frequencies in Hz.
Output Frequency[13]	52:55		All output frequencies in Hz.
Output Frequency[14]	56:59		All output frequencies in Hz.

## 3.3 Link Topology

### 3.3.1 Overview

In the E810, the Ethernet link management task is performed by firmware, using scripting language to allow flexible programming of each link component. To manage the link, the firmware must know which components are connected to the link, how those components are connected to perform the link, and how each component can be accessed to configure it. The scheme of component connections to perform the link is referred as link topology. The link topology might include internal PHYs (within an SoC), external on-board PHY and re-timers, and additional optical or electrical modules and cables either mounted on board or plugged into a cage (for example, SFP+ or QSFP cages). Firmware must know the type of each device connected to the Ethernet link, the sequence of connections between the devices, how to access each device registers, and how to configure it. Internal PHYs might be connected using the SoC internal bus, while external devices are usually connected using the I<sup>2</sup>C bus or MDIO, optionally using I<sup>2</sup>C multiplexers at the I<sup>2</sup>C path. In addition, some control signals are needed for those devices, (for example, RST\_N, PRSNT\_N and INTR\_N). Those control signals are either connected directly to the SoC SDP, or indirectly using an I<sup>2</sup>C port replicator connected at the I<sup>2</sup>C tree. Finally, the link management task also includes control of link-related LEDs. Firmware must know how to access the LEDs associated with each Ethernet link. Those LEDs might be connected directly to the SoC or indirectly using an I<sup>2</sup>C LED driver.

The way that the internal or external components are connected to the Ethernet link is referred to as the link topology. The topology describes how components connected to the Ethernet link and how to access them for configuration. The topology also includes a description of the low-speed devices, such as I<sup>2</sup>C multiplexers and port expanders. Link management tasks must configure those I<sup>2</sup>C multiplexers to allow access to link components. In addition, link management task must know the port expander connectivity to access the reset and interrupt signals of the link components, and to know if those components exist on the board.

The topology of the main board is stored within an NVM section. During initialization, firmware should read the topology and initialize all devices accordingly. However, some parts of the topology might change dynamically. For example, if an SFP module is inserted into an SFP cage, firmware must detect this event and configure the link appropriately.

**Note:** The E810 does not support topologies with mezzanine cards.

This section describes the structure of such topology descriptions and how firmware reads and process the topology.

- [Section 3.3.2](#) defines link topology and illustrates the framework of link topology.
- [Section 3.3.3](#) describes the structures needed for link topology in the platform NVM. A high-level overview of all link structures including the link topology netlist structures is given.
- [Section 3.3.5](#) discusses an example for the link topology netlist for main board topology.
- [Section 3.3.8](#) gives detailed information about the link topology netlist structures.
- [Section 3.3.9](#) discuss sizes, conventions, and constraints of the netlist.
- [Section 3.3.10](#) describes the link topology software interface using admin commands.

### 3.3.2 Link Topology Definition

The link topology describes any device connected to the Ethernet link (for example, PHY or re-timer). The topology also describes the associated devices used for managing the link devices (for example, I<sup>2</sup>C multiplexer). In addition, the associated SDPs and LEDs that are used to indicate link changes are defined within the topology description. Those devices are located on NIC.

Figure 3-18 illustrates link topology.

Figure 3-18. Topology Schematic

### 3.3.3 Topology Structures

The link topology is described using the link topology netlist structure in the platform NVM. The E810 registers that are affected by the link topology are modified using the adaptive NVM tables that are stored in the platform NVM.

The link topology netlist describes all topology components and the connection(s) between them, and is composed of several sections. The first one is stored in the link topology NVM section, and describes the motherboard topology.

Some topology-related parameters, referred as link topology capabilities registers, are stored directly as NVM words, and therefore can be modified using adaptive NVM configuration tables. For example, the number of available ports and link speeds is determined by the link topology netlist, and is applied to E810 registers using adaptive NVM. Those parameters are therefore located in the NVM and are subject to adaptive NVM configuration.

The link topology netlist and link topology capabilities sections are also used by the link establishment state machine to bring up the link with the link partner. The NVM stores the adaptive NVM features table, which describes the link topology capabilities registers values and other NVM values, per Ethernet link for a list of predefined link modes.

The link modes configurations for the Ethernet links implemented on the NIC are also held in the platform NVM.

At initialization stage, when a module is plugged into a cage, the firmware reads the different topology structures and builds the current topology of the links.

#### 3.3.3.1 High-Speed PHY Chain

One part of the link topology can be viewed as a chain of PHYs, re-timers, and modules that are connected in a chain to perform a link. For the sake of simplicity, we treat all the elements in the chain as PHYs, with two ports: the line port, and the host port, where the line port is the port connected to the chain ended in the line side of the link, and the host port is the port connected to the chain ended at the host.

Figure 3-19 illustrates the PHY chain.

Figure 3-19. High-Speed PHY Chain

**Notes:**

- Some topologies do not include all components (for example, re-timer or a cage).
- The high speed PHY chain might contain components that are shared between several Ethernet links. For example, an external PHY might support four Ethernet links, or a QSFP cage might be plugged with breakout cable, that creates four different Ethernet links.

### 3.3.3.2 PHY Capabilities Structures

Ethernet link might work in different speeds and different electrical parameters. In general, each speed is specified with several different electrical specifications, to support different media. Such are short-reach cables (SR), long-reach cables (LR), different types of backplanes, and BASE-T pairs. We use single structure to describe the available modes, while each mode might have additional options that are described in adjacent parameters. The PHY capabilities structure, which is also referred to as PHY\_TYPE, is used in several topology structures, admin command parameters, and in PHY configuration scripts as a parameter. For the topology description, it is used as a link topology NVM word, that describes the outermost PHY capabilities. It is also used twice, for each PHY node in the topology structures, to indicate the supported modes at the line side and at the host side.

Some capabilities are valid only for the outermost PHY, while others can be reflected also at the board connection between two PHYs in a chain. [Table 3-88](#) and [Table 3-89](#) describe the PHY capabilities for outermost PHYs, which covers all types of links.

**Note:** For the sake of readability, these tables are organized with capabilities bit per speed.

To avoid explosion of the topology netlist, we implement two different structures. The extended structure is used for the line side of the outermost PHY, which includes all capabilities. The basic structure used for the host side of the outermost PHY and both line side and host side for the other PHYs in the chain.

The extended structure is implemented as 128-bit words (84 bits used and the rest reserved for future use) and is described in [Table 3-90](#). The basic structure is implemented as 64-bit words (31 bits used and the rest reserved for future use) and is described in [Table 3-91](#). Both PHY capabilities structures are implemented in the topology netlist PHY capabilities section, as described in [Section 3.3.8.6](#).

128 bits for outermost line side. 64 bits for everything else.

**Table 3-88. PHY Capabilities Bit Matrix (Part 1)**

Speed/Media Type	100M	1G	2.5G	5G	10G
BASE-T	100BASE-TX	1000BASE-T	2.5GBASE-T	5GBASE-T	10GBASE-T
Short Reach	1000BASE-SX <sup>1</sup>	1000BASE-SX			10GBASE-SR

CR	25GBASE-CR	40GBASE-CR4	50GBASE-CR2	100GBASE-CR4		
CR-S	25GBASE-CR-S					
CP			50GBASE-CR-PAM4	100GBASE-CR2-PAM4	200GBASE-CR4-PAM4	
	25GBASE-CR1		50GBASE-KR-PAM4	100GBASE-KR2-PAM4		
			50GBASE-LR	100GBASE-DR	200GBASE-DR4	400GBASE-DR4
			50GBASE-SR	100GBASE-SR2		
			50GBASE-FR		200GBASE-FR4	400GBASE-FR8
	25GBASE-KR1		50GBASE-AUI1	100G-AUI4	200G-AUI8	
			50G-AUI1-AOC / 50G-AUI1-ACC	100G-AUI4-AOC / 100G-AUI4-ACC	200G-AUI8-ACC / 200G-AUI8-AOC	
			50GBASE-AUI2	100G-AUI2		
			50G-AUI2-AOC/ 50G-AUI2-ACC	100G-AUI2-AOC / 100G-AUI2-ACC		
				100GBASE-CR-PAM4		
			100GBASE-KR-PAM4			

**Note:** As NVM word, the capabilities structure describes the enabled options for the outermost PHY. These link speeds and link options might or might not be supported at the specified device level, or for specific link. The enabled speeds/options in [Table 3-88](#) and [Table 3-89](#) should be selected in such a way that the device would be able to support them. For example, the E810 does not support 2.5G/40G/200G speeds, and therefore those options should not be selected for this device.

### 3.3.3.2.1 Extended PHY Capabilities 128-Bit Word Structure

### 3.3.3.3 Link Modes Adaptive NVM Features Tables

The link topology applied by the link topology netlist might affect can E810 CSRs. This is done using adaptive NVM method. The link topology netlist references two types of adaptive NVM features tables.:

- **Global super-feature tables** — Affect E810 configurations that should be modified according to the combination of the valid ports and their corresponding maximal speed.
- **Per-port/Per function features tables** — Affect configurations relevant for the specific port type and speed.

The global super-feature table is applied by the adaptive NVM configuration ID at the innermost PHY attached to the selected port option. There should be a different port option for each valid combination of E810 ports, as described in [Table 3-12, “Port Configurations”](#).

[Table 3-92](#) describes the main E810 settings that are affected by the global super-feature.

**Table 3-92. Global Super-Feature Affected Settings**

Feature	Description
E810 port topology mode	Controls the allocation of E810 resources according to the number of ports and speed of those ports.
Additional DCB configurations	DCB-to-UP translation tables. Congestion domain configurations.
VSI/VEB allocation	Allocations of resources to physical functions (see <a href="#">Section 7.8.10</a> ).
Max number of virtual functions allocated to physical function	
Physical function port association	Association of physical function to port (see <a href="#">Section 4.5</a> ).

[Table 3-93](#) describes the main E810 settings that are affected by the Per-port feature.

**Table 3-93. Per-Port Super Feature Affected Settings**

Feature	Description
Port enabling	Enable or disable the port (see <a href="#">Section 4.5</a> ).
Port WoL setting	Enable/Disable this port for WoL setting.

[Table 3-94](#) describes the main E810 settings that are affected by the Per-function feature.

**Table 3-94. Per-Function Super Feature Affected Settings**

Feature	Description
Physical function enabling	Enabling the physical function that is associated with the port (see <a href="#">Section 4.5</a> ).
Device ID	

### 3.3.3.4 Link Topology Netlist

The topology netlist is a description of all components associated with the Ethernet link, a description of the way to control those components and the connectivity between them. The topology netlist includes an entry for each topology device (node), with a description of its interfaces, capabilities, device types, associated configuration, and any information needed to setup this device to bring up the Ethernet link.

Each topology node is composed of several sections. Two sections are common for all topology nodes and are reflected the topology netlist:

- **Node Header Section** — Includes the basic description of the node and pointers to the other sections.
- **Node I/O Section** Includes pointers and descriptions of the node I/Os that connect the node toward the host.

Some topology devices do not need any additional description besides the Node Header Section and the Node I/O Section, while others include additional sections to reflect topology-related properties that are specific to the node. Some nodes need an additional scratch section, which is used by the scripts to store scratch data.

The following basic topology devices contain only the Node Header Section and the Node I/O Section, with some of the nodes also containing also the scratch area (Node Scratch Section):

- GPIO controller node
- MUX controller node
- LED controller node
- ID EEPROM node
- Cage node

The Node Header Section and the Node I/O Section that compose the basic topology device structure include the following information:

- **Node Header Section** — Contains information on the following:
  - Node type, node handle, node address, node part number, and node options.
  - I/O section pointer.
  - Port options section pointer — Relevant for PHY, LED, and Temperature sensor nodes and includes Port option count and the pointer to the Port options section.
  - Line-side analog Port options section pointer — Relevant for PHY nodes and includes the pointer to the analog Port options section.
  - Host-side analog Port options section pointer — Relevant for PHY nodes and includes the pointer to the analog Port options section.
- **Node I/O Section** — Includes a list of interfaces that are connected to this node. As all topology devices are eventually controlled by the SoC, the link topology netlist is built as a tree, where the roots of the tree are the SoC nodes that represent I/Os that are directly controlled by the SoC firmware. Therefore, it is sufficient that each topology node would list only the interfaces (I/Os) that connect between the node and other nodes that are up in the topology tree. Those I/Os could be either I/Os that are controlled by this node (master I/Os), or I/Os that are used to control this node (secondary I/Os). Within the Node I/O Section, each such interface contains the following information:
  - Driving node handle — This includes a node handle, used to point to the topology device that this interface is connected to, and the I/O number at that topology device.

- I/O type and driving interface — Contains information about the type of the interface (for example, I<sup>2</sup>C, MDIO, SDP, LED), and the function of the interface (for example, when is the type SDP, what is the functionality of that SDP - INT\_N / PRESET\_N / TX\_DISABLE, and so on).
- Other properties of the I/Os, like Polarity, Strapped, Strap value, Interrupt, and Speed. Those properties might be used with the proper I/O type.

For some devices, like the LEDs and the thermal sensors, we need to add an information about the association of the topology device with another topology device, referred as its parent device. The port option selected for the parent device is also applied for the current topology device. Therefore, LED and thermal sensor nodes include additional node parent section.

The LED topology node includes the basic node sections, the node parent section and additional LED configuration section for each port option, with the following information:

- LED link affinity (Lo /High) — Up to 24 bits (lowest 24 bits) are used to associate the Ethernet link with the LED. When the bit is set, the relevant Ethernet link affects the LED. The highest two bits are used to select the logic operation between the ports (AND or OR).
- LED flag (Low / High)
- LED color and condition

The Temperature Sensor node includes the basic node sections, the node parent section, and additional Thermal Sensor Configuration Section for each port option, with the following information:

- Temperature sensor link Affinity (Low / High) — Up to 32 bits are used to associate the Ethernet link with the temperature sensor. Each link should be associated with one temperature sensor.
- Temperature alarm threshold — The threshold temperature for this sensor.

The PHY node includes several sections that are added to the basic node description. A PHY node would include two sections of PMD analog options (one for the host side and one for the line side) and two sections of PMD miscellaneous analog options (one for the host side and one for the line side). The PMD analog options contain configurations and coefficients for the analog side of the PHY lines, while the PMD miscellaneous analog section might contain additional configuration that is PHY-specific.

In addition to the above sections, the PHY node also contains one port option pointer section and port option header sections per port option. Each port option contains several PMDs, with PHY capability section per PMD within the port option. See [Section 3.3.8.18](#) for an example of a PHY node.

The PMD Analog Section contains the following information:

- Coefficients for 1G/5G/10G/25G/50G AUI modes.
- Coefficients for 10G KR, 25G KR/CR and 50G KR modes.
- Link establishment state machine timeouts for 1G/5G/10G/25G/50G AUI modes.
- Link establishment state machine timeouts for 10G KR, 25G KR/CR and 50G KR modes.
- Lane transmit and receive polarity.

The Port Option Pointer Section includes the following information, per Port option:

- A pointer to the relevant port option section.

The Port Option Header Section includes the following information:

- Adaptive NVM Global Super Configuration ID — A pointer to the adaptive NVM super-feature table that sets NVM parameters per-port option.
- Adaptive NVM PHY Configuration ID — A pointer to the adaptive NVM feature table of the relevant PHY that sets NVM parameters per-port option of the PHY.

- Minimum SKU — The minimum SKU that this port option can work with.
- PMD count — The number of PMDs within this port option.
- A pointer to the Node PHY capabilities section per PMD.

The Node PHY Capabilities Section includes the following information:

- Feature IDs and configuration IDs of adaptive NVM tables of the port and the function, relevant for this port option.
- Link options (EEE enable, FEC abilities advertise and request for 25G (cl. 74,91), FEC abilities advertise and request for 10G, PCS enable, Low power mode enable, LPLU enable, Rx and Tx pause, auto-negotiation options (cl. 28, 37,73), LESM enable, Auto FEC enable, host and line lane reversal, and outermost indication).
- PMD width for host side and line side.
- First lane (lane 0) ID for host side and line side.
- EEE TWSysTX timer value.
- PHY capabilities structure for host side and line side per [Section 3.3.8.5.5](#).

Table 3-95 summarize the link topology node structure, for different nodes:

**Table 3-95. Link Topology Node Structure**

Section	Description	Applies to Node Types	Number of Sections in a Node
Header Section	The header section contains basic information for all node types, such as node type, section length, address and pointers to the other node sections.	All nodes types	One section. Fixed size
I/O Section	The IO section contains information about the connectivity of the node within the topology netlist.	All node types	One section. Size is linear with the number of I/Os.
Led Configuration Section	This section contains information about the configuration of the LED, such as polarity, port affinity and color.	LED nodes	One section. Size is linear with the number of port options of the parent PHY node.
Thermal Configuration Section	This section contains information dealing with the configuration of the thermal sensor, such as port affinity and alarm threshold.	Temperature sensor nodes	One section. Size is linear with the number of port options of the parent PHY node.
PMD Analog Section	This section contains the configuration of the PHY lanes analog side.	PHY nodes	Two section per PHY node, for the host and line side. Size is linear with the number of lanes.
PMD Analog Misc Section	This section contains PHY specific configuration of the PHY lanes analog side.	PHY nodes	Two section per PHY node, for the host and line side. Size is linear with the number of lanes.
Port Option Pointer Section	This section contains the pointers for all PMD options within a single PHY node.	PHY nodes	One section per PHY node. Size is linear with the number of port options.
Port Option Header Section	This section contains the number of PMDs per port option and pointers to Node PHY capabilities section.	PHY nodes	Each PHY node has sections for each port option. Size is linear with the number of PMDs within the port option.
Node PHY Capabilities Section	This section contains the configuration of the PHY in a specific port option.	PHY nodes	Each port option has sections for each PMD. Size is fixed.

### 3.3.3.5 MD Link Topology NVM Section

In addition to the link topology netlist, there is an additional NVM section for link topology parameters that might be updated by the link topology firmware. The following parameters are included in this section.

**Table 3-96. Link Topology NVM Section**

Parameter	Word/Bit Offset	Description
Netlist Map Version	Byte 0x2 - Generic Info / Bits [15:8]	The version of the netlist field definition
Load Mode	Byte 0x2 - Generic Info / Bit 0	Netlist Loading Mode — Controls the steps taken at the netlist load time. Valid only for the motherboard’s netlist. Two modes defined: 0x0 = Normal mode — the active port options are loaded. 0x1 = resolution mode — The active port options of the non-innermost nodes are updated and then the active port options are loaded. The update is performed based on matching the active port option of the connected innermost PHY. If the port option was forced, the active option is not updated.
Netlist Version	Byte 0x3 - Netlist Version / Bits [15:0]	The version of the netlist.
Active Port Option	Bytes 0x4-0x13 - Pair PHY Type[n] / Bits [3:0] and Bits [11:8]	The active port option selected for each PHY in the netlist. Up to 32 PHYs are supported, where each word holds the active option for two PHYs. The first is in Bits [3:0] and the second is in Bits [11:8].
Port Bitmap	Byte 0x14 - Port Bitmap 0 / Bits [15:0] Byte 0x15 - Port Bitmap 1 / Bits [3:0]	Port Bitmap

### 3.3.4 Link Default Override Mask NVM Section

This is per-port structure in the NVM PFA, which allows overriding some of the link topology netlist settings.

**Table 3-97. Link Default Override Mask Structure**

Offset	Content	Default Value	Notes	Override
0x0	Type	0x134		N/A
0x1	Length	0x50	4 bytes per port for options plus 16 bytes per-port for PHY types.	N/A
0x2 - 0x3	<b>32 bits defined as follows:</b>			
	<b>Bits [0:7] - Options:</b>			
	0 = Lenient / Strict	0b	0b = Lenient 1b = Strict	
	1 = EPCT ability to change Lenient / Strict enable	0b	0b = Enable 1b = Disable	

**Table 3-97. Link Default Override Mask Structure [continued]**

Offset	Content	Default Value	Notes	Override
	2 = Port Disable behavior mode	0b	Controls how to disable the port when requested. 0b = The request is honored only if WoL and Manageability are not enabled on this port. 1b = The request is honored even if WoL or manageability are enabled on this port. <b>Note:</b> This field should be set by UEFI driver if PermitTotalPortShutdown attribute is set.	
	3 = Override Enable	0b	Enables the override ability from PFA for this port. When this bit is set for a specific port, the parameters of this port that are specified in the right column are taken from the PFA and not from the link topology structures. 0b = Disable 1b = Enable	
	4 = Disable Automatic Link on Startup	0b	When <i>Override Enable</i> bit is set and <i>Override Disable Automatic Link on Startup</i> (Bit 25) is set, the Disable Automatic link on Startup feature is taken from here and not from the link topology. 0b = Automatic Link on startup feature is enabled. 1b = Automatic Link on startup feature is disabled.	Override Enable & Bit 25
	5 = EEE Enable	From netlist	When <i>Override Enable</i> bit is set and <i>Override EEE Setting</i> (Bit 26) is set, the EEE can be enabled or disabled according to this bit, assuming that the PHY_TYPE is supporting EEE. 0b = Disable 1b = Enable	Override Enable & Override EEE Setting - Bit 26
	6:7 = Reserved			N/A
	<b>Bits [8:15] - "Set PHY Config" - Byte 16</b>			
	8:9 = PAUSE Ability	From netlist	When <i>Override Enable</i> bit is set and <i>Override PAUSE Setting</i> (Bit 27) is set, the <i>PAUSE Ability</i> bits are taken from here and not from the topology netlist.	Override Enable & Override PAUSE Setting - Bit 27
	10:13 = Reserved			N/A
	14 = LESM Enable	From netlist	When <i>Override Enable</i> bit is set and <i>Override LESM Enable</i> (Bit 28) is set, the <i>LESM Enable</i> bit is taken from here and not from the topology netlist.	Override Enable & Override LESM Enable - Bit 28
	15 = Auto FEC Enable	From netlist	When <i>Override Enable</i> bit is set and <i>Override FEC Setting</i> (Bit 29) is set, the <i>Auto FEC Enable</i> bit is taken from here and not from the topology netlist.	Override Enable & Override FEC - Bit 29
	<b>Bits [16:23] - "Set PHY Config" - Byte 22 (FEC options)</b>	From netlist	When <i>Override Enable</i> bit is set and <i>Override FEC Setting</i> (Bit 29) is set, the FEC options bits as described in Set PHY Config - Byte 22 are taken from here and not from the topology netlist.	Override Enable & Override FEC - Bit 29
	<b>Bits [24:31] - Override by Function</b>			
	24 = Override PHY Types	0b	Enables the override ability from PFA PHY Types for this port. When this bit is set for a specific port, the PHY Types capabilities of this port are masking the link topology capabilities. 0b = Disable 1b = Enable	N/A

**Table 3-97. Link Default Override Mask Structure [continued]**

Offset	Content	Default Value	Notes	Override
	25 = Override Disable Automatic Link on Startup	0b	Enable the override ability from PFA <i>Disable Automatic Link on Startup</i> bit. 0b = Disable 1b = Enable	N/A
	26 = Override EEE Setting	0b	Enable the override ability from PFA <i>EEE Enable</i> bit. 0b = Disable 1b = Enable	N/A
	27 = Override PAUSE Setting	0b	Enable the override ability from PFA <i>PAUSE</i> bits. 0b = Disable 1b = Enable	N/A
	28 = Override LESM Enable	0b	Enable the override ability from PFA <i>LESM Enable</i> bit. 0b = Disable 1b = Enable	N/A
	29 = Override FEC Setting	0b	Enable the override ability from PFA <i>FEC</i> fields 0b = Disable 1b = Enable	N/A
	30:31 = Reserved			N/A
0x4 - 0xB	PHY Types	Either from netlist or 0xFFFF_FFFF 0xFFFF_FFFF	PHY Types for Port 0 8 Words per port. PHY types as defined in <a href="#">Table 3-90</a> .	Override Enable and Override PHY Types
0xC - 0xD	32 bits defined as above for Options for Port 1		Options for Port 1.	Override Enable and Override PHY Types
0xE - 0x15	PHY Types for Port 1		PHY Types for Port 1.	Override Enable and Override PHY Types
0x16 - 0x17	32 bits defined as above for Options for Port 2		Options for Port 2.	Override Enable and Override PHY Types
0x18 - 0x1F	PHY Types for Port 2		PHY Types for Port 2.	Override Enable and Override PHY Types
0x20 - 0x21	32 bits defined as above for Options for Port 3		Options for Port 3.	Override Enable and Override PHY Types
0x22 - 0x29	PHY Types for Port 3		PHY Types for Port 3.	Override Enable and Override PHY Types
0x2A - 0x2B	32 bits defined as above for Options for Port 4		Options for Port 4.	Override Enable and Override PHY Types
0x2C - 0x33	PHY Types for Port 4		PHY Types for Port 4.	Override Enable and Override PHY Types
0x34 - 0x35	32 bits defined as above for Options for Port 5		Options for Port 5.	Override Enable and Override PHY Types
0x36 - 0x3D	PHY Types for Port 5		PHY Types for Port 5.	Override Enable and Override PHY Types

**Table 3-97. Link Default Override Mask Structure [continued]**

Offset	Content	Default Value	Notes	Override
0x3E - 0x3F	32 bits defined as above for Options for Port 6		Options for Port 6.	Override Enable and Override PHY Types
0x40 - 0x47	PHY Types for Port 6		PHY Types for Port 6.	Override Enable and Override PHY Types
0x48 - 0x49	32 bits defined as above for Options for Port 7		Options for Port 7.	Override Enable and Override PHY Types
0x4A - 0x51	PHY Types for Port 7		PHY Types for Port 8.	Override Enable and Override PHY Types

### 3.3.5 Link Topology Use Cases

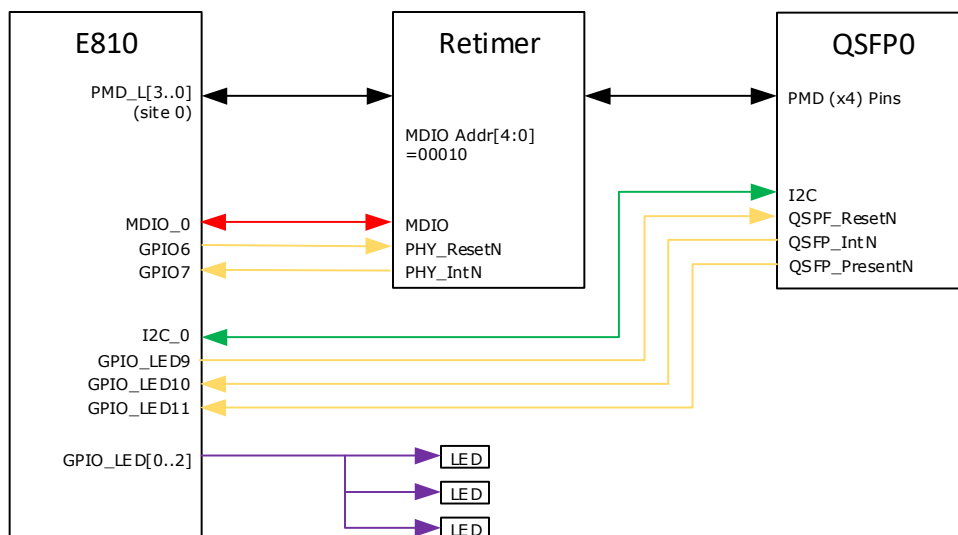

This section illustrates the resulting link topology netlist, with a specific use case. We take our use cases from the *NAC Hardware Topology Design Specification* document.

The following use case is taken:

- NIC use case, where all link topology components are on NIC.

#### 3.3.5.1 NIC Use Case

Figure 3-20 describes typical Network Interface Card (NIC) use case. Figure 3-21 describes the resulting topology data structures.

**Figure 3-20. NIC Topology Use Case**

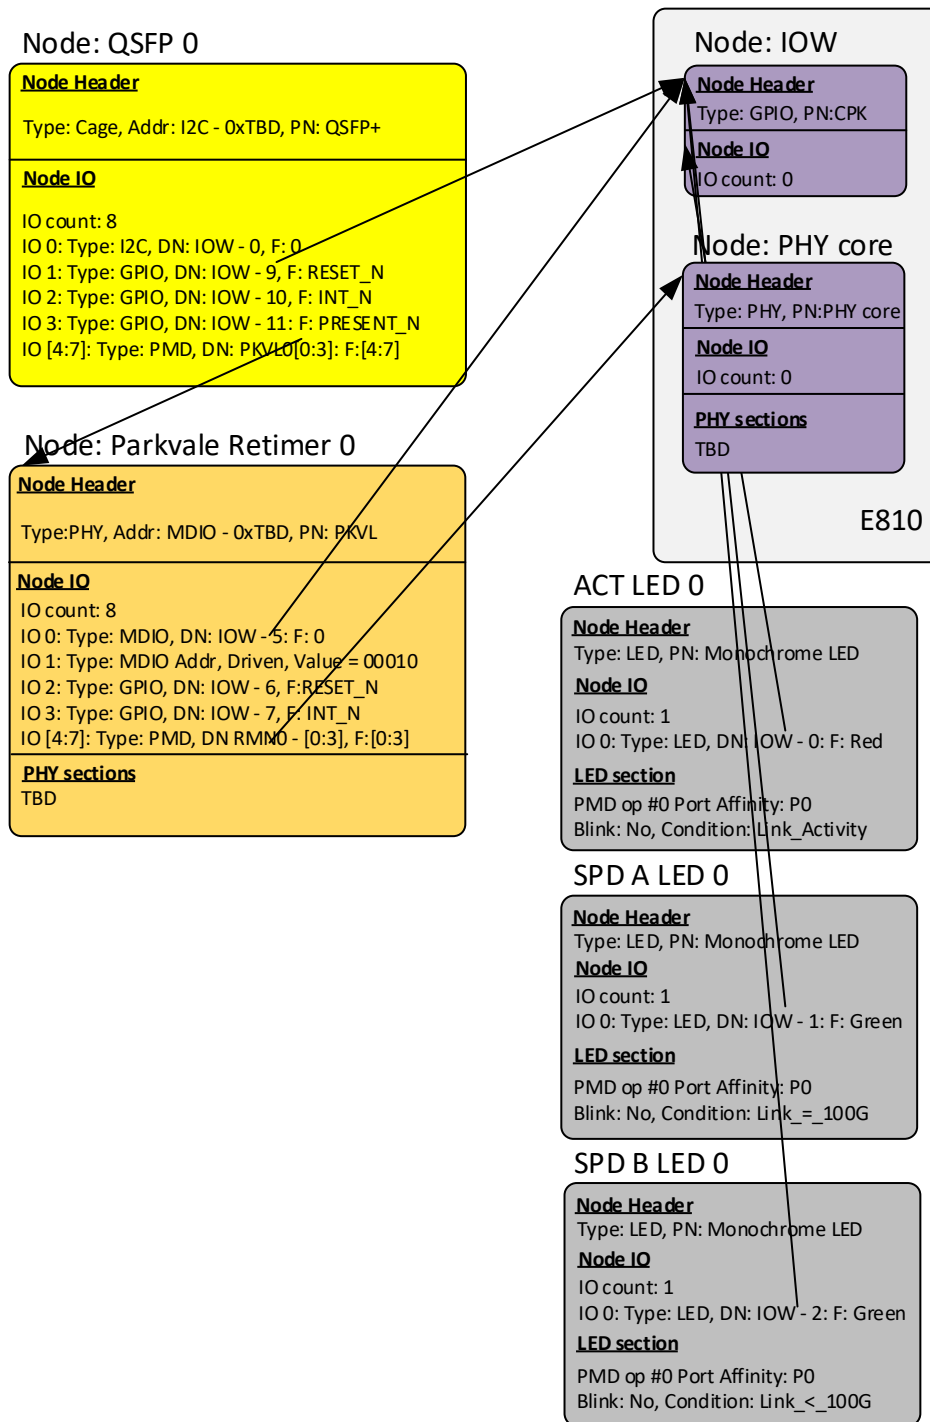

Figure 3-21. NIC Topology Use Case Data Structures

### 3.3.6 Topology Device Loading and Programming

External topology devices (e.g. PHYs) connected to the E810 might have a firmware engine within the device and the firmware is usually loaded from NVM connected to the topology device.

In some cases, those firmware packages might need to be regularly updated in a secure way to prevent malicious user to burn malicious firmware into the topology device. In other cases, the topology device firmware might be burned independently, as burning the NVM attached to the device might cause the device to stop function but could be fixed without permanent damage.

The topology device NVM images can be updated using software tools (like LANConf, nvupdate, and so on). However, when the images are not protected, it might present a security risk, if there is no validation of the integrity of those images before programming it to the device NVM. Malicious or unverified images can cause disruption and “Denial of Service” scenarios. These topology device firmware images come from the vendor.

To prevent security risk, the topology device NVM image might be included as part of the E810 NVM image. When the topology device NVM image is present in the E810 NVM image, it is authenticated and might be loaded to the topology device at startup. Due to size restriction of the E810 NVM image and depending on the image size needed for the external topology device, the topology device images might not fit into the main E810 NVM. In such case, it is recommended to attach NVM into the topology device, so it can start working independently. The update process for such NVMs that are attached to the topology devices depends on the availability of an image for the topology device NVM within the E810 NVM package. Systems that will have external devices with NVM images that cannot fit their NVM will not be able to update all external device NVMs using this flow, or it will be possible to update one external device NVM at a time.

#### 3.3.6.1 Topology Device NVM Image

External topology device NVM images should be attached to the main E810 NVM image. There might be up to four sections in the NVM, one for each type of external topology device.

- The topology device NVM image is authenticated as part of the overall E810 NVM bank.
- The external topology device might not have its own NVM attached to it. The E810 firmware should load the external topology device firmware from the NVM into the external device as part of the initialization process. This option can be determined by setting the *FW Download Enable* bit in the *Node Part Number and Node Options* field of the Node Header section of the PHY node in the topology netlist. This indication is valid only when there is an NVM section for the external topology device with a valid image for loading and Part Number that matches the PHY Part Number in the topology netlist.
- When the PHY is not configured within the topology netlist for *FW Download Enable*, it might still have image for programming in the NVM bank. The Program Topology Device NVM admin command should be used in this case. The E810 firmware should check for availability of external topology device images in the main NVM bank, it should reflect that with the device capabilities. Software tools, such as the NVM update tool, can read this capability and trigger an update for the NVM that is attached to the external topology device.

**Note:** The PLDM firmware update flow can update NVM packages that embed external topology device NVM images. However, triggering the Program Topology Device NVM admin command is currently not covered by the PLDM firmware update flow. The programming of external device NVMs must be done manually after updating the NVM with the PLDM flow using additional tool that supports programming of topology devices (for example, NVM update tool).

### 3.3.6.2 External Topology Device NVM Section Format

Each external topology device NVM section includes a package for loading/programming the external topology device with the following format.

**Table 3-98. External Topology Device NVM Section Format**

31:24	23:16	15:8	7:0
Section Length (In 16 bits words)			
Topology Device Image Version Number (4 high bytes)			
Topology Device Image Version Number (4 Low bytes)			
Number of Sub-Sections		Device Part Number	Flags Bits 7:2 = Reserved Bit 1 = ProgEn Bit 0 = LoadEn
Subsection Flag 0x0: Default 0x1: Pre-load Section Else: Reserved future use	Sub Section Length (in bytes)		
Sub-Section Start Address			
Sub-Section Content			
Sub-Section Content			
Subsection Flag 0x0: Default 0x1: Pre-load Section Else: Reserved future use	Sub Section Length (in bytes)		
Sub-Section Start Address			
Sub-Section Content			
Sub-Section Content			
Additional sub-sections, according to the <i>Number of Sub-Sections</i> field			

**NVM Section Header:** Contains the following fields

- **Section Length** (4 bytes) — The total size of the NVM section in 16 bits words.
- **Topology Device Image Version Number** (8 bytes) — A version number for the external topology device image.
- **Device Part number** (1 bytes) — This should match the node part number of the corresponding PHY within the netlist (for example, 0x31 for C827).
- **Flags**
  - *LoadEn* — This bit indicates that the image is in a format that enables loading it to the topology device.
  - *ProgEn* — This bit indicates that the image is in a format that enabled programming it to the topology device NVM.
- **Number of Sub-Sections** (2 bytes) — The number of sections to program.

**NVM Section Body:** Contains the sub-sections to load/program within the external device, each sub-section contains

- **Sub-Section Length** in bytes (3 bytes)
- **Sub-Section Start Address** (4 bytes) — The start address within the topology device.
- **Sub-Section Content** (according to sub-section length, but rounded up to 4 bytes)

**Note:** The first four 32-bits words should be defined within the NVM map (default values for all fields is 0x0). Those fields are:

- Section Length (in 16 bits words)
- Topology Device Image Version Number (4 high bytes)
- Topology Device Image Version Number (4 low bytes)
- Number of Sub-Sections
- Device Part Number
- Flags

The rest of the section is provided in RAW format and appended to the image.

### 3.3.7 Block Access to External PHY During Its NVM Programming

Firmware blocks changes in the configurations of links that their external PHY is currently programmed or to links that their external PHY firmware is currently loading.

- **Blocking "Set PHY Config" and "Setup link and Restart Auto-negotiation" admin commands:** Firmware returns an error to "Set PHY Config" and "Setup link and Restart Auto-negotiation" when the PHY attached to the port is being programmed. Error code is "12 – EBUSY" with a meaning of "External PHY attached to this port is currently programmed – port cannot be configured".
- **Blocking "Set PHY Loopback" and "Set PHY Debug" debug admin commands:** Firmware blocks link debug commands "Set PHY Loopback" and "Set PHY Debug", when they targeting any port mapped into the PHY node that is currently being loaded or its NVM is programmed. Error code is "12 – EBUSY" with a meaning of "External PHY attached to this port is currently programmed – port cannot be configured".
- **Blocking NC-SI commands that change link configurations:** Firmware blocks any command that changes link configurations that is coming from MNG/NC-SI/PLDM. For NC-SI, "Set Link" and "Get Link" commands are blocked and return with response code = 0x1 (command failed) and the reason code is "channel not ready" – 0x0003.
- **Blocking answers to PLDM sensors that need access to the PHY:** Firmware blocks any response to PLDM sensor that require access to the PHY that is being loading or its NVM being programmed. This may include PLDM thermal sensor, power plug or Health sensor, which needs direct reading from the PHY. For such sensors, answer is "ERROR\_NOT\_READY" - (0x04).

- **Blocking RDE operations that change link configurations:** Firmware blocks RDE operations that change link configurations targeting ports that mapped into a PHY node whose FW is currently loading or its NVM currently being updated. The blocking is by returning "NOT\_READY" answer to the RDEOperationInit command. Any other RDE command later in the process should always succeed. If a PHY NVM update or PHY FW load is received after RDEOperationInit command was answered, FW responds with EBUSY to the admin command request. The software might respond to EBUSY with waiting and re-trying the PHY NVM programming or the PHY FW load. The waiting for the RDE task to complete is done in software, before the PHY NVM update or PHY FW load is starting, as the RDE task is relatively short. Note that this is true for both GET and PUT tasks.
- **Blocking any access using topology I2C/MDIO access commands to the external PHY:** Firmware blocks any access to the external PHY, via I2C or MDIO. It returns "EBUSY" error, to "Read I2C", "Write I2C", "Read MDIO" and "Write MDIO" commands, when the access is done to the external PHY which is currently programmed. In addition, when the "context" field of those commands is "direct" or "address override", FW cannot know the exact device that is accessed and the access is blocked with "EBUSY" during external PHY loading or programming.
- **Blocking any GPIO that controls the loaded/programmed PHY:** Firmware blocks "Set GPIO", when the GPIO resets the loaded/programmed PHY. Any GPIO connected via the netlist in any way to the PHY and is defined as the reset signal to the PHY that SW attempts to configure through any Set GPIO mechanism (Set GPIO or Set GPIO by Function) shall be blocked.
- **Blocking any direct access using "Neighbor Device Request" command:** Direct access to I2C or MDIO, e.g. via "Neighbor Device Request" command is blocked during the time that the external PHY is loaded or programmed. In order to simplify firmware implementation, firmware blocks any access to IO widget via "Neighbor Device Request" command during the time that the external PHY is loaded or programmed. Firmware responds with EBUSY when it blocks "Neighbor Device Request" command due to external PHY being loaded or its NVM being programmed.

### 3.3.8 Topology Netlist

This section defines the structure of the topology netlist module of the NVM and the mezzanine ID EEPROM. The module begins with a header followed by DWord aligned blocks describing the netlist nodes in the following order: PHY Nodes, GPIO Controller Nodes, MUX Controller Nodes, LED Controller Nodes, LED Nodes, Temperature Sensor Nodes, ID EEPROM Node, Cage Nodes, and Mezzanine Connector Nodes.

For each of the nodes the netlist contains a block with separate sections dedicated to different features of the node. Presence of certain sections depends on the node type.

**Note:** This section defines the topology netlist for several products, therefore some entries include descriptions of values that are not supported in the current product. Those values are usually marked in the **Magenta** color.

### 3.3.8.1 Topology Netlist Header

This section describes the length of the Topology Netlist Section and the number of nodes it holds.

Word Offset	Description	Section Reference
0x0000	Module Length	3.3.8.1.1
0x0001	Node Count	3.3.8.1.2
0x0002	Netlist Map Version and CRC	3.3.8.1.3
0x0003	Netlist Version	3.3.8.1.4
0x0004 + n*2 (0x0004 for n=0)	Node Handle (for Node 0)	3.3.8.1.5
0x0005 + n*2 (0x0005 for n=0)	Node Block Offset (for Node 0)	3.3.8.1.6
0x0004 + n*2 (0x0006 for n = 1)	Node Handle (for Node 1)	3.3.8.1.5
0x0005 + n*2 (0x0007 for n = 1)	Node Block Offset (for Node 1)	3.3.8.1.6
...	...	...
0x0004 + (Node Count - 1)*2	Node Handle for last node (n = Node Count - 1)	3.3.8.1.5
0x0005 + (Node Count - 1)*2	Node Block Offset for last node (n = Node Count - 1)	3.3.8.1.6
0x0004 + Node Count*2	First Word (Offset 0x0) of the Netlist Identifier Block	
...	...	...
0x0033 + Node Count*2	Last Word (Offset 0x2F) of the Netlist Identifier Block	3.3.8.1.30

#### Netlist Identifier Block:

Word Offset	Description	Section Reference
0x0000	Module ID - Netlist Identifier Block	3.3.8.1.7
0x0001	Module Length - Netlist Identifier Block	3.3.8.1.8
0x0002	Base Release Version - Major Low Word - Netlist Identifier Block	3.3.8.1.9
0x0003	Base Release Version - Major High Word - Netlist Identifier Block	3.3.8.1.10
0x0004	Base Release Version - Minor Low Word - Netlist Identifier Block	3.3.8.1.11
0x0005	Base Release Version - Minor High Word - Netlist Identifier Block	3.3.8.1.12
0x0006	Base Release Version: Type Low Word - Netlist Identifier Block	3.3.8.1.13
0x0007	Base Release Version: Type High Word - Netlist Identifier Block	3.3.8.1.14
0x0008	Base Release Version: Revision Low Word - Netlist Identifier Block	3.3.8.1.15
0x0009	Base Release Version: Revision High Word - Netlist Identifier Block	3.3.8.1.16
0x000A - 0x0019	Netlist Binary Hash Word - Netlist Identifier Block	3.3.8.1.17
0x001A	Netlist Origin Flags: Low - Netlist Identifier Block	3.3.8.1.18
0x001B	Netlist Origin Flags: High - Netlist Identifier Block	3.3.8.1.19

Word Offset	Description	Section Reference
0x001C	Netlist Modification Date: Year - Netlist Identifier Block	3.3.8.1.20
0x001D	Netlist Modification Date: Day/Month - Netlist Identifier Block	3.3.8.1.21
0x001E	Netlist Modification Date: Time - Netlist Identifier Block	3.3.8.1.22
0x001F	ETT Version Used for Netlist Compile: Major - Netlist Identifier Block	3.3.8.1.23
0x0020	ETT Version Used for Netlist Compile: Minor - Netlist Identifier Block	3.3.8.1.24
0x0021	ETT Version Used for Netlist Compile: Revision - Netlist Identifier Block	3.3.8.1.25
0x0022	ETT Version Used for Netlist Compile: Patch - Netlist Identifier Block	3.3.8.1.26
0x0023 - 0x002C	Full git Netlist SHA-1 Hash Word - Netlist Identifier Block	3.3.8.1.27
0x002D	Customer IANA: Low Word - Netlist Identifier Block	3.3.8.1.28
0x002E	Customer IANA: High Word - Netlist Identifier Block	3.3.8.1.29
0x002F	Customer Netlist Version Word - Netlist Identifier Block	3.3.8.1.30

The section is not accessible through the GETNODEATTR action.

### 3.3.8.1.1 Module Length (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Module Length		Module length in double words. Does not include the first DWord that contains the <i>Module Length</i> field itself and the <i>Node Count</i> field.

### 3.3.8.1.2 Node Count (0x0001)

Bits	Field Name	Default NVM Value	Description
15:12	Netlist Version		The version of the Netlist. This field changes when the content of a tracked netlist changes, In other words, the values of some of the fields in the netlist change. It reflects the short hash of the GIT commit corresponding with the last change. This 4-bit field is added as LSB [3:0] to the 16 bits <i>Netlist Version</i> field below (Section 3.3.8.1.4) to form a 20-bit <i>Netlist Version</i> field.
11:10	Reserved		Reserved.
9:0	Node Count		The number of nodes captured in the topology netlist.

### 3.3.8.1.3 Netlist Map Version and CRC (0x0002)

Bits	Field Name	Default NVM Value	Description
15:8	Netlist Map Version	0x01	The version of the netlist field definition. This field changes every time there is a change in the definition of the netlist, like fields, structures, or nodes are added, removed, or modified.
7:0	CRC8		CRC-8-CCITT: Start Section -> Word offset = 0x0004 End Section -> Word offset = Module Length

### 3.3.8.1.4 Netlist Version (0x0003)

Bits	Field Name	Default NVM Value	Description
15:0	Netlist Version	1	The version of the netlist. This field changes when the content of a tracked netlist changes. That is, the values of some of the fields in the netlist change. It reflects the short hash of the GIT commit corresponding with the last change. This field is added as MSB [19:4] to the 4-bit <i>Netlist Version</i> field from <a href="#">Section 3.3.8.1.2</a> to form a 20-bit <i>Netlist Version</i> field.

### 3.3.8.1.5 Node Handle (0x0004 + n\*2)

Bits	Field Name	Default NVM Value	Description
15:10	Reserved		Reserved.
9:0	Node Handle		Unique identifier of the node in the topology. Matches the <i>Node Handle</i> field inside the corresponding Node Header Section. See <a href="#">Section 3.3.8.2.2</a> .

### 3.3.8.1.6 Node Block Offset (0x0005 + n\*2)

Bits	Field Name	Default NVM Value	Description
15:0	Node Block Offset		The word offset of the node section relative to the beginning of the module.

**Note:** The next nodes are referenced with Netlist Identifier Block offset, which is equal to Node Block Offset + 0x0004 + NodeCount \* 2.

### 3.3.8.1.7 Module ID - Netlist Identifier Block Offset + 0x0000

Bits	Field Name	Default NVM Value	Description
15:0	Module ID	0x0000	Module ID.

### 3.3.8.1.8 Module Length - Netlist Identifier Block Offset + 0x0001

Bits	Field Name	Default NVM Value	Description
15:0	Module Length	0x0000	Module length in double words. Does not include the <i>Module Length</i> field.

### 3.3.8.1.9 Base Release Version: Major Low Word - Netlist Identifier Block Offset + 0x0002

Bits	Field Name	Default NVM Value	Description
15:0	Base Release Version: Major Low Word	0x0000	Low word of the Base Release version: Major value. Stored in BCD (binary coded decimal). Similar to NVM version.

### 3.3.8.1.10 Base Release Version: Major High Word - Netlist Identifier Block Offset + 0x0003

Bits	Field Name	Default NVM Value	Description
15:0	Base Release Version: Major High Word	0x0000	High word of the Base Release version: Major value. Stored in BCD (binary coded decimal). Similar to NVM version.

### 3.3.8.1.11 Base Release Version: Minor Low Word - Netlist Identifier Block Offset + 0x0004

Bits	Field Name	Default NVM Value	Description
15:0	Base Release Version: Minor Low Word	0x0000	Low word of the Base Release version: Minor value. Stored in BCD (binary coded decimal). Similar to NVM version.

### 3.3.8.1.12 Base Release Version: Minor High Word - Netlist Identifier Block Offset + 0x0005

Bits	Field Name	Default NVM Value	Description
15:0	Base Release Version: Minor High Word	0x0000	High word of the Base Release version: Minor value. Stored in BCD (binary coded decimal). Similar to NVM version.

### 3.3.8.1.13 Base Release Version: Type Low Word - Netlist Identifier Block Offset + 0x0006

Bits	Field Name	Default NVM Value	Description
15:0	Base Release Version: Type Low Word	0x0000	Low word of the Base Release version: Type value. Each unique netlist from Intel has a different Type value. Stored in BCD (binary coded decimal). Similar to NVM version.

### 3.3.8.1.14 Base Release Version: Type High Word - Netlist Identifier Block Offset + 0x0007

Bits	Field Name	Default NVM Value	Description
15:0	Base Release Version: Type High Word	0x0000	High word of the Base Release version: Type value. Each unique netlist from Intel will have a different Type value. Stored in BCD (binary coded decimal). Similar to NVM version.

### 3.3.8.1.15 Base Release Version: Revision Low Word - Netlist Identifier Block Offset + 0x0008

Bits	Field Name	Default NVM Value	Description
15:0	Base Release Version: Revision Low Word	0x0000	Low word of the Base Release revision. This is updated by ETT on any change to the template. Automatic by ETT. <b>Note:</b> A value of 0 in the <i>Revision</i> field means that this is a draft/pre-production netlist/ Otherwise, it is a published/production netlist.

### 3.3.8.1.16 Base Release Version: Revision High Word - Netlist Identifier Block Offset + 0x0009

Bits	Field Name	Default NVM Value	Description
15:0	Base Release Version: Revision High Word	0x0000	High word of the Base Release revision. This is updated by ETT on any change to the template. Automatic by ETT. <b>Note:</b> A value of 0 in the <i>Revision</i> field means that this is a draft/pre-production netlist/ Otherwise, it is a published/production netlist.

### 3.3.8.1.17 Netlist Binary Hash Word: Netlist Identifier Block Offset + 0x000A-0x0019

Bits	Field Name	Default NVM Value	Description
15:0	Hash Value of Netlist	0x0000	Hash of Netlist complied binary. Inserted by ETT. It should be the SHA3 256 bit hash of the netlist where the Hash Field is set to all zeros. The binary hash should be calculated assuming that both the binary hash field and the CRC8 field in the netlist header is zero. And once the binary hash is injected, the CRC8 for the netlist header should be calculated as the final step for the netlist binary compilation.

### 3.3.8.1.18 Netlist Origin Flags Low: Netlist Identifier Block Offset + 0x001A

Bits	Field Name	Default NVM Value	Description
15:3	Reserved	0x0000	Reserved.
2	Intel Created Custom		0b = Not custom. 1b = Intel-created net for use with a customer netlist by OEM.
1	Intel Factory Created		0b = Not created by Intel factory. 1b = Intel factory-created net for use as a reference netlist.
0	Netlist Origin	0	0b= Intel-created and unmodified by customer. 1b= Customer modified netlist. ETT must set this bit on any customer change of the netlist.

### 3.3.8.1.19 Netlist Origin Flags High: Netlist Identifier Block Offset + 0x001B

Bits	Field Name	Default NVM Value	Description
15:0	Reserved	0x0000	Reserved.

### 3.3.8.1.20 Netlist Modification Date: Year - Netlist Identifier Block Offset + 0x001C

Bits	Field Name	Default NVM Value	Description
15:0	Netlist Modification Date: Year	0x0000	Year of the last netlist modification in BCD (binary coded decimal). Set by ETT on any Intel or customer modification of the netlist. Example: 0x2019 = 2019.

### 3.3.8.1.21 Netlist Modification Date: Day/Month - Netlist Identifier Block Offset + 0x001D

Bits	Field Name	Default NVM Value	Description
15:8	Netlist Modification Date: Day	0x00	Day of the month of last netlist modification in BCD (binary coded decimal). Set by ETT on any Intel or customer modification of the netlist. Example: 0x20 = 20th day of the month.
7:0	Netlist Modification Date: Month	0x00	Numerical representation of the Month of last netlist modification in BCD (binary coded decimal). Set by ETT on any Intel or customer modification of the netlist. Example: 0x11 = the 11th months, which is November.

### 3.3.8.1.22 Netlist Modification Date: Time - Netlist Identifier Block Offset + 0x001E

Bits	Field Name	Default NVM Value	Description
15:0	Netlist Modification Date: Time	0x0000	Time of the last netlist modification in BCD (binary coded decimal). Set by ETT on any Intel or customer modification of the netlist. Example: 0x1300 is 1:00 pm.

### 3.3.8.1.23 ETT Version Used for Netlist Compile: Major - Netlist Identifier Block Offset + 0x001F

Bits	Field Name	Default NVM Value	Description
15:0	ETT Major Version Used for Netlist Compile	0x0000	Major version of ETT used to compile the most recent version of the netlist. This should be inserted and updated on any netlist change by Intel or customer.

### 3.3.8.1.24 ETT Version Used for Netlist Compile: Minor - Netlist Identifier Block Offset + 0x0020

Bits	Field Name	Default NVM Value	Description
15:0	ETT Minor Version Used for Netlist Compile	0x0000	Minor version of ETT used to compile the most recent version of the netlist. This should be inserted and updated on any netlist change by Intel or customer.

### 3.3.8.1.25 ETT Version Used for Netlist Compile: Revision - Netlist Identifier Block Offset + 0x0021

Bits	Field Name	Default NVM Value	Description
15:0	ETT Revision Version Used for Netlist Compile	0x0000	Revision version of ETT used to compile the most recent version of the netlist. This should be inserted and updated on any netlist change by Intel or customer.

### 3.3.8.1.26 ETT Version Used for Netlist Compile: Patch - Netlist Identifier Block Offset + 0x0022

Bits	Field Name	Default NVM Value	Description
15:0	ETT Patch Version Used for Netlist Compile	0x0000	Patch version of ETT used to compile the most recent version of the netlist. This should be inserted and updated on any netlist change by Intel or customer.

### 3.3.8.1.27 Full git Netlist SHA-1 Hash Word - Netlist Identifier Block Offset + 0x0023-0x002C

Bits	Field Name	Default NVM Value	Description
15:0	Full Git Hash Value	0x0000	Full git commit hash of netlist. Should be set by ETT when committing changes to git.

### 3.3.8.1.28 Customer IANA: Low Word - Netlist Identifier Block Offset + 0x002D

Bits	Field Name	Default NVM Value	Description
15:0	Customer IANA - Low Word	0x0157	Customer IANA low. Intel to set Intel IANA 0x0157. Customer to fill in their IANA.

### 3.3.8.1.29 Customer IANA: High Word - Netlist Identifier Block Offset + 0x002E

Bits	Field Name	Default NVM Value	Description
15:0	Customer IANA - High Word	0x0000	Customer IANA high. Intel to set Intel IANA 0x0000. Customer to fill in their IANA.

### 3.3.8.1.30 Customer Netlist Version Word - Netlist Identifier Block Offset + 0x002F

Bits	Field Name	Default NVM Value	Description
15:0	Customer Netlist Version	0x0000	Customer version that customer can set in customer ETT. Template images from Intel would set this to 0.

### 3.3.8.2 Node Header Section

This section describes the structure of the Node Header Section, detailing the node type, node block length, node handle and node part number. Based on node type where applicable, the number of I/Os, port options, Module Qualification options, firmware download options and conflict resolution options are also defined.

Word Offset	Description	Section Reference
0x0000	Node Type and Node Section Length	3.3.8.2.1
0x0001	Node Handle	3.3.8.2.2
0x0002	Node Address	3.3.8.2.3
0x0003	Node Part Number and Node Options	3.3.8.2.4
0x0004	Node I/O Section Pointer	3.3.8.2.5
0x0005	Node Port Options Section Pointer	3.3.8.2.6
0x0006	Node PMD Line Analog Section Pointer	3.3.8.2.7
0x0007	Node PMD Host Analog Section Pointer	3.3.8.2.8

The section is accessible through the GETNODEATTR action starting at the DWord-aligned Attribute ID offset 0x0000. The Node Address within Attribute ID 0x0001 can also be modified through the SETNODEATTR action.

#### 3.3.8.2.1 Node Type and Section Length (0x0000)

Bits	Field Name	Default NVM Value	Description
15:12	Node Type		Defines the node type. Valid values are: 0x00 = PHY device 0x01 = GPIO Controller (Port Expander) 0x02 = MUX Controller (Bus Expander) 0x03 = LED Controller (LED Driver) 0x04 = LED 0x05 = Temperature Sensor 0x06 = Cage (SFP, SFP28, QSFP, QSFP28) 0x07 = Mezzanine Connector 0x08 = ID EEPROM 0x09 = Clock Controller (DPLL/Synthesizer/Divider) 0x0A = Clock MUX 0x0B = GPS device 0x0C-0xFF = Reserved
11:0	Node Section Length		Node section length in double words. Does not include the first double word, the <i>Node Section Length</i> field itself.

### 3.3.8.2.2 Node Handle (0x0001)

Bits	Field Name	Default NVM Value	Description
15:10	Reserved		Reserved.
9:0	Node Handle		<p>Unique identifier of the node in the topology. Values must be assigned sequentially from 0 to Node Count - 1.</p> <p>Bit 9 = Board Type — Identifies if the node is on the motherboard or a mezzanine card.                      0b = LOM                      1b = Mezzanine Card</p> <p>For LOM:                      Bit 8:0 = Unique node identifier within the context of the motherboard.</p> <p>For Mezzanine Cards:                      Bit 8:6 = Mezzanine card number. Populated by firmware during the mezzanine discovery flow. The value in the mezzanine topology is always 3'b0.                      Bit 5:0 = Unique node identifier within the context of the mezzanine card.</p>

### 3.3.8.2.3 Node Address (0x0002)

Bits	Field Name	Default NVM Value	Description
15:14	Module Max Power Hi		<p>Module Max Power [5:4] - The upper two bits of <i>Module Max Power</i>.</p> <p>The field represents the maximum allowed module power with a 0.5 W resolution. Valid for Cage nodes only and reserved for all other node types. Note: The value of Module Max Power shall be greater than or equal to 2 (1.0 W) for SFP cage nodes and 3 (1.5 W) for QSFP cages.</p>
13:12	Bus Address Type		<p>Defines whether the bus address is absolute or relative to the mezzanine card (CEI) slot.</p> <p>00b = Reserved                      01b = Absolute address. The uniqueness of the address is ensured by the topology.                      10b = Relative address. The address must be updated on board initialization to avoid conflicts.                      11b = Reserved.</p> <p>Not applicable to LED nodes.</p>
11:10	Bus Type		<p>Defines the bus type.</p> <p>Valid options are:                      00b = SoC internal bus                      01b = I<sup>2</sup>C                      10b = MDIO                      11b = Reserved</p> <p>Not applicable to LED nodes.</p>

Bits	Field Name	Default NVM Value	Description
9:0	Bus Address		<p>For all node types other than LED: The bus address that the node can be accessed at. The range of valid addresses depends on the bus type.</p> <p>For SoC internal bus, the assignment is as follows: 0x000 = PHY Core 0 0x001 = PHY Core 1 0x002 = PHY Core 2 0x003 = I/O Widget 0x004-0x3FF - Reserved</p> <p>For I<sup>2</sup>C, the field represents the 7-bit or 10-bit address of the I<sup>2</sup>C attached node: 0x000-0x07F = For 7-bit addressable I<sup>2</sup>C devices, the 3 high MSB should be set to 0x0. 0x000-0x3FF = For 10-bit addressable I<sup>2</sup>C devices.</p> <p>For MDIO, the field represents the 5-bit Port Address: 0x000-0x01F = 5bit MDIO Port Address. 0x020-0x3FF = Reserved.</p>

### 3.3.8.2.4 Node Part Number and Node Options (0x0003)

Bits	Field Name	Default NVM Value	Description
15:8	Node Part Number		<p>The part number assigned to each of the POR devices supported by the topology and link management.</p> <p>The defined part numbers are: 0x00 = I/O Widget (Node type - GPIO controller) 0x10 = CEI Connector (Node type - mezzanine connector) 0x11 = SFP+ Cage (Node type - Cage) 0x12 = SFP28 Cage (Node type - Cage) 0x13 = QSFP+ Cage (Node type - Cage) 0x14 = QSFP28 Cage (Node type - Cage) 0x15 = Monochrome LED (Node type - LED) 0x16 = RGB LED (Node type - LED) 0x20 = PCA9545A \ PCA9546A (Node type - MUX controller) 0x21 = PCA9575 (Node type - GPIO controller) 0x22 = PCA9685 (Node type - LED controller) 0x23 = PCA9552 (Node type - LED controller) 0x24 = ZL30632/ZL80032 (Node type - Clock Controller) 0x25 = SI5383 (Node type - Clock Controller) 0x30 = PHY Core (Node type - PHY) 0x31 = C827 (Node type - PHY) 0x32 = X557-AT4 (Node type - PHY) (Not supported) 0x33 = 88E1543 (Node type - PHY) 0x34 = 88E1512 (Node type - PHY) 0x35 = 88E1514 (Node type - PHY) 0x36 = E810 internal PHY (Node type - PHY) 0x37 = X557-AT2 (Node type - PHY) (Not supported) 0x43 = AT24C32 (ID EEPROM 32K bit) (Node type - ID EEPROM) 0x44 = SFPx Module Temperature Sensor 0x45 = QSFPx Module Temperature Sensor 0x47 = Generic Clock MUX 0x48 = Generic GPS All other values are reserved.</p>

Bits	Field Name	Default NVM Value	Description
7:4	Module Max Power Lo		Module Max Power [3:0] - The lower four bits of <i>Module Max Power</i> . The field represents the maximum allowed module power with a 0.5 W resolution. Valid for Cage nodes only and reserved for all other node types. Note: The value of Module Max Power shall be greater than or equal to 2 (1.0 W) for SFP cage nodes and 3 (1.5 W) for QSFP cages.
3	Module Qualification Enable		Module qualification enable. 0b = Pluggable module qualification is disabled for the cage. 1b = Pluggable module qualification is enabled for the cage. Valid for Cage nodes only. Reserved for all other node types.
2	Innermost PHY		Defines whether the PHY is the innermost PHY: 0b = The PHY has host side PMD connections to another PHY node. 1b = The PHY has host side connections to the MAC. Valid for PHY nodes only. Reserved for all other node types.
1	Auto Conflict Resolution		Auto conflict resolution. depending on the node type, enables automatic Topology or Media Conflict resolution. Applicable to Innermost PHY and Cage nodes only: <ul style="list-style-type: none"> <li>When set on an Innermost PHY node, it enables automatic Topology Conflict resolution.</li> <li>When set on a Cage node, it enables automatic Media Conflict resolution.</li> </ul> Valid for PHY and Cage nodes only. Reserved for all other node types.
0	FW Download Enable		Firmware download enable. 0b = The PHY load its firmware from a dedicated EEPROM/Flash after reset. 1b = The PHY firmware should be downloaded from NVM at initialization Valid for PHY nodes only. Reserved for all other node types.

### 3.3.8.2.5 Node I/O Section Pointer (0x0004)

Bits	Field Name	Default NVM Value	Description
15:12	I/O Count		The number of host side I/O connections of the node. This defines the length of the Node I/O Section.
11:0	Node I/O Section Offset		The word offset of the Node I/O Section relative to the beginning of the node section.

### 3.3.8.2.6 Node Port Options Section Pointer (0x0005)

Bits	Field Name	Default NVM Value	Description
15:12	Port Option Count		Defines the number of Port Options supported by the node. This defines the number Node PHY Port Options. The LED node and Thermal sensor LED inherit the number of Port Options from their Parent PHY node. Not applicable to nodes of type other than PHY. For those nodes this field is reserved and must be 0x0.
11:0	Node Port Options Section Offset		For PHY nodes: The word offset of the Node Port Options Section relative to the beginning of the node section. For LED nodes: The word offset of the first Node LED Configuration Section relative to the beginning of the node section. For Temperature Sensor nodes: The word offset of the Node Thermal Configuration Section relative to the beginning of the node section. Not applicable to any other node types.

### 3.3.8.2.7 Node PMD Line Analog Section Pointer (0x0006)

Bits	Field Name	Default NVM Value	Description
15:12	Line Lane Count		The number of line side lanes on the PHY node.
11:0	Node PMD Line Analog Section Offset		The word offset of the Node PMD Line Analog Section relative to the beginning of the node section.

### 3.3.8.2.8 Node PMD Host Analog Section Pointer (0x0007)

Bits	Field Name	Default NVM Value	Description
15:12	Host Lane Count		The number of host side lanes on the PHY node.
11:0	Node PMD Host Analog Section Offset		The word offset of the Node PMD Host Analog Section relative to the beginning of the node section.

### 3.3.8.3 Node I/O Section

This section describes the structure of the Node I/O Section, detailing the I/O connections of a topology node.

Word Offset	Description	Section Reference
0x0000 + n*2	Driving Node Handle	3.3.8.3.1
0x0001 + n*2	I/O Type and Driving Interface	3.3.8.3.2

The section is accessible through the GETNODEATTR action starting at the DWord-aligned Attribute ID offset 0x2000.

#### 3.3.8.3.1 Driving Node Handle (0x0000 + n\*2)

Bits	Field Name	Default NVM Value	Description
15:10	Driving I/O Number		The number of the interface with the specified <i>I/O Type</i> on the device pointed to by Driving Node Handle to which the connection leads.
9:0	Driving Node Handle		Unique identifier of the node in the topology to which the I/O is connected.

#### 3.3.8.3.2 I/O Type and Driving Interface (0x0001 + n\*2)

Bits	Field Name	Default NVM Value	Description
15	Driven	1b	Defines if the I/O is strapped to a certain value or is driven by another node in the topology. 0b = The I/O is strapped to a value defined by the <i>Value</i> field. 1b = The I/O is driven by the device identified by the Driving Node Handle. Only applicable to I/Os with <i>I/O Type</i> of GPIO and MDIO Address. <b>Note:</b> For I/Os that use inverted I/O function (e.g. RESET_N or INT_N) and the I/O is defined as "Driven", it is driven to the inverse of the <i>Value</i> field.
14	Value		For driven I/Os, defines the default value. For strapped I/Os, defines the static value of the I/O is configured to. Only applicable to I/Os with <i>I/O Type</i> of GPIO and MDIO Address.
13	Polarity		Polarity configuration for the I/O. 0b = The signal is active low. 1b = The signal is active high. Only applicable to I/Os with <i>I/O Type</i> of GPIO.
12:11	Interrupt		Interrupt configuration for the I/O. 00b = No interrupt. 01b = Interrupt on rising edge. 10b = Interrupt on falling edge. 11b = Interrupt on change (rising or falling edge). Only applicable to I/Os with <i>I/O Type</i> of GPIO.

Bits	Field Name	Default NVM Value	Description
10:8	I <sup>2</sup> C/MDIO Speed		<p>The bus speed.</p> <p>For I<sup>2</sup>C, the I/O Widget supports the following speeds:            000b = 100 kHz            001b = 400 kHz            010b = 1 MHz            All other values are reserved.</p> <p>For MDIO, the I/O Widget supports the following speeds:            000b = 2.441 MHz            All other values are reserved.</p> <p>Only applicable to I/Os with <i>I/O Type</i> of I<sup>2</sup>C Bus and MDIO Bus.</p>
7:5	I/O Type		<p>The type of the I/O.</p> <p>The defined I/O types are:            000b = PMD            001b = I<sup>2</sup>C Bus            010b = MDIO Bus            011b = GPIO            100b = MDIO Address            101b = Clk In            110b = Clk Out            111b = Reserved</p>
4:0	I/O Function / I/O Number		<p>I/O Function:            For I/Os with <i>I/O Type</i> of GPIO defines the specific use of the GPIO            0x00 = GPIO            0x01 = RESET_N            0x02 = INT_N            0x03 = PRESENT_N            0x04 = TX_DISABLE            0x05 = MODSEL_N            0x06 = LPMODE            0x07 = TX_FAULT            0x08 = RX_LOSS            0x09 = RS0            0x0A = RS1            0x0B = EEPROM_WP            0x0C = LED/LED.Red            0x0D = LED.Green            0x0E = LED.Blue            0x0F-0x13 = Reserved            0x14 = Clk Dir            0x15 = Clk Out En            0x16 = Clk In Sel            0x17 = Safe Boot N            0x18-0x1F = Reserved</p> <p>I/O Number:            For I/Os with <i>I/O Type</i> of PMD, I<sup>2</sup>C Bus, MDIO Bus, and MDIO Address, defines the index of the I/O on the node.</p>

The I/O connections are grouped by *I/O Type*. For a given I/O connection, on the node describing the connection, the I/O Number/Function is used to identify the interface within the group. On the node identified by the Driving Node Handle, the driving I/O (located within the group with matching *I/O Type*) is pointed to by the Driving I/O Number.

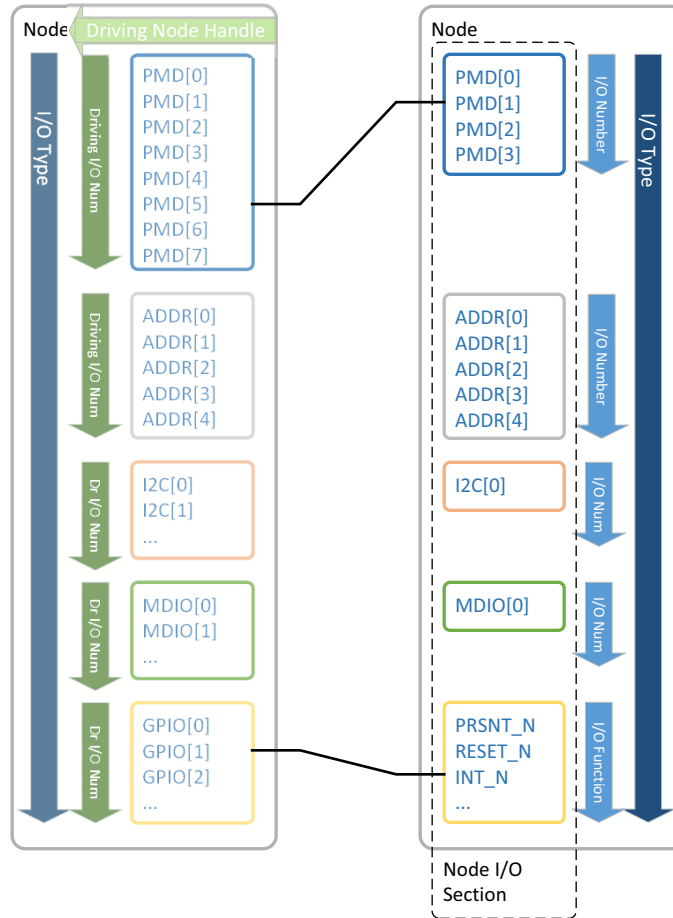

Figure 3-22. I/O Numbering Convention

### 3.3.8.4 Node Port Option Pointer Section

This section describes the structure of the Node Port Option Pointer Section, detailing the available Port Options.

Word Offset	Description	Section Reference
0x0000 + n	Port Option Pointer	3.3.8.4.1

The section is not accessible through the GETNODEATTR action.

#### 3.3.8.4.1 Node Port Option Pointer (0x0000 + n)

Bits	Field Name	Default NVM Value	Description
15	Invalid		This bit marks the port option as valid or invalid, 0b = Port option is valid. 1b = Port option is invalid.
14:12	Reserved		Reserved.
11:0	Port Option Pointer		The Port Option's word offset relative to the beginning of the node section.

### 3.3.8.5 Node Port Option Header Section

This section describes the structure of the Node Port Option Header Section, detailing the available Port Options.

Word Offset	Description	Section Reference
0x0000	Adaptive NVM Global (per Port Option) Super Configuration ID	3.3.8.5.1
0x0001	Adaptive NVM PHY Configuration ID	3.3.8.5.2
0x0002	Minimum SKU	3.3.8.5.3
0x0003	Adaptive NVM PF-to-Port mapping Configuration ID	3.3.8.5.4
0x0004	PMD Count and PHY Capabilities [0] Pointer	3.3.8.5.5
0x0005 + n - 1	PHY Capabilities [n] Pointer	3.3.8.5.6

The section is not accessible through the GETNODEATTR action.

#### 3.3.8.5.1 Adaptive NVM Global (per Port Option) Super Configuration ID (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Adaptive NVM Global (per port option) Super Configuration ID		Global adaptive NVM Super Configuration ID [15:0]. Used to identify the adaptive NVM configuration needed to apply to configure the controller for this Port Option (E810 port mode - 2/4/8 ports; DCB Configuration - pipe monitors, RPB thresholds, VSI/VEB allocation, and so on). See <a href="#">Section 3.3.3.3</a> .

### 3.3.8.5.2 Adaptive NVM PHY (per Innermost PHY) Super Configuration ID (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Adaptive NVM PHY Configuration ID (per Innermost PHY)		Adaptive NVM PHY Configuration ID[15:0]. Used to identify the adaptive NVM configuration ID needed to apply to configure the PHY for the innermost PHY at this Port Option). See <a href="#">Section 3.3.3.3</a> .

### 3.3.8.5.3 Minimum SKU (0x0002)

Bits	Field Name	Default NVM Value	Description
15:12	Adaptive NVM RDMA & MTU Global Super Configuration ID		Adaptive NVM RDMA & MTU Global Super Configuration ID - Used to identify the adaptive NVM configuration ID for super feature ID (0xF0FD). This super feature controls the RDMA setting together with the MTU setting. The value here must match the number of ports defined in the port option.
11:8	Reserved		Reserved.
7	Required Lane Speed		Maximum lane speed required. 0b = 50G serial required. 1b = 25G serial required.
6:4	Reserved		Reserved.
3:2	Required Bandwidth		Specifies the Required bandwidth for this port option: 00b = 200 Gb/s required. 01b = 100 Gb/s required. 10b = 50 Gb/s required. 11b = 25 Gb/s required.
1:0	Required Ports		Number of ports required: 00b = 8 ports required. 01b = 4 ports required. 10b = 2 ports required. 11b = 1 port required.

### 3.3.8.5.4 Adaptive NVM PF-to-Port Mapping Configuration ID (0x0003)

Bits	Field Name	Default NVM Value	Description
15:0	Adaptive NVM PF to Port Mapping Configuration ID		This is the adaptive NVM configuration ID that selects the relevant PF-to-port mapping using the adaptive NVM PF-to-port mapping feature ID.

### 3.3.8.5.5 PMD Count and PHY Capabilities Pointer (0x0004)

Bits	Field Name	Default NVM Value	Description
15:12	PMD Count		The number of PMDs within the Port Option.
11:0	PHY Capabilities [0] Pointer		The PHY Capabilities Section's word offset relative to the beginning of the Node Port Option Header Section.

### 3.3.8.5.6 Capabilities Pointer (0x0005 + n - 1)

Bits	Field Name	Default NVM Value	Description
15:12	Reserved		Reserved.
11:0	PHY Capabilities [n] Pointer		The PHY Capabilities Section's word offset relative to the beginning of the Node Port Option Header Section.

### 3.3.8.6 Node PHY Capabilities Section

This section describes the structure of the Node PHY Capabilities Section, detailing the PHY capabilities for a PHY for a given Port Option. It is used within the PHY node, as described in [Section 3.3.8.18](#).

Word Offset	Description	Section Reference
0x0000	Per-Port Adaptive NVM Configuration ID	<a href="#">3.3.8.6.1</a>
0x0001	Per-Function Adaptive NVM Configuration ID	<a href="#">3.3.8.6.2</a>
0x0002	Per-Port/Function Adaptive NVM Feature ID	<a href="#">3.3.8.6.3</a>
0x0003	PMD Width	<a href="#">3.3.8.6.4</a>
0x0004	Link Options 0	<a href="#">3.3.8.6.5</a>
0x0005	Link Options 1	<a href="#">3.3.8.6.6</a>
0x0006	EEE Options 0	<a href="#">3.3.8.6.7</a>
0x0007	EEE Options 1	<a href="#">3.3.8.6.8</a>
0x0008	Host Side PMD Capabilities 0	<a href="#">3.3.8.6.9</a>
0x0009	Host Side PMD Capabilities 1	<a href="#">3.3.8.6.10</a>
0x000A	Host Side PMD Capabilities 2	<a href="#">3.3.8.6.11</a>
0x000B	Host Side PMD Capabilities 3	<a href="#">3.3.8.6.12</a>
0x000C	Line Side PHY Capabilities (PHY Types) 0	<a href="#">3.3.8.6.13</a>
0x000D	Line Side PHY Capabilities (PHY Types) 1	<a href="#">3.3.8.6.14</a>
0x000E	Line Side PHY Capabilities (PHY Types) 2	<a href="#">3.3.8.6.15</a>
0x000F	Line Side PHY Capabilities (PHY Types) 3	<a href="#">3.3.8.6.16</a>
0x0010	Line Side PHY Capabilities (PHY Types) 4	<a href="#">3.3.8.6.17</a>
0x0011	Line Side PHY Capabilities (PHY Types) 5	<a href="#">3.3.8.6.18</a>
0x0012	Line Side PHY Capabilities (PHY Types) 6	<a href="#">3.3.8.6.19</a>
0x0013	Line Side PHY Capabilities (PHY Types) 7	<a href="#">3.3.8.6.20</a>

The section is accessible through the GETNODEATTR action starting at the DWord-aligned Attribute ID offset 0x4000. Attribute ID 0x4006-4009 (Line Side PHY Capabilities 4-7) are only defined for PMDs with the *Outermost PMD* bit set.

### 3.3.8.6.1 Per-Port Adaptive NVM Configuration ID (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Per Port Adaptive NVM Configuration ID		Per port adaptive NVM Configuration ID [15:0]. Used to identify the adaptive NVM Configuration ID needed to apply to configure the port associated with the PMD. The field applies to the Innermost PHY node only and is reserved for all other nodes.

### 3.3.8.6.2 Per-Function Adaptive NVM Configuration ID (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Per Function Adaptive NVM Configuration ID		Per function adaptive NVM Configuration ID [15:0]. Used to identify the adaptive NVM feature needed to apply to configure the port associated with the PMD (PF assignment). The field applies to the Innermost PHY node only and is reserved for all other nodes.

### 3.3.8.6.3 Per-Port/Function Adaptive NVM Feature ID (0x0002)

Bits	Field Name	Default NVM Value	Description
15:8	Port Feature ID		Port Feature ID. Used to specify the adaptive NVM feature ID of the port.
7:0	Function Feature ID		Function Feature ID. Used to specify the adaptive NVM feature ID of the function.

### 3.3.8.6.4 PMD Width (0x0003)

Bits	Field Name	Default NVM Value	Description
15:12	Host PMD Width		The number of lanes assigned to the Host side PMD. The Host side PMD's lanes will range from PHY Node Lane [Host PMD Lane 0] to PHY Node Lane [Host PMD Lane 0 + Host PMD Width - 1].
11:8	Host PMD Lane 0		The number of the Host side PMD's Lane 0 on the PHY Node.
7:4	Line PMD Width		The number of lanes assigned to the Line side PMD. The Line side PMD's lanes will range from PHY Node Lane [Line PMD Lane 0] to PHY Node Lane [Line PMD Lane 0 + Line PMD Width - 1].
3:0	Line PMD Lane 0		The number of the Line side PMD's Lane 0 on the PHY Node.

### 3.3.8.6.5 Link Options 0 (0x0004)

Bits	Field Name	Default NVM Value	Description
15	Rx PAUSE		Controls Link Flow control Rx PAUSE default for this link. 0b = Rx PAUSE is disabled by default. 1b = Rx PAUSE is enabled by default.
14	Tx PAUSE		Controls Link Flow control Tx PAUSE default for this link. 0b = Tx PAUSE capability is disabled by default. 1b = Tx PAUSE capability is enabled by default.
13	AN Clause 37 Enable		Controls Clause 37 auto-negotiation for the line side PMD. 0b = Clause 37 auto-negotiation is disabled. 1b = Clause 37 auto-negotiation is enabled.
12	AN Clause 73 Enable		Controls Clause 73 auto-negotiation for the line side PMD. 0b = Clause 73 auto-negotiation is disabled. 1b = Clause 73 auto-negotiation is enabled.
11	AN Clause 28 Enable		Controls Clause 28 auto-negotiation for the line side PMD. 0b = Clause 28 auto-negotiation is disabled. 1b = Clause 28 auto-negotiation is enabled.
10:8	Reserved		Reserved.
7	CL74_ConFEC_Abl		Controls KR FEC (Fire Code FEC) ability advertisement for 25G KR1/CR1. 0b = KR FEC is not supported. 1b = KR FEC is supported.
6	CL91_ConFEC_Abl		Controls RS FEC ability advertisement for 25G KR1/CR1. 0b = RS FEC is not supported. 1b = RS FEC is supported.
5	Reserved		Reserved.
4	RS FEC 544 Request		Controls RS FEC 544 capability request for 25G/50G/100G KR/KR-S/KR1/CR/CR-S/CR1. 0b = RS FEC is not requested. 1b = RS FEC is requested.
3	25G KR FEC Request		Controls KR FEC (Fire Code FEC) capability request for 25G KR/KR-S/KR1/CR/CR-S/CR1. 0b = KR FEC is not requested. 1b = KR FEC is requested.
2	RS FEC 528 Request		Controls RS FEC 528 capability request for 25G KR/KR-S/KR1/CR/CR-S/CR1. 0b = RS FEC is not requested. 1b = RS FEC is requested.
1	10G KR FEC Request		Controls FEC (Fire Code FEC) capability request for 10G KR. 0b = FEC is not requested. 1b = FEC is requested.
0	10G KR FEC Enable		Controls FEC (Fire Code FEC) capability advertisement for 10G KR. 0b = FEC is disabled. 1b = FEC is enabled and is advertised.

### 3.3.8.6.6 Link Options 1 (0x0005)

Bits	Field Name	Default NVM Value	Description
15:12	Max LPLU Speed		Max LPLU speed. Limits the maximum speed that can be enabled using Low Power Link Up (LPLU) algorithm for BASE-T PHYs. 0x0 = 10M 0x1 = 100M 0x2 = 1G 0x3 = Reserved 0x4 = 5G 0x5 = 10G 0x6-0xF = Reserved <b>Note:</b> This option is valid when LPLU is enabled (See bit 3 - LPLU enable).
11	Disable automatic Link on Start-Up		This bit, when set, disables the automatic link on start-up. When the port is defined as manageability port, the LESM ignores this bit and tries to start the link anyway.
10	Reserved		Reserved.
9	Flow Control ASM_DIR Capability		Controls Link Flow control ASM_DIR (A6) ability to advertise. 0b = 0ASM_DIR is advertised as 0. 1b = ASM_DIR is advertised as 1.
8	Flow Control PAUSE capability		Controls Link Flow control PAUSE (A5) ability to advertise. 0b = PAUSE is advertised as 0. 1b = PAUSE is advertised as 1.
7	PCS Enable	1b	Controls the PCS of the PMD. <ul style="list-style-type: none"> <li>PCS is disabled, the PHY is operating in a transparent re-timer mode.</li> <li>PCS is enabled.</li> </ul>
6	LESM Auto FEC Enable	1b	Controls the FEC options for the Link Establishment State Machine (LESM). This option is valid, when the LESM is enabled. 0b = LESM uses the default FEC mode based on the current media. 1b = LESM automatically detects the link partner's FEC type. This might include FEC types not specifically supported by the spec.
5	LESM Enable	1b	Controls the Link Establishment State Machine for the PMD. 0b = LESM is disabled. 1b = LESM is enabled.
4	Low Power Mode	0b	Controls the Low Power Mode for the module. 0b = The device is allowed to operate at high power. 1b = The device must operate in low power mode. Pluggable modules are only allowed to operate at their lowest power level.
3	LPLU Support Enable	0b	Enables or disables the Low Power Link-up (LPLU) support for the PMD. 0b = LPLU support is disabled. 1b = LPLU support is enabled.
2	Host Lane Reversal Enable	0b	Controls lane reversal on the host side of the PMD. 0b = The lane order is normal. 1b = The lane order needs to be reversed.
1	Line Lane Reversal Enable	0b	Controls lane reversal on the line side of the PMD. 0b = The lane order is normal. 1b = The lane order needs to be reversed.
0	Outermost PMD		Defines whether the PMD is the outermost PMD. 0b = The PMD has no outside of box connections. 1b = The PMD has outside of the box connection on the line side.

### 3.3.8.6.7 EEE Options 0 (0x0006)

Bits	Field Name	Default NVM Value	Description
15:0	EEE_TWsysTX		EEE_TWsysTX. See <a href="#">Section 5.3.1</a> .

### 3.3.8.6.8 EEE Options 1 (0x0007)

Bits	Field Name	Default NVM Value	Description
15:11	Reserved		Reserved.
10	EEE Enable 100GBASE-KR2-PAM4	0b	Controls the EEE functionality for 100GBASE-KR2-PAM4. 0b = EEE is disabled. 1b = EEE is enabled.
9	EEE Enable 100GBASE-KR4	0b	Controls the EEE functionality for 100GBASE-KR4. 0b = EEE is disabled. 1b = EEE is enabled.
8	EEE Enable 50GBASE-KR-PAM4	0b	Controls the EEE functionality for 50GBASE-KR-PAM4. 0b = EEE is disabled. 1b = EEE is enabled.
7	EEE Enable 50GBASE-KR2	0b	Controls the EEE functionality for 50GBASE-KR2. 0b = EEE is disabled. 1b = EEE is enabled.
6	Reserved		Reserved.
5	EEE Enable 25GBASE-KR	0b	Controls the EEE functionality for 25GBASE-KR. 0b = EEE is disabled. 1b = EEE is enabled.
4	EEE Enable 10GBASE-KR	0b	Controls the EEE functionality for 10GBASE-KR. 0b = EEE is disabled. 1b = EEE is enabled.
3	EEE Enable 1000BASE-KX	0b	Controls the EEE functionality for 1000BASE-KX. 0b = EEE is disabled. 1b = EEE is enabled.
2	EEE Enable 10GBASE-T	0b	Controls the EEE functionality for 10GBASE-T. 0b = EEE is disabled. 1b = EEE is enabled.
1	EEE Enable 1000BASE-T	0b	Controls the EEE functionality for 1000BASE-T. 0b = EEE is disabled. 1b = EEE is enabled.
0	EEE Enable 100BASE-TX	0b	Controls the EEE functionality for 100BASE-TX. 0b = EEE is disabled. 1b = EEE is enabled.

### 3.3.8.6.9 Host Side PMD Capabilities 0 (0x0008)

Host-side PMD capabilities are mapped based on line side link speed.

Bits	Field Name	Default NVM Value	Description
15	50GBASE-KR2		
14:13	Reserved		Reserved.
12	25G-AUI-C2C		
11	25GBASE-KR1		
10	25GBASE-KR-S		
9	25GBASE-KR		
8	10G-SFI-C2C		
7	10GBASE-KR/CR1		
6	10G-SFI-DA		
5	5GBASE-KR		
4:3	Reserved		Reserved.
2	1G-SGMII		
1	1000BASE-KX		
0	100M-SGMII		

### 3.3.8.6.10 Host Side PMD Capabilities 1 (0x0009)

Host-side PMD capabilities are mapped based on line side link speed.

Bits	Field Name	Default NVM Value	Description
15:14	Reserved		Reserved.
13	200G-AUI8		
12	200G-AUI4		
11	200GBASE-KR4-PAM4		
10	100G-AUI2		
9	Reserved		Reserved.
8	100GBASE-KR2-PAM4		
7	100GBASE-KP4-PAM4		
6	100G-AUI4		
5	100G-CAUI4		
4	100GBASE-KR4		
3	50G-AUI1		
2	50GBASE-KR-PAM4		
1	50G-AUI2		
0	50G-LAUI2		

### 3.3.8.6.11 Host Side PMD Capabilities 2 (0x000A)

Host-side PMD capabilities are mapped based on line side link speed.

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 3.3.8.6.12 Host Side PMD Capabilities 3 (0x000B)

Host-side PMD capabilities are mapped based on line side link speed.

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 3.3.8.6.13 Line Side PHY Capabilities (PHY Types) 0 (0x000C)

The following table defines the Line Side PHY Capabilities for the outermost PMD. If the *Outermost PMD* bit is not set, the Line Side PHY Capabilities match the Host Side PHY Capabilities structure. See [Section 3.3.8.6.9](#).

Bits	Field Name	Default NVM Value	Description
15	10GBASE-LR		
14	10GBASE-SR		
13	10G-SFI-DA		
12	10GBASE-T		
11	5GBASE-KR		
10	5GBASE-T		
9:7	Reserved		Reserved.
6	1G-SGMII		
5	1000BASE-KX		
4	1000BASE-LX		
3	1000BASE-SX		
2	1000BASE-T		
1	100M-SGMII		
0	100BASE-TX		

### 3.3.8.6.14 Line Side PHY Capabilities (PHY Types) 1 (0x000D)

The following table defines the Line Side PHY Capabilities for the outermost PMD. If the *Outermost PMD* bit is not set, the Line Side PHY Capabilities match the Host Side PHY Capabilities structure. See [Section 3.3.8.6.10](#).

Bits	Field Name	Default NVM Value	Description
15:14	Reserved		Reserved.
13	25G-AUI-C2C		
12	25G-AUI-AOC/ACC		
11	25GBASE-KR1		
10	25GBASE-KR-S		
9	25GBASE-KR		
8	25GBASE-LR		
7	25GBASE-SR		
6	25GBASE-CR1		
5	25GBASE-CR-S		
4	25GBASE-CR		
3	25GBASE-T		
2	10G-SFI-C2C		
1	10G-SFI-AOC/ACC		
0	10GBASE-KR/CR1		

### 3.3.8.6.15 Line Side PHY Capabilities (PHY Types) 2 (0x000E)

The following table defines the Line Side PHY Capabilities for the outermost PMD. If the *Outermost PMD* bit is not set, the Line Side PHY Capabilities match the Host Side PHY Capabilities structure. See [Section 3.3.8.6.11](#).

Bits	Field Name	Default NVM Value	Description
15	50GBASE-LR		
14	50GBASE-FR		
13	50GBASE-SR		
12	50GBASE-CP		
11	50G-AUI2		
10	50G-AUI2-AOC/ACC		
9	50G-LAUI2		
8	50G-LAUI2-AOC/ACC		
7	50GBASE-KR2		
6:5	Reserved		
4	50GBASE-CR2		
3:0	Reserved		Reserved.

### 3.3.8.6.16 Line Side PHY Capabilities (PHY Types) 3 (0x000F)

The following table defines the Line Side PHY Capabilities for the outermost PMD. If the *Outermost PMD* bit is not set, the Line Side PHY Capabilities match the Host Side PHY Capabilities structure. See Section 3.3.8.6.12.

Bits	Field Name	Default NVM Value	Description
15	100GBASE-DR		
14	100GBASE-SR2		
13	100GBASE-CR2-PAM4		
12	100GBASE-KP4-PAM4		
11	Reserved		Reserved.
10	100G-AUI4		
9	100G-AUI4-AOC/ACC		
8	100G-CAUI4		
7	100G-CAUI4-AOC/ACC		
6	100GBASE-KR4		
5	100GBASE-LR4		
4	100GBASE-SR4		
3	100GBASE-CR4		
2	50G-AUI1		
1	50G-AUI1-AOC/ACC		
0	50GBASE-KR-PAM4		

### 3.3.8.6.17 Line Side PHY Capabilities (PHY Types) 4 (0x0010)

The following table defines the Line Side PHY Capabilities for the outermost PMD. Not defined for PMDs with the *Outermost PMD* bit not set.

Bits	Field Name	Default NVM Value	Description
15	400GBASE-FR8	0b	
14	200G-AUI8	0b	
13	200G-AUI8-AOC/ACC	0b	
12	200G-AUI4	0b	
11	200G-AUI4-AOC/ACC	0b	
10	200GBASE-KR4-PAM4	0b	
9	200GBASE-DR4	0b	
8	200GBASE-LR4	0b	
7	200GBASE-FR4	0b	
6	200GBASE-SR4	0b	
5	200GBASE-CR4-PAM4	0b	
4	100G-AUI2		
3	100G-AUI2-AOC/ACC		
2:1	Reserved		Reserved.
0	100GBASE-KR2-PAM4		

### 3.3.8.6.18 Line Side PHY Capabilities (PHY Types) 5 (0x0011)

The following table defines the Line Side PHY Capabilities for the outermost PMD. Not defined for PMDs with the *Outermost PMD* bit not set.

Bits	Field Name	Default NVM Value	Description
15:4	Reserved		Reserved.
3	400G-AUI8	0b	
2	400G-AUI8-AOC/ACC	0b	
1	400GBASE-DR4	0b	
0	400GBASE-LR8	0b	

### 3.3.8.6.19 Line Side PHY Capabilities (PHY Types) 6 (0x0012)

The following table defines the Line Side PHY Capabilities for the outermost PHY. Not defined for PMDs with the *Outermost PHY* bit not set.

Bits	Field Name	Default NVM Value	Description
15:0	Reserved	0x0	Reserved.

### 3.3.8.6.20 Line Side PHY Capabilities (PHY Types) 7 (0x0013)

The following table defines the Line Side PHY Capabilities for the outermost PHY. Not defined for PMDs with the *Outermost PHY* bit not set.

Bits	Field Name	Default NVM Value	Description
15:0	Reserved	0x0	Reserved.

### 3.3.8.7 Node PMD Analog Section

This section describes the structure of the Node PMD Analog Section, detailing the analog configuration of a PHY Lane.

Word Offset	Description	Section Reference
0x0000 + n*14	1G/5G C2C Coefficients Low	3.3.8.7.1
0x0001 + n*14	Polarity and 1G/5G C2C Coefficients High	3.3.8.7.2
0x0002 + n*14	10G C2C Coefficients Low	3.3.8.7.3
0x0003 + n*14	10G C2C Coefficients High	3.3.8.7.4
0x0004 + n*14	10G C2M Coefficients Low	3.3.8.7.5
0x0005 + n*14	10G C2M Coefficients High	3.3.8.7.6
0x0006 + n*14	25G C2C Coefficients Low	3.3.8.7.7
0x0007 + n*14	25G C2C Coefficients High	3.3.8.7.8
0x0008 + n*14	25G C2M Coefficients Low	3.3.8.7.9
0x0009 + n*14	25G C2M Coefficients High	3.3.8.7.10
0x000A + n*14	50G C2C Coefficients Low	3.3.8.7.11
0x000B + n*14	50G C2C Coefficients High	3.3.8.7.12
0x000C + n*14	50G C2M Coefficients Low	3.3.8.7.13
0x000D + n*14	50G C2M Coefficients High	3.3.8.7.14

**Notes:** There is no standard definition for how the device must implement the coefficient values set in this section. The values set in this section of the netlist are PHY-specific, and must align with the definition conventions for the PHY which they are specifying, as well as the PHY-specific script which configures the device.

C2C Coefficients are used for link modes directly connecting PHY devices, such as 10G SFI DA and 25G AUI C2C. C2M coefficients are used for link modes that use a module, such as 10GBASE-LR and 25G-AUI AOC/ACC

This section is accessible through the GETNODEATTR action starting at the DWord-aligned Attribute ID offset 0x6800 for the line side and 0x7000 for the host side.

### 3.3.8.7.1 1G/5G C2C Coefficients Low (0x0000 + n\*14)

Defines the transmit equalizer settings for 1G/5G serial AUI/C2C interfaces.

**Note:** It is important to understand that each PHY uses its own definition for TXFFE values, including format and sign. It is required that the values saved in the netlist align with the format used by the specific PHY they are defining. Therefore, there is no standardized way that the coefficients are defined in this section. The convention used must also align with the script that manages the link up process for that individual PHY. Overriding TXFFE values should only be done by an advanced user with specific knowledge of how the PHY should be configured for the given mode, such as tuning the coefficients based on conformance testing results.

Bits	Field Name	Default NVM Value	Description
15:8	C[0][7:0]		Cursor value for C2C 1G/5G speeds.
7:0	C[1][7:0]		Post-Cursor value for C2C 1G/5G speeds.

### 3.3.8.7.2 Polarity and 1G/5G C2C Coefficients High (0x0001 + n\*14)

Defines the lane polarity and transmit equalizer settings for 1G/5G serial AUI/C2C interfaces.

Bits	Field Name	Default NVM Value	Description
15	Rx Polarity	0b	Lane Rx Polarity control. 0b = Normal Rx polarity. 1b = Inverted Rx polarity.
14	Tx Polarity	0b	Lane Tx Polarity control. 0b = Normal Tx polarity. 1b = Inverted Tx polarity.
13	TXFFE Override 50G AUI-C2M		TXFFE Override 50G AUI-C2M control. 0b = Use silicon default TXFFE values for AUI-C2M PHY modes with 50G lane speeds. 1b = Use netlist defined TXFFE values for AUI-C2M PHY modes with 50G lane speeds.
12	TXFFE Override 50G AUI-C2C		TXFFE Override 50G C2C control. 0b = Use silicon default TXFFE values for AUI-C2C PHY modes with 50G lane speeds. 1b = Use netlist defined TXFFE values for AUI-C2C PHY modes with 50G lane speeds.
11:10	Reserved		Reserved.
9	TXFFE Override Enable		TXFFE Override Enable control. 0b = Always silicon default TXFFE values for all PHY modes. 1b = Use netlist defined TXFFE values for PHY modes based on the TXFFE Override bit corresponding to each mode.
8	TXFFE Override 1G/5G		TXFFE Override 1G/5G control. 0b = Use silicon default TXFFE values for PHY modes with 1G/5G lane speeds. 1b = Use netlist defined TXFFE values for PHY modes with 1G/5G lane speeds.
7:0	C[-1][7:0]		Pre-Cursor value for C2C 1G/5G speeds.

### 3.3.8.7.3 10G C2C Coefficients Low (0x0002 + n\*14)

Defines the transmit equalizer settings for 10G serial C2C interfaces.

Bits	Field Name	Default NVM Value	Description
15:8	C[0][7:0]		Cursor value for AUI-C2C 10G speeds.
7:0	C[1][7:0]		Post-Cursor value for AUI-C2C 10G speeds.

### 3.3.8.7.4 10G C2C Coefficients High (0x0003 + n\*14)

Defines the transmit equalizer settings for 10G serial AUI-C2C interfaces.

Bits	Field Name	Default NVM Value	Description
15:9	Reserved		Reserved.
8	TXFFE Override 10G AUI-C2C		TXFFE Override 10G AUI-C2C control. 0b = Use silicon default TXFFE values for AUI-C2C PHY modes with 10G lane speeds. 1b = Use netlist defined TXFFE values for AUI-C2C PHY modes with 10G lane speeds.
7:0	C[-1][7:0]		Pre-Cursor value for 10G speeds.

### 3.3.8.7.5 10G C2M Coefficients Low (0x0004 + n\*14)

Defines the transmit equalizer settings for 10G serial AUI-C2M interfaces.

Bits	Field Name	Default NVM Value	Description
15:8	C[0][7:0]		Cursor value for AUI-C2M 10G speeds.
7:0	C[1][7:0]		Post-Cursor value for AUI-C2M 10G speeds.

### 3.3.8.7.6 10G C2M Coefficients High (0x0005 + n\*14)

Defines the transmit equalizer settings for 10G serial AUI-C2M interfaces.

Bits	Field Name	Default NVM Value	Description
15:9	Reserved		Reserved.
8	TXFFE Override 10G AUI-C2M		TXFFE Override 10G AUI-C2M control. 0b = Use silicon default TXFFE values for AUI-C2M PHY modes with 10G lane speeds. 1b = Use netlist defined TXFFE values for AUI-C2M PHY modes with 10G lane speeds.
7:0	C[-1][7:0]		Pre-Cursor value for C2M 10G speeds.

### 3.3.8.7.7 25G C2C Coefficients Low (0x0006 + n\*14)

Defines the transmit equalizer settings for 25G serial AUI-C2C interfaces.

Bits	Field Name	Default NVM Value	Description
15:8	C[0][7:0]		Cursor value for AUI-C2C 25G speeds.
7:0	C[1][7:0]		Post-Cursor value for AUI-C2C 25G speeds.

### 3.3.8.7.8 25G C2C Coefficients High (0x0007 + n\*14)

Defines the transmit equalizer settings for 25G serial AUI-C2C interfaces.

Bits	Field Name	Default NVM Value	Description
15:9	Reserved		Reserved.
8	TXFFE Override 25G AUI-C2C		TXFFE Override 25G AUI-C2C control. 0b = Use silicon default TXFFE values for AUI-C2C PHY modes with 25G lane speeds. 1b = Use netlist defined TXFFE values for AUI-C2C PHY modes with 25G lane speeds.
7:0	C[-1][7:0]		Pre-Cursor value for AUI-C2C 25G speeds.

### 3.3.8.7.9 25G C2M Coefficients Low (0x0008 + n\*14)

Defines the transmit equalizer settings for 25G serial AUI-C2M interfaces.

Bits	Field Name	Default NVM Value	Description
15:8	C[0][7:0]		Cursor value for AUI-C2M 25G speeds.
7:0	C[1][7:0]		Post-Cursor value for AUI-C2M 25G speeds.

### 3.3.8.7.10 25G C2M Coefficients High (0x0009 + n\*14)

Defines the transmit equalizer settings for 25G serial AUI-C2M interfaces.

Bits	Field Name	Default NVM Value	Description
15:9	Reserved		Reserved.
8	TXFFE Override 25G AUI-C2M		TXFFE Override 25G AUI-C2M control. 0b = Use silicon default TXFFE values for AUI-C2M PHY modes with 25G lane speeds. 1b = Use netlist defined TXFFE values for AUI-C2M PHY modes with 25G lane speeds.
7:0	C[-1][7:0]		Pre-Cursor value for AUI-C2M 25G speeds.

### 3.3.8.7.11 50G C2C Coefficients Low (0x000A + n\*14)

Defines the transmit equalizer settings for 50G serial AUI-C2C interfaces.

Bits	Field Name	Default NVM Value	Description
15:8	C[0][7:0]		Cursor value for AUI-C2C 50G speeds.
7:0	C[1][7:0]		Post-Cursor value for AUI-C2C 50G speeds.

### 3.3.8.7.12 50G C2C Coefficients High (0x000B + n\*14)

Defines the transmit equalizer settings for 50G serial AUI-C2C interfaces.

Bits	Field Name	Default NVM Value	Description
15:8	C[-2][7:0]		Pre-Cursor 2 (C[-2]) value for AUI-C2C 50G speeds.
7:0	C[-1][7:0]		Pre-Cursor 1 (C[-1]) value for AUI-C2C 50G speeds.

### 3.3.8.7.13 50G C2M Coefficients Low (0x000C + n\*14)

Defines the transmit equalizer settings for 50G serial AUI-C2M interfaces.

Bits	Field Name	Default NVM Value	Description
15:8	C[0][7:0]		Cursor value for AUI-C2M 50G speeds.
7:0	C[1][7:0]		Post-Cursor value for AUI-C2M 50G speeds.

### 3.3.8.7.14 50G C2M Coefficients High (0x000D + n\*14)

Defines the transmit equalizer settings for 50G serial AUI-C2M interfaces.

Bits	Field Name	Default NVM Value	Description
15:8	C[-2][7:0]		Pre-Cursor 2 (C[-2]) value for AUI-C2M 50G speeds
7:0	C[-1][7:0]		Pre-Cursor 1 (C[-1]) value for AUI-C2M 50G speeds

### 3.3.8.8 Node PMD Analog Misc Section

An extension of the Node PMD Analog Section, this section contains PHY device specific lane configuration. The section is located immediately at after the Node PMD Analog Section for both the host and line sides.

Word Offset	Description	Section Reference
0x0000	PMD Analog Misc Length	3.3.8.8.1
0x0001	Auto-neg LESM Timeout	3.3.8.8.2
0x0002	1G/5G/10G serial AUI LESM Timeout	3.3.8.8.3
0x0003	25G/50G serial AUI LESM Timeout	3.3.8.8.4

The section is accessible through the GETNODEATTR action starting at the DWord-aligned Attribute ID offset 0x8800 for the line side and 0x9000 for the host side.

#### 3.3.8.8.1 PMD Analog Misc Length (0x0000)

Bits	Field Name	Default NVM Value	Description
15:8	Reserved		Reserved.
7:0	PMD Analog Misc Length		The length of the PMD analog miscellaneous section in words.

#### 3.3.8.8.2 Auto-Neg LESM Timeout (0x0001)

Bits	Field Name	Default NVM Value	Description
15:8	Auto-Neg LESM Timeout		Auto-negotiation LESM timeout defined in 200 ms increments.
7:0	Reserved		Reserved.

#### 3.3.8.8.3 1G/5G/10G Serial AUI LESM Timeout (0x0002)

Bits	Field Name	Default NVM Value	Description
15:8	10G Serial AUI LESM Timeout		10G AUI LESM timeout defined in 200 ms increments.
7:0	1G/5G Serial AUI LESM Timeout		1G/5G AUI LESM timeout defined in 200 ms increments.

#### 3.3.8.8.4 25G/50G Serial AUI LESM Timeout (0x0003)

**Note:** This parameter applies to all link modes that are using 50G serial signaling. For example, 100G implemented as 2x50G.

Bits	Field Name	Default NVM Value	Description
15:8	50G Serial AUI LESM Timeout		50G AUI LESM Timeout defined in 200 ms increments.
7:0	25G Serial AUI LESM Timeout		25G AUI LESM Timeout defined in 200 ms increments.

### 3.3.8.9 Node LED Configuration Section

This section describes the structure of the Node LED Configuration Section, detailing the configuration of an LED for a given Port Option. The length of the section is dependent on the number of conditions defined for the LED to indicate. See [Section 3.3.8.9.3](#).

Word Offset	Description	Section Reference
0x0000	Port Option Port Affinity Low	<a href="#">3.3.8.9.1</a>
0x0001	Port Option Port Affinity High	<a href="#">3.3.8.9.2</a>
0x0002 + n*1	Port Option Color and Condition [n], where n = 0:3	<a href="#">3.3.8.9.3</a>

The section is accessible through the GETNODEATTR action starting at the DWord-aligned Attribute ID offset 0xA000.

#### 3.3.8.9.1 Port Option Port Affinity Low (0x0000)

Defines the port affinity of the LED for a given Port Option.

If the netlist describes the LOM, the ports are referring to Physical MAC Ports. If the netlist describes a mezzanine card, the ports are referring to PHY Ports within the context of the mezzanine card. These, during the mezzanine card topology detection, are re-mapped into the Physical MAC Ports within the context of the system in which the mezzanine card was inserted. Therefore, when accessed through the GETNODEATTR action, the *Port Affinity* bits always refer to Physical MAC Ports.

Bits	Field Name	Default NVM Value	Description
15	Port 15		If set, the LED is associated with Port 15
14	Port 14		If set, the LED is associated with Port 14
13	Port 13		If set, the LED is associated with Port 13
12	Port 12		If set, the LED is associated with Port 12
11	Port 11		If set, the LED is associated with Port 11
10	Port 10		If set, the LED is associated with Port 10
9	Port 9		If set, the LED is associated with Port 9
8	Port 8		If set, the LED is associated with Port 8
7	Port 7		If set, the LED is associated with Port 7
6	Port 6		If set, the LED is associated with Port 6
5	Port 5		If set, the LED is associated with Port 5
4	Port 4		If set, the LED is associated with Port 4
3	Port 3		If set, the LED is associated with Port 3
2	Port 2		If set, the LED is associated with Port 2
1	Port 1		If set, the LED is associated with Port 1
0	Port 0		If set, the LED is associated with Port 0

### 3.3.8.9.2 Port Option Port Affinity High (0x0001)

Bits	Field Name	Default NVM Value	Description
15:14	Logic Operator	10b	The logic operator to be used between port flags. 00b = Reserved 10b = AND 10b = OR 11b = Reserved
13:9	Reserved		Reserved.
8	Port ID		If set, the LED is used for port identification based on software request.
7:4	Reserved		Reserved.
3	Port 19		If set, the LED is associated with Port 19.
2	Port 18		If set, the LED is associated with Port 18.
1	Port 17		If set, the LED is associated with Port 17.
0	Port 16		If set, the LED is associated with Port 16.

### 3.3.8.9.3 Port Option Color and Condition [n] (0x0004 + n\*1)

The state of the LED is controlled by four conditions defined separately for each Port Option. The conditions are prioritized: Condition[0] being the highest in priority and Condition[3] the lowest. The true condition with the highest priority defines the Color and Blink configuration of the LED.

To allow for more flexibility, two adjacent conditions can be combined through the defined Logic Operator. If the expression Condition[i] <Operator[i]> Condition[i+1] is true, the LED is configured with the Color and Blink configuration associated with Condition[i].

Bits	Field Name	Default NVM Value	Description
15:14	Reserved		Reserved.
13:11	Blink		Blink configuration for the LED. 000b = No Blink 001b = Blink 010b = Blink on MAC Activity All other values are reserved. Blinking results in a cadence of 200 ms on / 200 ms off.

Bits	Field Name	Default NVM Value	Description
10:8	Color		<p>Defines the color of an RGB LED. The color is mixed though driving the associated Red, Green and Blue LEDs with the appropriate PWM signals through a PCA9585 LED controller. The possible colors are as follows:</p> <ul style="list-style-type: none"> <li>000b = SKIP — Skip Condition: The LED state should be driven based on the result of evaluating the next condition.</li> <li>001b = RED</li> <li>010b = ORANGE</li> <li>011b = YELLOW</li> <li>100b = GREEN</li> <li>101b = BLUE</li> <li>110b = PURPLE</li> <li>111b = Reserved</li> </ul> <div data-bbox="678 680 1117 1066" style="text-align: center;"> </div> <p>Colors are only supported if the Node Part Number is RGB LED. The node has three I/Os defined, and they all are driven by the same PCA9585 LED controller.</p>
7:6	Logic Operator		<p>The logic operator to be used between Condition[i] and Condition[i+1].</p> <ul style="list-style-type: none"> <li>00b = NONE</li> <li>01b = AND</li> <li>10b = OR</li> <li>11b = Reserved</li> </ul> <p>The field is ignored for Condition[3].</p>

Bits	Field Name	Default NVM Value	Description
5:0	Condition		<p>Defines the condition in which the LED should be asserted.</p> <p>Valid conditions are:</p> <ul style="list-style-type: none"> <li>0x00 = FALSE</li> <li>0x01 = TRUE</li> <li>0x02 = LINK</li> <li>0x03 = LINK_ACTIVITY</li> <li>0x04 = MAC_ACTIVITY</li> <li>0x05 = FILTER_ACTIVITY</li> <li>0x06 = INVALID_MEDIA</li> <li>0x07 = LINK_LESS_THAN_1G</li> <li>0x08 = Reserved</li> <li>0x09 = LINK_LESS_THAN_5G</li> <li>0x0A = LINK_LESS_THAN_10G</li> <li>0x0B = LINK_LESS_THAN_25G</li> <li>0x0C = Reserved</li> <li>0x0D = LINK_LESS_THAN_50G</li> <li>0x0E = LINK_LESS_THAN_100G</li> <li>0x0F = LINK_LESS_THAN_200G</li> <li>0x10 = LINK_LESS_THAN_400G</li> <li>0x11 = LINK_100M</li> <li>0x12 = LINK_1G</li> <li>0x13 = Reserved</li> <li>0x14 = LINK_5G</li> <li>0x15 = LINK_10G</li> <li>0x16 = LINK_25G</li> <li>0x17 = Reserved</li> <li>0x18 = LINK_50G</li> <li>0x19 = LINK_100G</li> <li>0x1A = LINK_200G</li> <li>0x1B = LINK_400G</li> <li>0x1C = NO_LINK</li> <li>0x1E:0x1F = Reserved</li> <li>0x20 = TEMP_WARN_N</li> <li>0x21 = TEMP_CRIT_N</li> <li>0x22 = FAN_ON_AUX</li> <li>0x23:0x3F - Reserved</li> </ul>

### 3.3.8.10 Node Thermal Configuration Section

This section describes the structure of the Node Thermal Configuration Section, detailing the configuration of the temperature sensor.

Word Offset	Description	Section Reference
0x0000	Min and Max Readable Value	<a href="#">3.3.8.10.1</a>
0x0001	Tolerance and Hysteresis	<a href="#">3.3.8.10.2</a>
0x0002	Resolution Low	<a href="#">3.3.8.10.3</a>
0x0003	Resolution High	<a href="#">3.3.8.10.4</a>
0x0004	Offset Low	<a href="#">3.3.8.10.5</a>
0x0005	Offset High	<a href="#">3.3.8.10.6</a>
0x0006	Normal Max and Warning High Thresholds	<a href="#">3.3.8.10.7</a>
0x0007	Critical High and Fatal High Threshold	<a href="#">3.3.8.10.8</a>
0x0008	Accuracy	<a href="#">3.3.8.10.9</a>
0x0009	Reserved	<a href="#">3.3.8.10.10</a>
0x000A + n*2	Temperature Sensor Port Affinity Low	<a href="#">3.3.8.10.11</a>
0x000B + n*2	Temperature Sensor Port Affinity High	<a href="#">3.3.8.10.12</a>

The section is accessible through the GETNODEATTR action starting at the DWord-aligned Attribute ID offset 0xC000. The Temperature Sensor Port Affinity is replicated for each Port Option of the associated Parent PHY node. Only the copy with the same index as the Parent PHY's active Port Option is loaded to RAM and accessible through GETNODEATTR.

**Note:** For SFP and QSFP standard sensors, E810 firmware follows the standard and should not modify parameters from the netlist. The firmware should not take (i.e. ignore) the critical thresholds from the netlist, where SFP or QSFP standard sensor is defined. Instead, it should use the thresholds as read from the module itself (SFF-8436 defines them in bytes 128-129)

#### 3.3.8.10.1 Min and Max Readable Value (0x0000)

Bits	Field Name	Default NVM Value	Description
15:8	Max Readable Value	0xFF	Thermal Sensor <i>maxReadable</i> value.
7:0	Min Readable Value	0x00	Thermal Sensor <i>minReadable</i> value.

#### 3.3.8.10.2 Tolerance and Hysteresis (0x0001)

Bits	Field Name	Default NVM Value	Description
15:8	Hysteresis	0x02	Thermal Sensor Hysteresis (°C).
7:0	Tolerance	0x01	Thermal Sensor <i>plusTolerance</i> and <i>minusTolerance</i> (°C).

### 3.3.8.10.3 Resolution Low (0x0002)

Bits	Field Name	Default NVM Value	Description
15:0	Resolution [15:0]	0x0000	Lower two bytes of the Thermal Sensor resolution. The field uses a real32 representation. <b>Note:</b> The available resolution is 0.125 °C, but the supported value is 1 °C. <b>Note:</b> For the internal thermal sensor definition, the resolution is not taken from the netlist, but it is set to the NVM default.

### 3.3.8.10.4 Resolution High (0x0003)

Bits	Field Name	Default NVM Value	Description
15:0	Resolution [31:16]	0x3F80	Higher two bytes of the Thermal Sensor resolution. The field uses a real32 representation. <b>Note:</b> The available resolution is 0.125 °C, but the supported value is 1 °C. <b>Note:</b> For the internal thermal sensor definition, the resolution is not taken from the netlist, but it is set to the NVM default.

### 3.3.8.10.5 Offset Low (0x0004)

Bits	Field Name	Default NVM Value	Description
15:0	Offset [15:0]	0x0000	Lower two bytes of the Thermal Sensor offset. The field uses a real32 representation.

### 3.3.8.10.6 Offset High (0x0005)

Bits	Field Name	Default NVM Value	Description
15:0	Offset [31:16]	0x0000	Higher two bytes of the Thermal Sensor offset. The field uses a real32 representation.

### 3.3.8.10.7 Normal Max and Warning High Thresholds (0x0006)

Bits	Field Name	Default NVM Value	Description
15:8	Warning High		Warning High - High temperature warning threshold (°C).
7:0	Normal Max		Normal Max - Maximum normal temperature threshold (°C).

### 3.3.8.10.8 Critical High and Fatal High Thresholds (0x0007)

Bits	Field Name	Default NVM Value	Description
15:8	Fatal High		Fatal High - Fatal temperature alarm threshold (°C). <b>Note:</b> For any thermal sensor, this threshold must be set between the "Internal Thermal Sensor Minimum Threshold" and "Internal Thermal Sensor Maximum Threshold" NVM parameters.
7:0	Critical High		Critical High - Critical temperature alarm threshold (°C).

### 3.3.8.10.9 Accuracy (0x0008)

Bits	Field Name	Default NVM Value	Description
15:0	Accuracy		Thermal sensor accuracy (percentage of readable value).

### 3.3.8.10.10 Reserved (0x0009)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 3.3.8.10.11 Temperature Sensor Port Affinity Low (0x000A + n\*2)

This section describes the port affinity of the temperature sensor. Each bit, if set, indicates the temperature sensor is associated with the respective port.

If the netlist describes the LOM, the ports are referring to Physical MAC Ports. If the netlist describes a mezzanine card, the ports are referring to PHY Ports within the context of the mezzanine card. These, during the mezzanine card topology detection, are re-mapped into the Physical MAC Ports within the context of the system into which the mezzanine card was inserted. Therefore, when accessed through the GETNODEATTR action, the Port Affinity bits always refer to Physical MAC Ports.

Bits	Field Name	Default NVM Value	Description
15	Port 15		If set, the temperature sensor is associated with Port 15
14	Port 14		If set, the temperature sensor is associated with Port 14
13	Port 13		If set, the temperature sensor is associated with Port 13
12	Port 12		If set, the temperature sensor is associated with Port 12
11	Port 11		If set, the temperature sensor is associated with Port 11
10	Port 10		If set, the temperature sensor is associated with Port 10
9	Port 9		If set, the temperature sensor is associated with Port 9
8	Port 8		If set, the temperature sensor is associated with Port 8
7	Port 7		If set, the temperature sensor is associated with Port 7
6	Port 6		If set, the temperature sensor is associated with Port 6
5	Port 5		If set, the temperature sensor is associated with Port 5
4	Port 4		If set, the temperature sensor is associated with Port 4
3	Port 3		If set, the temperature sensor is associated with Port 3

Bits	Field Name	Default NVM Value	Description
2	Port 2		If set, the temperature sensor is associated with Port 2
1	Port 1		If set, the temperature sensor is associated with Port 1
0	Port 0		If set, the temperature sensor is associated with Port 0

### 3.3.8.10.12 Temperature Sensor Port Affinity High (0x000B + n\*2)

Bits	Field Name	Default NVM Value	Description
15:8	Sensor Location		Defines the location of the sensor.
7:4	Reserved		Reserved.
3	Port 19		If set, the temperature sensor is associated with Port 19.
2	Port 18		If set, the temperature sensor is associated with Port 18.
1	Port 17		If set, the temperature sensor is associated with Port 17.
0	Port 16		If set, the temperature sensor is associated with Port 16.

### 3.3.8.11 Node Clock Configuration Header Section

This section defines the structure of the Node Clock Configuration Header holding the pointers to the Clock Input, Clock Output, and DPLL Configuration sections.

Word Offset	Description	Section Reference
0x0000	Node Clock Input Configuration Section Pointer	3.3.8.11.1
0x0001	Node Clock Output Configuration Section Pointer	3.3.8.11.2
0x0002	Node DPLL Configuration Section Pointer	3.3.8.11.3
0x0003	Reserved	3.3.8.11.4

The section is accessible through the GETNODEATTR DNL action starting at the DWord-aligned Attribute ID offset 0x0004.

#### 3.3.8.11.1 Node Clock Input Configuration Section Pointer (0x0000)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:12	Clock Input Count		The number of clock inputs on the Clock Controller node. <b>Note:</b> A value of 0 indicates no Node Clock Input Configuration Sections captured within the netlist.
11:0	Clock Input Configuration Section Offset		The word offset of the Node Clock Input Configuration Section relative to the beginning of the node section.

### 3.3.8.11.2 Node Clock Output Configuration Section Pointer (0x0001)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:12	Clock Input Count		The number of clock inputs on the Clock Controller node. <b>Note:</b> A value of 0 indicates no Node Clock Input Configuration Sections captured within the netlist.
11:0	Clock Output Configuration Section Offset		The word offset of the Node Clock Output Configuration Section relative to the beginning of the node section.

### 3.3.8.11.3 Node DPLL Configuration Section Pointer (0x0002)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:12	DPLL Count		The number of DPLLs within the Clock Controller node. <b>Note:</b> A value of 0 indicates no Node DPLL Configuration Sections captured within the netlist.
11:0	Node DPLL Configuration Section Offset		The word offset of the Node DPLL Configuration Section relative to the beginning of the node section.

### 3.3.8.11.4 Reserved (0x0003)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

## 3.3.8.12 Node Clock Input Configuration Section

Word Offset	Description	Section Reference
0x0000	Clock Input Mode	3.3.8.12.1
0x0001	Frequency Option Count and Clock I/O Number	3.3.8.12.2
0x0002	Phase Offset Compensation Lo	3.3.8.12.3
0x0003	Phase Offset Compensation Hi	3.3.8.12.4
0x0004	Max Phase Offset Compensation Lo	3.3.8.12.5
0x0005	Max Phase Offset Compensation Hi	3.3.8.12.6
0x0006 + n*2	Option[n] Frequency Lo	3.3.8.12.7
0x0007 + n*2	Option[n] Frequency Hi	3.3.8.12.8

**Note:** In this context, *n* refers to the index of the frequency option allowed for the clock input and ranges from 0 to *Frequency Option Count* - 1.

This section is accessible through the GETNODEATTR DNL action starting at the DWord-aligned Attribute ID offset 0x2800.

### 3.3.8.12.1 Clock Input Mode (0x0000)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15	eSync Ability		eSync ability of the clock input. 0b = Not eSync capable. 1b = eSync capable.
14	eSync Enable		Default eSync configuration for the clock input. 0b = Disabled 1b = Enabled
13:8	Reserved		Reserved.
7:5	Mode		Specifies the default mode of operation for the clock input. 000b = Disabled — The input is disabled during board initialization. 001b = Enabled — The input is enabled during board initialization. 011b = Auto — The input is configured based on link status of the relevant port. 111b = Silicon Default — The input is not configured until explicitly requested via an admin command. All other values are reserved.
4:0	Reserved		Reserved.

### 3.3.8.12.2 Frequency Option Count and Clock I/O Number (0x0001)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:12	Frequency Option Count		The number of allowed frequency options for the clock input.
11:8	Default Frequency Option		The index of the default frequency option for the clock input.
7:5	Clock I/O Type		Specifies type of the clock input. 000b = Single ended GPS clock. 001b = Single ended PHY recovered clock. 010b = Single ended external clock. 011b = Reserved. 100b = Differential GPS clock. 101b = Differential PHY recovered clock. 110b = Differential external clock. 111b = Reserved.
4:0	Clock I/O Number		The number of the clock Input I/O Connections associated with this clock input configuration. <b>Note:</b> A value of 0x1F designates a clock input with no associated I/O Connections captured within the netlist.

### 3.3.8.12.3 Phase Offset Compensation Lo (0x0002)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Phase Offset Compensation Lo		Phase Offset Compensation with 1 ps resolution (signed integer). Phase Offset Compensation [15:0].

### 3.3.8.12.4 Phase Offset Compensation Hi (0x0003)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Phase Offset Compensation Hi		Phase Offset Compensation with 1 ps resolution (signed integer). Phase Offset Compensation [31:16].

### 3.3.8.12.5 Max Phase Offset Compensation Lo (0x0004)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Max Phase Offset Compensation Lo		Max Phase Offset Compensation with 1 ps resolution (max absolute offset). Max Phase Offset Compensation [15:0]

### 3.3.8.12.6 Max Phase Offset Compensation Hi (0x0005)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Max Phase Offset Compensation Hi		Max Phase Offset Compensation with 1 ps resolution (max absolute offset). Max Phase Offset Compensation [31:16]

**Note:** The Phase Offset Compensation shall be within the Max Phase Offset Compensation limits:  
-(Max Phase Offset) < Phase Offset < Max Phase Offset.

### 3.3.8.12.7 Option[n] Frequency Lo (0x0006 + n\*2)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Option[n] Frequency Lo		Option[n] Frequency with 1 Hz resolution. Option[n] Frequency [15:0]

### 3.3.8.12.8 Option[n] Frequency Hi (0x0007 + n\*2)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Option[n] Frequency Hi		Option[n] Frequency with 1 Hz resolution. Option[n] Frequency [31:16]

### 3.3.8.13 Node Clock Output Configuration Section

Word Offset	Description	Section Reference
0x0000	Clock Output Mode Source Select	3.3.8.13.1
0x0001	Frequency Option Count and Clock I/O Number	3.3.8.13.2
0x0002	Phase Offset Compensation Lo	3.3.8.13.3
0x0003	Phase Offset Compensation Hi	3.3.8.13.4
0x0004	Max Phase Offset Compensation Lo	3.3.8.13.5
0x0005	Max Phase Offset Compensation Hi	3.3.8.13.6
0x0006 + n*2	Option[n] Frequency Lo	3.3.8.13.7
0x0007 + n*2	Option[n] Frequency Hi	3.3.8.13.8

**Note:** In this context, *n* refers to the index of the frequency option allowed for the clock output and ranges from 0 to *Frequency Option Count* - 1.

This section is accessible through the GETNODEATTR DNL action starting at the DWord-aligned Attribute ID offset 0x3000.

#### 3.3.8.13.1 Clock Output Mode and Source Select (0x0000)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15	eSync Ability		eSync ability of the clock output. 0b = Not eSync capable. 1b = eSync capable.
14	eSync Enable		Default eSync configuration for the clock output. 0b = Disabled 1b = Enabled
13:8	Reserved		Reserved.
7:5	Mode		Specifies the default mode of operation for the clock output. 000b = Disabled — The output is disabled during board initialization. 001b = Enabled — The output is enabled during board initialization. 010b = Force Enabled — The output is forced to enabled. Any configuration attempt is denied and results in a configuration error. <b>Note:</b> This mode is intended for clock outputs driving the network controller's reference clock input. 111b = Silicon Default — The output is not configured until explicitly requested via an admin command. All other values are reserved.
4:0	Source Select		Default source configuration. Specifies the index of the DPLL confirmed as a source in <i>Enabled</i> and <i>Force Enabled</i> modes.

### 3.3.8.13.2 Frequency Option Count and Clock I/O Number (0x0001)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:12	Frequency Option Count		The number of allowed frequency options for the clock output.
11:8	Default Frequency Option		The index of the default frequency option for the clock output.
7:5	Clock I/O Type		Specifies type of the clock input. 000b = Single ended clock. 100b = Differential clock. All other values are reserved.
4:0	Clock I/O Number		The number of the clock Input I/O Connections associated with this clock output configuration. <b>Note:</b> A value of 0x1F designates a clock output with no associated I/O Connections captured within the netlist.

### 3.3.8.13.3 Phase Offset Compensation Lo (0x0002)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Phase Offset Compensation Lo		Phase Offset Compensation with 1 ps resolution. Phase Offset Compensation [15:0].

### 3.3.8.13.4 Phase Offset Compensation Hi (0x0003)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Phase Offset Compensation Hi		Phase Offset Compensation with 1 ps resolution. Phase Offset Compensation [31:16].

### 3.3.8.13.5 Max Phase Offset Compensation Lo (0x0004)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Max Phase Offset Compensation Lo		Max Phase Offset Compensation with 1 ps resolution. Max Phase Offset Compensation [15:0]

### 3.3.8.13.6 Max Phase Offset Compensation Hi (0x0005)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Max Phase Offset Compensation Hi		Max Phase Offset Compensation with 1 ps resolution. Max Phase Offset Compensation [31:16]

### 3.3.8.13.7 Option[n] Frequency Lo (0x0006 + n\*2)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Option[n] Frequency Lo		Option[n] Frequency with 1 Hz resolution. Option[n] Frequency [15:0]

### 3.3.8.13.8 Option[n] Frequency Hi (0x0007 + n\*2)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Option[n] Frequency Hi		Option[n] Frequency with 1 Hz resolution. Option[n] Frequency [31:16]

## 3.3.8.14 Node Recovered Clock Output Configuration Section

Word Offset	Description	Section Reference
0x0000	Clock Output Mode Source Select	3.3.8.14.1
0x0001	Frequency Option Count and Clock I/O Number	3.3.8.14.2
0x0002 - 0x0005	Reserved	3.3.8.14.3
0x0006 + n*2	Option[n] Frequency Lo	3.3.8.14.4
0x0007 + n*2	Option[n] Frequency Hi	3.3.8.14.5

**Note:** In this context,  $n$  refers to the index of the frequency option allowed for the clock output and ranges from 0 to *Frequency Option Count* - 1.

This section is accessible through the GETNODEATTR DNL action starting at the DWord-aligned Attribute ID offset 0x3000.

### 3.3.8.14.1 Clock Output Mode and Source Select (0x0000)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description																
15:8	Source Enable		<p>Specifies the PHY Lanes allowed as recovered clock source. A lane may only be configured as a source of the clock output if the corresponding source enable bit is asserted.</p> <p><b>Bit Description</b></p> <table border="0"> <tr><td>0</td><td>Lane 0</td></tr> <tr><td>1</td><td>Lane 1</td></tr> <tr><td>2</td><td>Lane 2</td></tr> <tr><td>3</td><td>Lane 3</td></tr> <tr><td>4</td><td>Lane 4</td></tr> <tr><td>5</td><td>Lane 5</td></tr> <tr><td>6</td><td>Lane 6</td></tr> <tr><td>7</td><td>Lane 7</td></tr> </table>	0	Lane 0	1	Lane 1	2	Lane 2	3	Lane 3	4	Lane 4	5	Lane 5	6	Lane 6	7	Lane 7
0	Lane 0																		
1	Lane 1																		
2	Lane 2																		
3	Lane 3																		
4	Lane 4																		
5	Lane 5																		
6	Lane 6																		
7	Lane 7																		
7:5	Mode		<p>Specifies the default mode of operation for the clock output.</p> <p>000b = Disabled — The output is disabled during board initialization.</p> <p>001b = Enabled — The output is enabled during board initialization.</p> <p>010b = Force Enabled — The output is forced to enabled. Any configuration attempt is denied and results in a configuration error.</p> <p><b>Note:</b> This mode is intended for clock outputs driving the network controller's reference clock input.</p> <p>011b = Auto — The output is configured based on link status of the relevant port.</p> <p>111b = Silicon Default — The output is not configured until explicitly requested via an admin command.</p> <p>All other values are reserved.</p>																
4:0	Source Select		<p>Default source configuration</p> <p>Specifies the PHY Lane number configured as a recovered clock source in <i>Enabled</i> and <i>Force Enabled</i> modes.</p>																

### 3.3.8.14.2 Frequency Option Count and Clock I/O Number (0x0001)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:12	Frequency Option Count		The number of allowed frequency options for the clock input.
11:8	Reserved		Reserved.
7:5	Clock I/O Type		<p>Specifies type of the clock input.</p> <p>000b = Single ended clock.</p> <p>100b = Differential clock.</p> <p>All other values are reserved.</p>
4:0	Clock I/O Number		<p>The number of the clock Input I/O Connections associated with this clock output configuration.</p> <p><b>Note:</b> A value of 0x1F designates a clock output with no associated I/O Connections captured within the netlist.</p>

### 3.3.8.14.3 Reserved (0x0002 - 0x0005)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 3.3.8.14.4 Option[n] Frequency Lo (0x0006 + n\*2)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:12	Reserved		Reserved.
11:0	Option[n] Frequency Divider		The frequency divider to be configured for Option[n].

### 3.3.8.14.5 Option[n] Frequency Hi (0x0007 + n\*2)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:12	Option[n] Baud Rate		The Baud Rate associated with the Option[n]. 0x0 = 1.25G 0x1 = 3.125G 0x2 = 5.15625G 0x3 = 10.3125G 0x4 = 25.78125G 0x5 = 26.5625G All other values are reserved.
11:0	Reserved		Reserved.

### 3.3.8.15 Node Clock DPLL Configuration Section

Word Offset	Description	Section Reference
0x0000	DPLL Mode and Reference Select	3.3.8.15.1
0x0001	Source Type and EEC Mode	3.3.8.15.2
0x0002	Synthesizer Frequency Lo	3.3.8.15.3
0x0003	Synthesizer Frequency Hi	3.3.8.15.4
0x0004 + n	Reference Priority	3.3.8.15.5

**Note:** In this context,  $n$  ranges from 0 to the Clock Controller node's Clock Input Count / 2. When  $n$  is odd, the section is padded with one Word of 0x0000 to ensure DWord-alignment of the following sections.

This section is accessible through the GETNODEATTR DNL action starting at the DWord-aligned Attribute ID offset 0x8000.

#### 3.3.8.15.1 DPLL Mode and Reference Select (0x0000)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15	Reserved		Reserved.
14	Ref SW eSync		Reference switch on eSync failure.
13	Reserved		Reserved.
12	Ref SW PFM		Reference switch on Precision Frequency Monitor failure.
11	Ref SW GST		Reference switch on Guard Soak Timer failure.
10	Ref SW CFM		Reference switch on Coarse Frequency Monitor failure.
9	Ref SW SCM		Reference switch on Single Cycle Monitor Failure.
8	Ref SW LOS		Reference switch on Loss of Signal.
7:5	Mode		Specifies the default mode of operation for the DPLL. 000b = FreeRun 001b = Force Holdover 010b = Force Lock 011b = Auto 100b = NCO 111b = Silicon Default All other values are reserved.
4:0	Reference Select		Default reference configuration. Specifies the Clock Input number to be configured in <i>Force Lock</i> mode.

### 3.3.8.15.2 Source Type and EEC Mode (0x0001)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:8	Reserved		Reserved.
7:5	Source Type		Specifies type of associated reference clock inputs. 000b = Single ended 1 pulse per second. 001b = Single ended recovered clock. 100b = Differential 1 pulse per second. 101b = Differential recovered clock. All other values are reserved.
4	Reserved		Reserved.
3:0	ECC Mode		Ethernet Equipment Clock Mode. Specifies the default clock quality requirement. 0xA = QL-EEC2 0xB = QL-EEC1 0xF = QL-DUS (i.e. Unknown) All other values are reserved.

### 3.3.8.15.3 Synthesizer Frequency Lo (0x0002)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Synthesizer Frequency Lo		Synthesizer Frequency with 1 Hz resolution. Synthesizer Frequency [15:0]

### 3.3.8.15.4 Synthesizer Frequency Hi (0x0003)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:0	Synthesizer Frequency Hi		Synthesizer Frequency with 1 Hz resolution. Synthesizer Frequency [31:16]

### 3.3.8.15.5 Reference Priority (0x0004 + n)

Applicable only to nodes with Node Type of Clock Controller.

Bits	Field Name	Default NVM Value	Description
15:13	Reserved		Reserved.
12:8	Reference Priority[n/2+0]		Default reference priority for Clock Input [n/2+1]. A value of 0 designates the highest priority, and higher values correspond to lower priorities. <b>Note:</b> A value of 0x1F invalidates the corresponding reference clock input for the DPLL.
7:5	Reserved		Reserved.
4:0	Reference Priority[n/4+0]		Default reference priority for Clock Input [n/2+0].

### 3.3.8.16 Node Parent Section

This section describes the structure of a node's parent node section. LED and Temperature Sensor nodes might be associated with a PHY node as they might contain different configuration for all Port Options of the specified PHY node. Used by firmware to select which configuration section to load.

Word Offset	Description	Section Reference
0x0000	Parent Node Handle	<a href="#">3.3.8.16.1</a>
0x0001	Reserved	<a href="#">3.3.8.16.2</a>

#### 3.3.8.16.1 Parent Node Handle (0x0000)

Bits	Field Name	Default NVM Value	Description
15:11	Reserved		Reserved.
10	Parent Valid	1b	Indicates whether the Parent Node ID is valid. 0b = The node does not have a parent node. The Parent Node Handle field should be ignored. 1b = The node is associated with a parent node. The parent node is identified by the Parent Node Handle.
9:0	Parent Node Handle		The node handle of the parent node.

#### 3.3.8.16.2 Reserved (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 3.3.8.17 Node Scratch Section

This section describes the structure of the Node Scratch Section. Used by scripts to store node-related temporary variables. This section is implemented only in EMP firmware RAM and is not stored in the NVM. The exact use of the scratch section is subject to script implementation and it is beyond the scope of this specification. The section must be initialized to 0x0000 on POR, EMPR, and script engine reset.

Word Offset	Description	Section Reference
0x0000	Scratch 0	3.3.8.17.1
0x0001	Scratch 1	3.3.8.17.2
0x0002	Scratch 2	3.3.8.17.3
0x0003	Scratch 3	3.3.8.17.4
0x0004	Scratch 4	3.3.8.17.5
0x0005	Scratch 5	3.3.8.17.6

The section is accessible through the GETNODEATTR and SETNODEATTR action starting at the DWord-aligned Attribute ID offset 0x3800.

#### 3.3.8.17.1 Scratch 0 (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

#### 3.3.8.17.2 Scratch 1 (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

#### 3.3.8.17.3 Scratch 2 (0x0002)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

#### 3.3.8.17.4 Scratch 3 (0x0003)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 3.3.8.17.5 Scratch 4 (0x0004)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 3.3.8.17.6 Scratch 5 (0x0005)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

## 3.3.8.18 PHY Node

This section describes the block structure of a PHY node. The block contains several sections of variable length: the Node I/O Section, host and line side PMD Analog Sections, host and line side PMD Analog Misc Sections, Port Option Pointer Section, Port Option Header Sections, and the Node PHY Capabilities Sections.

A PHY can support multiple Port Options. The number of the supported Port Options is defined by the *Port Option Count* field in the Node Header Section. The netlist captures the Port Options in order of decreasing priority.

For each of these options, the Node PHY Options Header Section captures the number of PMDs available. For each of the PMDs in a given Port Option the node includes a Node PHY Capabilities Section.

The Adaptive NVM Pointer of the active Port Option on the innermost PHY node identifies the Adaptive NVM Feature required to configure the controller for the current Port Option. The active Port Option of all connected PHY nodes is selected as a function of the active Port Option of the innermost PHY. The active Port Option of the PHY node identified by the Parent PHY Handle of an LED node determines the active Port Option of the LED node.

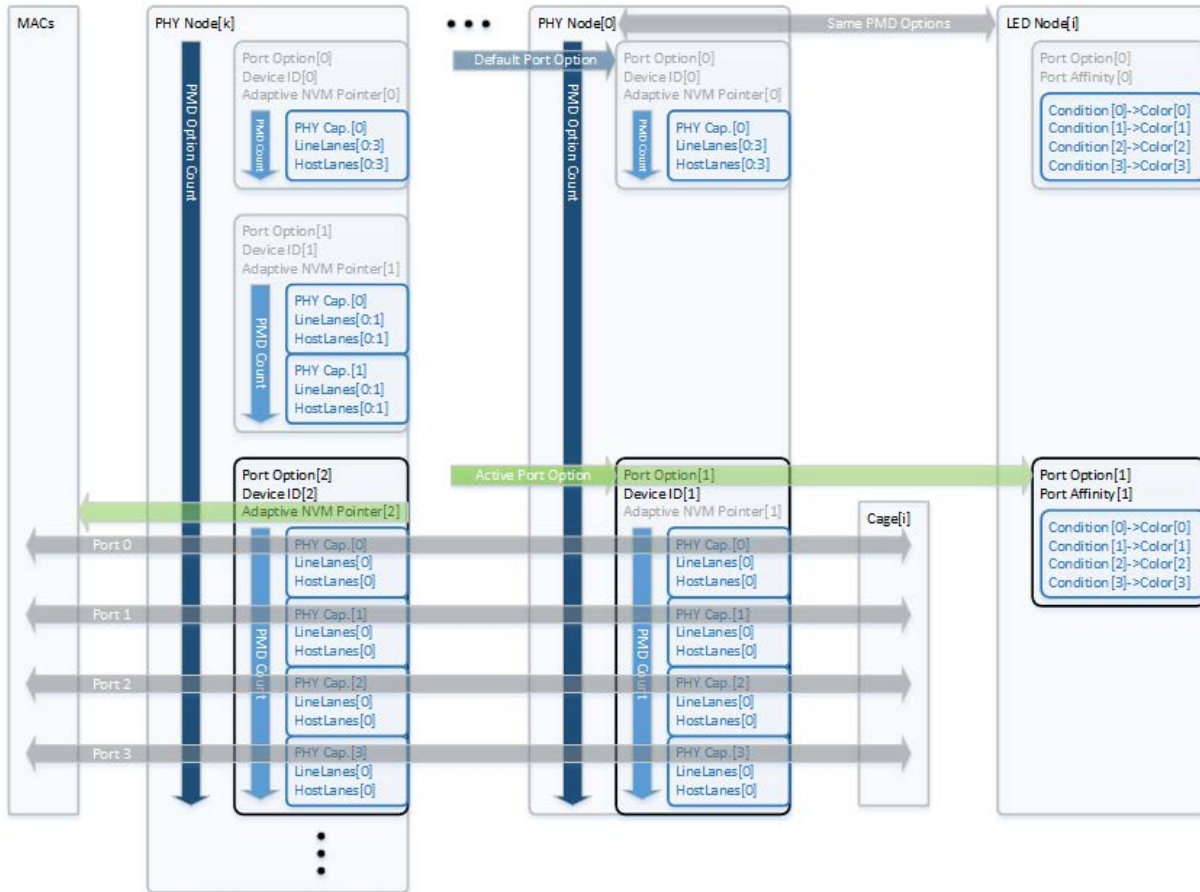

Figure 3-23. Port Options

Word Offset	Attribute ID	Description	Section Reference
0x0000	0x0000	Node Header Section	3.3.8.2
0x0008	0x2000	Node I/O Section	3.3.8.3
	0x6800	PMD Line Analog Section	3.3.8.7
	0x8800	PMD Line Analog Misc Section	3.3.8.8
	0x7000	PMD Host Analog Section	3.3.8.7
	0x9000	PMD Host Analog Misc Section	3.3.8.8
	N/A	Port Option Pointer Section	3.3.8.4
	N/A	Port Option Header Section [0:Port Option Count]	3.3.8.5
	0x4000	PHY Capabilities Section [0:PMD Count - 1][0:Port Option Count]	3.3.8.6

The Node I/O Section should define the following I/Os: I<sup>2</sup>C or MDIO, Int\_N, Reset\_N, PMD[0:n]. Additionally if the *Bus Address Type* defined in the Node Header Section is Relative Address ADDR[0:4] can also be defined.

### 3.3.8.19 GPIO Controller Node

This section describes the block structure of a GPIO Controller node. The block contains one section of variable length: the Node I/O Section.

Word Offset	Attribute ID	Description	Section Reference
0x0000	0x0000	Node Header Section	3.3.8.2
0x0008	0x2000	Node I/O Section	3.3.8.3
N/A	0x3800	Node Scratch Section	3.3.8.17

The Node I/O Section should define the following I/Os: I<sup>2</sup>C, Int\_N, and Reset\_N.

### 3.3.8.20 MUX Controller Node

This section describes the block structure of an MUX Controller node. The block contains one section of variable length: the Node I/O Section.

Word Offset	Attribute ID	Description	Section Reference
0x0000	0x0000	Node Header Section	3.3.8.2
0x0008	0x2000	Node I/O Section	3.3.8.3
N/A	0x3800	Node Scratch Section	3.3.8.17

The Node I/O Section should define the following I/Os: I<sup>2</sup>C and Reset\_N.

### 3.3.8.21 LED Controller Node

This section describes the block structure of an LED Controller node. The block contains one section of variable length: the Node I/O Section.

Word Offset	Attribute ID	Description	Section Reference
0x0000	0x0000	Node Header Section	3.3.8.2
0x0008	0x2000	Node I/O Section	3.3.8.3
N/A	0x3800	Node Scratch Section	3.3.8.17

The Node I/O Section should define the following I/Os: I<sup>2</sup>C and Reset\_N.

### 3.3.8.22 LED Node

This section describes the block structure of an LED node. The block contains two or more sections of variable length: the Node I/O Section and the Node LED Configuration Section.

An LED node can have one or three I/O connections. The number is reflected by the *I/O Count* field of the Node Header Section (Section 3.3.8.2). If the LED is a monochrome indicator, the I/O Section defines a single I/O (*I/O Type* LED) and if the LED is an RGB color indicator then the I/O Section defines three I/Os (*I/O types* LED.Red, LED.Green, and LED.Blue).

The LED can have a different configuration for each of the Port Options of the PHY it is associated with. Therefore the LED Node block contains a Node LED Configuration Section for each of the Port Options of the PHY with which the LED is associated. When the Parent Node Handle is valid, the number of the Port Options captured in the Node Header Section (Section 3.3.8.2) must match the number of Port Options defined for the PHY node with which the LED is associated. Otherwise, the number of Port Options in the node header should be 1.

Word Offset	Attribute ID	Description	Section Reference
0x0000	0x0000	Node Header Section	3.3.8.2
0x0008	0x2000	Node I/O Section	3.3.8.3
0x000A / 0x000E	N/A	Node Parent Section	3.3.8.16
0x000C + n*6 / 0x0010 + n*6	0xA000	Node LED Configuration Section. n - port option index	3.3.8.9
N/A	0x3800	Node Scratch Section	3.3.8.17

### 3.3.8.23 Temperature Sensor Node

This section describes the block structure of a Temperature Sensor node. The block contains one section of variable length: the Node I/O Section.

Word Offset	Attribute ID	Description	Section Reference
0x0000	0x0000	Node Header Section	3.3.8.2
0x0008	0x2000	Node I/O Section	3.3.8.3
0x000C	N/A	Node Parent Section	3.3.8.16
0x0010	0xC000	Node Thermal Configuration Section	3.3.8.10

The Temperature Sensor node can have a different configuration for each of the Port Options of the PHY with which it is associated. Therefore, the Temperature Sensor node block contains a Node Thermal Configuration Section for each of the Port Options of the PHY with which the Temperature Sensor is associated. When the parent node handle is valid, the number of the Port Options captured in the Node Header Section (Section 3.3.8.2) must match the number of Port Options defined for the PHY node with which the Temperature Sensor is associated. Otherwise, the number of Port Options in the node header should be 1.

The Node I/O Section should define the following I/Os: I<sup>2</sup>C, Int\_N, and Reset\_N.

### 3.3.8.24 ID EEPROM Node

This section describes the block structure of an ID EEPROM node. The block contains one section of variable length: the Node I/O Section.

Word Offset	Attribute ID	Description	Section Reference
0x0000	0x0000	Node Header Section	3.3.8.2
0x0008	0x2000	Node I/O Section	3.3.8.3

The Node I/O Section should define the following I/Os: I<sup>2</sup>C and EEPROM\_WP.

### 3.3.8.25 Cage Node

This section describes the block structure of a Cage node. The block contains one section of variable length: the Node I/O Section.

Word Offset	Attribute ID	Description	Section Reference
0x0000	0x0000	Node Header Section	3.3.8.2
0x0008	0x2000	Node I/O Section	3.3.8.3
N/A	0x3800	Node Scratch Section	3.3.8.17

The Node Header Section should indicate a *Bus Type* of I<sup>2</sup>C and the *Bus Address* should be 0xA0.

For an SFP+ or SFP28 cage, the following I/Os must be defined: I<sup>2</sup>C, Present\_N. Optionally, the following I/Os could be also defined: TX\_Disable.

For a QSFP+ or QSFP28 cage, the following I/Os must be defined: I<sup>2</sup>C, Present\_N, Reset\_N, Int\_N. Optionally, the following I/Os could be also defined: Modsel\_N, LPMode.

### 3.3.8.26 Mezzanine Connector Node

This section describes the block structure of an Mezzanine Connector node. The block contains one section of variable length: the Node I/O Section.

Word Offset	Attribute ID	Description	Section Reference
0x0000	0x0000	Node Header Section	3.3.8.2
0x0008	0x2000	Node I/O Section	3.3.8.3

The Node Header Section should indicate a *Bus Type* of I<sup>2</sup>C and the *Bus Address* should be 0xA8.

Setting the path to this mezzanine connector and using this bus allows for reading the mezzanine card's ID EEPROM.

For a CEI mezzanine connector, part of the motherboard topology, the following I/Os must be defined: I<sup>2</sup>C, Present\_N, Int\_N, Reset\_N, MDIO, ADDR[0:2], and PMD[0:3].

When the topology of a mezzanine card is discovered, the connections with the motherboard are determined by matching the I/O types of the mezzanine connector from the mezzanine card topology with the I/Os of the mezzanine connector of the motherboard topology according to the below in Figure 3-24.

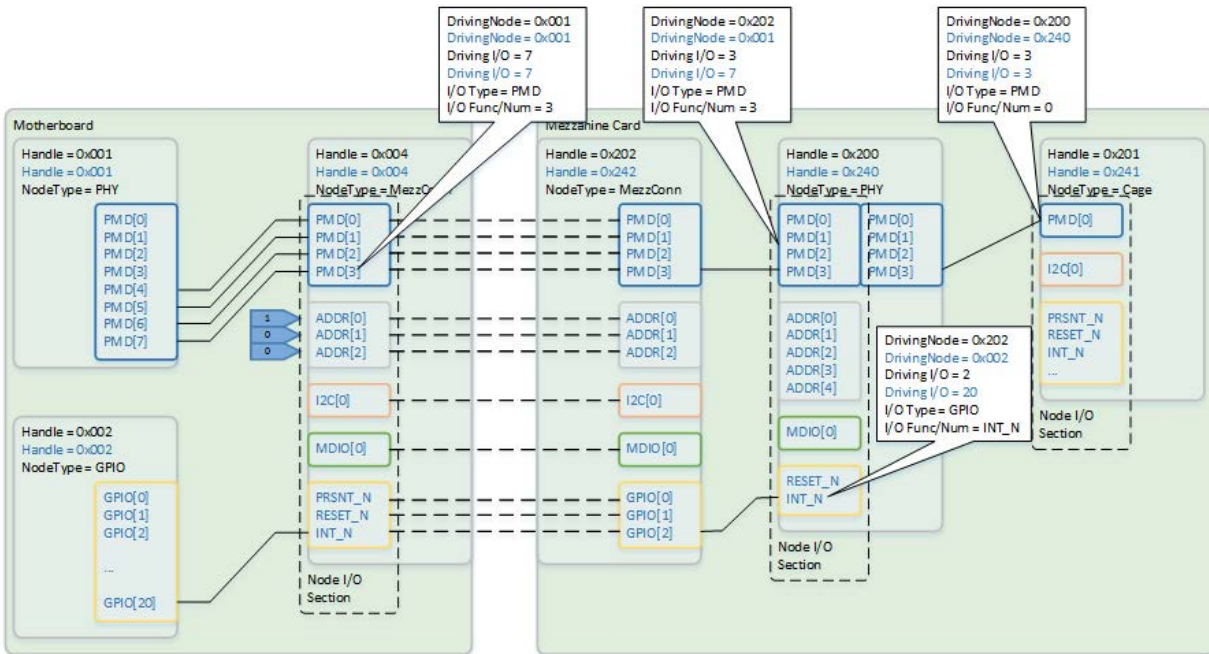

Figure 3-24. Mezzanine Connector Mapping

### 3.3.8.27 Clock Controller Node

This section describes the block structure of a Clock Controller node. The block contains several sections of variable length: the Node I/O Section (Section 3.3.8.3), the Node Clock Input Configuration Section (Section 3.3.8.12), the Node Clock Output Configuration Section (Section 3.3.8.13), the Node Recovered Clock (Section 3.3.8.14), and Node Clock DPLL Configuration Section (Section 3.3.8.15).

Word Offset	Attribute ID	Description
0x0000	0x0000	Node Header Section
0x0008	0x2000	Node I/O Section
	N/A	Node Parent Section
	0x0004	Node Clock Configuration Header Section
	0x2800	Node Clock Input Configuration Sections
	0x3000	Node Recovered Clock/Clock Output Configuration Sections <b>Part SectionNum.</b> 0x24 ZL30632/ZL80032: Node Clock Output Configuration Sections 0x31 C287: Node Recovered Clock Output Configuration Sections
	0x8000	Node Clock DPLL Configuration Sections
N/A	0x3800	Node Scratch Section

### 3.3.8.28 Clock MUX Node

This section describes the block structure of a Clock MUX node. The block contains one section of variable length: the Node I/O Section ([Section 3.3.8.3](#)).

Word Offset	Attribute ID	Description
0x0000	0x0000	Node Header Section
0x0008	0x2000	Node I/O Section

### 3.3.8.29 GPS Node

This section describes the block structure of a GPS node. The block contains one section of variable length: the Node I/O Section ([Section 3.3.8.3](#)).

Word Offset	Attribute ID	Description
0x0000	0x0000	Node Header Section
0x0008	0x2000	Node I/O Section

## 3.3.9 Topology Netlist Constraints and Conventions

The topology netlist describes design-specific configuration and connections between various motherboard or mezzanine card components, referred to as nodes.

The E810 link management engine imposes the following constraints:

### 3.3.9.1 Netlist Size Constraints

- The maximum size of the netlist supported in EMP firmware RAM is 12 KB, including the motherboard and all potential mezzanine cards. For PHY and LED nodes, this includes only the currently-active Port Option.
- The maximum size of the motherboard netlist in the NVM is 28 KB.
- The maximum size of the mezzanine card netlist in the IDEEPROM is 4 KB.
- The maximum size of the motherboard netlist in RAM is 12 KB. For all PHY and LED nodes, this includes only the currently-active Port Option.
- The maximum size of the mezzanine card netlist in RAM is 2 KB. For all PHY and LED nodes, this includes only the currently-active Port Option.

### 3.3.9.2 Node Constraints

- The maximum number of nodes supported on a motherboard is 128.
- The maximum number of nodes supported on a mezzanine card is 32.
- The maximum number of nodes of Mezzanine Connector type supported on a motherboard is 5.
- The maximum number of nodes of Mezzanine Connector type supported on a mezzanine card is 1.
- The maximum depth of cascaded PHY nodes (PHY chain length) is 4.

### 3.3.9.3 Node I/O Constraints

- The maximum number of I/O connections supported on the motherboard is 384.
- The maximum number of I/O connections supported on a mezzanine card is 64.
- The maximum number of I/O connections supported on a node is 16.
- The maximum number of I/O connections of a given I/O type to a node is 64.
- The maximum number of I/O connections with I/O Type of PMD supported on a motherboard is 40.
- The maximum number of I/O connections with I/O Type of PMD supported on a mezzanine card is 8.
- The maximum number of I/O connections with I/O Type of PRESENT\_N supported on a motherboard is 20.
- The maximum number of I/O connections with I/O Type of PRESENT\_N supported on a mezzanine card is 4.
- The maximum number of I/O connections with I/O Type of INT\_N supported on a motherboard is 16.
- The maximum number of I/O connections with I/O Type of INT\_N supported on a mezzanine card is 4.
- Each node can have up to one I/O connection with I/O type GPIO and a given I/O Function / I/O Number.
- All I/O connections to the a specific driving I/O on any given node must have matching configuration. For example, all I/O connections with *I/O Type* of GPIO and *I/O Function* of RESET\_N connecting to the same driving GPIO input must have matching Polarity and Default Value configuration.
- With the exception of I/O connections with *I/O Type* of I<sup>2</sup>C Bus, MDIO Bus and GPIO with *I/O Function* of RESET\_N must be dedicated point to point connections. Another exception to this rule is GPIO signal driving the rate select pins of modules (RS0 and RS1).
- If a node is accessible through an I<sup>2</sup>C or MDIO, the connection must be described by the first entry in the I/O connections.
- On each board the I<sup>2</sup>C attached MUX Controllers, GPIO Controllers, and LED Drivers must have a shared reset signal. Each of these nodes must have and I/O connection with *I/O Type* of GPIO and *I/O Function* of RESET\_N pointing to the same driving I/O on the same driving node.
- PHY nodes must not share their reset signal with other devices. The driving I/O on the driving node pointed to by a PHY node's I/O connection with *I/O Type* of GPIO and *I/O Function* of RESET\_N must not have more than one connection to it.
- Mezzanine cards that implements more than one PHY, should not share their reset signal.
- The maximum number of MDIO/I<sup>2</sup>C I/Os on the I/O Widget node is 16.
- The maximum number of MDIO/I<sup>2</sup>C I/Os on a Mux node is 62.

### 3.3.9.4 Node I/O Conventions

#### 3.3.9.4.1 I/O Widget

- Pins MDC[0:4]/SCL[0:5], MDIO[0:4]/SDA[0:4] are referred to as MDIO[0:4] or I<sup>2</sup>C[0:4], depending on the *I/O Type* of the connected I/O connection.
- Pins GPIO[0:31] are referred to as GPIO[0:31].

#### 3.3.9.4.2 PCA9545A

- Pins SD0 and SC0 defined in Chapter 6 of the PCA9545A Datasheet are referred to as I<sup>2</sup>C[0].
- Pins SD1 and SC1 defined in Chapter 6 of the PCA9545A Datasheet are referred to as I<sup>2</sup>C[1].
- Pins SD2 and SC2 defined in Chapter 6 of the PCA9545A Datasheet are referred to as I<sup>2</sup>C[2].
- Pins SD3 and SC3 defined in Chapter 6 of the PCA9545A Datasheet are referred to as I<sup>2</sup>C[3].

#### 3.3.9.4.3 PCA9575

- Pins P0\_0 through P0\_7 defined in Table 3 of the PCA9575 Datasheet are referred to as GPIO[0:7].
- Pins P1\_0 through P1\_7 defined in Table 3 of the PCA9575 Datasheet are referred to as GPIO[8:15].

#### 3.3.9.4.4 PCA9685

- Pins LED0 through LED15 defined in Table 3 of the PCA9685 Datasheet are referred to as GPIO[0:15].

#### 3.3.9.4.5 C827

- Pins LIP0, LIN0, LOP0, and LON0 defined in Table 2 of the C827 Datasheet are referred to as PMD[0].
- Pins LIP1, LIN1, LOP1, and LON1 defined in Table 2 of the C827 Datasheet are referred to as PMD[1].
- Pins LIP2, LIN2, LOP2, and LON2 defined in Table 2 of the C827 Datasheet are referred to as PMD[2].
- Pins LIP3, LIN3, LOP3, and LON3 defined in Table 2 of the C827 Datasheet are referred to as PMD[3].
- Pins HIP0, HIN0, HOP0, and HON0 defined in Table 2 of the C827 Datasheet are referred to as PMD[0].
- Pins HIP1, HIN1, HOP1, and HON1 defined in Table 2 of the C827 Datasheet are referred to as PMD[1].
- Pins HIP2, HIN2, HOP2, and HON2 defined in Table 2 of the C827 Datasheet are referred to as PMD[2].
- Pins HIP3, HIN3, HOP3, and HON3 defined in Table 2 of the C827 Datasheet are referred to as PMD[3].

### 3.3.9.4.6 Generic Clock Mux

The Generic Clock MUX node is dedicated for describing muxing options available on external clock input and output connections. The node only captures the internal facing pins and connections and the external connections are omitted.

Figure 3-25 displays the assumed internal topology of the clock mux node.

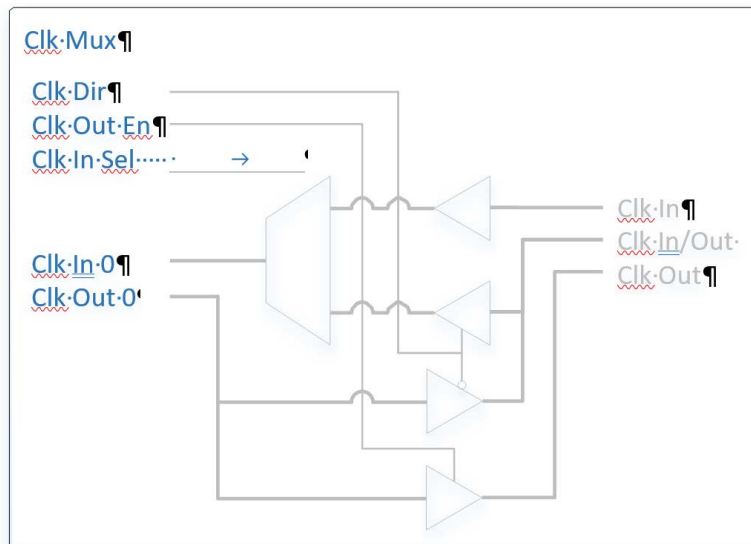

Figure 3-25. Clock MUX I/O Conventions

**Note:** The Generic Clock MUX nodes are not configured by the Link Manager and as a result the node may also be used to abstract other clock muxing topologies.

### 3.3.9.5 PHY Node Constraints

- The maximum number of lanes on line or host side of a PHY node is 8.
- The maximum number of Port Options supported for a PHY node is 16.
- The E810 has one PHY node defined for each of the three PHY Cores.
- The first two PHY Core nodes allow for a total of eight line-side lanes, while the third one only four line-side lanes. None of the PHY Core nodes have host-side lanes. Therefore, the *Host Lane Count* is 0, the Node PMD Host Analog Section Pointer is ignored, and the corresponding Node PMD Analog Section does not exist.
- The netlist must capture the PHY nodes in a well defined order. All PHY nodes must be preceded by the PHY nodes that it has host side connections to (I/O Connections with *I/O Type* of PMD). This results in the innermost PHY nodes needing to be captured first.
- All I/O connections with *I/O Type* of PMD from any PHY node must connect to the same node.

### 3.3.9.6 GPIO Controller Node Constraints

- The E810 has one GPIO Controller node defined for the I/O Widget.
- The netlist must capture the GPIO nodes in a well-defined order. The first node captured by the netlist must be the I/O Widget with a node handle equal to 0.

### 3.3.9.7 LED Node Constraints

- All I/O connections of an LED node must be to the same driving node.
- The parent PHY node of a LED node, should be described in the netlist prior to the description of the LED node.
- The LED node configuration sections that are linked to the LED node must be ordered with respect to the port option order at the parent PHY node.

### 3.3.9.8 Temperature Node Constraints

- The parent PHY node of a Temperature node, should be described in the netlist prior to the description of the Temperature node.
- The Node Thermal configuration sections that are linked to the Temperature node must be ordered with respect to the port option order at the parent PHY node.

### 3.3.9.9 Cage Node Constraints

- The I/O connection with *I/O Type* of I<sup>2</sup>C must point to an I<sup>2</sup>C interface dedicated to the cage. All cages must have dedicated I<sup>2</sup>C interfaces. The MODSEL\_N pin of the QSFP cages must be asserted low through a strapping.

## 3.3.10 Link Topology Admin Commands

Most components of the link topology are accessed by the device firmware, either directly or using PHY configuration scripts. However, sometimes there is a need for direct access of the software driver, or tools driver to the link topology components. As link topology components are owned by the firmware, any such access should be coordinated and conducted through firmware admin command, where the firmware can synchronize and control the required access.

The following link topology firmware admin commands are defined:

**Table 3-99. Link topology Admin Commands**

Command	Opcode	Description	Section Reference
Set GPIO by Function	0x06E6	Set value to GPIO signal referenced by its function	3.3.10.1
Get GPIO by Function	0x06E7	Get value from GPIO signal referenced by its function	3.3.10.2
Set Port Identification LED	0x06E9	Set the LED used for identification of this port.	3.3.10.3
Read/Write SFF EEPROM	0x06EE	Read or Write 1-16 bytes from SFF EEPROM.	3.3.10.4
Program Topology Device NVM	0x06F2	Triggers the write of the topology device NVM.	3.3.10.5

### 3.3.10.1 Set GPIO by Function (0x06E6)

The Set GPIO By Function admin command is used to set a GPIO signal which is part of the topology structures. The GPIO signal is referenced by its function within the netlist (in other words, it can be used to set the RST signal of specific topology node). The software driver might provide the node handle of the node that is using the GPIO directly, or use context search and provide the Port number, node type, and node index and firmware retrieves the node handle. The software should also provide the GPIO function and the value to set.

**Table 3-100. Set GPIO by Function Admin Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x06E6	Command opcode.
Datalen	4-5	0x0	No external buffer for this command.
Return Value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16-17		Software uses this field to send the logical port number when the <i>Context</i> field is "Port". Software might mark the logical port number as not valid. In this case, firmware might use the port that is owned by the function. <b>Byte 16:</b> Logical Port number This field specifies the port number, and it is used when the physical function owns more than one port or when the physical function owns single port, but the <i>Logical Port number is valid</i> bit (Bit 17.0) is turned on. <b>Bit 17.0:</b> Logical Port number is valid <b>All other bits</b> = Reserved.
Node Type / Context	18		<b>Bits 7:4:</b> Context Software indicates the context within which the handle should be identified. 0x0 = Global — The index and node type are used to identify the node within the context of the entire topology. 0x1 = Board — The index and node type are used to identify the node within the context of a single board. 0x2 = Port — The index and node type are used to identify the node within the context of a single port, as specified in the <i>Logical Port Number</i> field. 0x3 = Node — The index and node type are used to identify the node within the context of a single node. In other words, the requested node must be connected in the topology netlist using I/O connection to a specified reference node. 0x4 = Provided Node — The reference node is provided by software and no search is conducted. <b>Bits 3:0:</b> Node Type Software indicates the requested node type. For a list of node types, refer to <a href="#">Section 3.3.8.2.1</a> .
Index	19		Software indicates the requested node index. When a PHY device is requested and the context of the search is "Port", PHYs are indexed according to their place in the PHY chain, while 0 means the outermost PHY. For other node types, the nodes are indexed according to their appearance in the netlist. An error is returned when the index is bigger than the number of topology node retrieved in the context search.

**Table 3-100. Set GPIO by Function Admin Command [continued]**

Name	Byte.Bit	Value	Remarks
Reference Node Handle / Node Handle	20-21		<p><b>Bits 9:0:</b> Reference Node Handle / Node Handle Software uses this field to specify the reference node handle when the context of the search is "Node". When the context is "Provided Node", software uses this field to provide the node handle directly. See description of node handle in <a href="#">Section 3.3.8.2.2</a>. This field is used as input. <b>All other bits</b> = Reserved.</p>
I/O Function	22		Software provides the I/O Function of the GPIO that needs to be set. The five LSB are used. See <a href="#">Section 3.3.8.3.2</a> .
I/O Value	23		Software provides the I/O value to set in the LSB.
Reserved	24-31		Reserved. Set to zero.

### 3.3.10.2 Get GPIO by Function (0x06E7)

The Get GPIO By Function admin command is used to get the value of a GPIO signal which is part of the topology structures. The GPIO signal is referenced by its function within the net-list (in other words, it can be used to set the RST signal of specific topology node). The software driver might provide the node handle of the node that is using the GPIO directly, or use context search and provide the Port number, node type, and node index and firmware retrieves the node handle. The software should also provide the GPIO function and firmware returns the value read from the GPIO.

**Table 3-101. Get GPIO by Function Admin Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x06E7	Command opcode.
Datalen	4-5	0x0	No external buffer for this command.
Return Value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16-17		Software uses this field to send the logical port number when the <i>Context</i> field is "Port". Software might mark the logical port number as not valid. In this case, firmware might use the port that is owned by the function. <b>Byte 16:</b> Logical Port number This field specifies the port number, and it is used when the physical function owns more than one port or when the physical function owns single port, but the <i>Logical Port number is valid</i> bit (Bit 17.0) is turned on. <b>Bit 17.0:</b> Logical Port number is valid <b>All other bits</b> = Reserved.
Node Type / Context	18		<b>Bits 7:4:</b> Context Software indicates the context within which the handle should be identified. 0x0 = Global — The index and node type are used to identify the node within the context of the entire topology. 0x1 = Board — The index and node type are used to identify the node within the context of a single board. 0x2 = Port — The index and node type are used to identify the node within the context of a single port, as specified in the <i>Logical Port Number</i> field. 0x3 = Node — The index and node type are used to identify the node within the context of a single node. In other words, the requested node must be connected in the topology netlist using I/O connection to a specified reference node. 0x4 = Provided Node — The reference node is provided by software and no search is conducted. <b>Bits 3:0:</b> Node Type Software indicates the requested node type. For a list of node types, refer to <a href="#">Section 3.3.8.2.1</a> .
Index	19		Software indicates the requested node index. When a PHY device is requested and the context of the search is "Port", PHYs are indexed according to their place in the PHY chain, while 0 means the outermost PHY. For other node types, the nodes are indexed according to their appearance in the netlist. An error is returned when the index is bigger than the number of topology node retrieved in the context search.

**Table 3-101. Get GPIO by Function Admin Command [continued]**

Name	Byte.Bit	Value	Remarks
Reference Node Handle / Node Handle	20-21		<p><b>Bits 9:0:</b> Reference node handle / Node handle Software uses this field to specify the reference node handle when the context of the search is "Node". When the context is "Provided Node", software uses this field to provide the node handle directly. See description of node handle in <a href="#">Section 3.3.8.2.2</a>. This field is used as input. <b>All other bits</b> = Reserved.</p>
I/O Function	22		Software provides the I/O Function of the GPIO that needs to be set. The five LSB are used. See <a href="#">Section 3.3.8.3.2</a> .
I/O Value	23		Software provides the I/O value to set in the LSB.
Reserved	24-31		Reserved. Set to zero.

### 3.3.10.3 Set Port Identification LED (0x06E9)

The Set Port Identification LED admin command is used to set the LED that is used to identify the port as indicated in the topology structures (see [Section 3.3.8.9.2](#)). The software driver should provide the Logical Port Number.

**Table 3-102. Set Port Identification LED Admin Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x06E9	Command opcode.
Datalen	4-5	0x0	No external buffer for this command.
Return Value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16-17		Software uses this field to send the logical port number. Software might mark the logical port number as not valid. In this case, firmware might use the port that is owned by the function. <b>Byte 16:</b> Logical Port number This field specifies the port number, and it is used when the physical function owns more than one port or when the physical function owns single port, but the <i>Logical Port number is valid</i> bit (Bit 17.0) is turned on. <b>Bit 17.0:</b> Logical Port number is valid <b>All other bits</b> = Reserved.
Set Indent Mode	18		<b>Bit 0:</b> Set the LED into identification mode 0b = The LED is configured to its original mode (by the netlist). 1b = The LED is configured to identification mode and will blink. <b>All other bits</b> = Reserved.
Reserved	19-31		Reserved. Set to zero.

### 3.3.10.4 Read/Write SFF EEPROM (0x06EE)

The Read/Write SFF EEPROM admin command is an immediate and indirect admin command used to read or write 1 to 16 bytes of data from SFF EEPROM at a user defined I<sup>2</sup>C bus address. Using this command, the software driver can set the *Page* bit and the firmware checks the appropriate *Page* byte(s) from the EEPROM to verify operation on the right page of the module. When firmware detects that the module is currently configured to different page access, it updates the module page before the desired read or write action.

The checking and setting of the module page and the actual read or write operation are done as an atomic block, where no other I<sup>2</sup>C access to this module is performed between those actions. The page aware SFF module access should be used by software to access SFF EEPROM module, as it is done in coordination with DNL preventing potential problem where the page setting and the actual read or write are interleaved between DNL and other host access.

To find the topology node for the I<sup>2</sup>C SFP/QSFP module relevant to the user in this command, firmware searches the topology node based on the function that the admin command is being called from or the Logical Port that is explicitly specified in this command (that is, Node type = cage, Context = port, Index = 0, Node Handle/Reference Node Handle = 0).

**Table 3-103. Read/Write SFF EEPROM Admin Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x06EE	Command opcode.
Datalen	4-5	1-16 bytes	Size of external buffer.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by Firmware. 0 = No error (success) 1 = EPERM. The module pointer location specified in the command does not permit the required operation. 12 = EBUSY. Either Link Management blocked us from even talking to the device, or it was unable to finish writing the page in the allotted time. Please retry your request.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16		Software uses this field to send the logical port number. Software might mark the logical port number as not valid. In this case, firmware might use the port that is owned by the function. <b>Byte 16:</b> Logical Port Number This field specifies the port number, and it is used when the physical function owns more than one port or when the physical function owns single port, but the <i>Logical Port Number Valid</i> bit (Bit 17.0) is turned on.
Logical Port Number Valid	17		<b>Bit 17.0:</b> Logical Port number is valid. <b>All other bits = Reserved.</b>
I <sup>2</sup> C Bus Address	18.0-19.1		Slave address (10 bits). For 7-bit address, only bits 18.0-18.6 are used. When all bits in 18.0-18.6 are equal to 0, the slave address is taken from the topology netlist. <b>Bits 18.7-19.1:</b> Extra bits Extra bits for 10-bit address. Ignored if bit 19.2=0
10-Bit Address Select	19.2	0b	10-Bit Address Select 0b = 7-bit address used. 1b = 10-bit address used.

**Table 3-103. Read/Write SFF EEPROM Admin Command [continued]**

Name	Byte.Bit	Value	Remarks
Set EEPROM Page	19.3-19.4		Set EEPROM Page 00b = Do not change page. 01b = Read offset 127 of EEPROM, set it to Byte 23 on mismatch. 10b = Read offset 126 of EEPROM, set it to Byte 22 on mismatch. 11b = Reserved.
Reserved	19.5-19.6		Reserved. Software should set to zero.
Command	19.7		SFF EEPROM module access command. 0b = Read 1b = Write
I <sup>2</sup> C Memory Address (Offset)	20-21		Offset within the RRPROM to start reading from, up to 16 bits. <b>Note:</b> SFF compliant modules requires 8-bit address and therefore the high 8 MSB are ignored and only the low 8 LSB are sent during the I <sup>2</sup> C transaction. Software should set the high 8 MSB to 0.
EEPROM Page	22-23		<b>Byte 22:</b> Set offset 126 to this value. If not already set, set offset 126 to this value immediately before accessing each block. <b>Byte 23:</b> Set offset 127 to this value. If not already set, set offset 127 to this value immediately before accessing each block. (QSFP)
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address low	28-31	Buffer Address	Low bits of buffer address.

Data Address low	28-31	Buffer Address	Low bits of buffer address.

### 3.3.10.5 Program Topology Device NVM (0x06F2)

This command triggers the write of the external device NVM taken from one of the NVM sections that includes the external topology device image. The programming of the new device firmware into the external device NVM is done using MDIO or I<sup>2</sup>C commands, depending on the topology device.

This admin command is optionally called from the NVM update tool.

The format of this command is similar to the other topology commands, as follows:

**Table 3-105. Program Topology Device NVM Admin Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See Section 9.5.5.1.1 for details.
Opcode	2-3	0x06F2	Command opcode.
Datalen	4-5	0	Direct command. No external buffer should be attached.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by Firmware. 0 = Success 2 = ENOENT. No such element. For example, node handle was not found (e.g. Index was higher than the number of handles found for the given context) 6 = ENXIO. No such resource. Firmware did not find a valid external topology device image in the NVM to match the requested device. 12 = EBUSY. For example, when the command is called when a previous request to program or read the external topology device is ongoing. This code also returned when RDE operation is currently executed. 14 = EINVAL. Invalid argument. For example, wrong search context. When using "Node" context, input node handle is not valid. 17 = ENOSYS. Device programming not implemented for this device or the device image in NVM is not enabled for programming. 18 = ERANGE - Parameter out of range. For example, when using "Port" context, port number is out of range. 21 = EMODE. Operation not allowed in current device mode. For example, when it is called when link module is disabled or not initialized.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Logical Port Number	16-17		Software uses this field to send the logical port number, when the context field is "Port". Software might mark the logical port number as not valid. In this case, firmware might use the port that is owned by the function. <b>Byte 16:</b> Logical Port number This field specifies the port number, and it is used when the physical function owns more than one port or when the physical function owns single port, but the <i>Logical Port Number Valid</i> bit (Bit 17.0) is turned on. <b>Bit 17.0:</b> Logical Port number is valid. <b>All other bits</b> = Reserved.

**Table 3-105. Program Topology Device NVM Admin Command [continued]**

Name	Byte.Bit	Value	Remarks
Node Type/Context	18		<p><b>Bits 7:4:</b> Context Software indicates the context within which the handle should be identified.</p> <p>0x0 = Global — The index and node type are used to identify the node within the context of the entire topology.</p> <p>0x1 = Board — The index and node type are used to identify the node within the context of a single board.</p> <p>0x2 = Port — The index and node type are used to identify the node within the context of a single port, as specified in the <i>Logical Port Number</i> field.</p> <p>0x3 = Node — The index and node type are used to identify the node within the context of a single node. In other words, the requested node must be connected in the topology netlist using I/O connection to a specified reference node.</p> <p>0x4 = Provided Node — The reference node is provided by software and no search is conducted.</p> <p><b>Note:</b> The "Board" context is not available in this command. Firmware should respond with EINVAL.</p> <p><b>Note:</b> The "Node" context is not available in this command. Firmware should respond with EINVAL.</p> <p><b>Note:</b> The "Provided Node" context is not available in this command. Firmware should respond with EINVAL.</p> <p><b>Note:</b> The "Direct" context is not relevant for this command. Firmware should respond with EINVAL in that case.</p> <p><b>Bits 3:0:</b> Node Type Software indicates the requested node type. For a list of node types, refer to <a href="#">Section 3.3.8.2.1</a>.</p>
Index	19		<p>For topology searches, software indicates the requested node index.</p> <p>When a PHY device is requested and the context of the search is "Port", PHYs are indexed according to their place in the PHY chain, while 0 means the outermost PHY. For other node types, the nodes are indexed according to their appearance in the netlist.</p> <p>An error is returned when the index is bigger than the number of topology node retrieved in the context search.</p>
Reserved	20-31		Reserved.

**Notes:**

- Device must be in the netlist in order to be accessed. For the typical case of accessing an external PHY, it can be searched by "Port" content. Specifying port number and node type equal to "PHY" and Index of zero provides the outermost PHY. When an external PHY is used for multiple ports, any port number that is connected to the external PHY, should give the same Node ID.
- Firmware must check that a valid section present in the NVM with the topology device image. Otherwise, it should return with error (ENXIO - Firmware did not find a valid external topology device image in the NVM to match the requested device).
- Firmware must check that the device part number within the package match the device pointed in the topology netlist. Otherwise, it should return with error (ENXIO - Firmware did not find a valid external topology device image in the NVM to match the requested device).
- Firmware must check that the device part number is one of the supported devices that it knows how to program. Otherwise, it should return with error (ENOSYS - Device programming not implemented for this device).
- Firmware programs the device using I<sup>2</sup>C or MDIO, according to the device part number and the programming rules of the specific device.

- This command is asynchronous. Firmware reads this command from the admin queue and writes back immediate completion. The immediate completion indicates that the topology device NVM programming started/did not start. Once the topology device NVM programming finishes, firmware should respond with additional completion (event) to acknowledge programming is finished successfully or not.
- Upon unsuccessful programming of the external topology device, or when the programming is interrupted (for example, with GLOBR), depending on the PHY, it might be that the PHY is not recovering and link is not started, it will be marked with "link configuration error". Software might recover that with re-programming of the PHY.
- This command should block additional calls to Program Topology Device NVM command or calls to the Read Topology Device NVM command until the current process is completed. This command is also blocked when external topology device programming or read is done.
- The programming process should be split into smaller DNL activities that should fit the DNL execution window. Firmware should monitor the programming process to make sure each activity finishes successfully and might execute other DNL activities in the middle of the process to keep monitoring the link management process.

### 3.3.10.5.1 Response Buffer Format

The response buffer is identical to the admin command and it is returned twice as follows:

- Immediate response — Firmware should check if it can trigger the topology device NVM write. It should return error if it cannot trigger it and success if the write is triggered. The following error codes apply at this stage:
  - 0 - Success** — Means that the external topology device NVM write is triggered.
  - 2 - ENOENT** — No such element. For example, node handle was not found (Index was higher than the number of handles found for the given context).
  - 6 - ENXIO** — No such resource. Firmware did not find a valid external topology device image in the NVM to match the requested device.
  - 12 - EBUSY** — For example, when the command is called when a previous request to program or read the external topology device is ongoing. This code also returned when RDE operation is currently executed.
  - 14 - EINVAL** — Invalid argument. For example, wrong search context. When using "Node" context, input node handle is not valid.
  - 17 - ENOSYS** — Device programming not implemented for this device or the device image in NVM is not enabled for programming.
  - 18 - ERANGE** — Parameter out of range. For example, when using "Port" context, port number is out of range.
  - 21 - EMODE** — Operation not allowed in current device mode. For example, when it is called when link module is disabled or not initialized.
- Event message — Firmware returns this message when the programming is completed. The event is sent to the same admin queue that generated the original message. The following error codes apply at this stage:
  - 0 - Success** — Means that the external topology device NVM write has completed successfully.
  - 5 - EIO** — When the programming was not completed due to some error with accessing the topology device.

### 3.3.10.5.2 Using the Program Topology Device NVM Admin Command

The NVM Update tool should use the following flow:

1. Determine the sections in the NVM bank that are available for the topology device NVM update. This is done by reading capabilities 0x81, 0x82, 0x83, 0x84. It can read the *Node P/N* and *Version* fields to determine which part numbers can be updated and what is the target version.
2. Search for all PHYs in the topology netlist and find out *Node P/N* for each PHY and the port that this PHY is serving. Some PHYs might serve several ports (for example, the C827 serves four ports) and need one firmware update.
3. Read the current PHY firmware version of the PHY using the Get PHY Abilities command (see [Section 3.2.4.1.4](#)).
4. Allow the user to update to the new version if available, or automatically update all PHYs to the newer version. The update can be done using the Program Topology Device NVM admin command, providing it the right PHY handle.

## 3.4 Non-Volatile Memory (NVM)

### 3.4.1 General Overview

The following conditions specific to the E810 induced an approach to NVM access:

- LAN and RDMA traffic can be handled only if the EMP code runs.
- For flexibility reasons, the main EMP code is retrieved from the NVM and not from ROM.
- Unless authenticated, the EMP/PE firmware code presents a potential security threat for the system:
  - Modification/tampering firmware code is presently undetectable to the rest of the system.
  - The E810's various virtualization capabilities (like SR-IOV with VFs and PFs) can virtually reach into any VM or VMM address space.
  - A malicious firmware is capable of sending out the harvested data from the server to unauthorized recipients via DMA reads ... again, undetected. The host CPU is not involved in this process.
  - A malicious firmware is capable of injecting malware into the host, bypassing other platform-level access control.
- The E810 controller core IP is part of several products with specific NVM needs, while the NVM design is common for all of them and consequently it has to meet the most strict requirements.
- Host should only acquire NVM semaphore for NVM commands (commands 0x7xx), or a deadlock might occur.
- Non-NVM Host commands should be able to accept EBUSY as a response. This indication means that either SPI is busy with other operation, or that NVM resource is owned by another flow such as NVM update.

#### 3.4.1.1 Requirements on NVM Access

The basic requirements from NVM access in the E810 include the following:

- Guarantee that only Intel-provided firmware code (EMP, PE, PHY) is run and device-critical data is used by the E810.
  - The firmware code and device-critical data is cryptographically signed and authenticated prior to execution.
  - The Intel ECSS/EDSS is used for signing.
  - PKCS #1 v2.2 format with 2048-bit RSA keys and SHA-256 hash is used for signing EMSA-PKCS1-v1.5.
- Protect NVM image against compromised supply chains and at least partial protection against physical attacks, such as NVM content replacement en-route. Full protection against physical attacks is not required at the moment but can be requested in future. It implies security on read approach, where the firmware ROM code is the Root of Trust and the authentication is done at every step of the Chain of Trust. That is, ROM-Miniload-NVM image.
  - Authentication of the NVM bank is only at major resets, but not performed on every NVM access. The resets on which the NVM bank is re-authenticated are: POR and EMPR.

- The hash value of the public key is stored in fuses, while the public key is part of the NVM image.
- Compromised key revocation is supported, while only level two keys can be revoked by providing a new CA certificate. The key for CA authentication cannot be changed in the field.
- Protection against rollback to the NVM version with known security issues is provided.
  - This is achieved by guaranteeing that the NVM image security revision is not decreased during NVM update.
  - A way to override the security revision rollback protection with BMC manageability commands is provided.
- Initial NVM programming is responsible to program blank fuses encoding the hash of the public verification key if fuses are not configured as part of the packaging process.
- The ROM firmware supports blank Flash programming mode, where the Flash can be written by host software, and then subsequently verified on device reset. Blank Flash programming mode assumes known good device initialization parameters are built into the ROM.
- Protect NVM update flow from power failure before completion. This implies the image-update procedure of modules uses a double-bank policy.
- Meet the boot time requirements described in PCIe specification.
- Reduce the surface for security attacks and protect as much NVM content as possible taking the “allowlist” approach. Consequently, only a small PFA area with system-specific settings surviving NVM update is unprotected by design. All other NVM settings are read only and/or signed.
- Provide a simple way to update NVM shifting responsibility for system specific configuration preservation to the device firmware. This is required to support the update over PLDM DMTF emerging standard and any to any NVM update.
- Prevent a malicious software from causing permanent damage to the system, and to the NVM (and the E810 in particular) so that Flash parts or NICs are not returned to Intel. It implies some countermeasure be taken against a malicious software that would excessively write access the Flash to precipitate its wear-out.

### 3.4.1.2 Operational Limitations

The NVM protection method selected in the E810 relies on authenticating key sections on initial load, also known as authenticate on read. Protected modules are authenticated before their first usage following a power-on reset, in addition to validating image updates prior to committing an update. NVM protection is implemented using a ROM-based firmware digital signature authentication algorithm, which uses fuse-encoded hashes of the public verification keys. Authenticating images on every initial load greatly reduces the possibility of unwanted modification to device firmware being introduced from compromised supply chains or physical tampering.

There is small set of PCIe-related time-critical CSRs, which are auto-loaded speculatively without authentication. This content is verified later at initialization time. If the verification fails, the NVM content is fixed and the error is reported to the software (using `GL_MNG_FWSW` CSR), with the request to initiate a corresponding reset.

In normal operating mode, NVM write accesses are access controlled by the EMP firmware and cannot be performed directly from the host to the NVM device via the memory-mapped accesses. Memory-mapped NVM access remains available for NVM read accesses only. For simplicity and flexibility reasons, NVM write accesses (except for VPD) can be initiated only via an admin command or following a BMC command, which are both handled by the EMP.

The ROM-based EMP firmware supports a blank Flash programming mode in the event the initial EMP firmware loader detects either a blank, corrupt, or invalid NVM image. In blank Flash programming mode, the host software program can program an image directly to the Flash device without any security limitations, nor is the EMP firmware involved. The host software has direct access to the SPI Flash controller with the same permission as the EMP firmware in the blank Flash programming mode. It should be noted that the new image is not functional without a reset. Upon a reset, the image is authenticated.

When the host debug mode is entered, the host can remove address protection of the PF space and write into the register that controls the blank Flash programming mode.

**Note:** This is not an error flow. Thus, the main firmware is loaded, the auto-load process still occurs, and the state of the device might not be the hardware default state.

## 3.4.2 External Flash

In the E810, the LAN controller core is the main client of the internal SPI controller. The E810's full Flash image must also contain a descriptor for the SPI controller as described below.

The SPI controller is responsible for the following tasks:

- Perform arbitration between the different clients.
- Manage the access control to the different regions.
- Reflect a zero-base address to each of the clients such as each client's first address is address zero.
- Enable access for a software tool for global blank Flash programming.

**Note:** **External Flash must have Descriptor for SPI controller preprogrammed.** The External Flash used by the device must have Descriptor for SPI controller pre-programmed in the Flash for the device to function. Until the Flash contains this information, Software Tools cannot program an NVM image.

### 3.4.2.1 E810 NVM Regions

In the E810, the NVM uses a 16 or 32 MB Flash and contains the following regions:

- **Descriptor region** — The first 4 KB of the Flash that contains the following data:
  - Signature
  - Content section (3 DWords)
  - Component section
  - Region section
  - Masters section
  - Soft-Straps

Presence of the descriptor region is a requirement of the SPI Controller block. This region must be pre-programmed before the host or firmware can access the Flash device via the SPI controller. This programming can be done off-line during the manufacturing process, or via the host interface using the "bit bang" mode.

- **Core region** — The core NVM used by the IP as described in [Section 6.3](#). It is mapped as region 3 and has a size of 8-10 MB.

### 3.4.3 Shadow RAM

NVM modules that meet one of these criteria must also be mirrored internally into a Shadow RAM that is loaded once after POR:

- Software must be able to partially update the module without being forced to rewrite the entire module (like SMBus address, VPD, and so on).

Unlike an EEPROM, Flash devices require rewriting an entire sector even if it comes to updating a single byte. The partial update is first performed against the Shadow RAM. Later on, the E810 commits the entire updated Shadow RAM into the Flash.

- On device-level resets (in contrast to function-level resets), the module (or parts of it) is auto-loaded by the E810 into registers that are mapped to the host memory BAR.

Auto-load done after PCIe fundamental resets (POR and PERST#) must be completed within a bounded time, and cannot wait for the delays involved by a sector erase operation (hundreds of milliseconds) that could have been initiated just before. Flash read accesses are suspended until a Flash sector erase operation completes. NVM auto-load performed further to device-level resets are done from the internal Shadow RAM into the registers, without involving Flash read cycles.

The E810 maintains the first 32 x 4 KB sectors of the Flash area allocated to it for the configuration content that must be mirrored into the Shadow RAM. These sectors are organized in two equally-sized banks, each one capable of containing the PFA of the Shadow RAM contents (See [Figure 3-26](#), this includes also the init module). These banks are referred to as the basic NVM banks. At any time one of these two banks must be valid or else the E810 is set by hardware default and enters into blank Flash programming mode (refer to [Section 3.4.4.2](#)).

Following a Power-on Reset (POR), the E810 firmware copies the valid Persistent Shadow RAM bank of the Flash device and Non-persistent Shadow RAM area of the valid NVM Bank into the internal Shadow RAM (see [Figure 3-26](#) and [Figure 3-27](#)), which is made resilient to device-level resets that might occur later on. The valid bank is the lowest indexed bank with the validity field content read as 01b. The NVM *Validity* field is located at NVM Control Word 1. At any time, the valid bank is referred to as the current basic bank, while the other is referred as the next basic bank. Any further accesses of software to this section of the NVM are directed to the internal Shadow RAM. Modifications made to the Persistent Shadow RAM area content are then copied by the E810 into the next bank of the NVM, flipping circularly the valid Persistent Shadow RAM bank between bank 0 and bank 1 of the Flash.

This mechanism also provides a way for software to protect an image-update procedure from power-down events by establishing a dual-bank policy even when performing a module partial update.

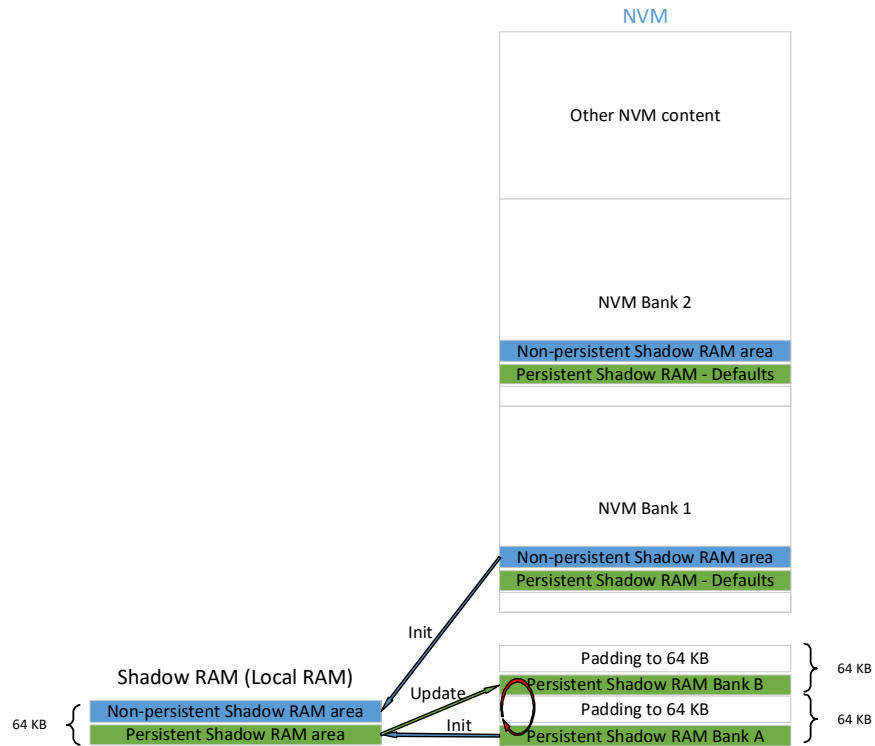

Figure 3-26. NVM Shadow RAM

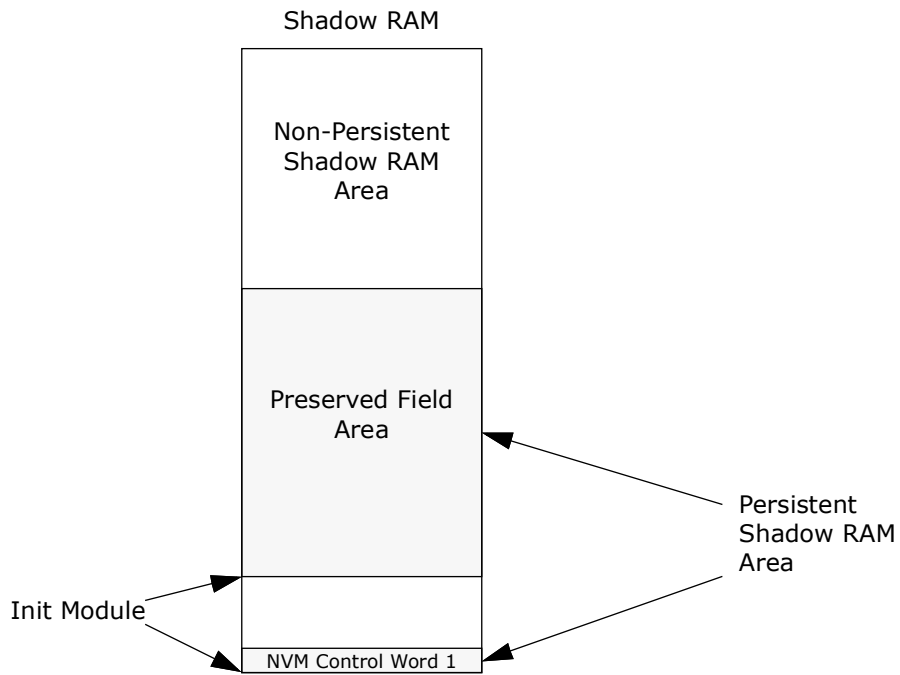

Figure 3-27. Shadow RAM Structure

## 3.4.4 NVM Access Modes

The NVM is connected to the device through SPI. Every access method eventually uses the SPI.

The NVM is accessed in multiple ways according to the entity and the state of the NVM image. following are the different access modes.

- SPI access mode
- Normal access mode
  - Through admin commands.
  - VPD register set
  - Memory map
- Blank Flash programming mode.

### 3.4.4.1 Normal Mode

For BIOS read accesses and VPD accesses, any read or write access to the NVM by the host must be preceded by taking ownership of the NVM resource via the Request Resource Ownership admin command (see [Section 9.5.13.5](#)). This prevents the following situations:

- Reading a module that is currently being modified by another entity.
- Concurrent modifying a module contents.

#### 3.4.4.1.1 Normal Read Access

Memory-mapped read accesses to the NVM do not require the EMP to be involved. EMP is involved when the read is performed via the NVM Read admin command.

Available read accesses are as follows:

- An NVM Read admin command from the PF.
- VPD register set.
- Memory mapped read via the memory/Option ROM BAR. To save host memory addresses, memory BAR access to the NVM is not always available. It is enabled/disabled by setting the *Flash\_Expose* bit in the NVM (or setting the `GLPCI_LBARCTRL.FLASH_EXPOSE` CSR bit).

#### 3.4.4.1.2 Normal Write Access

Write accesses to the NVM are controlled by the EMP.

Two accesses are provided:

- An NVM Update admin command from the PF.
- VPD register set. The EMP asserts the *Done* bit.

NVM write access attempts performed via the memory/Option ROM BARs are not performed by the E810, although PCIe transactions are completed normally.

### 3.4.4.2 Blank Flash Programming Mode

The E810 enters local blank Flash programming mode based on the following:

- When a blank Flash is detected. It means that the NVM *Blank Validity* field (NVM Control Word 1) read from the two basic banks is not equal to 01b.
- When the EMP image read at initialization time does not belong to the E810.
- When the ROM code fails to authenticate the mini-loader image.
- When the mini-loader fails to authenticate the whole NVM bank.
- When the GLNVM\_FLG.LOCKED bit is cleared. This bit can be cleared from the PF space if host debug mode is entered. It is recommended that Flash programming platforms at manufacturing sites be provided with the JTAG as a back-up means.

This mode is not safe and must be used only at manufacturing time and/or as a last resort to recover from initial mis-configurations. Only host access to the Flash and Shadow RAM is guaranteed when in this mode.

It is not recommended to enter this mode at run-time because no resource ownership taking is required prior to accessing the NVM. Also, taking resource ownership requires an operational EMP, which is not the case when in this mode.

When the E810 is in this mode (see conditions in the previous list), the EMP/PE codes are not loaded from the NVM and the EMP/PE remains disabled. The E810 is not able to exchange any kind of traffic over the lines and no admin command can be posted. The E810 is in an unknown operational state where only the Flash programming flow is operational.

### 3.4.5 NVM Update Flows

The flows described in this section affect only normal programming mode. When in the Blank Flash Programming mode, refer to the NVM access procedures described in [Section 3.4.8](#).

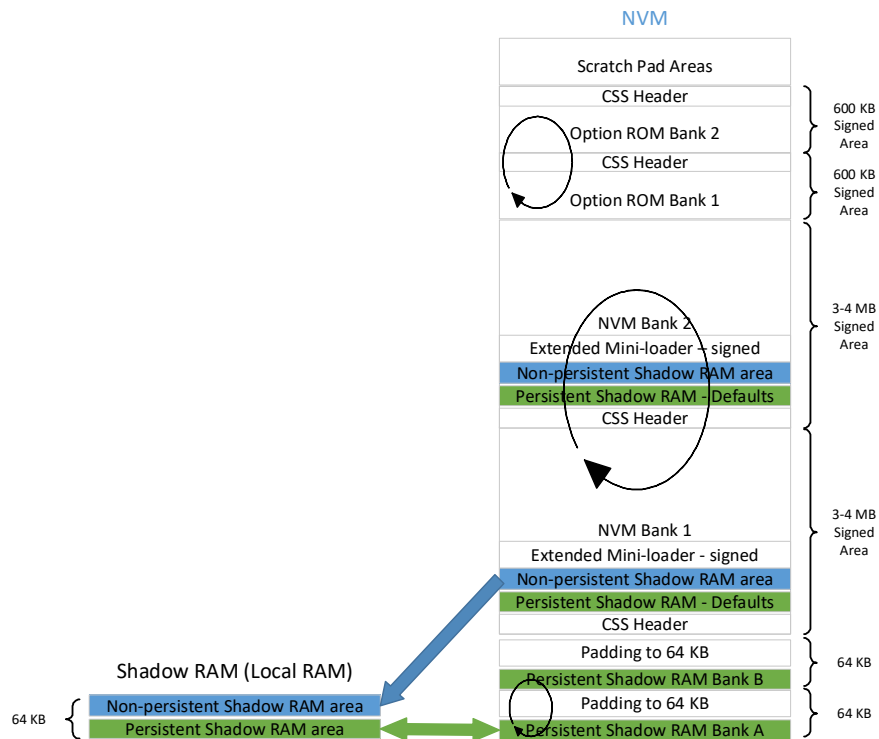

It is firmware's responsibility to keep track of Shadow RAM consistency between Internal RAM and Flash. If GLOBR/CORER occurs while Shadow RAM is inconsistent, EMPR is triggered, which eventually results in coherent Shadow RAMs by rolling-back the internal RAM changes.

It is assumed that an NVM update sequence does not last beyond the NVM ownership timeout for a write of three minutes (refer to [Table 9-45](#)). Failing to complete an update (by setting *LAST* bit in the command flag) within that time, results in EMPR which causes a roll-back of the non-completed update.

The firmware is responsible to re-compute and update the software checksum (PFA section with *TLV Type* = 0x3F) each time the Shadow RAM content is changed.

### 3.4.5.1 Flash High-Level Map

**Figure 3-28. Flash High-Level Map**

Figure 3-28 shows the high level mapping of the NVM in the E810, while the exact mapping is given in Chapter 6. It is made of the following areas:

- **Two Basic Persistent Shadow RAM Banks A,B** — It contains a modifiable content, including NVM Control Word 1 (offset 0x00) along with the Preserved Fields Area (PFA) that includes the VPD area and other modules to be preserved upon a new image release. It might also contain other content for convenience, which is overwritten with the clean copy of the Shadow RAM at POR. The current valid bank is mirrored into the internal Shadow RAM at POR events. Changes that are made in the Shadow RAM are finally dumped into the next bank, which becomes the current valid, and so forth, cyclically. Refer to Section 3.4.5.3 and Section 3.4.5.4, and Section 3.4.5.6 for the Shadow RAM update flows.
- **Two Authenticated NVM Banks** — They contain the basic NVM image from which specific images are created. One of the banks is valid, and the other is used for updating. Each area contains:
  - A clean copy of the Shadow RAM area, with default values in the Preserved Field Area.
  - The mini-loader image signed along with the time critical configurations.
  - EMP Image area, containing the code to be run by EMP embedded processor.
  - PE Image area, containing the code to be run by the Protocol Engine.
  - PHY Configuration scripts.
  - Parts CORER and GLOBR reset register auto-load sections, which are not modifiable by the Adaptive NVM features.

- EMP Global and Setting modules, containing basic configurations common to all images.
- Adaptive NVM metadata, which is a data structure containing the metadata required to modify an image to match a given configuration.
- PHY Analog modules (internal Ethernet PHY microcode and configuration) loaded by the E810 at power-up events only.
- PE Settings module, containing defaults to PE registers.
- Recovery Mode firmware image, separately signed. See [Section 15.4](#).

See [Section 3.4.5.6](#) for the update flow of the signed area.

- **Two Expansion/Option ROM Areas (OROM area)** — It contains pre-boot code and settings read by BIOS. Refer to [Section 3.4.5.5](#) for the update flow. Pre-boot code is authenticated by BIOS at initialization time before being executed. Pre-boot code is also internally authenticated on update. One of the banks is valid, and the other is used for updating.
- **Netlist Module** — A pair of RW modules used to store the netlist structure.
- **Scratch Pads** — A set of RW areas that are not double banked, where software and firmware can store data for logging and debug.

Refer to [Section 6.3](#) for the detailed NVM map.

## 3.4.5.2 Generic Flows

This section describes the flows that are used as building blocks by other flows.

### 3.4.5.2.1 Shadow Ram Dump

1. The firmware sets internal bit indicating Flash and Shadow RAM are inconsistent.
2. The firmware erases the next bank. It erases the contents of the next basic bank sectors.
3. The firmware copies first part of the Shadow RAM (from the first word until the end of the PFA) into the next bank sector with the exception of the *Validity* field, which is left as all ones.
4. The firmware checks the Flash write. The new bank content is read and checked to be identical to the Shadow RAM contents. This can be done in the course of writing to the Flash using previous step.
  - a. If not identical (such as Flash defect), exit the flow. Refer to [Section 9.5.13.6](#).
  - b. If the check was successful (identical), the EMP validates the new bank and invalidates the old bank.
    1. The *Validity* field of the new bank is set to 01b. The EMP checks that the *Validity* field is read as written in the Flash. If not, then go to the previous sub-step.
    2. The EMP toggles the state of the *BANK1VAL* bit in the *GLNVM\_GENS* register to indicate that the non-valid bank became the valid one and vice versa.
    3. The current (old) bank is invalidated by setting its *Validity* field to 00b.
    4. Firmware clears internal bit indicating Flash and Shadow RAM are inconsistent.

### 3.4.5.3 VPD Update

#### 3.4.5.3.1 First VPD Area Programming

The VPD capability is exposed on the PCIe interface only if the `GLPCI_CAPCTRL.VPD_EN` bit is set to 1b, regardless to any other sanity check that is performed on the VPD area contents.

The VPD area and VPD pointer must be written on a blank Flash and must contain a valid contents from this first programming. If VPD tags were modified, it is required to issue a PCIe reset before write accessing the VPD area from PCIe configuration space.

#### 3.4.5.3.2 VPD Area Update from PCIe Configuration Space

The flow described on this section is used once the VPD area contents and pointer have been already programmed in the NVM and loaded into the E810.

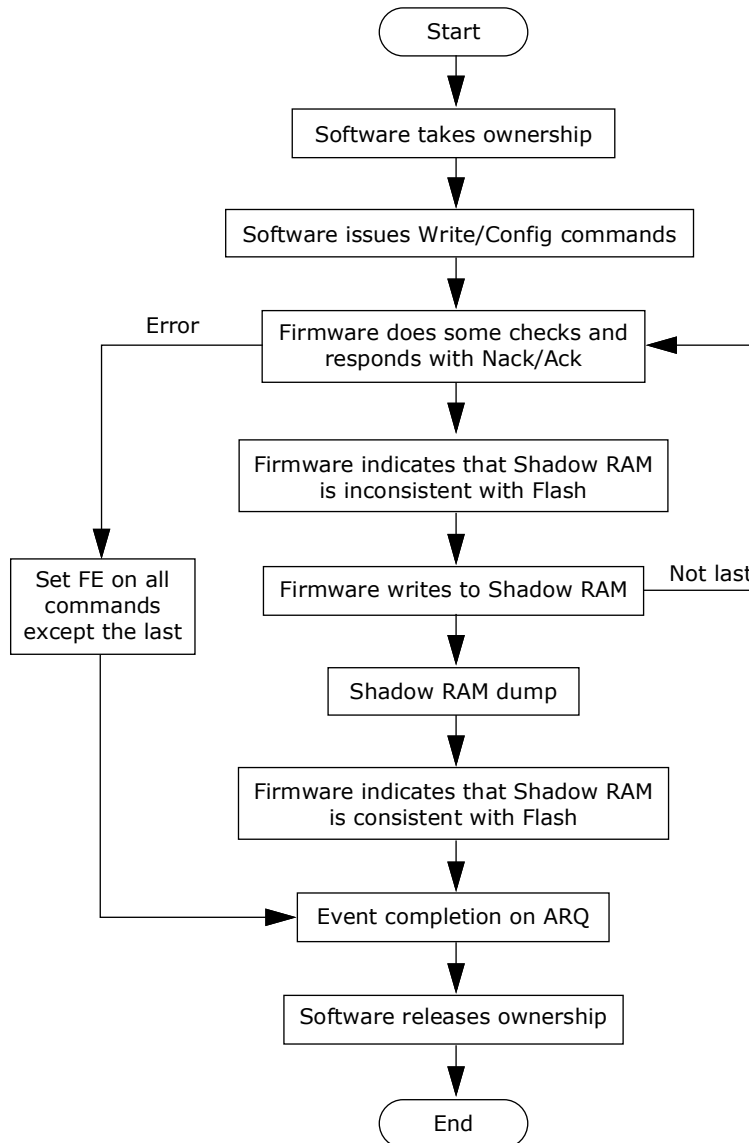

1. A PF VPD software performs a VPD write. It sets write offset/data into VPD register set of the relevant PF configuration space, setting the *VPD* Flag (bit 15 in VPD Address register 0x0E2).
2. Hardware notifies the EMP. It issues an internal VPD access interrupt to the EMP to notify it of the VPD access and of the PF affected.
3. The EMP checks that the VPD write is allowed. It checks that the write offset points to the *VPDRW* area (and not to a VPD RO area).
  - If not, the EMP clears the *VPD* Flag in the PF configuration space to notify PF VPD software that the transaction completed and then exits the flow.
4. EMP writes the change into Shadow RAM.
5. The EMP completes the VPD access to software. The EMP clears the *VPD* Flag in the PF configuration space to notify PF VPD software that the access completed.
6. The EMP dumps the Shadow RAM to Flash.
  - a. The EMP takes ownership over the NVM resources for a write.
  - b. EMP performs the dump as described in [Section 3.4.5.2.1](#).
  - c. If the Flash is busy by a previous sector erase operation, Flash erase is blocked by the wear-out protection mechanism (lack of credits) or if NVM ownership is held by software, it might indicate that the flow needs to be restarted from step 1 at this stage by successive VPD write accesses initiated by VPD software.
  - d. The EMP releases the NVM ownership.

**Notes:** Users must be made aware that dumping the VPD change into the Flash might take a few hundredths of a millisecond after the VPD transaction completes to software (by clearing the *VPD* flag). As a result, they must wait few seconds before they can shut down the system.

If the VPD write access is attempted by the host when the E810 has just started a Shadow RAM dump ([Step 6](#)), then it might be that the write request times out.

### 3.4.5.4 Updating Items in the Preserved Fields Area (PFA)

Figure 3-29 describes the PFA update flow:

**Figure 3-29. PFA Update Flow**

The update flow detailed description is as follows:

1. Software takes ownership over the NVM resource for a write (see [Section 9.5.13.5](#)).
2. Software issues one or several NVM Write commands or NVM Config Write commands. For NVM Write admin command see [Section 3.4.10.3](#). For NVM Config Write admin command see [Section 3.4.10.5](#).

3. In update flows, if the *Last Command* bit is cleared in the command, it means that the command belongs to a complex NVM update operation made of several elementary NVM update commands that are posted in the Admin Queue. In between completions of elementary commands in a chain, other commands can be posted by a PF, besides other NVM-related commands. The entire NVM change is committed to the Flash part only once the last NVM command of the sequence is processed.

The Flush on Error (FE) bit must be set for all the commands of a sequence, with the exception of the last one.

4. The firmware checks that the command is valid and posts a response to software. It performs the following command validity checks and posts a response (ACK/NACK) to software. If one check fails, the EMP flushes the remaining NVM update commands (if any) of the sequence and exits the flow. Otherwise, if no error is encountered, the EMP runs the command (NVM update) or schedules the NVM command to run in a separate thread, resuming from the next step.
  - The pointer points to a section within the PFA area. The start/end offsets, once applied to the module's location in the basic bank, do not lead to addresses beyond the PFA size. In case of "Dynamic NVM Update" command, the offset/length must be within the selected module.
5. The firmware sets internal bit, indicating Flash and Shadow RAM are inconsistent.
6. The firmware writes the change into Shadow RAM.
7. If the *Last Command* bit is set in the command, the firmware dumps the Shadow RAM to Flash (see [Section 3.4.5.2.1](#)). Otherwise, it completes the command to software and exits the flow. When the next command is posted by software the flow continues from [Step 2](#).
8. The firmware clears internal bit, indicating Flash and Shadow RAM are inconsistent.
9. The firmware posts an event completion on ARQ to software.
  - If the NVM ownership timeout for write ends before reaching this step, the EMP flushes the remaining NVM update commands (if any) of the sequence, reporting a timeout error status.
10. In config write flows, the software should initiate a Shadow RAM dump by sending a NVM Write Activate command with no activation bits set.
11. Software releases NVM ownership (see [Section 9.5.13.6](#)).
12. Software initiates a reset for loading the modifications into the E810.

#### 3.4.5.4.1 Limitations on PFA Updates/Handling

To allow seamless upgrade and downgrade updates, the following limitations and assumptions are made as to how PFA can be modified:

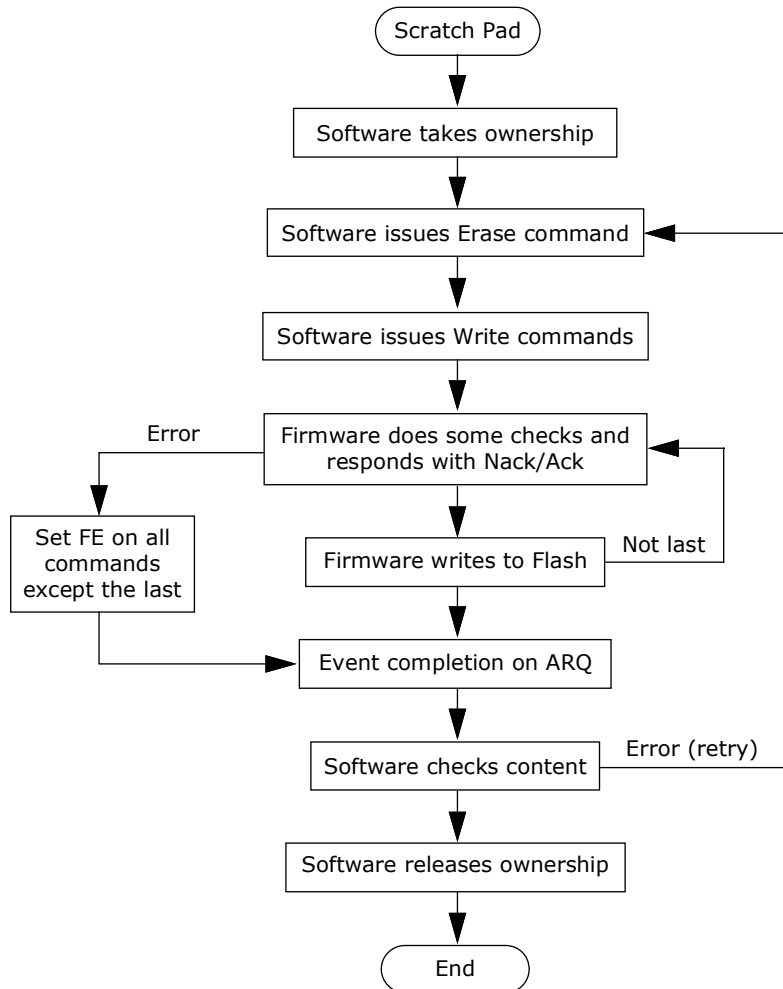

- When new TLVs are added, they must be added at the end of the PFA, replacing part of the padding TLV.
- Firmware ignores unknown TLVs and does not treat their presence as an error.
- Reserved fields in existing TLVs must not be reused.
- The size of TLVs must not change between versions. One exception is the ANVM feature selection TLV, which might expand into the next padding area.
- TLVs are never removed from PFA, even if no longer used.

### 3.4.5.5 Scratch Pads Update

The following flow supports only the full module replacement without the double-bank policy. The following NVM modules are affected by this flow:

- Firmware Scratch Pad Area (pointed by NVM word 0x50)
- Link Topology Scratch Pad Area (pointed by NVM word 0x4B)

Figure 3-30 shows the non-authenticated module update flow:

**Figure 3-30. Non-Authenticated Module Update Flow**

The flow details are below:

1. Software takes ownership over the NVM resource for a write (see [Section 9.5.13.5](#)).
2. Software issues a single NVM Erase command to the EMP, providing the following parameters (see [Section 3.4.10.2](#)):
  - Address in the NVM of the pointer to the relevant scratch pad area of one of the modules previously listed.

3. Software issues one or several NVM Write commands to the EMP, providing the following parameters (see [Section 3.4.10.3](#)):
  - Address in the NVM of the pointer to one of the modules previously listed.
  - Offset inside the module.
  - Buffer in host memory.
  - Buffer length (maximum supported is 4 KB).

The *Flush on Error* (FE) bit must be set for all the commands of a sequence with the exception of the last one.

4. The firmware checks that the command is valid and posts a response to software. It performs the following command validity checks and posts a response (ACK/NACK) to software. If one check fails, the firmware flushes the remaining NVM update commands (if any) of the sequence and exits the flow. Otherwise, if no error is encountered, the EMP schedules the NVM command to run in a separate thread, resuming from the next step.
  - a. The pointer location belongs to one of the modules in the list.
  - b. The offset and length, once applied to the relevant area, do not lead to addresses beyond the device's NVM area size.
  - c. The offset and length, once applied to the relevant area, do not spread over two consecutive 4 KB sectors.
5. The firmware posts an event completion on ARQ to software.
  - If the NVM ownership timeout for write ends before reaching this step, the EMP flushes the remaining NVM update commands (if any) of the sequence, reporting a timeout error status.
6. Software releases NVM ownership (see [Section 9.5.13.6](#)).
7. Software takes ownership over the NVM resource for a read (see [Section 9.5.13.5](#)).
8. Software reads from Flash the contents of the new module to check that it has been correctly recorded into the Flash.
  - In case it was not, Software re-does the flow.
9. Software releases NVM ownership (see [Section 9.5.13.6](#)).
10. Software initiates a device reset (PCIR, CORER, or GLOBR) for loading the modifications into the E810.

### 3.4.5.6 Updating a Double Bank Module

The following flow supports only the full bank replacement via a double-bank policy. The following banks are affected by this flow:

- **NVM** — Word 0x42 holds the 1st NVM bank pointer and word 0x43 holds the NVM bank size. The valid bank is indicated by a bit in Control Word 1. The 2nd NVM bank is right after the 1st NVM bank and has the same size.
- **OROM** — Word 0x44 holds the 1st OROM bank pointer and word 0x45 holds the OROM bank size. The valid bank is indicated by a bit in Control Word 1. The 2nd OROM bank is right after the 1st OROM bank and has the same size.
- **Netlist** — Word 0x46 holds the 1st TLV bank pointer and word 0x47 holds the netlist bank size. The valid bank is indicated by a bit in Control Word 1. The 2nd netlist bank is right after the 1st netlist bank and has the same size.

Figure 3-31 shows the double banked modules update flow:

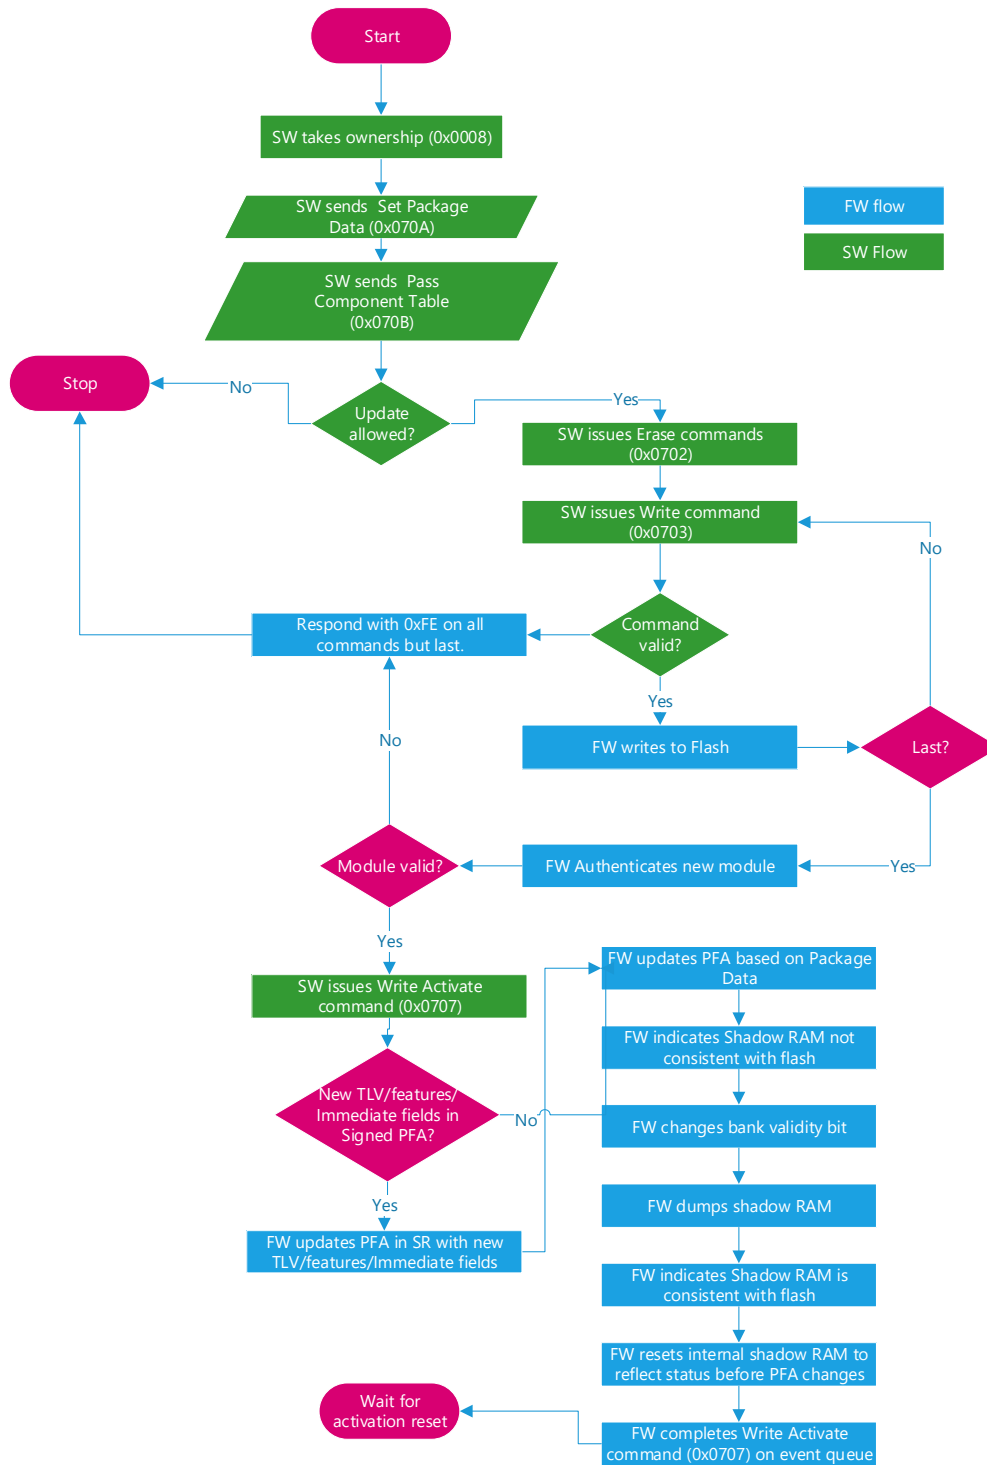

Figure 3-31. Authenticated Module Update Flow

The detailed flow is described as follows:

1. Software Tools verifies that the source/destination NVM images are compatible:
  - a. Takes ownership on the NVM (see [Section 9.5.13.5](#)) and reads valid NVM sections through admin commands (see [Section 3.4.10.1](#)).
  - b. Send a [Set Package Data \(0x070A\)](#) command to provide package metadata to firmware.
  - c. Send a [Pass Component Table \(0x070B\)](#) command to check if images are compatible.
  - d. If the images are not compatible, Software Tools notifies users of the error and exits the flow.

**Note:** This step is not performed by EUpdate, LANConf and NUR-a tools, which are not using config files. These tools are used by OEMs and Hardware manufacturers only (not end-users), who refer to Intel documentation for compatibility check.

2. If not done previously, software takes ownership over the NVM resource for a write (see [Section 9.5.13.5](#)).
3. Software issues a single NVM Erase command to the EMP, providing the following parameters (see [Section 3.4.10.2](#)):

- TypeId of the module to be replaced.

Firmware knows to erase the non valid bank.

4. Software issues several NVM Write commands to the EMP, providing the following parameters (see [Section 3.4.10.3](#)):

- TypeId of the module to be replaced.
- Offset inside the module.
- Buffer in host memory.
- Buffer length (maximum supported is 4 KB).

If the *Last Command* bit is cleared in the command, it means that the command belongs to a complex NVM update operation made up of several elementary NVM Write commands that are posted in the Admin Queue. In between completions of elementary commands in a chain, other commands can be posted by a PF, besides other NVM-related commands. The entire non-valid bank must always be written.

The *Flush on Error* (FE) bit must be set for all commands of a sequence with the exception of the last one.

5. The firmware checks that the command is valid and posts a response to software. It performs the following command validity checks and posts a response (ACK/NACK) to software. If one check fails, the EMP flushes the remaining NVM Update commands (if any) of the sequence and then exits the flow. Otherwise, if no error is encountered, the EMP schedules the NVM command to run in a separate thread, resuming from the next step.
  - a. The module TypeID belongs to one of the banks in the list.
  - b. The offset and length, once applied to the relevant non valid bank area, do not lead to addresses beyond the non valid bank area size.
  - c. The offset and length, once applied to the relevant non valid bank area, do not spread over two consecutive 4 KB sectors.
6. The firmware writes the non valid bank area. The firmware writes the change required by the (elementary) command into it. If the last bit is cleared, the firmware posts an event completion on ARQ to software and completes the command. The flow continues from [Step 4](#) for the next (elementary) command of the sequence.

7. If the *Last* flag is set, the firmware performs the following security checks and authenticates the next NVM bank. It reads the new bank from the Flash and authenticates its signature according to the procedure described in [Section 3.4.9](#). If one of the security check fails or if authentication fails, firmware posts an error event on ARQ to **Software Tools** (either the *Public Key Check Failed* or the *Module Signature Check Failed* bit). The flow goes to [Step 22](#).
  - a. The *lad\_srev* in the destination is equal or greater than the one in the source.
  - b. The *Blank NVM Device ID* field in the destination corresponds to the E810 device ID (0x1590).
  - c. The *lad\_module\_id* in the destination corresponds to bank currently being updated.
  - d. In case of PLDM firmware update, GFID match is checked, as described in [Section 3.4.5.6.1](#).
  - e. The checks for the netlist update are specified in [Section 3.4.9.3](#).

**Note:** Note that before authenticating the Option ROM and netlist modules, the module must be appended with the last 330 words of the module's area, as the CSS header has been moved to the module's trailer. See [Section 6.1.5.2](#) for more details.
8. Firmware posts an event completion on ARQ to software.
  - a. Where applicable, software driver must save *RESET\_FLAG* as returned by this command.
9. Software driver can release NVM ownership, or keep it until NVM Write Activate is completed.

**Note:** An attempt to write to a ready double bank at this stage results in rollback of the previous write so that authentication must be done again on new write completion.
10. A Write command that modifies PFA TLV configuration (including VPD) can be called with the *Last* bit cleared to activate (dump to Flash) in the same time of the Bank Update Activation command. However, it is recommended to use the package data provided in the Get Package Data command to request PFA modifications.
11. If not already taken, software driver takes ownership over the NVM resource for a write.
12. Software driver sends an NVM Write Activate Command and states which modules need activation by setting a flag per module (NVM Bank, OROM, Topology Netlist). Shadow RAM Bank is written by default and does not require setting any flag. Only banks that were written completely (that is, the *Last* bit was set) can be activated. Firmware posts a fail response to the command if one of the following checks fails:
  - a. All specified banks were written.
  - b. If an NVM bank was written, it is also activated.
13. Firmware sets internal bit indicating that Flash and Shadow RAM are inconsistent.
14. If the command was issued from ACQ: From this point until command completion ([Step 21](#)), in case of a CORER/GLOBR/PFR, firmware triggers EMPR.
15. Firmware parses the content of the package data provided by the Set Package Data command and modifies the PFA accordingly.
16. Depending on preservation mode, firmware overwrites current PFA with the default PFA from the image (no preservation), replaces selected PFA fields in current PFA with the default ones from the image (selective preservation), copies the factory setting region to the PFA (restore to factory settings), or makes no changes to current PFA (full preservation).

17. In case of NVM module update, firmware compares the TLVs present in signed version of the PFA with the ones in the actual PFA. If a TLV is present in the signed PLA and is not the actual PFA, it is added to the actual PFA, replacing part of the padding TLV. It also checks if new features or new immediate fields are added to the PFA version of the signed NVM. If there are new features or immediate fields, they are copied with their default values to the PFA in the Shadow RAM.
  - a. If features changed, the firmware runs the ANVM flow to ensure that any affected PFA TLVs are updated.

**Note:** From this point until initiating the reset that will switch to the new firmware, NVM Write (0x703) to PFA or to any of the double banks is rejected.
18. The firmware changes the valid bit indication in Control Word 1.
19. The firmware dumps the Shadow RAM to Flash (see [Section 3.4.5.2.1](#)).
20. Firmware clears internal bit indicating that Flash and Shadow RAM are inconsistent.
21. The firmware posts an event completion on ARQ to software. It posts a completion/response to the last admin command of the sequence.
22. Software releases NVM ownership (see [Section 9.5.13.6](#)).
23. At this stage, if a new update is needed, the software can revert to previous state by using the NVM Write Active command with revert flag set. After that it can restart the flow for a new image.
24. Software checks the *RESET\_FLAG* field.
25. Software Tools checks the value of the *RESET\_FLAG* field in the event posted by firmware:
  - If *RESET\_FLAG* == PERST, Software Tools notifies the user to reboot the system since it no ability to issue a PERST cycle (it can only ask the OS to do so).
  - If *RESET\_FLAG* == POR, Software Tools notifies the users to reboot the system (to initiate a PERST cycle) as before.

**Note:** In PLDM firmware update case, firmware sends feedback to BMC with the requested reset to activate the update.
26. Software may choose to activate the new Firmware in two ways:
  - Wait for the next PERST event — On the next PERST event, firmware also resets itself by issuing an EMPR cycle. In this case, the PERST can take a longer time to complete and might violate PCIe rules.
  - Send a NVM Update EMPR command, and then request for an immediate PERST event. In this case, the NVM Update EMPR command creates an EMPR, and the PERST will be faster and compliant with the PCIe rules. **The software should not initiate any NVM change between the two resets.**
27. Auto-load (driven by new Firmware) occurs from the new SR contents.
28. Software Tools checks that the destination map EETrackID was loaded in Internal SR to verify that there was no spurious reset during update, causing ROM to load the wrong Shadow RAM bank.
  - a. In case the original map EETrackID is read from Internal SR, **Software Tools** restarts the flow from the beginning.
29. (New) firmware loads the new firmware code and other NVM settings into its Internal RAM.

**Note:** Contents of the old module cannot be erased by a software command prior to completing this flow.

### 3.4.5.6.1 GFID Handling

GFID is used to identify if two images are compatible. If the GFID of the current image is the same as the GFID of the new image, the new image can be used to upgrade the current one. In some cases, it is needed to allow a split of a single family of images to multiple families. As GFIDs must be defined as part of the first image released, a mechanism to move from one GFID to another is needed. Hence each image contains two GFIDs: an original GFID and a current one. The following algorithm is used to define if an image can be updated based on the two GFIDs in the current (Adapter) and next (Update) images:

Figure 3-32. GFID Handling Flow

The GFIDs are stored in the non-PFA part of the Shadow RAM for the current image and in the package data of the PLDM header for the new image.

### 3.4.5.6.2 Recovery from Reset During Flash Update

In case a spurious reset occurs (other than POR) before the update sequence is fully completed, the following flow is used to recover:

1. Firmware issues a graceful EMPR cycle, notifying **Software Tools** about the event.
2. **Software Tools** report to user that the update has failed. Software is notified by interrupt on the fact the firmware was reset.
3. User restarts the flow from the beginning.

### 3.4.5.7 Flash Wear-Out Protection

This mechanism prevents Flash part wearing out by malicious software. This mechanism blocks excessive Flash erase operations.

Assuming a typical Flash device endurance is ~100,000 erase/program cycles and the required system lifespan is 10 years, a Flash erase can happen every  $10 \text{ (years)} * 365 \text{ (days/year)} * 24 \text{ (hours)} * 60 \text{ (minutes)} / 100,000 = \sim 53$  minutes.

The E810 does not have access to the real-time clock, and its clocks do not survive a POR reset. As a result, the algorithm has some limitations related to POR resets. Assuming a POR is not a frequent event that can not be initiated by malicious software, it does not pose a problem.

**Note:** An entry to the Sx power state is equivalent to power-on reset for the systems with no AUX power.

The simple algorithm described in [Figure 3-33](#) is credit-based. Separate credits are counted for every erase unit. To avoid credit counter proliferation, the number of erase units is limited to the following blocks, while more blocks can be added in future if there is such a need:

- Two NVM Banks
- Two OROM Banks
- Two persistent SR Banks
- Two TLV Extension Banks
- Link topology Scratch Pad Area
- Firmware Scratch Pad Area

It is noted that limiting the number of units requires modification of the NVM update flows to allow only the whole unit erase at a time, blocking the per-sector erase operations. To simplify system validation and Flash content update after the first power-on of the system, there are initial credits assigned to each unit.

The recommended values for the initial and maximal credits are 2000 (2%) and 5000 (5%), correspondingly. These values are stored in the signed part of the NVM image.

The algorithm is presented in [Figure 3-33](#).

**Figure 3-33. Flash Wear-Out Protection Algorithm<sup>1</sup>**

1. Credit update time is once per hour.

### 3.4.5.8 Save Factory Settings AQC

This section describes the flow executed by the Save Factory Settings Command (see [Section 3.4.10.9](#)).

#### 3.4.5.8.1 Save Factory Settings Flow

The following flow is run by the Save Factory Settings admin command (opcode 0x0708) and can be used by manufacturing tools to modify the image before programming the device.

- Word pointer to PFA in internal Shadow RAM (iSR) is located at iSR word offset 0x40.
- PFA word size is at first PFA word.
- Word pointer to netlist is located at iSR word offset 0x46.
- Netlist word size is at second netlist word.
- Word pointer to Factory Settings is located at iSR word offset 0x61

Flow:

1. Verify PFA checksum.
2. Check that Factory Settings (FS) password is "0xFFFF".
3. Setup a variable to keep FS size within limits in init module word offset 0x62.
4. Copy PFA content from iSR to Factory settings PFA area (offset 32B from address in word 0x61).
5. Copy netlist content from valid netlist bank to Factory Settings netlist area (offset 32B + PFA size from address in word 0x61).
6. Set FS header fields located at the first 32 bytes of Factory Settings:
  - password = 0x2811
  - Size = 32B + PFA size + netlist size
  - TLV\_Extension\_Offset = 32B + PFA size
  - TLV\_Extension\_Size = netlist size
  - CIR\_AL\_Offset = PCIR AL section byte offset relative to PFA start. TLV 0x133.
  - POR\_AL\_Offset = POR AL section byte offset relative to PFA start. TLV 0x118.
  - PCI\_Serial\_ID\_MAC\_Offset = PCI Serial ID MAC section byte offset relative to PFA start. TLV 0x133.
  - Set all reserved bytes to '0'

### 3.4.6 NVM Clients and Low-Level Interfaces

There are several clients that can access the NVM to different address ranges via different access modes, methods, and low-level interfaces. The various clients to the NVM are hardware, Software Tools (BIOS, and so on), drivers, EMP, PE, BMC (via EMP), and VPD software.

Table 3-106 lists the different accesses to the NVM.

**Table 3-106. Clients and Access Types to the NVM**

Client	NVM Access Method	Accessed Programmed Against	Logical Byte Address Range	NVM Access Interface (CSRs or Other)
VPD Software	Parallel (32-bits)	Shadow RAM	0x000000 - 0x0003FF from VPD module beginning	VPD Address and Data registers. Any write access is immediately pushed by the E810 into the Flash.
PF Software	Parallel via Memory (CSR) BAR (32-bit read)	Flash Part	0x000000 - 0xFFFFFFFF	The address is relative to the beginning of the Flash. See Section 13.1.2.1 for details of the Flash offset within the CSR BAR.
	Parallel via Option ROM BAR (32-bit read only).	Flash Part	0x020000 - 0xFFFFFFFF	This logical address range is relative to the beginning of the Option ROM module.
	Via AQC	Flash Part/Shadow RAM	0x000000 - 0x00FFFF	NVM Read, NVM Erase, and NVM Write admin commands as described in Section 3.4.10.

#### 3.4.6.1 Memory-Mapped Host Interface

The Flash is read by the E810 each time the host CPU performs a read operation to a memory location that is within the Flash address mapping, or upon boot via accesses in the space indicated by the Option ROM Base Address register. Accesses to the Flash are based on a direct decode of CPU accesses to a memory window defined in either:

- **Memory CSR + Flash Base Address register (PCIe Control register at offset 0x10)** — The Flash address space is exposed to the host memory BAR when the *Flash Expose* bit is set in the NVM (or the `GLPCI_LBARCTRL.FLASH_EXPOSE` CSR bit is set), or when the E810 is in blank Flash programming mode. The Flash size exposed is 16 MB. Refer to Section 13.1.1.2 for more details.
- **The Option ROM Base Address register (PCIe Control register at offset 0x30)** — The OROM module address space is exposed to the Option ROM BAR if the Flash is not blank and the Expansion ROM base address register contains a valid (non-zero) base memory address. Otherwise the BAR is not exposed. The Flash size exposed is retrieved from the `GLPCI_LBARCTRL.EXROM_SIZE` CSR field, and is 1 MB by default. The E810 is responsible to map read accesses via the Option ROM BAR to the physical NVM. Write attempts to the Flash through this BAR are not performed, and are silently dropped. The offset in the NVM of the Option ROM module is defined by the PCIe expansion/Option ROM pointer (Flash word address 0x05). This pointer is loaded by the E810 from the Flash before enabling any access to the Option ROM memory space.
  - When modifying the PXE driver section pointer in the NVM, it is required to issue a PCIe reset on which the updated offset is sampled by hardware.
  - If there is no valid NVM validity field in the two basic banks, the Option ROM BAR is disabled.

The E810 controls accesses to the Flash when it decodes a valid access. Out of range memory-mapped read access returns arbitrary data.

Refer to Section 3.1.2.2.1 for details on memory/Option ROM BAR access rules.

#### Notes:

- Flash read accesses are assembled by the E810 each time the access is greater than a byte-wide access.
- The E810 byte reads to the Flash take about 2 to 30  $\mu$ s. The E810 continues to issue retry accesses during this time.
- During normal operation, the host avoids memory-mapped accesses to the first two basic banks of the Flash because it might be non-coherent with the Shadow RAM contents.

Prior to initiating an NVM read cycle via memory-mapped access, PF software is required to take ownership over the NVM resources. Refer to [Section 9.5.13.5](#).

### 3.4.7 Flash Access Contention

Flash read accesses initiated through PFs might occur concurrently to the firmware modifying the NVM contents. The E810 does not synchronize between the different entities accessing the Flash, so contentions caused from one entity reading and the other modifying the same locations is possible.

To avoid such a contention between software and firmware accesses, these entities are required to make use of the NVM ownership take/release flows for any read or write access to NVM (see [Section 9.5.13.5](#) and to [Section 9.5.13.6](#) for more details). This is also useful to avoid the timeout of the PCIe transaction made to a memory mapped Flash address while the Flash is currently busy with a long sector erase operation.

However, two software entities cannot use the NVM ownership acquire/release mechanisms: BIOS reading through Expansion ROM BAR and VPD software. A BMC requesting firmware update via PLDM firmware update also does not require a semaphore.

- Since VPD software accesses only the VPD module, which is located in the first valid bank of the NVM, VPD accesses are always performed against Shadow RAM first. In this case, the firmware must take/release ownership over the NVM as if it was the originator of the Flash access. It is then the responsibility of hardware/firmware to update the NVM according to the Flash update sequence described in [Section 3.4.5.3](#).
- No contention can occur between BIOS and any other software entity (VPD included) as it accesses the NVM while the operating system is down.
- The firmware takes care of the semaphore ownership for PLDM firmware updates.

However, since BIOS cannot take ownership over the NVM resource, it might be that the Flash part is not accessible when BIOS attempts reading it. This might occur if a Flash erase operation was performed just before PCIe reset. In such a case, read accesses via the Option ROM BAR returns 0xDEADBEEF.

- It is assumed that the Option ROM signature check performed by BIOS fails in this case.
- The firmware must avoid initiating sector erase operations at boot time.
- It is assumed and recommended that users do not attempt to update the NVM contents via the BMC while the system is rebooting.
- The BMC delays PERST# de-assertion or boot running until after the BMC completes any OOB accesses to Flash memory. It is required to route the wake-up signal from the standby button to the BMC and not to the chipset. The BMC issues a system reboot signal to the chipset only after any NVM write access completes.
- If a system reboot is issued by a local user running on the host, there is no technical way to avoid contention in this case.

**Note:** It is the user's responsibility when accessing the NVM remotely via the BMC to ensure that another user is not currently initiating a local host reboot there.

- The firmware's responsibility to take NVM ownership on the BMC account prior to performing any NVM read or write access, which is needed for handling an NC-SI command. The NVM ownership is released by the firmware together with completing the NC-SI command. If NVM ownership is not free when processing the NC-SI command, the command completes with a Package Not Ready status.

## 3.4.8 NVM Access Procedures

Any software read/write or firmware write flow described in this section (except flows executed by VPD software or by BIOS or to flows executed when in blank Flash programming mode) must be preceded by taking NVM ownership. Anytime software is taking NVM ownership, it must re-read the pointers to the module it plans to access because they might have been modified by the firmware in between two ownership takings.

Refer to [Section 9.5.13.5](#) and [Section 9.5.13.6](#) for the NVM ownership taking/releasing procedures as well for the associated timeouts.

### 3.4.8.1 Auto-Load

This section describes only the auto-load/init tasks relative to NVM. Firmware is solely responsible for all auto-loads and initialization flows described in this section.

Firmware initialization performed at power-up and EMPR events consists for three steps, while DIGEST updating (discussed in [Section 3.4.8.1.2](#)) is done at each step:

1. ROM flow:
  - a. Find a valid NVM content.
  - b. Load the Extended mini-loader to the local RAM and authenticate it.
  - c. Jump to the mini-loader code entry point.
2. Mini-loader flow:
  - a. Auto-load time-critical NVM section, which is a part of the Extended mini-loader and the persistent Shadow RAM bank. Starting from this point, mini-loader is ready to handle time-critical PCIe auto-loads.
  - b. Read the Shadow RAM content to the local RAM from the NVM.
  - c. Read the whole NVM bank to the local RAM and authenticate it. The EMP firmware is placed in the local RAM at this moment, while most of the other content is discarded after the authentication.
  - d. Jump to the EMP Firmware entry point.
3. EMP Firmware flow:
  - a. Perform auto-load on every PCIe, CORER, and GLOBR resets.
  - b. Initialize all firmware code being ready to handling all runtime events.
  - c. Report initialization completion to the host software.

Simplified NVM Bank and Extended mini-Loader maps are shown in [Figure 3-34](#) for better understanding of the initialization flows.

**Figure 3-34. Simplified NVM Bank and Extended Mini-Loader Maps**

### 3.4.8.1.1 EMP Firmware Init Flow

The firmware is ready to PERST de-assertion handling during the flow. Such an event must be handled within 20 ms.

1. Run the adaptive NVM initialization flow using feature selections in PFA on the Shadow RAM copy in RAM. No Shadow RAM dump is required since the same initialization occurs after every POR reset.
2. Proceed initialization firmware initialization.

### 3.4.8.1.2 Firmware Measurement for Remote Attestation

A new *Controller Firmware Management System Architecture Specification* requires performing of remote attestation to prove the firmware identity. The EMP firmware is required to expose firmware measurement to the host software. This measurement is represented by a cryptographic identity of all firmware components.

Two 32-byte DIGEST registers (GL\_MNG\_SHA\_EXTEND in [Section 13.2.2.29.3](#) and GL\_MNG\_SHA\_EXTEND\_ROM in [Section 13.2.2.29.5](#)) are implemented in the E810 for this purpose. Another GL\_MNG\_SHA\_EXTEND\_STATUS register ([Section 13.2.2.29.4](#)) exposes the measurement status.

**Note:** The GL\_MNG\_SHA\_EXTEND\_ROM and GL\_MNG\_SHA\_EXTEND are writable only once after each EMP reset.

**CSR firmware attestation flow:**

1. The E810 ROM locates the E810 mini-loader.
  - a. If the mini-loader is not found<sup>1</sup>, the E810 ROM sets `GL_MNG_SHA_EXTEND_ROM` to the ROM version, sets `GL_MNG_SHA_EXTEND_STATUS.STAGE` to 001b, sets `GL_MNG_SHA_EXTEND_STATUS.FW_HALTED`, sets `GL_MNG_SHA_EXTEND_STATUS.DONE`, and moves to blank Flash programming.
2. If mini-loader is found, the mini-loader header contains a SHA256 hash of the mini-loader and signature over the hash. The E810 ROM authenticates mini-loader.
  - a. If the authentication is successful, the E810 ROM writes the mini-loader hash value to the `GL_MNG_SHA_EXTEND_ROM` register and sets `GL_MNG_SHA_EXTEND_STATUS.STAGE` to 010b. In this case, the computed mini-load hash matches what is in the header, and the ROM loads the mini-loader and passes control to it.
  - b. If the authentication fails, the E810 ROM writes the computed mini-loader hash value to the `GL_MNG_SHA_EXTEND_ROM` register, sets `GL_MNG_SHA_EXTEND_STATUS.STAGE` to 010b, sets `GL_MNG_SHA_EXTEND_STATUS.FW_HALTED`, sets `GL_MNG_SHA_EXTEND_STATUS.DONE`, and halts.
3. The E810 mini-loader locates the E810 firmware header. If the firmware is not found, the E810 mini-loader sets `GL_MNG_SHA_EXTEND_STATUS.STAGE` to 011b, sets `GL_MNG_SHA_EXTEND_STATUS.FW_HALTED`, sets `GL_MNG_SHA_EXTEND_STATUS.DONE`, and moves to blank Flash programming.
4. NVM Bank header contains a SHA256 hash of the NVM Bank content. Note that the E810 mini-loader itself is contained within the NVM Bank. The E810 mini-loader authenticates the complete NVM Bank content.
  - a. If the authentication is successful, the E810 mini-loader writes the firmware hash value to the `GL_MNG_SHA_EXTEND` register. In this case, the computed firmware hash matches what is in the header. The E810 mini-loader sets the following:
    - `GL_MNG_SHA_EXTEND_STATUS.STAGE` to 100b
    - `GL_MNG_SHA_EXTEND_STATUS.DONE`
  - b. If the authentication fails, the E810 mini-loader writes the computed firmware hash value to the `GL_MNG_SHA_EXTEND` register. The E810 mini-loader sets the following, then halts:
    - `GL_MNG_SHA_EXTEND_STATUS.STAGE` to 100b
    - `GL_MNG_SHA_EXTEND_STATUS.FW_HALTED`
    - `GL_MNG_SHA_EXTEND_STATUS.DONE`

**Software flow:**

1. Poll the `GL_MNG_SHA_EXTEND_STATUS.DONE` until set.
2. Keep value of `GL_MNG_SHA_EXTEND_STATUS`
3. Read the `GL_MNG_SHA_EXTEND` and `GL_MNG_SHA_EXTEND_STATUS` registers.
4. Reread the `GL_MNG_SHA_EXTEND_STATUS` register and check the value is the same as saved. If not, the firmware might have been reset during the read process.

**Note:** The complete read flow should complete within 100 ms to guarantee that a full reset cycle did not occur in between.
5. If `GL_MNG_SHA_EXTEND_STATUS.FW_HALTED`, the firmware load did not succeed.

---

1. If the RSA key verification fails, this is considered as if mini-loader is not found.

6. The `GL_MNG_SHA_EXTEND_STATUS.STAGE` indicates the latest firmware stage authenticated.

### 3.4.8.2 VPD Accesses

The VPD module (VPD area) is mapped into the valid basic bank and it is thus mirrored in Shadow RAM. It is accessed by VPD software via the PCIe VPD capability structure. Refer to [Section 3.4.5.3](#) for more details.

## 3.4.9 NVM Authentication Procedure

The NVM update integrity feature ensures that only Intel-approved firmware code (or another protected NVM module) is able to run on E810 devices after manufacturing. This procedure is performed by mini-loader and ROM-code on every initial program load and by a RAM-based firmware each time an attempt is made to update one of the protected modules. Refer to NVM update flows in [Section 3.4.5](#) for more details. The OROM image is not authenticated by EMP on device boot. It is authenticated only on OROM updates under the assumption that the system BIOS will authenticate the OROM prior to executing it during platform boot.

Integrity validation of NVM updates is provided by means of a digital signature. The digital signature is a SHA256 hash computed over the protected content that is then encrypted by a 2048-bit RSA encryption using an Intel private key. This digital signature is stored in what is called the manifest in the NVM module image. Also stored in the manifest is the corresponding RSA modulus (public key) and RSA exponent to be used to verify the digital signature. Refer to [Section 6.1.5](#) for more details.

To verify the authenticity of the digital signature of the mini-loader, EMP ROM must first verify that the SHA256 hash of the RSA Modulus and RSA Exponent fields in the new module loaded are identical to those retrieved from fuses. If the hash of the *RSA Modulus* and *Exponent* fields match the value in the fuses, EMP decrypts the digital signature using the 2048-bit RSA Modulus and Exponent fields stored in the manifest to extract the expected SHA256 hash of content (stored hash). EMP then performs an independent SHA256 hash over the protected content (computed hash). If the stored hash matches the computed hash, the digital signature is accepted and the NVM module update is applied.

When the mini-loader authenticates the digital signature of the full firmware or the recovery firmware, or when authentication occurs as part of a firmware update, the key hash in the authenticated firmware is compared with the one of three key hash values stored in the extended mini-loader:

- NVM Key hash (used for NVM and recovery)
- OS package key hash
- OROM key hash
- Netlist key hash

NVM updates are validated prior to invalidating the old NVM configuration, such that the old NVM configuration is still usable if the update fails to validate. After the new NVM is successfully verified, the updated image is committed to the E810's Flash by the EMP.

Figure 3-35. Sign and Verify Procedures for Authenticated NVM Modules

### 3.4.9.1 Digital Signature Algorithm Details

As previously mentioned, the digital signature generation is a hash computation followed by an RSA signature. This is performed within Intel as part of the NVM update image generation process and not performed by Intel software in the field, nor by the E810.

The algorithms used are described in the following locations:

- PKCS #1 v2.2: Encoding method - EMSA-PKCS1-v1\_5:  
<https://tools.ietf.org/html/rfc8017>
- SHA family definition:  
<http://nvlpubs.nist.gov/nistpubs/FIPS/NIST.FIPS.180-4.pdf>
- SHA usage with digital signatures:  
<https://nvlpubs.nist.gov/nistpubs/Legacy/SP/nistspecialpublication800-107r1.pdf>
- SHA validation vectors:  
<http://csrc.nist.gov/groups/STM/cavp/documents/shs/SHAVS.pdf>

**Note:** The protected module contents shown in Figure 3-35 starts with the CSS header, skips the RSA Public key, RSA exponent and Encrypted SHA256 hash, continues from the E810's Blank NVM Device ID word of the NVM header described in Section 6.1.5.2, and ends at the offset defined by the size field in the CSS header.

### 3.4.9.2 Intel Key Generation and Intel Code Signing System

The integrity of NVM digital signatures requires not only robust private RSA key generation but also continued protection of these private keys into the indefinite future as well as a method to generate new signed images using the existing private keys.

Intel's CSS follows the PKCSv2.2 format with 2048-bit RSA keys and SHA-256 hash - RSA-PSS. The CSS algorithm requires a standard manifest header to appear at the beginning of all signed modules.

The manifest header (represented in C syntax) is as follows:

```
typedef struct _CssHeader {
    uint32 moduleType;           // Reserved CSS field.
    uint32 headerLen;           // Reserved CSS field.
    uint32 headerVersion;       // Reserved CSS field.
    uint32 moduleID;            // Reserved CSS field.
    uint32 moduleVendor;        // Reserved CSS field.
    uint32 date;                 // Reserved CSS field.
    uint32 size;                 // In DWords - Reserved CSS field.
    uint32 keySize;              // Reserved CSS field.
    uint32 modulusSize;         // Reserved CSS field.
    uint32 exponentSize;        // Reserved CSS field.
    uint32 lad_srev;             // Internal security revision field.
    uint32 reserved;             // Reserved for future use.
    uint32 lad_fw_entry_offset;  // ND-specific offset from start of CSS header of the
                                // firmware code in WORDS.
    int32 reserved;              // Mandatory field, in use by previous project.
    uint32 lad_image_unique_id;  // Internal unique identifier for the specific NVM image
                                // version.
                                // Taken from NVM Software Reserved Words 22, 23 (a.k.a.
                                // EETRACK ID). N/A for mini-loader and Recovery
                                // Firmware CSS header.
    uint32 lad_module_id;        // Internal and per device unique identifier for NVM
                                // module. Is one of the following values:
    * 0x5 for Option ROM
    * 0x6 NVM Bank
    uint32 reserved[16];         // Mandatory field, but free for use.
} CssHeader;
```

The CSS header must be placed at the beginning of the integrity-checked data. Software Tools are also required to pre-process raw NVM images to prepend the manifest prior to CSS tool chain submission. All fields marked Reserved CSS Field must be zero when submitting to the CSS tool chain.

The E810 CSS header includes a Security Revision (*lad\_srev*) field. This field is monotonically updated for each and every security-related update to the NVM. If a security exploit is detected and an updated NVM image is released with an incremental security revision, the E810 does not allow an NVM image roll-back to an earlier version because this might expose previously known vulnerabilities.

Security version checking can only be temporarily disabled by a specific manageability command. There are multiple instances of the Security Revision (*lad\_srev*) field:

- NVM Module security revision
- Extended Mini-Loader security revision
- Recovery Firmware security revision
- OROM security revision
- Netlist security revision

All these security revisions must be the same and must be increased together.

**Notes:**

- Not all NVM updates need to have an incremental security revision. A roll back of updates to non-security related parameters (such as firmware patches where the Security Revision field is equal to the existing image) are allowed.
- The size field gives the entire module size including the CSS header itself. It is expressed in DWords.

The usage of SREV is optional, and users should opt in for the SREV to take effect. Opting in is done by updating the matching Min Srev value in the MinSrev TLV (for NVM bank, OROM) and NetlistMinSrev TLV (for Netlist).

**Note:** NVM Module and OROM module MinSrev are represented in the MinSrev TLV, as the Recovery Firmware Security Revision is always the same as the NVM module Security Revision, and the Extended Mini-loader Security Revision is always lower or equal to the NVM module Security Revision. Netlist MinSrev is represented in NetlistMinSrev TLV. All MinSrev values must be the same when the NVM image is generated. During the Opt-In process, if the opt-in request is different for the different modules, all MinSrevs must be updated to the highest number from the list.

### 3.4.9.3 Netlist Authentication During Update

Usage of signed netlist is optional and users should opt in for netlist authentication to take effect. Opting is done by updating the matching Min Srev and setting valid to 1 in the NetlistMinSrev TLV.

The following figure shows the netlist update flow in normal mode and recovery mode. This flow forms the "FW Authenticates the new module" function in the [Figure 3-31](#).

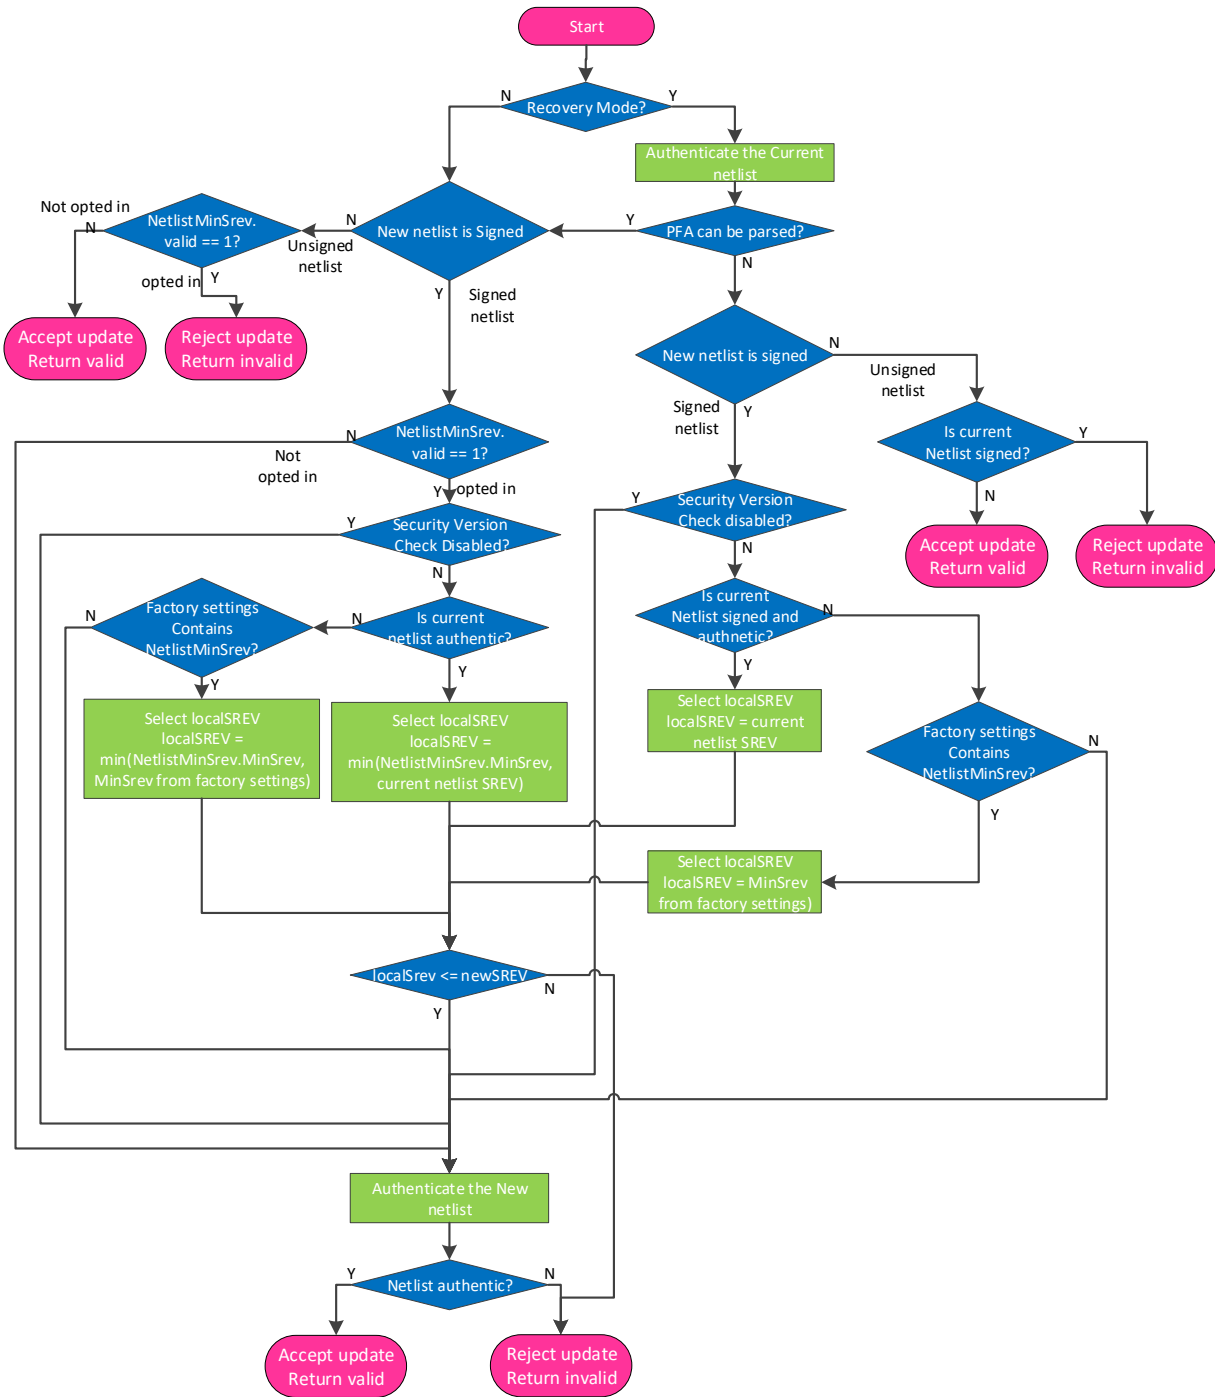

Figure 3-36. Netlist Authenticated Update Flow

The detailed flow is described as follows:

Signed netlist is identified by the presence of a valid CSS header and non-zero Key and Signature (NVM blank DeviceID = 0xTBD AND lad\_moduleID = 0x8 AND Key != 0 AND Signature != 0)

New unsigned netlist update in normal mode:

- If netlist signing is not opted in, the new unsigned netlist is updated.
- If netlist signing is opted in, the update fails.

New signed netlist update in normal mode:

- If netlist signing is not opted in, the signed netlist is authenticated and updated if the authentication passes.
- If netlist signing is opted in and if Security Version Check is disabled, the new netlist is authenticated and updated if the authentication passes.
- If netlist signing is opted in and if Security Version Check is enabled:
  - If the netlist in the current active bank (current netlist) is authentic and the new netlist *lad\_srev* is greater than or equal to minimum (NetlistMinSrev.MinSrev, *lad\_srev* of current netlist), the new netlist is authenticated and updated if the authentication passes.
  - If the current netlist is not authentic:
    - If the factory settings contain NetlistMinSrev TLV, then if the new netlist *lad\_srev* is greater than or equal to minimum (NetlistMinSrev.MinSrev, NetlistMinSrev.MinSrev from factory settings), the new netlist is authenticated and updated if the authentication passes.
    - If the factory settings do not contain the NetlistMinSrev TLV, the new netlist is authenticated and updated if the authentication passes.

New netlist update in recovery mode when the PFA can be parsed is considered similar to the update in non recovery mode.

New unsigned netlist update in recovery mode when the PFA cannot be parsed:

- If the current netlist is signed, the update fails.

New signed netlist update in recovery mode when the PFA cannot be parsed:

- If Security Version Check is disabled, the new netlist is authenticated and updated if the authentication passes.
- If Security Version Check is enabled:
  - If the current netlist is authentic and the new netlist *lad\_srev* is greater than or equal to *lad\_srev* of current netlist, the new netlist is authenticated and updated if the authentication passes.
  - If the current netlist is not authentic:
    - If the factory settings contain NetlistMinSrev TLV, then if the new netlist *lad\_srev* is greater than or equal to NetlistMinSrev.MinSrev from factory settings, the new netlist is authenticated and updated if the authentication passes.
    - If the factory settings do not contain the NetlistMinSrev TLV, the new netlist is authenticated and updated if the authentication passes.

### 3.4.9.4 Protected Modules

Any data that is modified in the field (either by the OEM during manufacturing or by the end user) cannot be included in the signed region of the NVM. The E810 cannot generate a signed image by itself because the private key is not available to it to generate the digital signature in the NVM.

Only the following NVM modules require authentication in the E810. Each module is with its own digital signature:

- Option ROM
- NVM bank
- Netlist

### 3.4.9.5 Software Requirements

A software tool must prepare NVM images for the CSS signing step, pre-pending the CSS manifest, and applying an Intel security revision field. After receiving the signed image, the tool merges the excluded fields back into the NVM image and performs an internal integrity check to verify that the merge was successful (such as a software computation of the digital signature passes).

SVTools (LANConf) MUST implement an NVM update image integrity check option in software prior to applying NVM updates to hardware. SVTools might integrate capabilities to generate self-signed NVM images to assist in the SV and debug process by developers.

CELO (or equivalent manufacturing diagnostics tool) must implement a test to check the `GLNVM_FLA.LOCKED` bit state as part of manufacturing qualification. If after the NVM is programmed, and the E810 powers up with the `GLNVM_FLA.LOCKED` bit not set, an inappropriate NVM image has been loaded during manufacturing (an NVM image with incorrect Flash opcodes). This represents a critical error. With `GLNVM_FLA` unlocked, unauthorized in-the-field updates can bypass designed firmware integrity checks.

Host software device drivers might implement an interface enabling a network administrator to perform an internal verification check of the signed NVM image. Using Windows drivers, this would take the form of an OID, which reports a `SUCCESS` or `INVALID_PARAMETER`. Using Linux, an **ehntool** command extension is advised to enable command line interrogation of the NVM content using the hash value built into the hardware, as well as the saved CSS manifest in the NVM image.

### 3.4.9.6 Manufacturing Requirements

#### 3.4.9.6.1 Factory Settings Preservation Flow

Manufacturing information should be stored at the end of board manufacturing to the 'Factory Settings' section that is read only to software and is located outside of NVM banks. This section includes the active PFA, active Topology Netlist and a 32B header.

Update of this section can be done only once, by firmware via the Save Factory Settings AQC (see [Section 3.4.10.9](#) or by Software Tools in Blank Flash Programming mode.

The AQC will fail with EMODE error if the 'Factory Settings' section is not entirely erased.

This section will never be modified in any NVM update.

The entire active PFA can be reset to factory settings by software via the NVM Write Activate Command AQC (see [Section 3.4.10.8](#)) using preservation mode 10b.

Software default to recover PFA & netlist should be 'return to factory settings'.

If software uses the 'return to signed default' option, following the update, firmware is required to restore MAC Addresses from factory settings at the next firmware load.

After recovery has been completed and normal mode firmware is running, software can do additional updates to modify PFA.

### 3.4.9.6.2 End-of-Line Verification

OEMs must execute CELO (or an equivalent manufacturing diagnostics tool) to verify the GLNVM\_FLA.LOCKED bit state (as described in [Section 3.4.9.5](#)).

## 3.4.10 NVM Access Admin Commands and Events

NVM access commands are not supported when the E810 is in the blank Flash programming mode. They are available only to the PFs once it has acquired NVM ownership via the commands described in [Section 9.5.13.5](#).

**Table 3-107. NVM Access Admin Commands and Events**

Command	Opcode	Description	Section Reference
NVM Read	0x0701	Read a segment from the NVM into a host buffer.	<a href="#">3.4.10.1</a>
NVM Erase	0x0702	Erase consecutive 4 KB sectors of the Flash.	<a href="#">3.4.10.2</a>
NVM Write	0x0703	Write a segment of the NVM from a host buffer.	<a href="#">3.4.10.3</a>
NVM Config Read	0x0704	Read feature selections.	<a href="#">3.4.10.4</a>
NVM Config Write	0x0705	Program Feature Selections.	<a href="#">3.4.10.5</a>
NVM Checksum	0x0706	Update PFA checksum.	<a href="#">3.4.10.7</a>
NVM Write Activate	0x0707	Activate new NVM.	<a href="#">3.4.10.8</a>
Save Factory Settings	0x0708	Save factory settings	<a href="#">3.4.10.9</a>
NVM Update EMPR	0x0709	Reset after new firmware update.	<a href="#">3.4.10.10</a>
Set Package Data	0x070A	Provide package data to firmware.	<a href="#">3.4.10.11</a>
Pass Component Table	0x070	Check if new module is compatible with current one.	<a href="#">3.4.10.12</a>

**Note:** All parameters in the admin commands are defined in little endian.

### 3.4.10.1 NVM Read (0x0701)

Table 3-108. NVM Read Command

Name	Byte.Bit	Value	Remarks
Flags	0-1		See Section 9.5.5.2.1 for details.
Opcode	2-3	0x0701	Command opcode.
Datalen	4-5		Length in bytes of command buffer
Return Value/VFID	6-7		Return value. Zeroed by the device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Offset	16-18		Offset in the module, which is expressed in bytes from the pointed module's beginning. This is the byte offset of the first byte returned in the data buffer.
Command Flags	19		NVM Access Admin Command Parameters <b>Bit 19.0:</b> Last Command Bit Used to notify EMP that this is the last admin command of a sequence. <b>Bit 19.7:</b> Read from Flash When Bit 7 is set, the read is done directly from the Flash and not from Shadow RAM. Relevant only if access address is below 64 KB. Ignored otherwise, so above 64 KB the read is always from the Flash, only when Module_TypeID is zero. <b>All other bits</b> = Reserved. Must be zeroed. Only one Module type is read at a time. For PFA TLVs only the length+data portion of the TLV is read (not the TLV Type). See Table 6-5 for TypeID values.
Module_TypeID	20-21		A value of 0x0000 means that the command is performed over the Flash part seen as a flat memory.
Length	22-23		Length of the section to be read, which is expressed in bytes from the offset in the module. A value of 0xFFFF means the last byte to be returned is the last byte of the module (if byte 17 was not set to 0x0000). In any case, a (single) read command is limited up to 4 KB.
Data Address High	24-27		Address of command buffer.
Data Address Low	28-31		

**Table 3-109. NVM Read Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0701	Command opcode.
Datalen	4-5		Number of bytes the were read. If a value of 0xFFFF was set in the admin command (and if byte 17 was not set to 0x0000), this field returns the length from the offset to the module's end unless it is above 4K.
Return Value	6-7		Return value. 0x0 = No error (success). EPERM = The module pointer location specified in the command does not permit the required operation. The word contents is not a pointer. EINVAL = Out of range offset/length (beyond the module's size). EIO = Flash defect. EBUSY = The PF is not permitted to post this command because it does not own the NVM resource. This error code is also returned if the PF attempts to post a command while another NVM command is in process.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Offset	16-18		Offset in the module, copied from the command.
Reserved	19		Reserved.
Module_TypeID	20-21		<i>Module_TypeID</i> copied from the command.
Length	22-23		Length in bytes of command buffer.
Data Address High	24-27		Address of command buffer. The buffer contains the read data.
Data Address Low	28-31		

### 3.4.10.2 NVM Erase (0x0702)

This command is used to erase the contents of 4 KB Flash sectors.

**Table 3-110. NVM Erase Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0702	Command opcode.
Datalen	4-5		Must be zeroed by the software device driver.
Return Value/VFID	6-7		Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-18		Reserved.
Command Flags	19		NVM Access Admin Command Parameters <b>Bit 19.0:</b> Last Command Bit Used to notify the EMP that this is the last admin command of a sequence. <b>All other bits</b> = Reserved. Must be zeroed.
Module_TypeID	20-21		The only valid TypeIDs are: <ul style="list-style-type: none"> <li>• 1st NVM Bank Pointer (0x42): Non-valid bank erase.</li> <li>• 1st OROM Bank Pointer (0x44): Non-valid bank erase.</li> <li>• 1st TLV Extension Bank Pointer (0x46): Non-valid bank erase.</li> <li>• One of the scratch pad pointers (0x4B, 0x50, 0x59).</li> </ul>
Reserved	22-31		Reserved.

This is an asynchronous command. The EMP reads the command from the ATQ and writes back an immediate completion, intended only as an ACK/NACK that the command has been addressed by the EMP. The EMP checks the validity of the command and returns an error (NACK) on the ATQ completion if it is unable to process the command. If successful (ACK), the EMP then schedules the NVM Erase operation to be performed by a lower priority thread, which can be preempted by other AQ commands.

Once completed, the EMP posts a completion event on the ARQ. Software must hold the NVM resource lock while performing this operation and must release it once the full NVM operations complete (assuming the erase is part of an update sequence).

Software must not post another NVM command while this command is in process. For example, during the time between posting the request on the ATQ and receiving the completion event on the ARQ.

**Table 3-111. NVM Erase Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0702	Command opcode.
Datalen	4-5		Reserved.
Return Value	6-7		Return value. 0x0 = No error (success). EPM = The module pointer location specified in the command does not permit the required operation. The word contents is not a pointer to a next bank area. EBUSY = The PF is not permitted to post this command because it does not own the NVM resource. This error code is also returned if the PF attempts to post a command while another NVM command is in process. EACCESS = Attempt to erase a non erasable area.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-31		Reserved.

**Table 3-112. NVM Erase Completion (on ARQ)**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0702	Command opcode.
Datalen	4-5		Reserved
Return Value	6-7		Return value. 0x0 = No error (success).
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-17	0x0	Reserved. Must be zeroed
Reserved	19		Reserved.
Module_TypeID	20-21		Copied from the command.
Length	22-23		Copied from the command. If a value of 0xFFFF was set in the admin command, this field returns the length from the offset to the module's end in 4 KB units.
Reserved	24-31		Reserved.

### 3.4.10.3 NVM Write (0x0703)

This command is used to write the data given by the attached buffer into a specified location in the NVM. Erasing the relevant sector(s) by posting NVM erase command(s) (see [Section 3.4.10.2](#)) is required prior to posting this command.

For double bank updates (like Module\_TypeId = 0x42, 0x44, 0x46), the command must be followed by the NVM Write Activate command for a bank update to take effect.

**Table 3-113. NVM Write Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0703	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value/VFID	6-7		Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Offset	16-18		Offset, which is expressed in bytes from the pointed module's beginning. This is the byte offset of the first byte to be written. Offset of zero points to the section length. However the length is not overwritten.
Command Flags	19		<p>NVM Access Admin Command Parameters</p> <p><b>Bit 19.0:</b> Last Command Bit Used to notify EMP that this is the last admin command of a sequence.</p> <p><b>Note:</b> Setting the <i>Last</i> bit causes a Shadow RAM dump, but it is recommended to use the NVM Write Activate to achieve this.</p> <p><b>Bit 19.6:</b> Allow Special Update Set to allow change of MinSrev TLV and NetlistMinSrev TLV.</p> <p><b>All other bits</b> = Reserved. Must be zeroed.</p>

**Table 3-113. NVM Write Command [continued]**

Name	Byte.Bit	Value	Remarks
Module_TypeID	20-21		<p>Module TypeID</p> <p>The only valid init module pointers are:</p> <ul style="list-style-type: none"> <li>• 0x00: Flat memory view</li> <li>• 1st NVM bank pointer (0x42): Non-valid bank.</li> <li>• 1st OROM bank pointer (0x44): Non-Valid Bank.</li> <li>• 1st TLV Extension Bank Pointer (0x46): Non-valid bank.</li> <li>• One of the scratch pad pointers: <ul style="list-style-type: none"> <li>— Firmware scratch pad pointer (0x50)</li> <li>— Link Topology scratch pad pointer (0x4B)</li> </ul> </li> <li>• PFA TypeIDs not included in the list below (see <a href="#">Table 6-5</a>).</li> </ul> <p>A value of 0x00 here means that the command is performed over the Shadow RAM part seen as a flat memory. No reset or pointer switch is initiated by the E810 in such a case. A flat write attempt to the first 64 KB of the Flash is performed against the Shadow RAM first, and then dumped to the next Shadow RAM bank in the Flash (see <a href="#">Section 3.4.5.4</a>).</p> <p>A flat write (0x00) attempt to a Shadow RAM area other than within the PFA, or words listed below or out side the Shadow RAM is rejected as well.</p> <p>The following PFA TLV sections cannot be updated by this AQC:</p> <ul style="list-style-type: none"> <li>• Immediate values</li> <li>• Feature configuration</li> <li>• POR auto-load section</li> <li>• PCIR auto-load section</li> <li>• TLVs Header</li> <li>• VPD when the VPD_WRITE_ENABLE is cleared</li> <li>• RDMA control</li> <li>• HII port/PF disable</li> <li>• Padding TLV</li> <li>• Software Checksum</li> </ul> <p>The MinSrev and NetlistMinSrev modules can be updated only if <i>Allow Special Update</i> is set. The following checks are applied when the MinSrev and NetlistMinSrev modules are updated:</p> <ul style="list-style-type: none"> <li>• MinSrev valid is not cleared (1 → 0).</li> <li>• If MinSrev valid and Current MinSrev ≤ Srev in signed image, then check that Current MinSrev &lt; New Srev ≤ Srev in signed image.</li> <li>• If Current MinSrev valid and Current MinSrev &gt; Srev in signed image OR Current MinSrev NOT valid, then check that New NVM Srev ≤ NVM Srev in signed image.</li> </ul> <p><b>Note:</b> Srev in signed image = Srev of the new image if exists - if not of current image.</p> <p><b>Note:</b> MinSrev and NetlistMinSrev cannot be updated in recovery mode.</p> <p>In debug mode, a value of 0x00 writes to the entire Flash seen as flat memory without any protection. Only one module is updated at a time.</p> <p>For TLVs only the data portion of the TLV is updated.</p>
Length	22-23		<p>Length of the section to be written, which is expressed in bytes from the offset in the module.</p> <p>A (single) write command is limited up to 4 KB and must not spread over two (consecutive) 4 KB sectors. Also, attempting to write a RO word invalidates the entire command.Length is truncated to size of TLV in bytes +2.</p>
Data Address High	24-27		Address of command buffer.
Data Address Low	28-31		

This is an asynchronous command. EMP reads the command from the ATQ and writes back an immediate completion, intended only as an ACK/NACK that the command has been addressed by the EMP. The EMP checks the validity of the command and returns an error (NACK) on the ATQ completion if it is unable to process the command. If successful (ACK), the EMP then schedules the NVM write operation to be performed by a lower priority thread, which can be preempted by other AQ commands.

Once completed, the EMP posts a completion event on the ARQ. Software must hold the NVM resource lock while performing this operation and must release it once NVM operations complete.

Software must not post another NVM command while this command is in process. For example, during the time between posting the request on the ATQ and receiving the completion event on the ARQ.

**Table 3-114. NVM Write Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0703	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value	6-7		Return value. 0x0 = No error (success). EPERM = The module type specified in the command does not permit the required operation. The word contents is not a pointer, or an attempt to write a RO module or word, or command is received not at the right place in the flow. EINVAL = Out of range offset/length (beyond the relative free area module's limits), or write spread over two (consecutive) sectors. EBUSY = The PF is not permitted to post this command because it does not own the NVM resource. This error code is also returned if the PF attempts to post a command while another NVM command is in process. EACCESS = Attempt to write to read only area or authentication failure.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-31		Reserved.

**Table 3-115. NVM Write Completion (on ARQ)**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0703	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value	6-7		Return value. 0x0 = No error (success). EIO = Flash defect. EACCES = Security check failed: <ul style="list-style-type: none"> <li>• Public key check failed.</li> <li>• Module digest (CRC) check failed.</li> <li>• Module security revision check failed.</li> <li>• Device ID check failed.</li> <li>• Module ID check failed.</li> </ul> EINVAL = Invalid parameters
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Offset	16-18		Copied from the command.
Response Flags	19		RESET_FLAG A reset flag to indicate the type of reset required to get the NVM bank update effective. 0 = POR 1 = PERST 2 = EMPR <b>All other bits</b> = Reserved <b>Note:</b> Relevant only for NVM Bank update.
Module_TypeID	20-21		<i>Module_TypeID</i> that was used for this update
Length	22-23		Copied from the command.
Data Address High	24-27		Address of command buffer.
Data Address Low	28-31		

### 3.4.10.4 NVM Config Read (0x0704)

This admin command reads currently configured feature/super-feature selections and immediate field values/entries. The features/fields to be read are specified in the command's buffer. It can also be used for reading all features or fields. In case one buffer is not enough Feature or field iteration is used. The next *Feature\_ID/Field\_ID* to read are returned in the command response in this case.

**Table 3-116. NVM Config Read Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0704	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value/VFID	6-7		Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Command Flags	16		NVM access admin command parameters. <b>Bit 16.0:</b> Single/Multiple elements. 0b = Only a single <i>Feature_ID/Field_ID</i> is read. 1b = <i>Feature_ID/Field_ID</i> iteration is used. <b>Bit 16.1:</b> Feature/Field 0b = Feature selections are read. 1b = Immediate fields are read. <b>All other bits</b> = Reserved. Must be set to zero.
Reserved	17	0x0	Reserved. Must be set to zero.
Element Count	18-19	0x0	The number of features/fields returned. Zeroed by driver, written by firmware.
Feature_ID/ Field_ID	20-21	See description	Single <i>Feature_ID/Field_ID</i> when Bit 16.0 is 0b. <i>Feature_ID</i> when Bit 16.1 is 0b. <i>Field_ID</i> when Bit 16.1 is 1b. Iterator: <i>Feature_ID/Field_ID</i> to start reading from (iterator) when Bit 16.0 is 1b. <b>Note:</b> When Bit 16.0 is 0b, <i>Feature_ID/Field_ID</i> = 0 is not valid. When Bit 16.0 is 1b, it indicates that the command reads the data starting from the first <i>Feature_ID/Field_ID</i> in the array.
Reserved	22-23		Reserved.
Data Address High	24-27		Address of command buffer.
Data Address Low	28-31		

**Table 3-117. NVM Config Read Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0704	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value	6-7		Return value. 0x0 = No error (success).
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Command Flags	16		NVM access admin command parameters. <b>Bit 16.0:</b> Single/Multiple elements. 0b = Only a single <i>Feature_ID/Field_ID</i> is read. 1b = <i>Feature_ID/Field_ID</i> iteration is used. <b>Bit 16.1:</b> Feature/Field 0b = Feature selections are read. 1b = Immediate fields are read. <b>All other bits</b> = Reserved. Must be set to zero.
Reserved	17	0x0	Reserved. Must be set to zero.
Element Count	18-19	See description	The number of features/fields returned.
Feature_ID/Field_ID	20-21	See description	Same as the command.
Reserved	22-23		Reserved.
Data Address High	24-27		Address of command buffer. See <a href="#">Section 3.4.10.6</a> .
Data Address Low	28-31		

### 3.4.10.5 NVM Config Write (0x0705)

This admin command writes the feature selections and the values of the immediate fields provided in the attached command buffer to the NVM.

After this command is completed, an [NVM Write Activate \(0x0707\)](#) must be called to make the configuration persistent.

**Table 3-118. NVM Config Write Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0705	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value/VFID	6-7	0x0	Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Command Flags	16		NVM Access Admin Command Parameters <b>Bit 16.0:</b> Reserved. <b>Bit 16.1:</b> Feature/Field 0b = Feature selections are written. 1b = Immediate fields are written. <b>Bit 16.2:</b> Add New Configuration 0b = Existing configuration. 1b = New configuration added. <b>All other bits</b> = Reserved. Must be set to zero.
Reserved	17	0x0	Reserved. Must be set to zero.
Element Count	18-19	0x0	The number of features/fields in the command buffer.
Reserved	20-23	0x0	Reserved. Must be set to zero.
Data Address High	24-27		Address of command buffer.
Data Address Low	28-31		

**Table 3-119. NVM Config Write Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0705	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value	6-7		Return value. 0x0 = No error (success).
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-31		Reserved.

### 3.4.10.6 NVM Config Read/Write Command Buffer

Described below is the format of the command buffer attached to the NVM Config Read Response and to the NVM Config Write commands. The buffer can either be filled with Feature Selection fields or Immediate Field fields, depending on Bit 16.1 in the command.

**Table 3-120. Feature Buffer for NVM Config Read/Write**

Parameter	Bytes.Bits	Description
Feature_ID	0-1	Feature_ID
Feature Flags	2-3	Feature options for NVM_Config_Read only. Reserved for NVM_Config_Write. <b>Bit 0:</b> OEM only (is set). <b>Bits 1:2:</b> Reserved. <b>Bit 3:</b> If set the Feature fields are mapped in DWORD-wise, otherwise are WORD. <b>Bit 4:</b> Should be set when using a POR CSR. <b>Bit 5:15:</b> Reserved.
Feature selection/Field Value	4-5	Configured feature selection for NVM Config Read. Requested feature selection for NVM Config Write.

**Table 3-121. Immediate Buffer for NVM Config Read/Write**

Parameter	Bytes.Bits	Description
Field_ID	0-1	Field_ID
Field flags	2-3	Field options for NVM Config Read. Reserved for NVM Config Write.
Field Value	4-5	Field value.

### 3.4.10.7 NVM Update Checksum (0x0706)

This admin command recalculates/verifies the PFA checksum. This command is used by software once it fixed a corrupted PFA or to check the validity of the PFA after reset.

**Table 3-122. NVM Update Checksum Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0706	Command opcode.
Datalen	4-5	0x0	Length in bytes of command buffer.
Return Value/VFID	6-7	0x0	Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Command Flags	16		<b>Bit 17.0:</b> Verify Checksum <b>Bit 17.1:</b> Recalculate Checksum <b>All other bits</b> = Reserved. <b>Note:</b> Only one bit of the above can be set in a command. <b>Note:</b> After a recalculate action, the software must initiate a Shadow RAM dump.
Reserved	17-31	0x0	Reserved. Must be set to zero.

**Table 3-123. NVM Update Checksum Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0706	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value	6-7	0x0	Return value. 0x0 = No error (success). INVAL = Both 17.0 and 17.1 bits are set.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-17		Reserved.
Checksum	18-19	0x0	A value of 0xBABA indicates a valid checksum. Returned only if <i>Verify Checksum</i> flag was set in command.
Reserved	20-31		Reserved.

### 3.4.10.8 NVM Write Activate (0x0707)

This admin command updates the control word with the required banks' validity bits and dumps the Shadow RAM to Flash.

It must be called after NVM Write AQ Command was successfully completed in order for the new bank(s) to be updated.

If no flag is set, this command acts as an SR-dump command.

**Table 3-124. NVM Write Activate Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See Section 9.5.5.1.1 for details.
Opcode	2-3	0x0707	Command opcode.
Datalen	4-5	0x0	Length in bytes of command buffer.
Return Value/VFID	6-7	0x0	Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-17	0x0	Reserved. Must be set to zero.
Command Flags 2	18	0x0	<b>Bit 18.0:</b> Set to Elevate next PERST to EMPR. Clear has no effect. <b>All other bits</b> = Reserved. Must be set to zero.
Command Flags	19	0x0	<b>Bit 19.0:</b> Reserved. <b>Bits 19.2-19.1:</b> Preservation Mode (relevant only if Bit 3 is set): 00b = No preservation — Notify EMP to avoid any field preservation during NVM bank update. Returns to the values in the copy of the PFA stored in the signed NVM module. 01b = Preserve all (Default) — Used to notify EMP to preserve all the necessary customization fields during NVM bank update. 10b = Return to factory settings. 11b = Preserve Only Selected Fields — Used to notify EMP to preserve only the immediate fields and section marked as such during NVM bank update. The following sections are currently included: <ul style="list-style-type: none"> <li>• PCI Serial ID</li> <li>• PF MAC Addresses TLV</li> <li>• MNG MAC Address TLV section</li> <li>• HLP MAC Address TLV section</li> <li>• SMBus addresses</li> <li>• MinSrev</li> <li>• NetlistMinSrev</li> </ul> <b>Bit 19.3:</b> 0b = Keep current NVM Bank. 1b = Switch to invalid NVM Bank <b>Bit 19.4:</b> 0b = Keep current NV OROM Bank. 1b = Switch to invalid OROM Bank <b>Bit 19.5:</b> 0b = Keep current EXT TLV Bank. 1b = Switch to invalid EXT TLV Bank <b>Bit 19.6:</b> 0b = No event. 1b = Revert Last Activate. <b>Bit 19.7:</b> Reserved. <b>Note:</b> If Bits 3:5 are clear, Shadow RAM is dumped and swapped with no validity bits change.
Reserved	20-31	0x0	Reserved. Must be set to zero.

**Table 3-125. NVM Write Activate Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0707	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value	6-7		Return value. 0x0 = No error (success). 0x0A = EPERM — Returned when at least one of the specified bank(s) is not in the expected state for being updated, or command is received not at the right place in the flow. 0x15 = EMODE — NVM module not included in activation.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-31		Reserved.

**Table 3-126. NVM Write Activate Completion (on ARQ)**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0707	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value	6-7		Return value. 0x0 = No error (success). 0xC = EBUSY - Unavailable resource. 0xA = EACCES - Not available for activation (no image was loaded successfully). 0x15 = EMODE - Internal firmware error.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-31	0x0	Reserved.

### 3.4.10.9 Save Factory Settings (0x0708)

This admin command saves the PFA, active Topology Netlist, and 32B header to a permanent read-only NVM location. This command should be executed at the end of product manufacturing after NVM content has been programmed, including MAC Addresses. For more information refer to [Section 3.4.9.6.1, "Factory Settings Preservation Flow"](#).

**Table 3-127. Save Factory Settings Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0708	Command opcode.
Datalen	4-5	0x0	Length in bytes of command buffer.
Return Value/VFID	6-7	0x0	Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-31	0x0	Reserved. Must be set to zero.

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0707	Command opcode.
Datalen	4-5	0x0	Length in bytes of command buffer.
Return Value	6-7	0x0	Return value. 0x0 = No error (success). EACCESS = Save Factory Settings command was previously executed.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-31	0x0	Reserved.

### 3.4.10.10 NVM Update EMPR (0x0709)

This admin command allows the software the request an EMPR after a successful reset to allow activation of the new firmware.

**Table 3-129. NVM Update EMPR Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0709	Command opcode.
Datalen	4-5	0x0	
Return Value/VFID	6-7	0x0	Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-31	0x0	Reserved. Must be set to zero.

Opcode	2-3	0x0709	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value/VFID	6-7		Return value. 0x0 = No error (success). EMODE = No successful update pending. Reset not allowed. EPRM = Command is received not at the right place in the flow.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-31	0x0	Reserved.

### 3.4.10.11 Set Package Data (0x070A)

This command is equivalent to the reception of a PLDM FW Update *GetPackageData* command. This command assumes that any package data is smaller than 4K and hence is contained within a single command. This command should be sent as part of the NVM update as the first command in the flow.

**Table 3-131. NVM Set Package Data Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x070A	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value/VFID	6-7		Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-18		Reserved.
Command Flags	19		<b>Bit 19.0:</b> Delete PackageData If set, the current PackageData stored by firmware is deleted. If this bit is set, buffer size is zero. <b>All other bits</b> = Reserved. Must be set to zero.
Reserved	20-23		Reserved.
Data Address High	24-27		Address of command buffer. The buffer contains the PackageData.
Data Address Low	28-31		

**Table 3-132. NVM Set Package Data Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x070A	Command opcode.
Datalen	4-5		
Return Value	6-7		Return Value. 0x0 = No error (success). EPERM = NVM update is not allowed (between activate and reset or lock-down). EINVAL = Error in parsing of the content of the package data. EBUSY = The PF is not permitted to post this command because it does not own the NVM resource. This error code is also returned if the PF attempts to post a command while another NVM command is in process. EACCESS = Attempt to request an update of a RO area.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-18		Reserved.
Flags	19		<b>Bit 19.0:</b> Skipped Entries If set, some of the update requests will be skipped due to unknown PFA TLVs or unknown VPD keys. <b>All other bits</b> = Reserved.
Reserved	20-23		Reserved.

**Table 3-132. NVM Set Package Data Response [continued]**

Name	Byte.Bit	Value	Remarks
Data Address High	24-27		Address of command buffer.
Data Address Low	28-31		

### 3.4.10.11.1 Buffer of NVM Set Package Data Command

The content of the buffer is the *PackageData* as read by the tool from the PLDM header. The size of this buffer is up to 1 KB.

The content is as follows:

- Byte [0].Bit 0 — PFA Preserve (default mode). Should be set to zero.
- Byte [0].Bits [7:1] — Reserved
- Byte[1] — Reserved
- TLV as follows:
  - Type — 2 bytes:
    - GFID - 0x1
  - Length — 2 bytes:
    - 36 words
  - Value:
    - 17:0 = Current GFID
    - 35:18 = Original GFID
- The following set of TLVs as needed:
  - Type — 2 bytes:
    - TLV + Offset update - 0x10 // used to update TLVs
  - Length — 2 bytes:
    - According to size of value (in words)
  - Value:
    - uint16: TLV number
    - uint16: Offset in words (offset 0 is the beginning of the TLV data)
    - uint16: Data length in words
    - Variable: Data
- The following set of TLVs as needed:
  - Type — 2 bytes:
    - VPD Key update - 0x11 // Used to update VPD entries
  - Length — 2 bytes:
    - According to size of value (in words)

— Value:

- uint16: VPD key (ascii - e.g. V2 = 0x5632 (ascii('V'), ascii('2')))
- uint16: Data length (in bytes) // should match current VPD entry size - error otherwise
  - Note:** If Data Length is odd, add a pad byte at end of data to make the TLV word aligned.
- Variable: Data

#### Notes:

- The TLVs can be in any order.
- Although this command is received at the beginning of the update flow, the actual programming of the PFA happens at the end (before the activation).
- The treatment of a PackageData received via *GetPackageData* PLDM firmware update command should be the same as described above.
- For all changes received via this package, regular PFA protection applies as defined in NVM Write admin command. The MinSrev and NetlistMinSrev can be changed according to the regular checks.
- After updating the VPD, the checksum in the VPD RV tag should be updated.
- If a modification of an unknown PFA tag or VPD key is requested, the command is accepted, and this tag/key is ignored. This is indicated via the *Skipped Entries* flag.
- To be able to modify parts of the VPD RO tag, the *VPD Write Enable* bit in NVM should be set. If not set, and modifications of the RO VPD area are requested the command will fail.
- If command 0x070A is received more than once, the last version is retained, even if faulty.
- If unknown TLVs or PFA TLVs with wrong size or VPD keys with wrong size are part of the PackageData, the command will fail.
- An NVM Write Activate command (0x0707) or PLDM *CancelUpdate* or PLDM *ActivateFirmware* or PLDM timeout will invalidate the content received in this command. For a new update, the command should be sent again.

**Note:** In Recovery Firmware mode, the following applies for the PackageData:

- The flags must follow the same rules as the normal firmware.
- The GFID check is not done, as the current GFID is not trusted.
- TLV data is ignored and no changes are done to the PFA. The *Skipped Entries* flag is set in the response. This also means that an update in Recovery mode that successfully restored to regular firmware should be reapplied when the regular firmware is running, to apply PFA change.

### 3.4.10.12 Pass Component Table (0x070B)

This command is equivalent to the reception of a PLDM firmware Update *PassComponentTable* command. This command is sent once per component. This command should be sent as part of the NVM update only after the Set Package Data command is sent and before the update actually starts. The E810 assumes these commands are going to be sent until the *TransferFlag* is set to *End* or *StartAndEnd*.

**Table 3-133. NVM Pass Component Table Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See Section 9.5.5.2.1 for details.
Opcode	2-3	0x070B	Command opcode.
Datalen	4-5		Length in bytes of command buffer.
Return Value/VFID	6-7		Must be zeroed by the software device driver.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
Reserved	16-18		Reserved.
TransferFlag	19		Possible values: 0x1 = Start 0x2 = Middle 0x4 = End 0x5 = StartAndEnd <b>Note:</b> This <i>TransferFlag</i> is ignored by firmware for now.
Reserved	20-23		Reserved.
Data Address High	24-27		Address of command buffer. Contains the component table.
Data Address Low	28-31		

**Table 3-134. NVM Pass Component Table Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x070B	Command opcode.
Datalen	4-5		
Return Value	6-7		Return Value. 0x0 = No error (success). EPERM = NVM update is not allowed (between activate and reset or lock-down). EBUSY = The PF is not permitted to post this command because it does not own the NVM resource. This error code is also returned if the PF attempts to post a command while another NVM command is in process. EINVAL = Wrong parameters.
Cookie High	8-11	Cookie	Opaque value copied by the EMP into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the EMP into the completion of this command.
ComponentResponse	16		<i>ComponentResponse</i> as described in DSP0267: 0 = Component can be updated - <i>ComponentResponseCode</i> must be set to 0x00. 1 = Component cannot be updated - A <i>ComponentResponseCode</i> greater than zero must be provided to explain the reason why the component cannot be updated, or if a flag is required to be set in <i>UpdateOptionFlags</i> field within the <i>UpdateComponent</i> request. 2 = Component should not be updated with this image (this is not part of the DSP0267 spec, but provides more information to host). The matching <i>ComponentResponseCodes</i> are denoted below. All other values reserved. This value reflects the update status of this module. Possible <i>ComponentResponse</i> in Recovery Firmware: Netlist: Same as in regular firmware (0x1 0x2 0x3). NVM: 0x3 = Partial Check. 0x2 - Component should not be updated with this image in case of <i>ComponentResponseCode</i> = 0x6 0x5 0x7.

**Table 3-134. NVM Pass Component Table Response [continued]**

Name	Byte.Bit	Value	Remarks
ComponentResponseCode	17		<p><i>ComponentResponseCode</i> as defined in DSP0267 and as described in <a href="#">Section 12.8.4.2.4</a>:</p> <p>0x00 = Component can be updated.</p> <p>0x01 = Component comparison stamp is identical to the firmware component comparison stamp in the FD. The device accepts such an update, but the software should reflect this to the user.</p> <p>0x02 = Component comparison stamp is lower than the firmware component comparison stamp in the FD (downgrade). The device accepts such an update, but the software should reflect this to the user.</p> <p>0x03 = Invalid component comparison stamp. The device rejects the request and returns a <i>ComponentResponse</i> = 2. Returned, among others, if GFID does not match.</p> <p>0x04 = Component has conflict with another component provided in a separate <i>PassComponentTable</i> command.</p> <p>0x05 = Prerequisites for this component have not been met. Returned if 0x70A was not sent before this command. The device rejects the request and returns a <i>ComponentResponse</i> = 2.</p> <p>0x06 = Component is not supported on FD. The device rejects the request and returns a <i>ComponentResponse</i> = 2.</p> <p>0x07 = Security restrictions prevent component from being downgraded. Should include Srev check. The device rejects the request and returns a <i>ComponentResponse</i> = 2.</p> <p>0x08 = Incomplete component image set was received. Not used.</p> <p>0x09 = Reserved.</p> <p>0x0A = Component version string is identical to the firmware component version string in the FD. The device accepts such an update, but the software should reflect this to the user.</p> <p>0x0B = Component version string is lower to the firmware component version string in the FD. The device accepts such an update, but the software should reflect this to the user.</p> <p>All other values are reserved.</p> <p>In case of Recovery Firmware, the following values are returned based on partial data:</p> <p>0x00 = Component can be updated.</p> <p>0x05 = Pre-requisites for this component have not been met. Returned if 0x70A was not sent before this command. The device rejects the request and returns a <i>ComponentResponse</i> = 2</p> <p>0x06 = Component is not supported on FD. The device rejects the request and returns a <i>ComponentResponse</i> = 2</p> <p>0x07 = Security restrictions prevent component from being downgraded. Should include Srev check. The device rejects the request and returns a <i>ComponentResponse</i> = 2 (NVM SREV)</p> <p>0x0A = Component version string is identical to the firmware component version string in the FD. The device accepts such an update, but the software can reflect this to the user. (netlist)</p> <p>0x0B = Component version string is lower to the firmware component version string in the FD. The device accepts such an update, but the software can reflect this to the user. (netlist)</p>
Reserved	18-23		Reserved.
Data Address High	24-27		Address of command buffer.
Data Address Low	28-31		

### 3.4.10.12.1 Buffer of NVM Pass Component Table Command

The buffer of NVM Pass Component Table command contains the Component Table as passed to the device by the PassComponentTable PLDM firmware command as described in DSP0267 *PassComponentTable* command and described in [Table 3-135](#). For more information, see [Section 12.8.5](#)

**Table 3-135. Component**

Type	Name	Format/Value
uint16	<b>ComponentClassification</b>	Should be 0x000A - Firmware for all components.
uint16	<b>ComponentIdentifier</b>	NVM = 0x6 OROM = 0x5 Topology Net List = 0x8
uint8	<b>ComponentClassificationIndex</b>	0x0 - Not used.
uint32	<b>ComponentComparisonStamp</b>	As defined in <a href="#">Section 12.8.5.2.1</a>
enum8	<b>ComponentVersionStringType</b>	ASCII = 1
uint8	<b>ComponentClassificationIndex</b>	The length, in bytes, of the ComponentVersionString.
Variable	<b>ComponentVersionString</b>	As defined in <a href="#">Section 12.8.5.2.1</a> .

## 3.4.11 VPD Support

The Flash image can contain an area for VPD. This area is managed by the OEM vendor and does not influence the behavior of hardware. The VPD area is stored in the PFA with a *TLV Type* of 0x2F. A value of 0b in the GLPCI\_CAPCTRL.VPD\_EN register bit means VPD is not supported and the VPD capability does not appear in the configuration space. The register bit must be set to 1b in NVM only once the VPD area has been programmed. Refer to [Section 3.4.5.3.1](#).

The maximal VPD area size provisioned in Shadow RAM is 1 KB, but it can be smaller. The VPD block is built from a list of resources. A resource can be either large or small. The structure of these resources are listed in [Table 3-136](#) and [Table 3-137](#).

**Table 3-136. Small Resource Structure**

Offset	Content
0	Tag = 0xxx,xyyyb (Type = Small(0), Item Name = xxxx, length = yy bytes)
1-n	Data

**Table 3-137. Large Resource Structure**

Offset	Content
0	Tag = 1xxx,xxxxb (Type = Large(1), Item Name = xxxxxxx)
1:2	Length
3-n	Data

The E810 parses the VPD structure during the auto-load process following PCIe reset to detect the read-only and read/write area boundaries. The E810 assumes the following VPD fields with the limitations listed:

**Table 3-138. VPD Structure Tags**

Tag	Length (Bytes)	Data	Resource Description
0x82	Length of identifier string	Identifier	Identifier string.
0x90	Length of RO area	RO data	VPD-R list containing one or more VPD keywords.
0x91	Length of RW area	RW data	VPD-W list containing one or more VPD keywords. This part is optional.
0x78	n/a	n/a	End tag.

VPD structure limitations:

- The structure must start with a tag = 0x82.
- The structure must end with a tag = 0x78 before the Shadow RAM's end. The tag must also be word-aligned.
- If the E810 does not detect a value of 0x82 in the first byte of the VPD area, or if no end tag is detected, or if the structure does not follow the information listed in [Table 3-138](#), it assumes the area is not programmed:
  - Any read/write access through the VPD registers set are ignored.
  - EMP considers the VPD area as an empty module and thus allows NVM Update commands to be performed over the area pointed by the VPD area pointer, up to the start of another RO module.
  - The VPD pointer itself remains RO.
- The RO area and RW area are both optional and can appear in any order. A single area is supported by per-tag type. Refer to Appendix I in the PCI 3.0 specification for details of the different tags.
- If a VPD-W tag is found, the area defined by its size is writable via the VPD structure.
- The VPD area can be accessed through the PCIe configuration space VPD capability structure listed in [Table 3-138](#). Write accesses to a RO area or any accesses outside of the VPD area via this structure are ignored. If the *VPD Write Enable* field is set to 1b in the NVM Security Control word and the entire VPD area can be modified via the NVM Update AQ command. Otherwise, the command is completed with an error status.
- VPD area must be mapped into the first valid basic bank of the Flash.
- VPD software does not check the NVM ownership before attempting to access the Flash via dedicated VPD registers (refer to [Section 14.3.4](#)). VPD software write access is recorded in the Flash immediately once the Flash part is available (such as not busy by a previous sector erase operation). Refer to [Section 3.4.5.3](#) for more details.

## 3.5 General Purpose I/O (GPIO) and LED

The E810 provides two types of GPIOs:

- Low latency GPIOs, that are directly controlled by the device registers.
- Standard GPIOs that are provided by an I/O Widget.

Four direct, low latency GPIOs are connected directly to single-ended 3.3 V IO pads, plus one differential output. In addition to the direct low latency GPIOs, the E810 controls an I/O Widget that provides an additional 20 GPIOs, which can be used either as SDPs or LEDs.

In total the E810 provides the following:

- Four direct low latency single-ended GPIOs, plus one differential output, mostly used for TimeSync application.
- An additional 20 GPIOs, controlled using an I/O Widget. The I/O Widget IP is able to provide up to 32 general-purpose GPIO pins. However, the following SDP/LED are externally connected.
  - 8 SDP pins, mostly for allowing direct control of SFP modules (for example, the MOD\_ABS pin).
  - 12 LED pins that can be divided into 3 LEDs per port in 4 SFP+ configuration.

**Note:** The I/O Widget generates LEDs and SDPs with the same feature set, so the division to 12 LEDs and 8 SDPs is provided only as an example to typical low port count application

### 3.5.1 E810 I/O Widget SDP and LED

The E810 controls an I/O Widget, which provides 8 SDPs and 12 LEDs. The I/O Widget is accessed using register access commands.

The eight widget SDPs are used for Ethernet link management purposes, as follows:

- Directly controlling link topology components, such as external PHY or re-timer. This is mostly used in low port count applications (such as reset or interrupt line).
- Detecting SFP module existence, in low port count applications (such as MOD\_ABS).

The 12 widget SDP/LED pins can be used as additional SDPs, for functions as described above or can be used as LEDs for low port count applications, up to three LEDs per port in 4-port configurations.

When a port has three dedicated LED pins, they are be configured as follows:

- One activity LED.
- One LED indicating the LINK is running at highest available speed (firmware only sets the highest Link speed in the LED control).
- One LED indicating the LINK is up but not at the highest speed available (firmware sets all speeds but the highest).

Another possible configuration is in a case of a break-out cable with QSFP+ cage. In this case there are only three LED pins for the entire cage that operates this way:

- One activity LED.
- One LED indicating that all LINKs in this cage are running at highest available speed (firmware configuration is TBD).
- One LED indicating at least one LINK in this cage is up (firmware sets all speeds but the highest).

The link topology netlist define how to use the I/O Widget SDP and LEDs. See [Section 3.3](#).

### 3.5.1.1 E810 GPIO Pin Names

Table 3-139 summarize the GPIO pin names:

**Table 3-139. E810 GPIO Pins**

Pin Name	Source	Signal Name	Control Register	Usage
SDP0	I/O Widget	iow_gpio_o/i[0]	IOW/GPIO_CTL[0]	LED or SDP assigned via the link topology netlist.
SDP1	I/O Widget	iow_gpio_o/i[1]	IOW/GPIO_CTL[1]	
SDP2	I/O Widget	iow_gpio_o/i[2]	IOW/GPIO_CTL[2]	
SDP3	I/O Widget	iow_gpio_o/i[3]	IOW/GPIO_CTL[3]	
SDP4	I/O Widget	iow_gpio_o/i[4]	IOW/GPIO_CTL[4]	
SDP5	I/O Widget	iow_gpio_o/i[5]	IOW/GPIO_CTL[5]	
SDP6	I/O Widget	iow_gpio_o/i[6]	IOW/GPIO_CTL[6]	
SDP7	I/O Widget	iow_gpio_o/i[7]	IOW/GPIO_CTL[7]	
SDP8	I/O Widget	iow_gpio_o/i[8]	IOW/GPIO_CTL[8]	
SDP9	I/O Widget	iow_gpio_o/i[9]	IOW/GPIO_CTL[9]	
SDP10	I/O Widget	iow_gpio_o/i[10]	IOW/GPIO_CTL[10]	
SDP11	I/O Widget	iow_gpio_o/i[11]	IOW/GPIO_CTL[11]	
SDP12	I/O Widget	iow_gpio_o/i[12]	IOW/GPIO_CTL[12]	
SDP13	I/O Widget	iow_gpio_o/i[13]	IOW/GPIO_CTL[13]	
SDP14	I/O Widget	iow_gpio_o/i[14]	IOW/GPIO_CTL[14]	
SDP15	I/O Widget	iow_gpio_o/i[15]	IOW/GPIO_CTL[15]	
SDP16	I/O Widget	iow_gpio_o/i[16]	IOW/GPIO_CTL[16]	
SDP17	I/O Widget	iow_gpio_o/i[17]	IOW/GPIO_CTL[17]	
SDP18	I/O Widget	iow_gpio_o/i[18]	IOW/GPIO_CTL[18]	
SDP19	I/O Widget	iow_gpio_o/i[19]	IOW/GPIO_CTL[19]	
SDP20	Controller Core	gbe_o/i_gpio[0]	GLGEN_GPIO_CTL[0]	1588 timing support.
SDP21	Controller Core	gbe_o/i_gpio[1]	GLGEN_GPIO_CTL[1]	
SDP22	Controller Core	gbe_o/i_gpio[2]	GLGEN_GPIO_CTL[2]	
SDP23	Controller Core	gbe_o/i_gpio[3]	GLGEN_GPIO_CTL[3]	
CLK_OUT_p/n	Controller Core	gbe_o/i_gpio[5]	GLGEN_GPIO_CTL[5]	

**NOTE:**      *This page intentionally left blank.*

## Chapter 4 Initialization

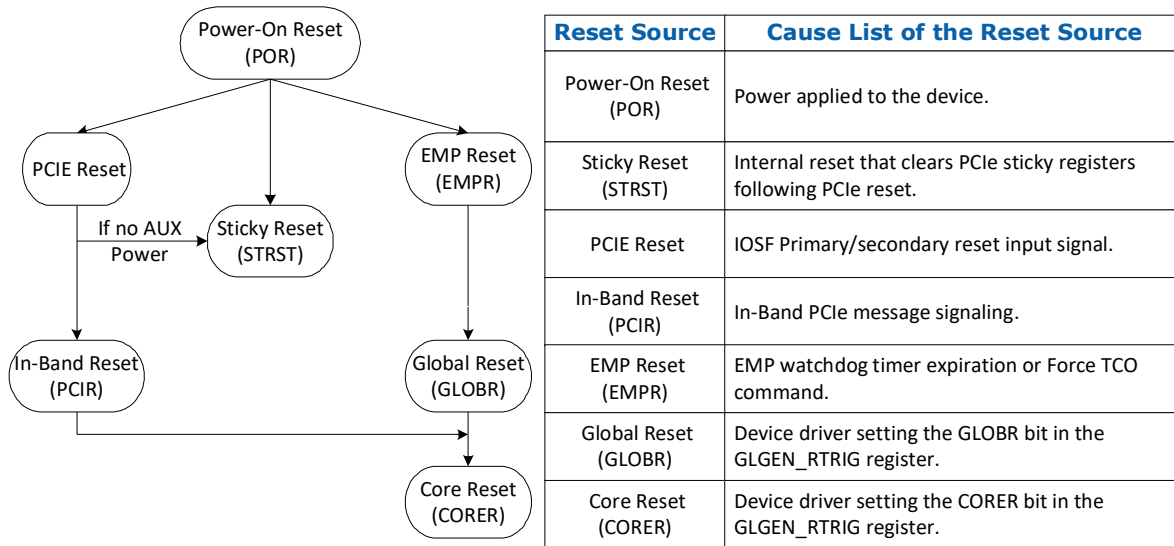

### 4.1 Reset Operation

The following sections lists the hardware and software reset sources that initialize the entire portions of the E810 and function-level resets. The reset sources are listed in [Section 4.1.1](#) and the reset flows are detailed in [Section 4.1.2](#).

#### 4.1.1 Reset Sources

This section lists the reset sources supported by the E810, while the complete list of initialized logic is listed in [Table 4-1](#).

A hierarchical reset tree is shown in the [Figure 4-1](#). Any logic initialized by a specific reset is initialized also by any other reset source that is linked to it and located above it in the reset tree.

**Figure 4-1. Hierarchical Hardware Reset Tree**

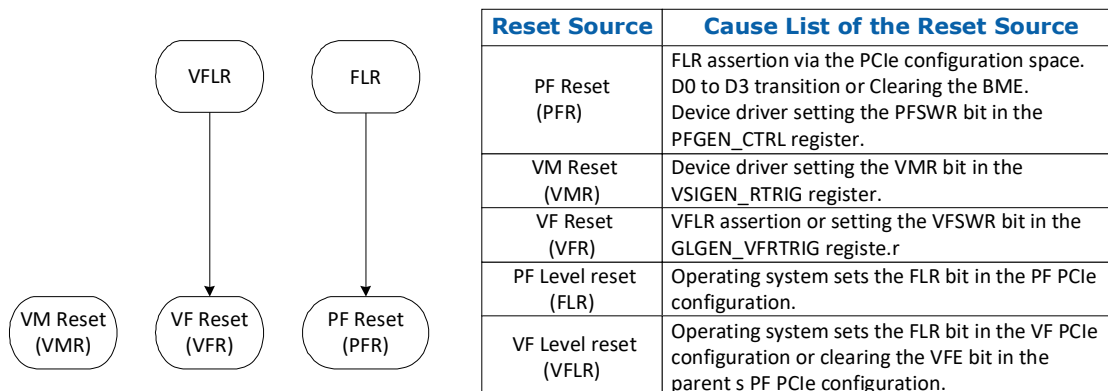

Figure 4-2. Function Virtual Resets

#### Hardware Resets:

- **Power-On Reset (POR)** — A full power-on flow is translated to sideband reset and global reset signals to the E810.
- **PCIe Reset (primary reset de-assertion)** — The primary reset signal is kept at the low level when the system is at power-down state and at system boot. PCIe reset triggers de-assertion of primary reset. If there is no AUX power, the PCI reset generates an internal STRST signal that clears PCIe sticky bits as listed in Table 4-1. De-assertion of primary reset also triggers internally a PCIR, which is detailed later in this section. Global reset is also de-asserted if link is not needed for APM and manageability is disabled.
- **Sticky Reset (STRST)** — Sticky reset is internal signal triggered by PCIe reset when the E810 is not powered by AUX power. This reset clears sticky registers in the PCIe interface (as defined by the PCIe specification). The sticky reset is also initiated by POR.
- **In-Band Reset (PCIR)** — PCIe supports in-band signaling for PCIe reset (called PCIR). Any cycles on the PCIe bus are gated instantly as well and packet transmission generated by software. The entire data path is initialized other than the EMP cluster. Although the EMP subsystem is not initialized, some packets of the EMP might be lost during a short window of about 1  $\mu$ s.
- **Core Reset (CORER)** — CORER initializes the shared data path for all functions excluding the EMP subsystem, PCI interface, and MAC/PHY logic of all ports. Any further master cycles of all PFs and VFs are not initiated while some packets that were already fetched completely might still be sent out. Even though the EMP subsystem is not cleared, pass-through traffic might be inhibited during the initialization cycle that might take  $\sim$ 20 ms. Also, SMBus accesses are responded with NACK during the initialization cycle. This reset is not expected to be used other than as an escape mechanism in case the E810 hangs and the PFR did not resolve the problem. This reset is initiated by the PFs by setting the CORER bit in the GLGEN\_RTRIG register. The EMP initiates this reset by setting a bit in an internal register. As seen in Figure 4-1, this reset is also set as part of EMPR reset or Global reset (higher level reset).
- **Global Reset (GLOBR)** — GLOBR is a superset CORER initializing any logic initialized by the CORER, plus the MAC/PHY logic of all ports (both internal PHY and external PHY if connected). This reset is not expected to be used other than escape mechanism in case CORER did not resolve the problem. This reset is initiated by the PFs by setting the GLOBR bit in the GLGEN\_RTRIG register. The EMP initiates this reset by setting a bit in an internal register. Global reset is also initiated following a Force TCO command (if it is not disabled by the Force TCO Reset Disable bit in the NVM). As seen in Figure 4-1, this reset is also set as part of EMPR reset (higher level reset) and this reset also generates CORE reset.

- **EMP Reset (EMPR)** — EMPR initializes the resources and data path connected to the EMP including its firmware reload (excluding internal-SR). EMPR is triggered internally by the EMP watchdog timer expiration or by EMP setting an internal flag or due to Force TCO command or due to uncorrectable ECC error in one of the EMP memory shells. As seen in [Figure 4-1](#), this reset generates CORE reset and global reset.

#### Function-Level Resets:

- **Function Level Reset (FLR)** — The E810 supports the standard FLR interface in the Device Control register of the PCIe capability structure within the PCI configuration space of the PFs. Setting the *FLR* bit initializes the PCI configuration of the PF (including the *VFE* flag in the SR-IOV Control/ Status register that disables all the VFs of the PF) and initiates an internal PFR described later in this section.
- **PF Reset (PFR)** — PFR initializes the resources and data path of the PF and its VFs with no impact on other PFs, VFs, or the EMP subsystem. Any further master cycles of the PF are not initiated while some packets that were already fetched completely might still be sent out. The PFR is generated by one of the following four causes:
  - D0 to D3hot transition, which is also known as ACPI reset.
  - FLR
  - PF software sets the *PFSWR* bit in the *PFGEN\_CTRL* register.
  - De-assertion of the *Bus Master Enable* flag in the PCI configuration space.
- **VF Level Reset (VFLR)** — The E810 supports the standard VFLR interface in the Device Control register of the PCIe capability structure within the PCI configuration space of the VFs. Setting the *VFLR* bit initializes the PCI configuration of the VF and initiates an interrupt to the PF that completes the VFR reset described later in this section. Clearing the *VFE* flag in the PF configuration space also impacts all its VFs the same as a VFLR.
- **VF Reset (VFR)** — VFR initializes the resources and data path of the VF with no impact on other PFs, VFs, or the EMP subsystem. Any further master cycles of the VF are not initiated, while some packets that were already fetched completely might still be sent out. The VFR is generated by one of the following two causes:
  - VFLR or clearing the *VFE* bit of the parent PF. Note that after the *VFE* bit is cleared, the PF driver should follow the VFR flow for all the VFs of the PF, including those VFs that are not enabled.
  - PF software sets the *VFSWR* bit in the *VPGEN\_VFRTRIG* register of its VF.
- **VM Reset (VMR)** — There are 768 VSIs. VMR is a mechanism to reset a VSI. VMR initializes the resources and data path of the VM with no impact on other PFs, VFs, VMs, or the EMP subsystem. Any further master cycles of the VM are not initiated, while some packets that were already fetched completely might still be sent out. The VMR is generated by the PF software setting the *VMSWR* bit in the *VSIGEN\_RTRIG* register.

**Table 4-1. Device Logic Affected by the Reset Sources**

Reset Activation	POR	STRST / PCIR / PERST	EMPR	GLOBR	CORER	FPR / FLR	VMR	VFR / VFLR
Load the NVM to the Shadow RAM in the hardware and clear the alternate structure	+							
Load the EMP and PE firmware from the NVM	Both+	PE	Both+	PE	PE			
Load device settings from NVM shadow and alternate structure (see details listed in <a href="#">Table 6-2</a> and the reset flow sections that follow)	Shad	Both	Both	Both	Both			
PF MAC Addresses (switch and WoL) <sup>1</sup>	+	+ <sup>1</sup>	+	+	+	+		
MAC and PHY interface	+	1	+	+

Interrupt cause control registers	+	+	+	+	+	By the PF SW	By the PF SW	By the PF SW

**Table 4-1. Device Logic Affected by the Reset Sources [continued]**

Reset Activation	POR	STRST / PCIR / PERST	EMPR	GLOBR	CORER	FPR / FLR	VMR	VFR/ VFLR
RSS key and table	+	+	+	+	+	PF		VF
Invalidate FD filters	+	+	+	+	+	PF	VM (FW clears all filters on VSI clear)	VF
Invalidate all internal caches: transmit and receive queue contexts; PE Quad Hash.	+	+	+	+	+			
Invalidate the FPM tables of the PF and its VFs (function private memory).	+	+	+	+	+	PF and its VFs		VF

1. PF MAC Addresses (switch and WoL) are cleared by hardware at POR and loaded from NVM by the firmware at any of the highlighted reset causes. Following PCIR, the switch MAC Addresses are loaded following the assertion of the PCIe reset or in-band reset, and the WoL MAC Addresses are loaded only following the de-assertion of the PCIe reset. The MAC and PHY are cleared only if link is not needed for APM and MNG is disabled. GLOBR if link is not needed for APM and MNG is disabled. If the WUC filter is inactive and no port is needed by firmware/MNG (PRTPM\_GC.EMP\_LINK\_ON is clear), GLOBR is maintained low by hardware during PCIR de-assertion for power savings.
2. Sticky PCIe context is cleared on PERST if no AUX power as documented in [Section 14.2.1](#).
3. For exception list of registers that are not cleared on PFR, see [Section 14.2.1](#).
4. The E810 has several flags that control the Bus Master Enable (BME). BME flags on the PCI configuration space (for each PF and VF) and the VMRD flag in the VSIGEN\_RSTAT registers for each VM that is not a VF. The BME flags of all PFs are cleared by all reset causes indicated by + symbol and a specific PF by FLR. The BME flags of all VFs are cleared by all reset causes indicated by + symbol and a specific VF by VFLR. The VMRD flags of all VSIs are set by all reset causes indicated by + symbol and a specific VSI by VMR. Note that as opposed to BMEs of the function that are cleared by the previous resets (disabling master accesses), the VMRD flags are set (enabling bus master accesses when the BME of their parent PF is set as well).
5. VSIs and its related switch context are cleared by admin command(s) initiated by the software.
6. Note that as opposed to any logic in the E810 that is initialized at the leading edge of PERST#, the WoL filters are initialized at the de-assertion of PERST# (entering the D0u state).

**Table 4-2. NVM Section Loaded by Reset Source Covered by GLNVM\_ULD Register**

NVM Section	POR	PERST	PCIR	EMPR	GLOBR	CORER

PHY Analog Configuration	+					
EMPR Registers Auto-Load	+			+		

## 4.1.2 Hardware Reset Flows

This section describes the reset flows in the E810 and software interaction.

### 4.1.2.1 POR Flow

Power-up sequence described in this document starts at power-on reset towards the E810.

1. Power-on reset is de-asserted. Crystal clocks are stable and toggling, and memory repair process has completed.
2. IPs perform fuse polling. At that stage, the SPI controller is ready to accept messages from other IPs.
3. The E810 derives an ECDSA384 key-pair from the Unique Device Secret (UDS). The private key is stored in secure memory in the crypto accelerator block, while the public key is exposed to the host in device registers.
4. The E810 starts its boot process, checks the validity of the NVM, and loads the initial firmware code (mini-loader). The mini-loader code is authenticated by the E810.

**Note:** PCI reset de-assertion occurs at least 100 ms after power-up flow is started. Since flow duration is less than 100 ms, it is guaranteed that firmware is ready for PCI reset de-assertion at the end of this stage.

- a. E810 firmware loads a small subset of configurations from the NVM into Shadow RAM (timing critical configurations or ones that might be later modified by software).
5. First load process. E810 firmware loads:
  - a. HIP's PLL configuration to the HIP modules. HIP's auto-loaded data is pushed over SB-IOSF by the E810.
  - b. CSR protected list.
  - c. POR section from Shadow RAM.
6. E810 firmware loads and authenticates the full firmware code content.
7. Second load process:
  - a. E810 firmware loads the full HIP configuration.

Figure 4-3 shows the stages through the power-up sequence. The numbers relate to the steps previously described.

Figure 4-3. External Power-On Flow

Table 4-3 lists the timing of each of the steps.

**Table 4-3. External Power-Up Sequence**

Step		Duration (ms) <sup>1</sup>	Completion Time from Start (ms) <sup>2</sup>
1	Power-on reset.	0	40
2	Read fuse and straps information.	4	44
3	Load mini-loader from the NVM <sup>3</sup> + Load Shadow RAM from the NVM.	20	64
4	Initial configuration of hardware blocks (auto-load).		

1. The time it takes to complete the respective step (usually defines the maximum duration).
2. The time the respective step ends, counting from beginning of the power-up sequence. It usually defines the latest time this step might end.
3. All NVM loads assumes an NVM clock speed of 50 MHz and a quad SPI interface + authentication process done by firmware.

### 4.1.2.2 Primary Reset and In-Band PCI Reset Flow

The internal reset flow is shown in Figure 4-4 and described in this section. In case of multiple hosts, these resets are per host.

**Note:** Core reset might be extended if none of the functions are enabled for WoL or Path-through.

**Figure 4-4. PCI Reset Flow**

Hardware response:

1. Avoid any further master accesses on the PCIe bus and discard any completions for the host.
2. Reset PCIe registers and core registers as listed in Table 4-1.
3. The following flags are cleared by the E810 when:
  - The \*\_DONE bits in GLNVM\_ULD register are cleared.
4. The E810 loads the NVM section into hardware. After loading, the EMP might start responding to the Get Version Admin command, which is blocked until this stage.
  - When checking for hardware configuration to complete, software device driver should either wait for a response to Get Version Admin command, or poll on the \*\_DONE bits.

Following these steps, hardware is ready to accept operating system configuration cycles.

**Note:** EMP packets might be lost as well in a window frame of tens of milliseconds.

### 4.1.2.3 Core, Global, and EMP Reset Flows

The global resets can be initiated by the PF software or the EMP firmware. It is expected to be used as a mechanism to resolve potential hardware locks or synchronization lose, bringing the E810 to a known functional state. These global resets impact all PFs (and their VFs) as well as the EMP subsystem (EMP reset only). Therefore, graceful flow is enabled by hardware as shown in Figure 4-5 and described in the following sections. The software initiates the global resets by the GLGEN\_RTRIG register. The EMP can access the same register or use an internal register.

As seen in the “Hierarchical Reset Tree” diagram (Figure 4-1):

- EMPR reset also triggers a global reset and a core reset.
- Global reset can be self asserted. When asserted, it also triggers a core reset.
- Core reset can be self-asserted.

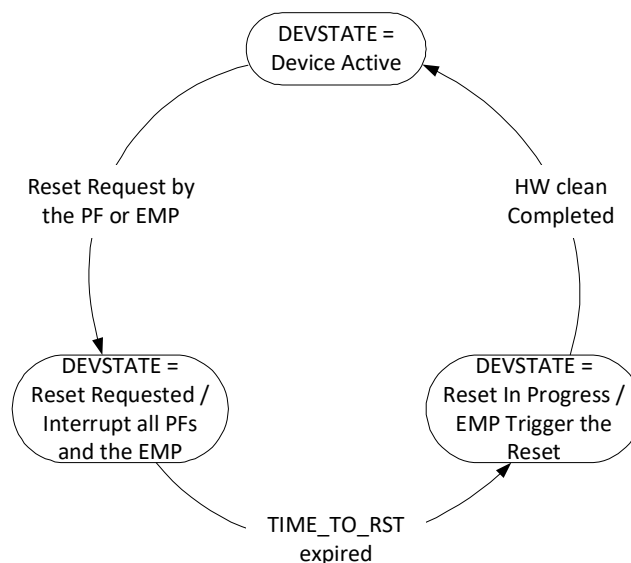

Figure 4-5. Global Reset Flow

#### 4.1.2.3.1 Software and Firmware Interface

- **GLOBR/CORER** — Setting the *GLOBR* flag or *CORER* flag in the GLGEN\_RTRIG register triggers a graceful global/core reset, respectively.
- **EMPFWR** — EMP firmware watchdog expiration or EMP setting internal EMP reset flag, triggers a graceful EMP reset (EMPR).
- **DEVSTATE** — Global device state exposed to all PFs in the GLGEN\_RSTAT registers. The DEVSTATE can be at one of the following states: device active, reset requested, or reset in progress.
- **RESET\_TYPE** — The RESET\_TYPE reflects the last reset cause initiated to the E810. It changes its state once any of the following reset sources is triggered. The RESET\_TYPE can be at one of the following states: POR, CORER, GLOBR, or EMPR.
- **RST\_CNT** — The GLGEN\_RSTAT reflects the following counters: CORERCNT, GLOBRCNT, and EMPRCNT. These fields are each 2-bit counters. They count the matched reset completion events since POR.

#### 4.1.2.3.2 CORER Flow

The PF software or EMP firmware initiates a graceful core reset by setting the *CORER* flag in the *GLGEN\_RTRIG* register and polling the E810 state in the *GLGEN\_RSTAT* register.

**Note:** If a *CORER* occurs while internal Shadow RAM is inconsistent with Flash Shadow RAM content, an *EMPR* is triggered as part of the *CORER* flow.

Hardware/EMP firmware response:

1. Changes to the *GLGEN\_RSTAT* register are as follows:
  - a. Set *DEVSTATE* to reset requested.
  - b. Set *RESET\_TYPE* to *CORER* indicating the requested reset.
  - c. Initiate a *GRST* interrupt to all PFs and EMP that the reset is about to be fired by hardware.
2. As a response to interrupt, EMP reads *TIME\_TO\_RST* by the *GLGEN\_RSTCTL.GRSTDEL* value and start counting down. When timer expires, EMP triggers the reset via the *GLGEN\_IMRTRIG* register. The *\*\_DONE* bits in *GLNVM\_ULD* are cleared by the E810 when reset is asserted.
3. The EMP firmware performs a re-authentication of the currently active NVM bank. This can take place in parallel to the countdown to reset.
4. Clear the entire transmit and receive data path and core registers as listed in [Table 4-1](#).
5. Avoid any further master accesses on the PCIe bus and discard any completions for the entire device, and abort any transmission in progress (including packets sent by the EMP).
6. Reset internal device logic excluding EMP cluster, PCI interface, and MAC/PHY cluster as listed in [Table 4-1](#).
7. Once the reset flow is completed, update the *GLGEN\_RSTAT* register as follows:
  - a. Set *DEVSTATE* to device active.
  - b. Increment the *CORERCNT* by one.
8. The E810 loads the NVM section into hardware. After loading, the EMP might start responding to the Get Version Admin command, which is blocked until this stage.

Following the *GRST* interrupt, all PFs poll the E810 state in the *GLGEN\_RSTAT* register.

1. Keep polling the register as long as *DEVSTATE* is not equal to device active. The *GLGEN\_RSTAT* register also indicates the number of the initiated global resets via the *GLGEN\_RTRIG* register (*CORER*, *GLOBR*, *EMPR*). These counters might be needed in case a function initiated consecutive global reset before all other functions had the chance to realized that the previous reset was completed. It is a good practice to avoid too frequent global resets to avoid such cases.
2. Check the *RESET\_TYPE* that indicates the reset that was initiated and follow the required initialization flow.

**Note:** Also, the function that initiated the reset should check the *RESET\_TYPE*, since it might reflect a stronger reset initiated by another function.
3. Check that the hardware completed to auto-load its settings from the NVM shadow and the alternate structure by polling the *\*\_DONE* flags in *GLNVM\_ULD* register.

**Note:** When checking for the EMP configuration to be done, software should either wait for a response to a Get Version Admin command or poll on the *\*\_DONE* bits.
4. The PFs proceeds with their software initialization flow.

#### 4.1.2.3.3 GLOBR Flow

Global reset is initiated by the PFs or the EMP by setting the *GLOBR* flag in the *GLGEN\_RTRIG*. As seen in the “Hierarchical Reset Tree” diagram (Figure 4-1), global reset also triggers core reset. The GLOBR flow is identical to the CORER flow with the following changes:

- GLOBR also initializes the MAC/PHY units.
- *GLGEN\_RSTAT.RESET\_TYPE* is set by the hardware to GLOBR (rather than CORER).
- Increment the *GLOBRCNT* by one (rather than *CORERCNT*).
- Loading the E810 setting from the NVM is listed by the GLOBR column in Table 4-2.

**Note:** If a GLOBR occurs while internal Shadow RAM is inconsistent with Flash Shadow RAM content, an EMPR is triggered as part of the CORER flow.

#### 4.1.2.3.4 EMPR Flow

EMPR reset is expected to be used by the EMP as a mechanism to resolve potential hardware locks or potential loss of synchronization between the firmware and hardware that are not expected to be resolved by CORER nor by GLOBR. The EMPR impacts also all PFs and their VFs. Therefore, the following graceful flow is recommended.

As seen in the “Hierarchical Reset Tree” diagram (Figure 4-1) EMPR reset also triggers and global reset and a core reset.

The EMP flow is identical to the CORER flow with the following changes:

- During normal operation, the EMPR can be initiated only by the EMP by setting an internal EMP reset flag.
- EMPR initializes also the MAC/PHY units as well as the EMP cluster.
- *GLGEN\_RSTAT.RESET\_TYPE* is set by hardware to EMPR (rather than CORER).
- Increment the *EMPRCNT* by one (rather than *CORERCNT*).
- Loading the E810 setting from the NVM is listed by the EMPR column in Table 4-2.

### 4.1.3 Function-Level Reset Flows

VF/VM/PF reset requests (*VPGEN\_VFRTRIG* for VF reset, *VSIGEN\_RTRIG* for VM reset, and *PFGEN\_CTRL.PFSWR* for PF reset) are ignored in the following cases:

- CORER reset is asserted (also during pre-indication of CORER)
- Between CORER de-assertion and CORER NVM load completion (*fleep\_al\_corer\_done* set)

**Note:** During a function-level reset, spurious malicious events might occur due to anti-spoof.

#### 4.1.3.1 PFR Flow

PFR resets a specific PF. For SR-IOV, it also resets the VFs of this PF. The reset flow is shown in Figure 4-6. It is initiated by the PF driver (setting the *PFSWR* bit in the *PFGEN\_CTRL* register) or operating system (setting the *FLR* flag in the Device Control register) or D0 to D3hot transition.

**Figure 4-6. PFR Triggers**

The PF hardware response to PFR is listed in [Table 4-1](#).

The E810 hardware initiates two orthogonal flows as a response to FLR:

**PCIe clean-up flow:**

1. Emulate internal VFR to all its VFs (the hardware response to VFR is described in [Section 4.1.3.3.3](#) with the exception that the VF's CSRs are not gated on read).
2. Avoid any further master accesses on the PCIe bus and discard any completions for the PF and its VFs.
  - a. Once all pending requests of the PF are completed, the *Transaction Pending* bit in the Device Status register in the PCIe configuration space is cleared.
  - b. Once all pending requests of each VF of the PF are completed, the *Transaction Pending* bit in the Device Status register the VF PCIe configuration space is cleared (per each VF).

**Data path clean up flow:**

1. Upon event, EMP does the next "pre hardware drain" clean ups:
  - a. Cleans up switch population of the PF.
  - b. Cleans up ACL population of the PF (as described in [Section 7.9.2.10](#)).
  - c. Cleans up RSS population of the PF (as described in [Section 7.10.11.2](#)).
  - d. Cleans and disables FD filters of the PF (as described in [Section 7.10.12](#)).
  - e. Disables mailbox queues and sideband queues of the PF and its VFs in SR-IOV mode, or its VMs when working in PASID mode (as described in [Section 9.5.3](#)).
  - f. Clears the enable bit of doorbell queues of the PF (doorbell queue context layout is described in [Section 10.5.5.6](#)).
  - g. Halts all the initialized transmit queues using the following flow (firmware must not halt an uninitialized queue):
    1. Set count down register GL\_TCVMLR\_QCNTR to the number of disabled queues
    2. Per each halted Tx-Queue, EMP sends queue halt command using GL\_TCVMLR\_QCTL register. Queue IDs are described in the global space.
    3. Tracks the completion of the multiple Q halt commands using GL\_TCVMLR\_QCNTR register. The entire Q halt operation is completed when this register is zeroed. Firmware can load value to this register only when it is equal to zero. Must not initiate any Q halt flow before the previous one is completed.

2. Via the GL\_XLR\_MARKER\_TRIG\* registers, EMP indicates to hardware to send a drain marker that drains the Tx data path, Rx data path, and PE data path orthogonally.
    - The specific GL\_XLR\_MARKER\_TRIG\* registers are:
      - GL\_XLR\_MARKER\_TRIG\_VMLR
      - GL\_XLR\_MARKER\_TRIG\_TCVMLR
      - GL\_XLR\_MARKER\_TRIG\_RCU\_PRS
      - GL\_XLR\_MARKER\_TRIG\_PE (should be written only if PW is enabled).
    - Draining the Tx and Rx data paths might take some time when the TC is paused by flow control. Hardware includes a timeout mechanism that prevents indefinite latency, as described in [Section 8.2.4.4.1](#).
    - As the second part of the data path clean up flow (cache clean-up phase after main data path is drained), PE firmware, cleans and disables QH filters of the PF (as described in [Section 7.10.12](#)).
- PFGEN\_PFRSTAT.PFRD indication is cleared when GL\_XLR\_MARKER\_TRIG\_VMLR is written.
3. When hardware drain flow ends, hardware sets the PFGEN\_PFRSTAT.PFRD and issues an interrupt to EMP.
  4. Upon interrupt (or firmware polling of PFRD), EMP sees that PFGEN\_PFRSTAT.PFRD is set, then does the following “post hardware drain” clean-ups
    - a. Firmware releases all resource of the PF and its VFs (for example, nodes in PSM and in PE scheduler, function profile, switch population).
  5. Firmware resets (zeros all fields) the QINT\_TXQCTL, QINT\_RXQCTL, and GLINT\_CEQCTL registers for the queues of the PF.
    - a. Disable the receive queues of the PF using the fast queue disable flow per each queue.
    - b. EMP polls that *Transactions Pending* flag in the PCI configuration space of the PF and of all its VFs until they are cleared.
  6. After all the previous steps are complete, firmware clears the PFSWR bit in the PFGEN\_CTRL register. As a response to PFSWR clearing, hardware releases bus master cycles for the PF and its VFs.
    - Before clearing the PFSWR bit in the PFGEN\_CTRL, the firmware must clear VFSWR bit in the respective VPGEN\_VFRTRIG register for all the PF’s VF, and the VMSWR bit in the VSIGEN\_VFRTRIG register for all the PF’s VSIs.
    - Firmware should clear the VFLRS bit of the corresponding VFs in the GLGEN\_VFLRSTAT register.

The PF software polls the PFSWR bit until it is cleared (indicating that hardware completed its reset flow). Additionally, software should also poll the *Transactions Pending* flag in the PCI configuration space of the PF (indicating that all outstanding requests of the PF were completed).

- Once the *Transactions Pending* flag is cleared, the PF software can release the pinned memory structures.
- Once the PFSWR bit is cleared as well, the PF software can proceed to the following steps.

**Note:** If the PFSWR bit is not cleared within ~100 ms, it can be assumed that the shared data path inhibits the PFR completion. In such a case, the software can initiate the CORER to overcome any possible lock.

As part of the initialization flow, the PF driver checks the pending transactions of its VFs (by setting the VF index and the offset of the VF Device Status register in the PF\_PCI\_CIAA register, and then polling the pending flag in the PF\_PCI\_CIAD register). As part of the software/hardware initialization flow, the PF software should check for potential race condition with another PF or EMP initiating a global reset (CORER, GLOBR, or EMPR):

1. Query the reset counters (*CORERCNT*, *GLOBRCNT*, and *EMPRCNT*) in the *GLGEN\_RSTAT* register.
2. Interrupt enable flow.
3. Read the *GLGEN\_RSTAT* register for the device state (*DEVSTATE*) and the reset counters (*CORERCNT*, *GLOBRCNT*, and *EMPRCNT*).
  - If *DEVSTATE* = "Reset requested" or "Reset in progress", go to the global reset flow.
  - If *DEVSTATE* = "Device active", if the updated values of the global reset counters equal to the value sampled at the beginning of this procedure, then "all good". Software can continue with the rest of the software/hardware initialization flow.
  - Else, go to the global reset flow.

The PF should also read the *PFINT\_OICR* register in case there were "other cause" interrupts during reset.

Figure 4-7. PFR Flow

### 4.1.3.2 FLR Flow

FLR resets a specific PF. In the case of SR-IOV, it also resets the VFs of this PF.

1. The following steps are optional:
  - a. The operating system is expected to clear the *BME* bit in the Command register in the PCI configuration register of the PF.
  - b. For SR-IOV, the operating system is expected to also clear the *BME* bit in the VF Command register in the PCI configuration register of all VFs of this PF.
  - c. As a response, hardware avoids any new master cycles of the PF and its VFs (including MSI-X initiation).
  - d. The operating system should poll the *Transaction Pending* bit in the Device Status register of the PF until it is cleared.
  - e. For SR-IOV, the operating system should poll also the *Transaction Pending* bit in the VF Device Status register of all VFs of the PF until they are cleared.

**Note:** All the previous steps are expected and recommended, but not enforced by the PCI specification.

2. The operating system sets the *FLR* bit in the Device Control register of the PF. The operating system is required by PCIe specification to wait 100 ms before it can assume that the FLR sequence is completed by hardware.
3. The PF hardware response as follows:
  - a. Initialize the PCIe configuration space of the PF including clearing the *BME* bit of the PF and the *VFE* bit.
    - By clearing the *BME* bit, hardware avoids any further master accesses on the PCIe bus and discards any completions for the PF.
    - By clearing the *VFE* bit, all VFs of the PF avoid any further master accesses on the PCIe bus, discards any completions targeted for these VFs, and become hidden on the PCIe bus.
    - As part of the PCIe configuration initialization, the completion timeout is set to its hardware default.
    - Once all pending requests of the PF and its VFs are completed or completion timeout expires (whichever comes first), the *Transaction Pending* bits in the PCIe configuration space are cleared.
  - b. Auto-set the *PFSWR* bit in the PFGEN\_CTRL register (triggering a PFR described in the section that follows).

Once the *Transaction Pending* bit in the PCIe configuration space of each VF is cleared, the operating system can release all VF memory structures and unload the VF driver (if required). Once the *Transaction Pending* bit in the PCIe configuration space of the PF is cleared, the operating system can release all PF memory structures and unload the PF driver (if required).

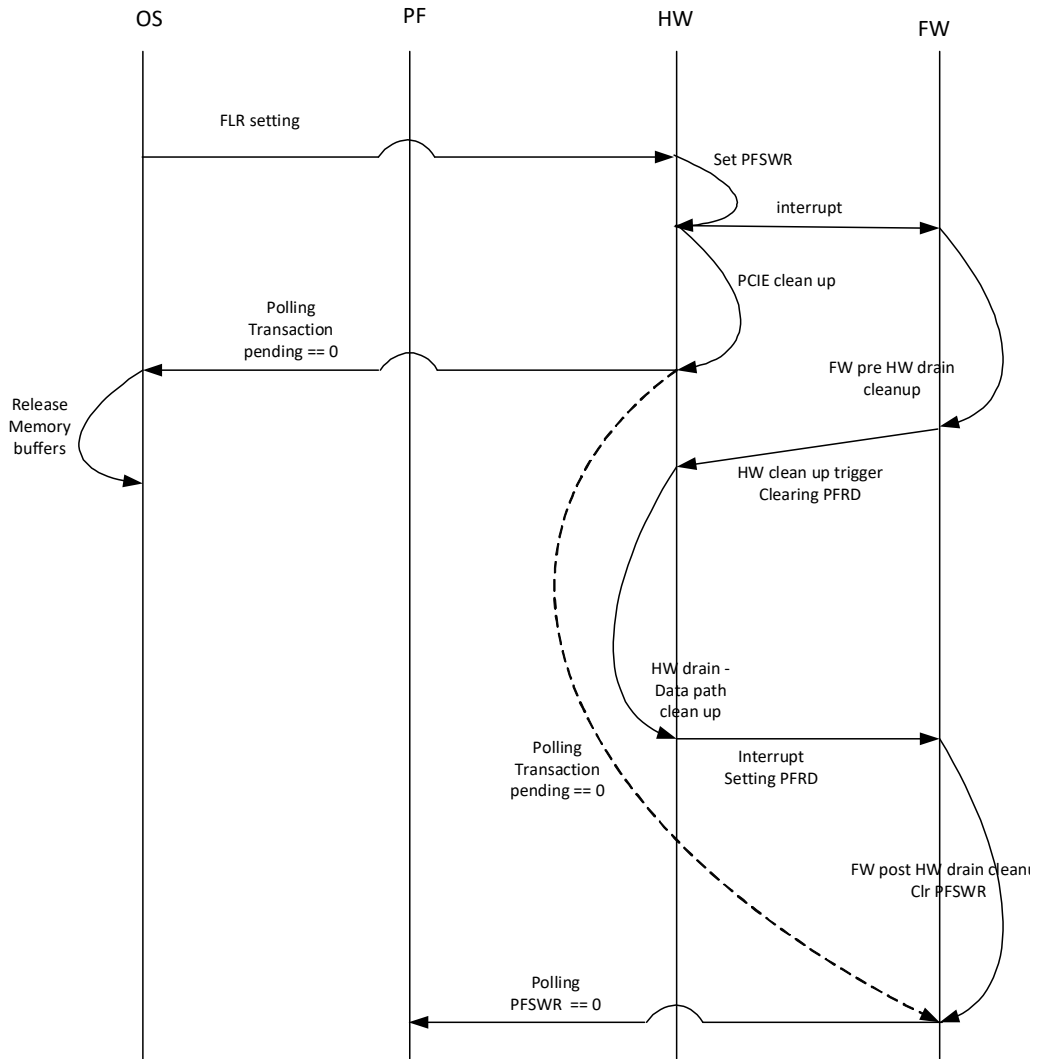

Figure 4-8. FLR Flow

### 4.1.3.3 VFR/VFLR Flows

The VF reset flow is shown in Figure 4-9 and detailed in the sections that follow.

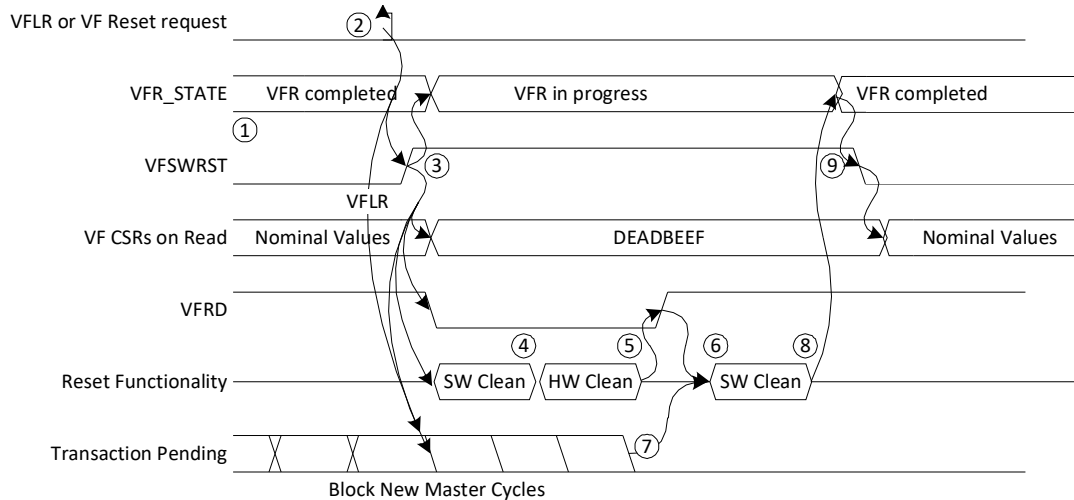

Figure 4-9. VF Reset (VFR) Flow

#### 4.1.3.3.1 VF Reset Request by the VF Driver

The VF driver requests the VF reset from its parent PF as follows, and is shown in Figure 4-9. Also see Section 4.1.3.3.3, which describes the PF response to the VF reset request.

The *VFR\_STATE* in the *VFGEN\_RSTAT* register in this step is expected to be VFR completed.

**Note:** The VF software gets a control over its VF only after any prior VF reset flow is completed (step 1 in Figure 4-9).

1. The VF driver initiates a request to its parent PF to initiate a VF reset. The mechanism for sending this request is outside the scope of this document. It could be done using a VF-to-PF or any other software-based sideband channel (Step 2 in Figure 4-9).
2. The VF polls the *VFR\_STATE* in the *VFGEN\_RSTAT* register until it is set by the PF to VFR completed (Step 9 in Figure 4-9, and explained in Section 4.1.3.3.3).
3. The VF software proceeds activating the function.

At some point prior to requesting the PF for reset once again, VF must set *VFR\_STATE* value to “reset in progress”. When called, the PF software is called to initiate the VFR by the VF software. It sets the *VFSWR* bit in the *VPGEN\_VFRTRIG* register of the VF (Step 3 in Figure 4-9) to initiate VFR (described in Section 4.1.3.3.3).

Figure 4-10. VFR Requested by VF Driver Flow

#### 4.1.3.3.2 VF Reset Request by the Operating System (VFLR)

The VF reset initiation by the operating system is described as follows and shown in Figure 4-9.

1. The following steps are optional:
  - a. Clear the *BME* bit in the VF Command register.
  - b. As a response, hardware avoids any new master cycles of the VF (including MSI-X initiation). Old completions are trashed by hardware.
  - c. The operating system polls the *Transaction Pending* bit in the VF Device Status register until it is cleared.
2. The operating system sets the *FLR* bit in the VF Device Control register (Step 2 in Figure 4-9).
3. The operating system is required by PCIe specification to wait 100 ms before it can assume that the VFLR sequence is completed by hardware.
4. If required, the operating system brings up a new VF (or the same VF). The VF software driver should poll the *VFR\_STATE* in the *VFGEN\_RSTAT* register until it equals to VFR completed (set by the PF software).

5. The VF software proceeds activating the function.

Hardware responses to VFLR are as follows:

1. Initialize the PCIe configuration space of the VF including the *Bus Master Enable* flag.
2. Set internally the *VFSWR* bit in the *VPGEN\_VFRTRIG* register of the VF, which initiates a VFR (Step 3 in Figure 4-9, and explained in Section 4.1.3.3.3).

### 4.1.3.3.3 VF Reset Flow by the PF Software Driver

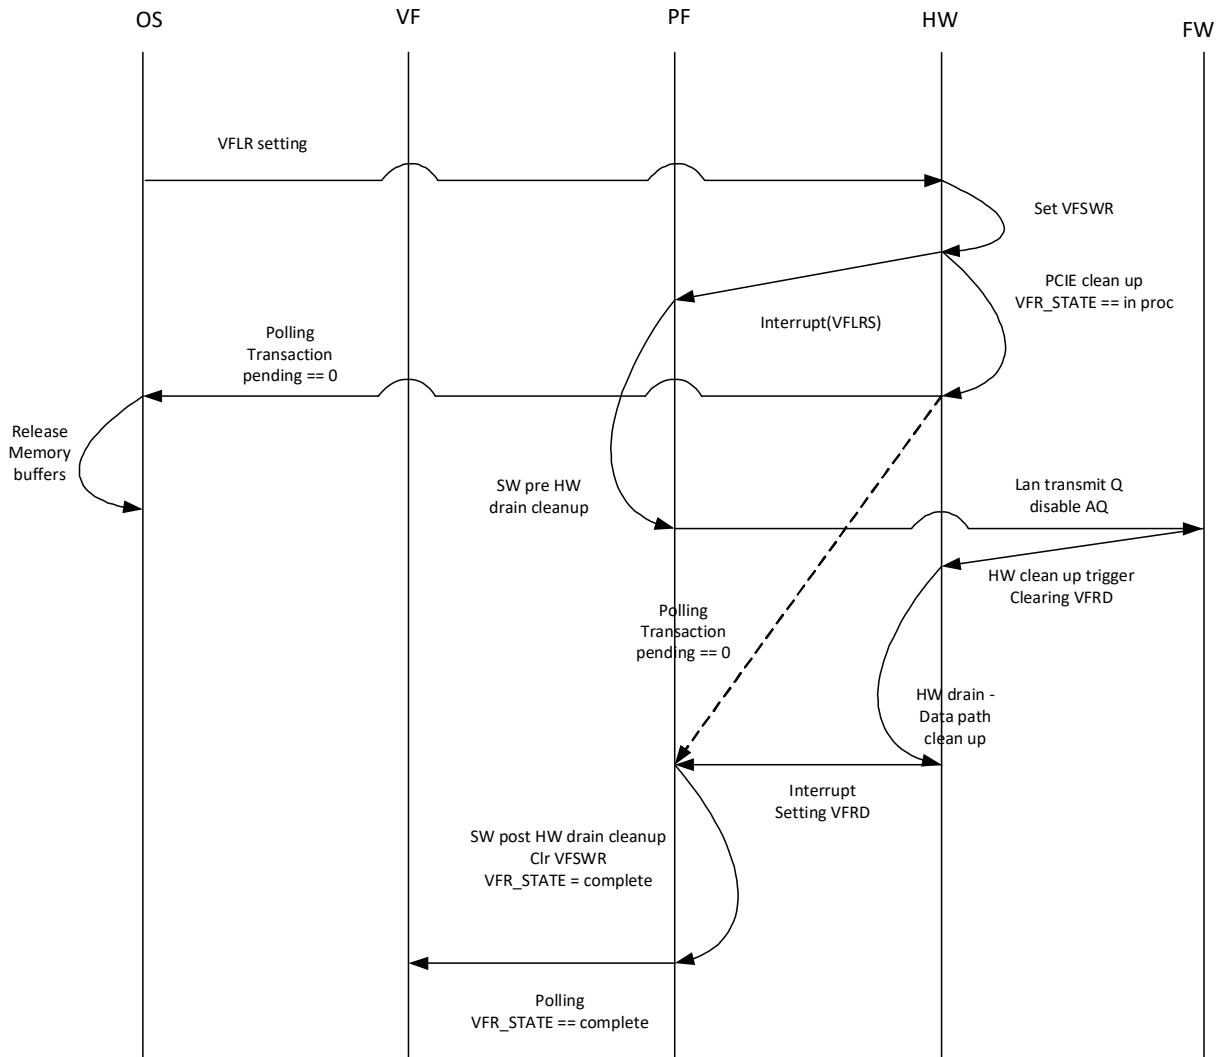

Figure 4-11. VFR Requested by OS

1. As a response to setting the *VFSWR*, hardware does the following:
  - a. Reflects the *VFSWR* bit through *VFLRS* flags in the *GLGEN\_VFLRSTAT* registers.
  - b. Only in case of *VFLR* (OS initiated reset) an interrupt is issued to the parent PF. The PF response to the *VFLR* interrupt is described below.
  - c. The hardware response to setting the *VFSWR* bit is listed in [Table 4-1](#).

**Note:** As part of the VF registers, the *VFGEN\_RSTAT* register is cleared as well, reflecting *VFR* in progress state. Furthermore, hardware also gates read accesses to the CSRs of the VF returning *DEADBEEF* or *DEADBEAF* values and also gates any master accesses.
  - d. The *Transaction Pending* bit is cleared when there are no more pending completions. Once the *Transaction Pending* bit in the VF Device Status register is cleared, the operating system can release all VF memory structures and unload the VF driver (if required).
2. The PF software responds to the interrupt and queries the *VFLRS* flags in the *GLGEN\_VFLRSTAT* registers to identify to which of its VFs a reset was issued (of the VFs that it owns). When set, PF software executes “pre hardware drain” clean-ups (Step 4 in [Figure 4-9](#)):
  - a. PF software cleans up switch population of the VF.
  - b. PF software cleans up ACL population of the VF (as described in [Section 7.9.2.10](#)).
  - c. PF software cleans up RSS population of the VF (as described in [Section 7.10.11.2](#)).
  - d. PF software cleans and disables FD and QH filters of the VF (as described in [Section 7.10.12.1](#) and [Section 7.10.12.2](#), respectively).
  - e. PF software clears the enable bit of doorbell queues that are associated with the doorbell queues of the reset VF. Tx-Queues and Admin queues are automatically disabled by hardware
  - f. When working in SR-IOV mode, PF software disables mailbox queues and sideband queues of the reset VF (as described in [Section 9.5.3](#)).
3. The PF software, via VM/VF Reset admin command, indicates firmware to initiate VF hardware drain (data path clean up) flow, it passes to firmware the Tx-Queue IDs of the VF (VM/VF Reset Admin queue command is described in [Section 9.5.13.8](#)). Queue IDs are described in the PF space. PF software must limit the amount of reset flows concurrently processed by hardware to maximum 4 for all its VFs and VMs (from *GL\_XLR\_MARKER\_TRIG\** setting to data path clean in indication setting by hardware)
  - a. EMP initiates and monitors the process of halting the Tx-Queues (as described in [Section 9.5.13.8](#)) via *GL\_XLR\_MARKER\_TRIG\** registers, EMP indicates hardware to send a drain marker that drains the Tx data path, Rx data path, PE data path and logic orthogonally.
    - The specific *GL\_XLR\_MARKER\_TRIG\** registers are:
      - *GL\_XLR\_MARKER\_TRIG\_VMLR*
      - *GL\_XLR\_MARKER\_TRIG\_TCVMLR*
      - *GL\_XLR\_MARKER\_TRIG\_RCU\_PRS*
      - *GL\_XLR\_MARKER\_TRIG\_PE* (should be written only if PW is enabled)
  - b. Draining the Tx and Rx data paths might take some time when the TC is paused by flow control. Hardware includes a timeout mechanism that prevents indefinite latency as described in [Section 8.2.4.4.1](#).
  - c. *VPGEN\_VFRSTAT.VFRD* indication is cleared when *GL\_XLR\_MARKER\_TRIG\_VMLR* is written.

4. When hardware drain flow ends (reset flow is completed - Step 5 in [Figure 4-9](#)), hardware sets `VPGEN_VFRSTAT.VFRD` and issues an interrupt to parent PF.
5. Once the `VFRD` flag in the `VPGEN_VFRSTAT` register is found active, the PF software writes 1b to clear to the matched `FVLR` bit in the `GLGEN_VFLRSTAT` registers for the VF under reset.  
**Note:** The `GLGEN_VFLRSTAT` registers are composed of 256 bits for the 256 VFs. All PFs have access to the bits of all VFs. However, it is expected that the PFs writes 1b to clear to those bits that match its VFs and only to those bits.)
6. After that PF software proceeds with the VF reset flow (Step 6 in [Figure 4-9](#)) and executes the “post hardware drain” clean-ups:
  - a. Disable the receive queues of the VF following the fast queue disable flow per each queue as described in [Section 10.4.3.1.2](#).  
**Note:** The hardware auto-disables the transmit queues of the VF.
  - b. PF releases all resource of the VF (for example, nodes in PSM and in PE scheduler, function profile, switch population, and queue allocation as described in [Section 10.2.1](#) and [Section 10.2.2](#)).
  - c. PF resets (zeros all fields) the `QINT_TXQCTL`, `QINT_RXQCTL`, and `GLINT_CEQCTL` registers for the queues of the VF.
  - d. Resets the `VPINT_ALLOC`, `VPINT_ALLOC_PCI`, and `GLINT_VECT2FUNC` registers of the VF (registers that define the vectors assignment to the VF).
7. The PF driver checks the pending transactions of its VF (by setting the VF index and the offset of the VF Device Status register in the `PF_PCI_CIAA` register and then polling the pending flag in the `PF_PCI_CIAD` register) (Step 7 in [Figure 4-9](#)).
8. The following steps in this bullet item are part of re-enabling the VF. It can be executed at this phase before notifying the VF that the reset flow is completed or at a later phase (depending on software implementation):
  - a. Add the VSIs for the VF (including its Transmit and Receive queues and its scheduler).
  - b. Add the MAC/VLAN filters for the VSI.
  - c. Enable the `VFLAN_QTABLE` by setting the `VPLAN_MAPENA` and then program the `VFLAN_QTABLE` to the queues of the VF.
9. The PF software completes the flow by notifying the VF that the reset flow is completed. It sets the `VFR_STATE` field in the `VFGEN_RSTAT` register to VFR completed and clears the `VFSWR` bit in the `VPGEN_VFRTRIG` register (Step 8 in [Figure 4-9](#)).
10. Hardware response to cleared `VFSWR` flag:
  - a. The VF CSRs are unlocked. As a result, the VF software can see the updated `VFR_STATE` in the `VFGEN_RSTAT` register that equals to VFR completed (Step 9 in [Figure 4-9](#)).
  - b. Master cycles are not blocked anymore by the reset logic.
  - c. The hardware is ready to be used by the VF.

#### 4.1.3.4 VMR Flow

1. PF sets the *VMSWR* bit in the *VSIGEN\_RTRIG* register of the VM.
2. PF initiates “pre hardware drain” clean-up flow.
  - a. PF software cleans up switch population of the VM.
  - b. PF software cleans up ACL population of the VM (as described in [Section 7.9.2.10](#)).
  - c. PF software cleans up RSS population of the VM (as described in [Section 7.10.11.2](#)).
  - d. PF software removes the QH and FD filters of the VM.
  - e. PF software sends dummy doorbell for all the doorbell queues of the VM and waits for all dummy doorbells (generated at “pre hardware drain” flow) to be pulled from doorbell queues. Dummy doorbell is a regular doorbell description that has its *RS* and *Dummy* fields set to 1 (doorbell descriptor format is described at [Section 10.5.5.6](#)).
  - f. When working in PASID mode, PF software disables mailbox queues of the reset VM.
  - g. PF software removes the interrupt causes of the VM from the active linked list (as described in [Section 9.1.3.1.2](#)).
3. As a response to *VMSWR* bit setting, hardware does the following:
  - a. The hardware response to setting the *VFSWR* bit is listed in [Table 4-1](#).

**Note:** As part of the VM registers, the *VSIGEN\_RSTAT* register is cleared.
  - b. The *Transaction Pending* bit is cleared when there are no more pending completions. Once the *Transaction Pending* bit in the VM Device Status register is cleared, the operating system can release all VM memory structures.
4. The PF software, via VM/VF Reset admin command, indicates firmware to initiate VM reset flow. It passes to firmware the VM Tx-Queues identifiers (VM/VF Reset Admin Queue command is described in [Section 9.5.13.8](#)). Queue IDs are relative to the PF space.
5. PF software must limit the amount of reset flows concurrently processed by hardware to maximum 4 for all its VFs and VMs (from *GL\_XLR\_MARKER\_TRIG\** setting to data path clean in indication setting by hardware).
  - a. EMP initiates and monitor the process of halting the Tx-Queues (as described in [Section 9.5.13.8](#)) via *GL\_XLR\_MARKER\_TRIG\** registers, EMP indicates hardware to send a drain marker that drains the Tx data path, Rx data path, and PE data path and logic orthogonally.
    - The specific *GL\_XLR\_MARKER\_TRIG\** registers are:
      - *GL\_XLR\_MARKER\_TRIG\_VMLR*
      - *GL\_XLR\_MARKER\_TRIG\_TCVMLR*
      - *GL\_XLR\_MARKER\_TRIG\_RCU\_PRS*
      - *GL\_XLR\_MARKER\_TRIG\_PE* (should be written only if PW is enabled)
    - Draining the Tx and Rx data paths might take some time when the TC is paused by flow control. Hardware includes a timeout mechanism that prevents indefinite latency as described in [Section 8.2.4.4.1](#).
    - *VSIGEN\_VFRSTAT.VMRD* indication is cleared when *GL\_XLR\_MARKER\_TRIG\_VMLR* is written.
  - b. When hardware drain flow ends (reset flow is completed - Step 5 in [Figure 4-9](#)), [Figure 4-9](#) sets the *VPGEN\_VFRSTAT.VFRD* and issues an interrupt to parent PF.

6. After that, PF software proceeds with the VF reset flow (step 6 in [Figure 4-9](#)) and executes the “post [Figure 4-9](#) drain” clean-ups.
  - a. Disables the receive queues of the VF following the fast queue disable flow per each queue.
  - b. Sends a CQ drain marker for all the completion queue of the VMs. It waits for all completions to be pulled from completion queues. CQ drain marker is generated by writing GLCOMM\_CQ\_CTL with the CMD field set to *VM\_reset\_marker* value.
  - c. PF releases all resource of the VM (For example, nodes in PSM and in PE scheduler, function profile, switch population). The PF driver checks the pending transactions of its VM and waits until it is cleared.
  - d. PF resets (zeros all fields) in the QINT\_TXQCTL, QINT\_RXQCTL, and GLINT\_CEQCTL registers for the queues of the VM.
7. The PF driver checks the pending transactions of its VM and waits until it is cleared.
8. The PF software clears the *VMSWR* bit in the VSIGEN\_VFRTRIG register.
9. Hardware response to cleared *VMSWR* flag:
  - a. Master cycles are not blocked anymore by the reset logic.
  - b. The hardware is ready to be used by the VM.
10. After PF driver polls the VMR done indication in the VSIGEN\_RSTAT register, it:
  - a. Polls the *Transactions Pending* flag of the VM, verifying that there are no transaction pending of the VM as follows:
    - Set the VSI index in the PFPCI\_VMINDEX and then poll the PFPCI\_VMPEND register.
  - b. Does not clear the interrupts settings that might be shared with the PF (or other VMs).
  - c. Does not check pending transactions of the VM that does not exist.
  - d. Completes the flow by clearing the *VMSWR* bit in the VSIGEN\_RTRIG register.

Figure 4-12. VMR Flow

**Notes:** Overall number of reset flows concurrently processed by hardware is limited to 40 (from GL\_XLR\_MARKER\_TRIG\* setting to data path clean in indication setting by hardware):

- Max 32 VF or VM reset flows - PF software limits the amount of reset flows concurrently processed by hardware to maximum 4 for all its VFs and VMs.
- Max 8 PF reset flows for 8 PFs.

## 4.2 Power-On and Reset

This section describes the flow of the E810 power-up. The initialization sequence for the E810 is broken down into phases: power on, BIOS initialization, and software device driver load.

- Power on ([Section 4.1.2.1](#)) is the first phase that includes all steps required to support pre-boot power management and manageability, satisfy the PCIe requirements for exiting cold reset, and prepare for the BIOS initialization phase. This stage also covers firmware initialization.
- BIOS initialization ([Section 4.3](#)) begins when Option ROM code is loaded by BIOS to provide boot services for PXE. Other Option ROM capabilities include configuration images for certain OEM environments, such as SMASH/CLP.
- The final phase of the E810 initialization is the software device driver load, where the operating system loads the various software device drivers and the E810 has been initialized for post-boot operation. See [Section 4.4](#).

### 4.2.1 Auto-Load Shadow RAM

This phase of auto-load determines if a properly-configured Flash device is attached:

- If the attached Flash device is not properly configured, the default hardware settings are kept. The power-on flow continues without loading from the NVM.
  - The NVM is expected to be reprogrammed. See [Section 3.4.4.2](#) for more details on how this is done.
- If the attached Flash device is properly configured, auto-load proceeds with its first stage. NVM modules loaded to the on-die Shadow RAM are read from the NVM.

Once the Shadow RAM is ready, an internal indication is set that the device enumeration may proceed. This indication is also set when the NVM is found blank.

#### 4.2.1.1 Auto-Load into Device Units

The NVM configurations are loaded into the device units directly from the NVM or indirectly through Shadow RAM.

The loading process of the NVM modules that are specified in [Table 4-2](#) are tracked and reported.

The following CSR fields track the progress of loading the NVM modules following power-on and the various resets:

- GLNVM\_ULD.\*\_DONE bits (one per module) indicates the unit is ready to use.

Default hardware values:

- GLNVM\_ULD.\*\_DONE = 0b

The flow during a power-on stage is as follows:

- If the NVM is found blank:
  - All GLNVM\_ULD.\*\_DONE bits are set by the E810.
- If the NVM is found valid:
  - After process is done by EMP firmware, it sets the GLNVM\_ULD.\*\_DONE bit to 1b.

### 4.2.1.2 Firmware Initialization

There are two sets of firmware loaded for the E810. The first is for the Embedded Management Processor (EMP). This firmware is first to load and is required for all E810 deployments. It is optionally followed by loading Protocol Engine firmware required for RDMA operation.

Once EMP firmware loads, the following E810 features are enabled:

- The external Ethernet link is active.
- Default internal switching components have been configured.
- Communication with the BMC is possible if supported by the E810 and the system (optional).
- OEM-specific manageability agents are active and responding to commands from the Ethernet fabric (optional).
- Admin queues for all enabled PCI functions are ready for commands - EMP responds to each function's Get Version AQ command to indicate that it is safe for software to start using the E810 for device driver initialization (see [Section 9.5.3](#)).
- HMC default profile has been configured.

Once EMP firmware is up and running, the E810 can be configured via its management interfaces, and certain device capabilities are then enabled or disabled (such as soft SKUing).

Protocol Engine firmware is responsible for processing configuration requests for RDMAUDATA functionality that is provided by the Protocol Engine. See [Section 11.5.2](#) for more information on the specifics of the commands supported by Protocol Engine Firmware. Protocol Engine firmware load begins once the EMP firmware has finished loading and initialization and only after primary reset was de-asserted. When the Protocol Engine firmware is loaded and initialized, the GLPE\_CPUSTATUS0-2 registers indicate that it is safe to start using Protocol Engine capabilities.

Protocol Engine firmware is loaded only when the protocol engine is enabled in the NVM.

### 4.2.1.3 MAC Address Initialization

The E810 supports a port MAC Address for each of its ports. These addresses are used by the internal switch for L2 filtering of packets, by the classification filters, for WoL purposes, and for link-level functionality, such as flow control frames and LLDP. The addresses are loaded from the NVM PRTPM\_SAL and PRTPM\_SAH registers.

[Table 4-4](#) lists how each address can be set or read and where it is stored.

**Table 4-4. MAC Address Information**

MAC Address Type	Where Stored	How Reported	How Modified	Modified at Manufacturing?
LAN MAC Address - factory	NVM PF MAC Address section (TLV type = 0x10F) Loaded by firmware to: <ul style="list-style-type: none"> <li>Internal switch entries</li> <li>PRTPM_SAL/H</li> <li>PRTMAC_HSEC_CTL_TX_SA_PART1/2</li> </ul>		N/A	Yes
LAN MAC Address - BIOS setting	Alternate RAM (Current LAN MAC Address (Low/High)) Loaded by firmware to: <ul style="list-style-type: none"> <li>Internal switch entries</li> <li>PRTPM_SAL/H</li> <li>PRTMAC_HSEC_CTL_TX_SA_PART1/2</li> </ul>	Manage MAC Address read (LAN address valid) - if no LAA	Write Alternate AQ command: <ul style="list-style-type: none"> <li>Alternate LAN MAC Address (LS)</li> <li>Alternate LAN MAC Address (MS)</li> <li>NC-SI Set Address OEM command</li> </ul>	No
WoL MAC Address	PRTPM_SAL/H	Manage MAC Address read (WoL address valid)	Manage MAC Address Write AQ command (update LAA and WoL address).	Yes
WoL MAC Address preserve on PFR	RAM	Manage MAC Address read (WoL_preserve_on_PFR)	Manage MAC Address Write AQ command (WoL_preserve_on_PFR). Set by software before D0->Dr/D3 transition. Cleared by software after returning to D0). 0 by default after POR/EMPR.	No
LAA MAC Address	Local firmware variable	Manage MAC Address read (LAN address valid)	AQ command (update LAA address) <b>Note:</b> Changing the LAA only does not impact the address used to detect Magic Packets.	No
MNG MAC Address	MNG MAC Address NVM module	NVM Read command (module type = 0x110)	NVM Write command (module type = 0x110)	No
PCIe serial address	PCIe serial address NVM module	NVM Read command (module type = 0x133)	NVM Write command (module type = 0x133)	Yes

The following rules apply:

- The *PF\_NUM* field in the PRTPM\_SAH register is deducted from the PF issuing the command.
- The *AV* field in PRTPM\_SAH is set by the EMP when writing a MAC Address.

The per-PF MAC Address used by the internal switch is managed via the Remove MAC/VLAN Pair and Add MAC/VLAN Pair commands.

### 4.2.1.3.1 Manage MAC Address Read Command (0x0107)

This command is used by the PF driver to read the per-PF station MAC Address. This is an indirect command.

**Table 4-5. Manage MAC Address Read Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0107	Command opcode.
Datalen	4-5	0x0	0x18 (the response buffer size).
Return Value/VFID	6-7	0x0	Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Command Flags	16-17	Reserved	Reserved.
Port Number	18-19.0	Port Number	<b>Byte 18:</b> Logical Port Number This field specifies the logical port number, and is used when the physical function owns more than one port. A value of 0xFF means that a dump of all ports addresses is requested. A port number of 20 (logical port number of the E810) returns the local MAC Address of the E810. <b>Bit 19.0:</b> Logical Port Number is valid.
	19.1-19.7	Reserved	Reserved.
Reserved	20-23	0x0	Reserved.
Data Address High	24-27	Buffer Address	High bits of the return buffer address.
Data Address Low	28-31	Buffer Address	Low bits of the return buffer address.

#### 4.2.1.3.1.1 Manage MAC Address Read Response (0x0107)

A firmware acknowledge to the Manage MAC Address Read command. This is an indirect response.

**Table 4-6. Manage MAC Address Read Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0107	Command opcode.
Datalen	4-5	0x0	0x18 (the response buffer size).
Return Value/VFID	6-7	Return Value	Return value. Firmware supplies in the <i>Return Value</i> field an indication on the completion of the Manage MAC Address Read command. 0x0 = No error. Others = Error detected in the command.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.

**Table 4-6. Manage MAC Address Read Response [continued]**

Name	Byte.Bit	Value	Remarks
Command Flags	16.0-16.3	Reserved	Zeroed by the EMP.
	16.4	LAN Address Valid	This bit is set if any of the addresses reported in the buffer is of type LAN.
	16.5	SAN Address Valid	Reserved for the E810.
	16.6	Port Address Valid	Reserved for the E810.
	16.7	WoL Address Valid	This bit is set if any of the addresses reported in the buffer is of type WoL.
	17.0	MC_MAG_EN	If set, multicast Magic Packets generate a WoL event (if WoL is enabled for this function).
	17.1	WoL_preserve_on_PFR	Set to preserve WoL MAC on PFR (to be set by software before D0->Dr/D3 transition. Cleared by software after returning to D0 state). 0 by default after POR/EMPR. Relevant only if WOL MAC was set.
	17.2-17.7	Reserved	Reserved.
Reserved	18-23	0x0	Reserved.
Data Address High	24-27	Buffer Address	High bits of the return buffer address.
Data Address Low	28-31	Buffer Address	Low bits of the return buffer address.

**Note:** All MAC Addresses are a byte stream in network order.

The buffer is as follows:

Address	Offset	Description
Port Number	0	The port number associated with this MAC address. Equivalent to the port through which the command was sent. Can be ignored.
Address Type	1	Address type: 0b = LAN Address 1b = WoL Address
PF LAN SA	2-7	Current device value of the PF LAN MAC Address. Validated by <i>LAN Address Valid</i> flag. This address is returned from LAA address if valid, otherwise from Alternate RAM if valid, otherwise from the NVM if valid.

### 4.2.1.3.2 Manage MAC Addresses Write Command (0x0108)

This command is used by the PF driver to write the per-PF station MAC Address. This is a direct command.

**Table 4-7. Manage MAC Address Write Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0108	Command opcode.
Datalen	4-5	0x0	Must be 0x0. Value is ignored.
Return Value/VFID	6-7	0x0	Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Command Flags	16	Port Number	Port Number This field specifies the port number, and it is used when the physical function owns more than one port.
	17.0	MC_MAG_EN	Used to set the <i>MC_MAG_EN</i> bit.
	17.1	LAA_WOL_PRESERVE	LAA WoL preserve on PFR Relevant only if WOL MAC was set.
	17.2	Valid	Port number in byte 16 is valid.
	17.5-17.3	0x0	Reserved.
	17.7-17.6	Write Type	00b = Update LAA only. 01b = Update LAA and WOL address. All other values are reserved.
SAH	18-23	MAC Address	MAC Address as a byte stream in network order.
Reserved	24-31	Reserved	Reserved.

#### 4.2.1.3.2.1 Manage MAC Address Write Response (0x0108)

A firmware acknowledge to the Manage MAC Address Write command. This is a direct response.

**Table 4-8. Manage MAC Address Write Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See Section 9.5.5.1.2 for details.
Opcode	2-3	0x0108	Command opcode.
Datalen	4-5	0x0	Must be 0x0. Value is ignored.
Return Value/VFID	6-7	Return value	Return value. Firmware supplies in the <i>Return Value</i> field an indication on the completion of the Manage MAC Address Write command. 0x0 = No error. Others = Error detected in the command.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Command Flags	16	Port Number	Port Number This field specifies the port number, and it is used when the physical function owns more than one port. Copied from command.
	17.0	MC_MAG_EN	Used to set the <i>MC_MAG_EN</i> bit.
	17.1	LAA_WOL_PRESERVE	LAA WoL preserve on PFR Relevant only if WOL MAC was set.
	17.2	Valid	Port number in byte 16 is valid.
	17.5-17.3	0x0	Reserved.
	17.7:17.6	Write Type	00b = Update LAA only. 01b = Update LAA and WOL address. All other values are reserved.
Reserved	18-31	Reserved	Reserved.

#### 4.2.1.4 Power-On Device State

This section describes the specific setting of each of the E810’s components required for pre-boot operation. It describes the information loaded from the NVM (per component) and the state attained by each.

- **Manageability** — System management functionality, if enabled, is fully operational by the end of the EMP firmware initialization sub-stage. Some configuration is loaded from the NVM during the power-on stage. Capabilities might include the following:
  - Sideband interfaces
  - Pass-through manageability (including packet filtering)
  - Preparation for OS-to-BMC traffic
  - Preparation for MCTP over PCIe operation

- **Internal MAC and PHY** — If either system management or APM WoL are enabled, enabled LAN ports are brought up by firmware once EMP firmware initialization completes. Otherwise, enabled LAN ports are brought up following PERST# de-assertion.
  - See [Section 3.2](#) for more details.
- **Admin Queue (AQ)** — A queue (Tx and Rx pair) is activated per enabled PCI function. For example, an AQ is needed for BIOS to change the switch or scheduler configuration.
  - See [Section 9.5.3](#) for more details.
- **Internal Switch** — The internal switch is configured from the NVM for basic switching capabilities to the EMP and the enabled PCI functions. First, the switch programmable logic is loaded, followed by configuration of a basic switch topology. The topology is for basic L2 functionality.
- **DCB** — The NVM loads the LLDP and DCBx setting into the E810. Once EMP firmware initializes and link is up, firmware engages in DCBx negotiation. Firmware then makes the appropriate changes in the E810's configuration based on the outcome of the DCBx protocol. At this stage, DCB capabilities (TCs, ETS, PFC) can be enabled.
- **Tx-Scheduler** — As the switch VSIs are enabled, firmware allocates Tx-Scheduler per each PF VSI based on the NVM configuration. Each queue is configured to default behavior. Firmware also generates the required handles to enable system software to update the configuration of each queue. If DCBx protocol runs, the outcome of the protocol exchange might translate into changes in scheduler configuration.
- **Host Memory Cache (HMC)** — NVM settings supply the initial HMC configuration using a simple set of rules that enable equal distribution of HMC resources to all PFs that are connected to external Ethernet ports.
- **Power Management** — Some power management capabilities are supported pre-boot or during BIOS initialization.
  - The E810 might be enabled for APM wake during power up. See [Section 5.3.1](#) for more details on how APM Wake is configured.
  - EEE might be enabled once EMP firmware is initialized.
- **LAN** — LAN queues are available for network boot in the BIOS initialization phase. Some LAN configuration is loaded from the NVM during power on, including partitioning of the LAN queues among PFs.
- **Protocol Engine (PE)** — NVM setting can disable PE operation in the device. The Protocol Engine is not enabled during Power-On and BIOS Initialization stages. It is configured and initialized in the Driver Load phase.

## 4.3 BIOS Initialization

This section describes how BIOS code might update the E810's configuration and the capabilities for network boot. The following sections are provided:

- [Section 4.3.2](#) describes how BIOS code might change the E810's configuration on each boot.
- [Section 4.3.3](#) describes some aspects of supporting network boot.
- [Section 4.3.4](#) describes the specific setting of each of the E810's components required for the BIOS initialization stage

### 4.3.1 Initial State

The state of the E810 when BIOS begins to access it is described in [Section 4.3.4](#).

BIOS code must check that the EMP completed device initialization. This is done through the Get Version AQ command described in [Section 9.5.13.1](#).

### 4.3.2 Non-Persistent Configuration

During power up, the E810 is factory-configured from the NVM. However, the factory configuration can be overridden in two possible ways:

- **Persistent Configuration** — System tools (such as software agents and SMCLP commands) can write into the NVM and change the factory defaults. It is also possible to add alternate values into the NVM so that the factory defaults are preserved and can be restored at a later time.
- **Non-Persistent Configuration** — An on-die Alternate RAM structure is provided to store configuration values that are not supposed to be maintained between cold resets. The information in this structure is retained during all resets other than a cold reset of the device. The specific fields are loaded by the device Firmware according to [Table 4-9](#).

During a cold reset sequence, the alternate structure might be written by either an external system management agent (via the device management interfaces) or by BIOS level code (like SMASH/CLP commands).

#### 4.3.2.1 Alternate RAM Structure

The alternate structure is 6 KB, partitioned into 32-bit entries. Accessing the structure is done by addressing 32-bit entries. An address is therefore 11 bits (1.5K DWords), where address 0x000 points to the beginning of the memory.

During a cold reset sequence, the alternate structure can be written by either an external system management agent (via the device management interfaces) or by BIOS level code (like SMASH/CLP commands).

The structure is partitioned as follows:

Section	Address (DW)	Size (DW)	Content
Per PF	0-511	512-64 per PF	8 per-PF sections, one per PF. These sections are described in <a href="#">Section 4.3.2.1.1</a> and can be accessed by each PF.
Reserved	512-1023		Reserved for more functions.
EMP	1024-1536	512	Reserved for EMP use, including error logging. Can be written and read only by the EMP. In debug mode, this section can be read by the PFs.

### 4.3.2.1.1 Per-PF Sections

**Table 4-9. Per-PF Alt RAM Content**

Scope	Address (DW)	Contents	Done Alternate Write Required <sup>1</sup>	NVM Dump Required <sup>2</sup>	Load Conditions
PF	0	Current LAN MAC Address (Low)	No	No	PFR, CORER
PF	1	Current LAN MAC Address (High)	No	No	PFR, CORER
PF	2-18	Reserved	N/A	N/A	Never
PF	19	RDMA	Yes	Yes	POR
PF	20-63	Reserved	N/A	N/A	Never

- The "Done Alternate Write Required" column indicates whether the Done Alternate Write (Opcode: 0x0904) command needs to be issued to the device for the configuration to take place on the conditions specified by the "Load Conditions" column. If "Done Alternate Write" is not required, just writing the value into the Alternate RAM and meeting the load conditions is sufficient for the configuration to take place. If the "Done Alternate Write" command was required, but not sent, the configuration is not applied, even if the condition is met. Issuing the "Done Alternate Write" command when it is not explicitly required does not have any adverse effects on the operation of the device.
- Some changes are persistent. To make sure the data is stored in NVM, the Shadow RAM must be written back to the Flash using the NVM Write Activate command ([Section 3.4.10.8](#)).

#### 4.3.2.1.1.1 Current LAN MAC Address (Offset 0x0, 0x1)

Lower DWord:

Field	Bit(s)	Description
MAC Address	31:0	MAC Address Contains the LS 32-bit of the address.

Upper DWord:

Field	Bit(s)	Description
MAC Address	15:0	MAC Address Contains the MS 16-bit of the address.
Reserved	30:16	Reserved.
Valid	31	Valid Bit 0b = The MAC Address two DWords are invalid and should be skipped. 1b = The MAC Address two DWords are valid and should be processed.

Actions taken on a change in this entry:

- When valid, it overrides the MAC Address loaded from the NVM.

#### 4.3.2.1.1.2 RDMA (Offset 0x19)

Field	Bit(s)	Description
Override Enable	0	Enable BIOS override of netlist configuration recommendation for topology of 4 ports and below.
RDMA Enable	1	Enable RDMA for topology of 4 ports and below.
Reserved	30:2	Reserved.
Valid	31	Valid bit 0b = DW is invalid and should be skipped. 1b = Entry is valid and should be processed.

#### 4.3.2.2 AQ Commands

Table 4-10 lists the different AQ commands used to manage the alternate structure.

**Table 4-10. List of AQ commands for the Alternate Structure**

Command	Opcode	Description	Section Reference
Write Alternate - Direct	0x0900	Write up to two parameters into the alternate structure.	4.3.2.2.1
Write Alternate - Indirect	0x0901	Write a block of parameters into the alternate structure.	4.3.2.2.2
Read Alternate - Direct	0x0902	Read up to two parameters from the alternate structure.	4.3.2.2.3
Read Alternate - Indirect	0x0903	Read a block of parameters from the alternate structure.	4.3.2.2.4
Done Alternate Write	0x0904	Indication that all CLP strings (for the entire E810 in legacy BIOS mode, and per LAN Port in UEFI mode) have been sent to the E810.	4.3.2.2.5
Clear Port Alternate	0x0906	Clear content of Alternate RAM relevant to this port.	4.3.2.2.6

### 4.3.2.2.1 Write Alternate - Direct Command (0x0900)

The Write Alternate - Direct command writes to the alternate structure up to two parameters.

**Table 4-11. Write Alternate - Direct Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0900	Command opcode.
Datalen	4-5	0x0	N/A
Return Value/VFID	6-7	0x0	N/A
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
First Parameter Address	16-19		Accessing the alternate structure is done by addressing 32-bit entries.
First Parameter Data	20-23		
Second Parameter Address	24-27		Address should be within the range allocated to the function inside the alternate structure. Value of 0xFF..FF means only the first parameter is written. Accessing the alternate structure is done by addressing 32-bit entries.
Second Parameter Data	28-31		

The following completion is sent for the Write Alternate - Direct command:

**Table 4-12. Completion for the Write Alternate - Direct Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0900	Command opcode.
Datalen	4-5	0x0	N/A
Return Value/VFID	6-7		Some comments on specific errors: 0x0 = No error. ENOMEM = Out of memory (access outside the alternate structure). EACCES = Permission denied (access to another PF's area).
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31		Reserved. Might contain the values sent in the original command.

### 4.3.2.2.2 Write Alternate - Indirect Command (0x0901)

The Write Alternate - Indirect command writes a block of parameters to the alternate structure. The command defines the number of DWords to be written and the starting address inside the alternate structure.

**Table 4-13. Write Alternate - Indirect Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0901	Command opcode.
Datalen	4-5		Size of buffer accompanying the command (in bytes).
Return Value/VFID	6-7	0x0	N/A
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Alternate Structure Address	16-19		Lowest address to be written into the alternate structure. Accessing the alternate structure is done by addressing 32-bit entries.
Alternate Structure Length	20-23		Number of DWords to be written into the alternate structure.
Data Address High	24-27	Buffer Address	High bits of the buffer address.
Data Address Low	28-31	Buffer Address	Low bits of the buffer address.

The following completion is sent for the Write Alternate - Indirect command:

**Table 4-14. Completion for the Write Alternate - Indirect Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0901	Command opcode.
Datalen	4-5	0x0	N/A
Return Value/VFID	6-7		Some comments on specific errors: 0x0 = No error. ENOMEM = Out of memory (access outside the alternate structure). EACCES = Permission denied (access to another PF's area).
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31		Reserved.

### 4.3.2.2.3 Read Alternate - Direct Command (0x0902)

The Read Alternate - Direct command reads from the alternate structure up to two parameters. This command, and the next one, returns the values as stored in the Alternate RAM, which might not reflect the current hardware configuration.

**Table 4-15. Read Alternate - Direct Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0902	Command opcode.
Datalen	4-5	0x0	N/A
Return Value/VFID	6-7	0x0	N/A
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
First Parameter Address	16-19		Address should be within the range allocated to the function inside the alternate structure. Accessing the alternate structure is done by addressing 32-bit entries.
Reserved	20-23	0x0	Reserved.
Second Parameter Address	24-27		Address should be within the range allocated to the function inside the alternate structure. Value of 0xFF..FF means only the first parameter is read. Accessing the alternate structure is done by addressing 32-bit entries.
Reserved	28-31	0x0	Reserved.

The following completion is sent for the Read Alternate - Direct command:

**Table 4-16. Completion for the Read Alternate - Direct Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0902	Command opcode.
Datalen	4-5	0x0	N/A
Return Value/VFID	6-7		Some comments on specific errors: 0x0 = No error. ENOMEM = Out of memory (access outside the alternate structure). EACCES = Permission denied (access outside of PF's area).
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
First Parameter Address	16-19		Copied from the command.
First Parameter Data	20-23		Data read.
Second Parameter Address	24-27		Copied from command. Value of 0xFF..FF means only the first parameter is read.
Second Parameter Data	28-31		Data read.

### 4.3.2.2.4 Read Alternate - Indirect Command (0x0903)

The Read Alternate - Indirect command reads a block of parameters to the alternate structure. The command defines the number of DWords to be read and the starting address inside the alternate structure.

**Table 4-17. Read Alternate - Indirect Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0903	Command opcode.
Datalen	4-5		Size of buffer accompanying the command (in bytes).
Return Value/VFID	6-7	0x0	N/A
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Alternate Structure Address	16-19		Lowest address to be read from the alternate structure. Accessing the alternate structure is done by addressing 32-bit entries.
Alternate Structure Length	20-23		Number of DWords to be read from the alternate structure.
Data Address High	24-27	Buffer Address	High bits of the buffer address.
Data Address Low	28-31	Buffer Address	Low bits of the buffer address.

The following completion is sent for the Read Alternate - Indirect command:

**Table 4-18. Completion for the Read Alternate - Indirect Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0903	Command opcode.
Datalen	4-5	0x0	Actual length of data returned by the command.
Return Value/VFID	6-7		Some comments on specific errors: 0x0 = No error. ENOMEM = Out of memory (access outside the alternate structure). EACCES = Permission denied (access to another PF's area).
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Alternate Structure Address	16-19		Lowest address read from the alternate structure.
Alternate Structure Length	20-23		Number of DWords read from the alternate structure.
Data Address High	24-27	Buffer Address	High bits of the buffer address.
Data Address Low	28-31	Buffer Address	Low bits of the buffer address.

### 4.3.2.2.5 Done Alternate Write Command (0x0904)

The Done Alternate Write command indicates to the E810 that the CLP strings have been sent to it:

- **Legacy BIOS mode** — Sent once per device after all CLP strings have been sent to the E810 (for all LAN ports). Following the command, firmware loads the contents of the alternate structure into the device functional units.
- **UEFI mode** — Sent once per each enabled LAN port. Once the command is received from all enabled ports, firmware loads the contents of the alternate structure into the E810's functional units.

After this command, the software should trigger a Shadow RAM dump using a dummy NVM update with *LAST* flag set (Bit 19.0 in [Table 3-113](#)).

**Table 4-19. Done Alternate Write Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0904	Command opcode.
Datalen	4-5	0x0	N/A
Return Value/VFID	6-7	0x0	N/A
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
BIOS Mode	16.0	See remarks	0b = Legacy BIOS 1b = UEFI
Reserved	16.1-31	0x0	Reserved.

The following completion is sent for the Done Alternate Write command:

**Table 4-20. Completion for the Done Alternate Write Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0904	Command opcode.
Datalen	4-5	0x0	N/A
Return Value/VFID	6-7		ENOSPC = More than 128 VFs are requested. EBUSY = Failed to perform command due to busy NVM.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16.0	0b	Reserved.
Return Flags	16.1		Reset Needed When set, indicates that software should do a global reset for the Alternate RAM content to take effect.
Reserved	16.1-31	0x0	Reserved.

### 4.3.2.2.6 Clear Port Alternate Write Command (0x0906)

The Clear Port Alternate command indicates to the E810 to clear the alternate sections of the PF. The port is inferred from the PF that sent the command.

**Table 4-21. Clear Port Alternate Write Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0906	Command opcode.
Datalen	4-5	0x0	N/A
Return Value/VFID	6-7	0x0	N/A
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31	0x0	Reserved.

The following completion is sent for the Clear Port Alternate Write command:

**Table 4-22. Completion for the Clear Port Alternate Write Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1		See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0906	Command opcode.
Datalen	4-5	0x0	N/A
Return Value/VFID	6-7	0x0	N/A
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31	0x0	Reserved.

### 4.3.2.3 Example of a SMASH/CLP Flow - Legacy BIOS

The following pseudo code provides an example of how such a flow might be performed by legacy BIOS using SMASH/CLP commands. The following guidelines should be kept:

- If a certain PCI function is disabled via this mechanism, pre-boot software does not access any resource of that function (such as any CSR) once it sends the Done Alternate Write AQ command. The E810 confirms the command, resets, and disables the function.
- By the time the SMASH/CLP commands are executed and a function is disabled, there is no Tx/Rx activity in the E810 (since no queues have been initialized).
- All ports enabled in the NVM have the Option ROM enabled (such as the lowest PCI function per port has an Expansion ROM BAR).
- BIOS calls all CLP entry points for all functions before getting into the initialization phase.
- It is not guaranteed that a system reset is issued immediately following this sequence. For example, the configuration settings must take place even if such a reset is not issued.
- During the initialization phase, pre-boot software has to issue a global reset followed by a Start LLDP Agent AQ command to start the LLDP agent in firmware.

```
// Initial state:
// The device is configured from NVM.
// The following flow runs per each device.

BIOS does PCI enumeration and discovers functions with Option ROM enabled.

For each LAN Port with Option ROM enabled // sent to the lowest number PCI function on the port,
  BIOS loads the Option ROM into system RAM.
  Set First-Init to true // When Init is later called, it's the 1st call to Init.

  For each CLP string received by BIOS for a function within the port,

    If the Option ROM for the port supports SMCLP entry point,
      BIOS calls SMCLP entry point for port with CLP string.
      SMCLP section in Option ROM processes the CLP string.
      Option ROM keeps track of SMCLP status for the port.
    End-If

  End-For
End-For

For each LAN port with Option ROM enabled,
  BIOS calls INIT entry point for the port.
End-For

SMCLP Entry Point:

If CLP type is SET and action is "Return to default" // clear any pre-existing CLP configuration,
  Send the "Clear Port Alternate" admin command to invalidate all Alternate Memory parameters
  for the port and its PFs.
End-If

If CLP type is SET,
  Generate "Write Alternate - Direct" admin command(s) to the device.
End-If

If CLP type is EXIT // Apply any configuration changes from previous commands that have not
been applied,
  Send appropriate admin commands with default values for the PF parameters not specified by
  the CLP string that have a default behavior in this mode, different than the hardware
  default.
End-If

End SMPCLP Entry Point.

SMCLP INIT Entry point:

If First-Init is true // the flow below should only be executed on the 1st call to Init,

  If SMCLP status is false // means no CLP strings have been received for any functions for the
  device,
    // Option ROM INIT configures the device in a standard operating mode (i.e. not an OEM
    specific mode).
  End-If

  If SMCLP status is true // means at least one function had CLP strings,
    // This is the time to load the CLP parameters from the Alternate Structure into the
    device.
    Send "Done Alternate Write" command indicating end of CLP strings for the device.
  End-If

  // Global Reset should be done only once per device.

  If firmware required a reset in the "Done Alternate Write" response,
    Issue Global Reset of the device.
    Set First-Init to false.
  End-If

End-If
```

```
Continue with INIT code...
End SMCLP INIT Entry Point.
```

### 4.3.2.4 Example of a SMASH/CLP Flow - UEFI

The following pseudo code provides an example of how such a flow might be performed by the UEFI drivers using SMASH/CLP commands. The following guidelines should be kept:

- If a certain PCI function is disabled via this mechanism, pre-boot software does not access any resource of that function (such as any CSR) once it sends the Done Alternate Write AQ command for that function. The E810 confirm the command, resets, and disables the function.
- By the time the SMASH/CLP commands are executed and a function is disabled, there is no Tx/Rx activity in the E810 (since no queues have been initialized).
- A UEFI driver is executed for each enumerated LAN port. For example, any port enabled in the NVM and not disabled by strapping.
- It is not guaranteed that a system reset is issued immediately following this sequence. For example, the configuration settings must take place even if such a reset is not issued.

```
// Initial state:
// The device is configured from NVM.
// The following flow runs per each device.

BIOS does PCI enumeration and discovers PCI functions.

For each enabled LAN Port,
  BIOS calls driver START entry point.

  For each CLP string received by BIOS for a function within the port,
    SMCLP section processes the CLP string.
  End-For

  Driver sends a "Done Alternate Write" command indicating end of CLP strings for the port.

  If firmware required a reset in the "Done Alternate Write" response,
    Issue Global Reset of the device.
  End-If

End-For

SMCLP section in START:

If CLP type is SET and action is "Return to default" // clear any pre-existing CLP configuration,
  Send the "Clear Port Alternate" admin command to invalidate all Alternate Memory parameters
  for the port and its PFs.
End-If

If CLP type is SET.
  Generate "Write Alternate - Direct" admin command(s) to the device.
End-If

If CLP type is EXIT // Apply any configuration changes from previous commands that have not been
applied,
  Send appropriate admin commands with default values for the PF parameters not specified by
  the CLP strings that have a default behavior in this mode, different than the hardware
  default.
End-If

End SMPCLP section.
```

### 4.3.2.5 Processing the Alternate Structure

As a result of each Done Alternate Write AQ command, the EMP loads the relevant alternate structure parameters into the E810 according to the following sequence:

- EMP loads any required parameters from the alternate structure into the hardware.
- EMP ACKs the Done Alternate Write command.
- Global reset is performed:
  - Initiated by software.
  - Reset is done only once and not per each instance of the Done Alternate Write AQ command.
- Hardware is initialized, including loading of the relevant sections of the Alternate Structure into the Hardware.

### 4.3.3 Network Boot

Any functions can be a PXE or UEFI boot function (up to 8 such functions).

### 4.3.4 Device State

This section is limited to changes in the E810's state made in the BIOS initialization stage. For units not mentioned here, behavior is as described in [Section 4.2.1.4](#).

#### 4.3.4.1 Switch/Tx-Scheduler

Some parameters of the switch and Tx-Scheduler configuration might change by the contents of the alternate structure. Such changes take effect when the alternate structure is enabled.

#### 4.3.4.2 LAN

Expansion ROM code might set LAN QPs for network boot. The sequence of setting a LAN QP is described in [Table 10-32](#) and [Section 10.4.3.6.1](#).

#### 4.3.4.3 Interrupts

Interrupts must be set if used for Admin Queue or LAN queues operation. See [Section 9.1.1.1](#) for the exact flow.

## 4.4 Driver Load

### 4.4.1 Introduction

#### 4.4.1.1 Driver Load (non-Virtualized)

As described earlier in this section, by the time the device driver loads, the NVM configuration is already complete and PCIe configuration has taken place. During a device driver load, the following sequence of commands is typically issued to the E810 to initialize it for normal operation. The major initialization steps are:

1. Device driver probes the E810 for resource allocations.
2. Disable interrupts.
3. Initialize the Admin Queue (see [Section 9.5.3](#)).
4. Initialize HMC (see [Section 9.3.4](#)).
5. Initialize MAC/PHY.
6. Initialize power management - wake-up (see [Section 5.3.5](#)).
7. Initialize DCB, including Rx-PB.
8. Initialize the switch and Tx-Scheduler (see [Section 7.8.12](#) and [Section 8.3.4.1](#)).
9. Initialize statistics by reading the counter's initial values to serve as a baseline.
10. Init Protocol Engine (see [Section 11.5.1](#)).
11. Initialize 1588.
12. Enable interrupts.

At this point, the E810 is ready to initialize VSIs and LAN/PE flows. These are done dynamically during operation:

- Initialize VSI.
- Initialize LAN QP, including its interrupts (see [Section 10.4.3](#) and [Section 10.5.5](#)) or Init PE QP (see [Section 11.5.1](#)).
- Configure filters (see [Section 7.10](#)).

### 4.4.1.2 Driver Load (SR-IOV)

The E810 approach for virtualized device drivers is to depend heavily on the PF device driver for management of chip resources. The device driver models for newer virtualized operating systems are moving in a direction that requires such functionality. Figure 4-13 shows the high-level initialization flow for virtualized device drivers that use a VF in a guest operating system.

Figure 4-13. Virtualized Device Driver Initialization Flow

#### 4.4.1.2.1 PF Initialization Details

In addition to the regular device driver initialization flow described in Section 4.4.1.1, the PF device driver should apply the following steps to enable support for VMs:

1. After the operating system enables virtual bridging, the PF device driver should create a VEB or a VEPA switching element using the following flow:
  - a. Query the switch structure using the Get Switch Configuration command (Section 7.8.12.2.1) to get the initial VSI and initial switch ID associated with the port.
  - b. Define mirroring rules using the Mirroring Rules commands (Section 7.8.12.7.1).
  - c. Define storm control rules using the Set Storm Control Configuration command (Section 7.8.12.4.1).
  - d. Activate malicious driver protection as described in Section 9.2.2.2.1.
2. When the VMM requests that a virtual port be created, the PF driver should:
  - a. Create a set of VSIs according to the flow described in the paragraphs that follow. The exact flow depends on the VMM-to-PF API.
  - b. Define the bandwidth allocated to the VSI and each of its TCs using the Scheduler Configuration commands (Section 8.3.4.3.6).
  - c. If the virtual port is a VF, allow VF access to the network by clearing the associated bit in GL\_VIRT\_VFLRE register.

#### 4.4.1.2.2 VF Initialization Details

This section describes the flow used to initialize a VF. It refers to various stages shown in [Figure 4-13](#). Only stages involving the hardware are detailed.

##### 4.4.1.2.2.1 Software Reset

A VF software reset can be asserted only by the PF using the `VPGEN_VFRTRIG.VFSWR` field. Following a VF software reset, the VF should request re-initialization of the queues from the PF.

Following the reset, the PF should preform the clean-up steps described in [Section 4.1.3.3](#).

##### 4.4.1.2.2.2 Request Resources and Create/Initialize Data Queues

On top of the resources statically allocated to a VF (interrupts, RSS table, and so on), a VF might have a set of VSIs. Each VSI contains objects such as:

- User priorities (transmit queue groups)
- Queue pairs
- Queuing filters

VSIs can be requested either for LAN or iWARP.

The resources should be requested in the following order (operations with the same stage number can be done in any order):

Step	Resource Requested	PF Action	Rules
1	VSI and UPs	Allocate VSIs according to allocation policies using the Add VSI AQ command ( <a href="#">Section 7.8.12.3.1</a> ).	The PF should activate the security features in the VSI (anti spoof, port based VLAN) according to the VF settings.
2	Forwarding table entries (MAC and VLANs)	Add the requested filters using the Add Switch Rules command ( <a href="#">Section 7.8.12.6.1</a> ).	
3	Data queue pairs	Create the requested queue contexts as described in <a href="#">Section 10.4.3</a> and <a href="#">Section 10.5.5</a> .	
	Protocol Engine resources	The resources for the Protocol Engine are described in <a href="#">Section 11.1</a> and the PF flow is described in <a href="#">Section 11.5.1</a> .	Before using any Protocol Engine related resources, the Host Memory Cache must be properly programmed. See section <a href="#">Section 9.3</a> for more details on the Host Memory Cache initialization. Virtual function HMC initialization must be performed by the PF driver on behalf of the VF driver.

## 4.5 Device/Port/Function Configuration

### 4.5.1 General

The E810 provides several mechanisms to configure which PCI functions and Ethernet ports are exposed.

The functions and ports can be hidden or exposed:

- Through NVM configuration.
- Based on power management policy.
- Through strapping pins.

#### 4.5.1.1 Port-to-Function Mapping

The `PFGEN_PORTNUM.PORT_NUM` per-PF register field (loaded from the NVM) associates each PF with a port.

### 4.5.2 Disable Through Strapping Pins

For a LAN on Motherboard (LOM) design, it might be desirable for the system to provide BIOS setup capability for selectively enabling or disabling E810 PCI devices, PCI functions, or external Ethernet ports and the associated PCI function. It provides end users more control over system resource management and avoids conflicts with add-in NIC solutions. The E810 provides support for selectively enabling or disabling one or more LAN PCI device(s) in the system.

The E810 provides options to disable its external Ethernet ports and/or PCI functions:

- A strapping pin (`DEV_DIS_N`) is sampled on `LAN_PWR_GOOD` and PCIe resets to disable Ethernet ports. The specific port(s) to be disabled is determined from NVM. Additional NVM configuration is provided to determine which PCI functions are disabled at the same time. The expected usage is to disable the PCI functions associated with the disabled ports.
- A strapping pin (`PCI_DIS_N`) is sampled on `LAN_PWR_GOOD` and PCIe resets to disable PCI functions. The specific functions that are disabled are determined from the NVM.

Following are some guidelines on usage of these straps:

- During power up, the `PCI_DIS_N` and `DEV_DIS_N` pins are ignored until the NVM is read. From that point, the E810 might disable all PCI functions if either `PCI_DIS_N` or `DEV_DIS_N` is asserted.
- De-assertion of the `PCI_DIS_N` or `DEV_DIS_N` pins requires the system to issue a power-on reset/`LAN_PWR_GOOD`/`PE_RST_N`/in-band reset to the E810 to re-enable any disabled PCI functions or external Ethernet ports.
- The `PCI_DIS_N` and `DEV_DIS_N` pins should maintain their state during system reset and system sleep states. It should also insure the proper default value on system power-up. For example, one could use a GPIO pin that defaults to 1b (enable) and is on system suspend power (such that it maintains its state in S0-S5 ACPI states).

### 4.5.3 Port and Device Disable

The following mechanisms are provided to enable and disable Ethernet ports:

- NVM configuration
  - Ports are enabled or disabled from the NVM. The `PRTGEN_CNF.PORT_DIS` per-port register bit (loaded from the NVM) disables external ports other than Port 0 (`PORT_DIS` for Port 0 is hard-wired to always enabled).
  - When cleared, the respective port is enabled.
  - The hardware default value is for Port 0 to be enabled and other ports to be disabled.
- Power management
  - If the Ethernet ports are not required in Dr state (such as if manageability is disabled and APME WoL is disabled as well), all ports are disabled during Dr state. See [Section 5.1.3.4](#).
- Strapping (`DEV_DIS_N`)
  - When the `DEV_DIS_N` pin is asserted low, the `PRTGEN_CNF.ALLOW_PORT_DIS` per-port bits (loaded from the NVM) determine if the port is disabled.
  - The hardware default value for these bits is 0x0 (do not disable).
  - If a bit is set to 0b, `DEV_DIS_N` has no effect on the port.

**Note:** If a port is required for manageability purposes, it should not be disabled by the mechanisms previously described.

The result of the previous mechanisms is reflected in the `PRTGEN_STATUS.PORT_VALID` bit (per port), which denotes if the port is enabled. A bit is cleared (port disabled) if at least one of the previous mechanisms disables the port. The port is then powered down (including MAC, PCS, PHY).

If all ports are disabled, the E810 is put in a power-down, reset state. Specifically, the E810 does not respond to PCI configuration cycles, the PCIe link is in L3 state, and Ethernet ports are in power-down. All PCI functions must be disabled as well via the mechanisms previously described (such as the proper NVM configuration must be set to disable for PFs).

#### 4.5.3.1 Dynamic Port Shutdown

Another related, per-port status bit is the `PRTGEN_STATUS.PORT_ACTIVE` indication. This is a dynamic state indicating that the port is temporarily inactive and is powered down. When the port is inactive, reactivating it does not require any reset, and the related PCIe function is still active.

A port is active (`PRTGEN_STATUS.PORT_ACTIVE = 1b`) based on the following rules:

- `PRTGEN_STATUS.PORT_VALID = 1b`, as previously described above AND the E810 is in D0 state (`PMCSR.PowerState = D0`).
  - If link is requested by manageability, the link is kept on. Specifically, hardware ignores disabling the link using the `PRTGEN_CNF2.ACTIVATE_PORT_LINK`.
  - Else,
    - In systems where the application needs to prevent any traffic on link before the device driver is loaded, the `PRTGEN_CNF2.ACTIVATE_PORT_LINK` is loaded from the NVM with the value of 0b (disable).

- Once the device driver loads, it uses the Set Link and Restart AN with the command bit 2 set (Enable Link). Following this, the EMP enables the link by writing the value of 1b to the `PRTGEN_CNF2.ACTIVATE_PORT_LINK` and starts the link bring-up sequence.
- If the device driver is about to be removed or disabled, then before going down the device driver might disable the link by the Set link and Restart AN with the command bit 2 cleared (Disable Link). Following this, firmware disables the link by writing the value of 0b to the `PRTGEN_CNF2.ACTIVATE_PORT_LINK`.
- `PRTGEN_STATUS.PORT_VALID = 1b`, as previously described, AND the E810 is in Dr state (`PMCSR.PowerState = D3`).
  - If port is enabled for wake-up. See the description in [Section 5.3](#).
  - Else,
    - The link should be down as it is not required for EMP functionality.
    - BMC might enable manageability by sending the appropriate command (see [Section 12.6.3.1](#)). As a result, EMP transitions to pass-through manageability-on state, enables the respective port (if disabled), and starts the link bring-up sequence.
    - If the channel is disabled by the BMC (by sending the appropriate command - see [Section 12.6.3.1](#)), and EMP has no other needs for the LAN port in Dr state (like proxy), the EMP reverts to the value of `EMP_LINK_ON` bit in the NVM manageability module or is set to zero (in case of the Disable Channel command with the `ALD` bit set).

## 4.5.4 Function Disable

The following mechanisms are provided to enable and disable PCI functions.

- NVM configuration
  - PCI functions are enabled or disabled from the NVM. The `PFPCI_FUNC.FUNC_DIS` per-PF bit (loaded from the NVM) disables PCI functions (other than function 0. `FUNC_DIS` for function 0 is hard-wired to enabled).
  - When cleared, the respective function is enabled.
  - The hardware default value is for function 0 to be enabled and other functions to be disabled.
- Strapping through `PCI_DIS_N`
  - When the `PCI_DIS_N` pin is asserted low, the `PFPCI_FUNC.ALLOW_FUNC_DIS` per-PF register bit (loaded from the NVM) determines if the function is disabled.
  - If this bit is set to 0b, `PCI_DIS_N` has no effect on the PCI function.
  - The hardware default value is 0b (keep enabled).
- Strapping through `DEV_DIS_N`
  - When the `DEV_DIS_N` pin is asserted low, the `PFPCI_FUNC.DIS_FUNC_ON_PORT_DIS` per-PF bit (loaded from the NVM) determines if the function is disabled.
  - If this bit is set to 0b, `DEV_DIS_N` has no effect on the PCI function.
  - The hardware default value is 0 (do not disable).

- Soft SKU commands
  - The soft SKU commands are executed either before or after PERST# was de-asserted and in any case, before the first access by BIOS to the E810 (such as before the first PCIe configuration cycle to the E810).
  - When a LAN port is enabled or disabled via a Soft SKU command, the EMP identifies (through the PFGEN\_PORTNUM registers) the PCI functions associated with the port.
  - EMP then updates the configuration of the functions enabled or disabled by writing to the PFPCI\_FUNC.FUNC\_DIS register bits.
  - PFPCI\_FUNC.FUNC\_DIS for function 0 is hard-wired to enabled, so is not affected by this mechanism.

The result of the previous mechanisms is reflected in the PFPCI\_STATUS1.FUNC\_VALID bit (per PF), which denotes if the function is enabled. A bit is cleared (function disabled) if at least one of the previous mechanisms disables the function.

When a function is disabled:

- It does not respond to PCI configuration cycles (unless specified otherwise). Effectively, the function becomes invisible to the system.
- The *PME\_En* bit is cleared to avoid issuing PME.

The Ethernet ports associated with disabled PCI functions are still available for manageability purposes.

#### 4.5.4.1 Dummy Function

When PCI function 0 is disabled, it does not disappear from the PCIe configuration space. Rather, the function presents itself as a dummy function. The Device ID and Class Code of this function change to other values (dummy function Device ID 0x10A6, Class Code 0xFF0000, with an option to load from the NVM) that claims 4 KB of memory. In addition, the function does not require any I/O space and does not require an interrupt line. All other PCI functions keep their respective locations.

#### 4.5.5 Port Enable and Disable from BIOS (HII)

The E810 allows disabling a port and its corresponding function as a BIOS setup option (for example, using HII). The operation involves setting adaptive NVM feature, triggering Shadow RAM dump to make this configuration persistent, and request PCIe reset, so the new configuration would take effect on enumeration.

The following set of adaptive NVM features is defined.

**Table 4-23. HII Port Disable of Physical Function X**

Adaptive NVM Feature	Description
HII Port Disable of physical function X	Eight feature IDs, one for each PF. Two configuration IDs: Enable = Set <i>HII Port Disable by Function</i> bit for function X to 0. Disable = Set <i>HII Port Disable by Function</i> bit for function X to 1.

The adaptive NVM features controls the following bit in NVM PFA area at a new TLV 0x139.

**Table 4-24. HII Port Disable by Function**

Field Name	Description
HII Port Disable by Function	One bit per PF. When the bit is set, the firmware should disable the port that is associated with the PF according to PFGEN_PORTNUM. The disable of the port should be done using the relevant <i>EMP_PORT_DIS</i> field of register PRTGEN_CNF.

## 4.5.6 Event Flow for Enable/Disable Ports and PCI Functions

This section describes the expected flow to disable or enable PCI functions or Ethernet ports. Following a power-on reset/LAN\_PWR\_GOOD/PE\_RST\_N/in-band reset, the DEV\_DIS\_N and PCI\_DIS\_N signals should be driven high (or left unconnected) for normal operation.

The following example assumes that PCI functions and/or Ethernet ports are being disabled during the BIOS initialization phase:

1. Following a power-up sequence, the DEV\_DIS\_N and PCI\_DIS\_N signals are driven high.
2. The PCIe link is established following PE\_RST\_N.
3. BIOS goes through PCI bus enumeration.
4. BIOS recognizes that the PCI functions in the E810 should be disabled.
5. The BIOS drives the DEV\_DIS\_N or PCI\_DIS\_N signal to a low level.
6. The BIOS asserts PCIe reset, either in-band or via PE\_RST\_N.
7. As a result, the E810 samples the DEV\_DIS\_N and PCI\_DIS\_N signals and disables the PCI functions and/or external Ethernet ports.
8. BIOS might do device enumeration a second time (the disabled PCI functions are invisible or changed to dummy function).
9. Proceed with normal operation.
10. Re-enable could be done by driving the DEV\_DIS\_N and PCI\_DIS\_N signals high and re-issuing a power-on reset/LAN\_PWR\_GOOD/PE\_RST\_N/in-band reset.

### 4.5.6.1 Multi-Function Advertisement

If all but one of the PCI functions are disabled, the E810 is no longer a multi-function device. The E810 normally reports a 0x80 in the PCI configuration header field header type, indicating multi-function capability. However, if only a single LAN is enabled, the E810 reports a 0x0 in this field to signify single-function capability.

### 4.5.6.2 Legacy Interrupts Use

Each NVM PF configuration module specifies the interrupt line used for each PCI function. When more than one PCI function is enabled, the E810 uses the INTA# to INTD# interrupts for interrupt reporting. The specific interrupt pin used is reported in the *PCI Configuration Header Interrupt Pin* field associated with each PCI function.

However, if only one PCI function is enabled, the INTA# must be used for this PCI function, regardless of the NVM configuration. Under these circumstances, the *Interrupt Pin* field of the PCI header always reports a value of 0x1, indicating INTA# usage.

### 4.5.6.3 Power Reporting

When more than one PCI function is enabled, the PCI power management register block has the capability of reporting a common power value. The common power value is reflected in the *Data* field of the PCI Power Management registers. The value reported as common power is specified via the LAN Power Consumption NVM word (word 0x22), and is reflected in the *Data* field each time the *Data\_Select* field has a value of 0x8 (0x8 = common power value select).

When only one PCI function is enabled, the E810 appears as a single-function device, the common power value, if selected, reports 0x0 (undefined value), as common power is undefined for a single-function device.

## 4.6 Shared Resource Management

The E810 is a device with multiple external Ethernet ports and that supports multiple PCI functions. Several on-chip resources are shared between device drivers that load the PCI functions exposed by the E810. Additionally, some resources for SR-IOV VFs are managed by the associated PFs. In general, the E810 minimizes the requirement for coordination between device drivers running on different PCI PFs through a combination of resource partitioning and programming interface assistance for remaining resources that are shared.

The E810 handles shared resources using a number of allocation mechanisms and/or access control mechanisms. [Table 4-25](#) lists the supported mechanisms.

**Table 4-25. Supported Mechanisms**

Class	Description
Dedicated	This resource is associated with a particular E810 element and is always available without respect to any other configuration or setting. Examples of elements in this context could be a PCI function or external Ethernet port.
Administered	Administered resources can be re-assigned based on BMC, BIOS settings, or other OEM specific mechanisms. These resources can be changed with a PCI reset but do not change dynamically after the PCI reset.
Profiles	Resources that are allocated via profiles are typically divided up among different entities based on some combination of other input. A profile might dictate that a resource is divided among the active PCI functions in a particular manner. Another possible usage of a profile is to divide resources based on both the number of PCI functions and the number of external Ethernet ports. The division of resources that are allocated by profiles happens between the time that a PCI reset occurs and might be impacted by an initial device driver load, but resource allocation based on profiles require a PCI reset to change after the initial device driver load.
Pool	Resources that are allocated from pools are typically allocated in a fashion that guarantees no resource starvation to an individual consumer of a resource but enables flexible allocation of remaining resources to any consumer that requires additional resources beyond the minimum. Pools are used for resources that do not need to have a maximum number of resources allocated to all consumers at the same time and that the consumers are reasonably able to fail an allocation.
Service	Resources that are possibly allocated on a per-device or per-port basis but are accessed by a software service that has visibility to multiple device driver interfaces that do not need the E810 to provide an arbitration mechanism. In these cases each PCI function associated with a given resource provides equal access to the resource as other PCI functions associated with the resource. This enables the software service to have the flexibility to access such resources from any device driver instance that it finds available and to switch between device driver instances as the device drivers are stopped and started. Resources that need to be accessed directly by a device driver without support from an overlaying software service cannot be handled in this fashion.
Arbitrated	Resources that are allocated on a per-device or per-port basis need an access control mechanism that enables multiple consumers of the resource to operate in an independent manner. The E810 does this by either providing a firmware interface to access the resource where firmware handles the requests one at a time or by other hardware based arbitration scheme.

### 4.6.1 Resource Profiles

The concept of resource profiles is used in order to make the E810's resource allocation mechanisms easier to understand. Resource profiles dictate how resources listed in [Table 4-25](#) as profiles are distributed among PCI functions so that software drivers do not need to coordinate allocation of these resources.

A resource profile is made up of the set of equations that take input parameters from the system configuration and distributes each resource. Each resource has a different equation for distribution (see the Description column in [Table 4-25](#)). Also, the following tables list examples of the result calculations for a full set of resources. Since some of the resource distribution equations simply take the number of PCI functions as input, while others might need additional input (such as the number of external Ethernet ports or the software usage model that a device driver needs to implement), [Table 4-26](#) lists which input parameters effect the allocation of each resource.

**Table 4-26. Resource Profiles**

Resource	# External Ethernet Ports	# PCI Physical Functions	PCI Function to External Ethernet Port Assignment	# PCI Virtual Functions	Driver Usage Model
LAN Queues	No	Yes	No	Yes	No
MSI-X Vectors	No	Yes	No	Yes	No
Multicast MAC Address Filters	No	Yes	No	No	No
Internal Switching Elements <sup>1</sup>	Yes	Yes	Yes	No	No
Protocol Engine Resources	No	Yes	No	Yes	Yes

1. Resource profiles only impact the default settings for internal switching elements. Run-time switch management software has the ability to override the default number of internal switching components and the internal switch topology.

Table 4-27 lists a few sample sets of typical input parameters that are used with the E810. The initial values of these resources are found in the NVM, but might be overridden by OEM-specific configuration mechanisms followed by a PCI reset.

**Note:** The device driver usage model can be changed and locked by the first device driver to load following a PCI reset. All other inputs are set at PCI reset.

**Table 4-27. Resources per Configuration**

Scenario Name	# External Ethernet Ports	# PCI Physical Functions	PCI Function to External Ethernet Port Assignment	# PCI Virtual Functions	Driver Usage Model
Single Port Default	1	1	PF0 -> Port 0	256	Default
Dual Port Default	2	2	PF0 -> Port 0 PF1 -> Port 1	256	Default
Quad Port Default <sup>1</sup>	4	4	PF0 -> Port 0 PF1 -> Port 1 PF2 -> Port 2 PF3 -> Port 3	256	Default
Octal Port Default <sup>2</sup>	8	8	PF0 -> Port 0 PF1 -> Port 1 PF2 -> Port 2 PF3 -> Port 3 PF4 -> Port 4 PF5 -> Port 5 PF6 -> Port 6 PF7 -> Port 7	256	Default
Single Port SR-IOV VF Primary	1	1	PF0 -> Port 0	256	SR-IOV PF Primary
Single Port SR-IOV Even Distribution	1	1	PF0 -> Port 0	256	SR-IOV Even Distribution

1. In this mode, the ports are ordered so that a single 100G port can be used in a 4x25G port configuration. See Table 3-22.  
2. See Table 3-21.

Table 4-28 lists the resulting resource distribution for each of the input scenarios listed in Table 4-27. With the exception of the switch topology, none of the resource distribution can be changed after the initial device driver load without a PCI reset occurring. If the resource distribution changes while an active device driver is running, unpredictable results can occur. For example, repartitioning the Host Memory Cache segment descriptor table while a device driver is active causes the E810 to improperly interpret the host memory used for caching resource objects. The E810 provides various mechanisms (such as the HMC resource profile locking) to prevent software from unknowingly causing these types of reconfigurations.

**Table 4-28. Resource Distribution**

Resource	#LAN QPs Per PF	#LAN QPs Per VF	#MSI-X Vectors Per PF	#MSI-X Vectors Per VF	Default Internal Switch Topology	HMC and Protocol Engine Resources				
						No SR-IOV	SR-IOV Primary Distribution		SR-IOV Even Distribution <sup>1</sup>

**NOTE:**      *This page intentionally left blank.*

## Chapter 5 Power Management

---

This section defines how Power Management is implemented in the E810.

### 5.1 PCIe Power Management

#### 5.1.1 Auxiliary Power Usage

Auxiliary power can be used for powering the E810 while the system is in low power state ( $D3_{cold}$ ). The E810 uses the AUX\_PWR pin as an indication that auxiliary power is available to it. The E810 uses this indication to advertise  $D3_{cold}$  wake-up support in the *PMC.PME\_Support* field and to set the *Aux Power Detected* bit in the PCIe capability structure Device Status Register. The AUX\_PWR pin is strapped during Power-On Reset (POR). The E810 only uses the auxiliary power if one of the functions requiring it (as indicated below) are enabled (and, if auxiliary power is available). If the usage of auxiliary power is not enabled (that is, none of the functions requiring it are enabled), the E810 must be power-gated and does not consume auxiliary power in  $D3_{cold}$ .

If AUX power usage during  $D3_{cold}$  is supported (as indicated below), all of the E810's sticky bits preserve their values and only get reset by the power-up reset (detection of power rising).

When AUX power is applied to the E810, the actual usage of AUX power during  $D3_{cold}$  is controlled through the following factors:

- NVM loaded bits:
  - Manageability — Bit per port loaded from NVM, which indicates if the relevant port link should be established for EMP functionality. The E810 provides the proper clocking to establish the required port link/s at this state.
  - APME — Bit per function (loaded to PFPM\_APM[PF]) indicates if the relevant PF associated to a port link should be established to enable APM WoL. The E810 provides the proper clocking to establish the required port link/s at this state.
- PCIe configuration bits:
  - *PME\_En* — This bit in the PMCSR PCI config space is used to determine if the E810 is allowed to consume AUX power for WoL.
- EMP firmware decision:
  - The EMP firmware might prevent the device from being power-gated in Sx states, and thus consume auxiliary power. The E810 should be specifically configured by the EMP firmware to provide the proper clocking or to establish the required port link/s at this state.

The following pseudo code defines AUX Power usage where *APME* and *PME\_En* bits refer to a logical OR over all the PFs attached to the port:

```
If (AUX_PWR = 1),
  If ((APME or EMP_LINK_ON or PME_En) = 1),
    AUX power is used to preserve link functionality.
  Else,
    Link functionality is not preserved during AUX power supply.
  End-IF
End-If
```

## 5.1.2 PCIe Link Power Management

The PCIe link state follows the power management state of the device. Since the E810 incorporates multiple PCI functions, the device power management state is defined as the power management state of the most awake function:

- If any function is in D0a state in ARI mode or either D0a or D0u in non-ARI mode, the PCIe link assumes the device is in D0 state.
- Else, If in ARI mode, at least one of the functions is in D3 state and the other functions are not in D0a state, or if in non-ARI mode all of the functions are in the D3 state, the PCIe link assumes the device is in D3 state.
- Else, the device is in Dr state (PE\_RST\_N is asserted to all functions).

The E810 supports all PCIe power management link states:

- L0 state is used in D0u and D0a states.
- The L0s state is used in D0a and D0u states each time link conditions apply.
- The L1 state is used in D0a and D0u states each time link conditions apply, as well as in the D3 state.
- The L2 state is used in the Dr state following a transition from a D3 state if PCI-PM PME is enabled.
- The L3 state is used in the Dr state following power up, on transition from D0a and also if PME is not enabled in other Dr transitions.

Figure 5-1. Link Power Management State Diagram

While in L0 state, the E810 transitions the transmit lane(s) into L0s state once the idle conditions are met for a period of time defined as follows.

- L0s configuration fields are:
  - L0s enable — The default value of the *Active State Link PM Control* field in the PCIe Link Control register is set to 00b (both L0s and L1 disabled). System software can later write a different value into the Link Control register.
  - L0s exit latency (as published in the *L0s Exit Latency* field of the Link Capabilities register) is loaded from/to the `GLPCI_PMSUP.L0S_EXIT_LAT` NVM/register field. Separate values are loaded when the E810 shares the same reference PCIe clock with its partner across the link, and when the E810 uses a different reference clock than its partner across the link. The E810 reports whether it uses the slot clock configuration through the *PCIe Slot Clock Configuration* bit loaded from/to the `GLPCI_PMSUP.SLOT_CLK` NVM/register bit.
  - L0s acceptable latency (as published in the *Endpoint L0s Acceptable Latency* field of the Device Capabilities register) is loaded from the `GLPCI_PMSUP.L0S_ACC_LAT` NVM/register field.

The E810 transitions the link into L0s state once the PCIe link has been idle for a period of time defined in the *l0s\_idle\_timer* field of `PMIDLTMR` register loaded from RO PCIe LCB module in NVM. The E810 then transitions the link into L1 state once the PCIe link has been in L0s state for a further period as defined in the *l1\_idle\_timer* register field of the same register.

The following NVM fields control L1 behavior:

- *L1 support* — Indicates support for ASPM L1 in the PCIe configuration space (loaded into the *Active State Link PM Support* field).
- *L1 exit latency* — Defines L1 active exit latency. The default value is loaded from/to the `GLPCI_PMSUP.L1_EXIT_LAT` NVM/register field.
- *L1 acceptable latency* — Defines L1 active acceptable exit latency. The default value is loaded from/to the `GLPCI_PMSUP.L1_ACC_LAT` NVM/register field.

### 5.1.3 Power States

The E810 supports the D0 and D3 architectural power states as described earlier. Internally, the E8100 supports the following power states:

- **D0u (D0<sub>un-initialized</sub>)** — An architectural sub-state of D0.
- **D0a (D0<sub>active</sub>)** — An architectural sub-state of D0.
- **D3** — Architecture state D3<sub>hot</sub>.
- **Dr** — Internal state that contains the architecture D3<sub>cold</sub> state. Dr state is entered when `PE_RST_N` is asserted, a PCIe in-band reset is received, or if the function is disabled.

Figure 5-2 shows the power states and transitions between them.

**Note:** PCI resets (cold/warm and hot) are reflected to the E8100 as primary bus reset (in case of cold/warm reset) or secondary bus reset (in case of a hot reset).

Figure 5-2. Power Management State Diagram

### 5.1.3.1 D0<sub>uninitialized</sub> (D0u) State

The D0u state is an architectural low-power state. In this state, the device is out of reset (conventional and FLR) but did not complete the enumeration and configuration stage.

#### 5.1.3.1.1 Entry to a D0u State

D0u is reached from either the Dr state (on de-assertion of internal PE\_RST\_N and auto-load of hardware configuration done) or the D3hot state (by configuration software writing a value of 00b to the *Power State* field of the PCI PM registers while primary and secondary accesses are disabled). De-assertion of internal PE\_RST\_N causes the entire state of the E810 to be cleared except for bits defined as sticky in configuration space. PCIe configuration is loaded from the NVM, followed by establishment of the PCIe enumeration. Once this is done, configuration software can access the E810.

### 5.1.3.2 D0<sub>active</sub> (D0a) State

A E810 Function enters the D0<sub>active</sub> state whenever any single or combination of the function's *Memory Space Enable*, *I/O Space Enable*, or *Bus Master Enable* bits are enabled by system software in the PCI Command configuration register.

In this state, it can transmit and receive packets if properly configured by the software device driver.

The PHY is enabled (or re-enabled) by the software device driver to operate/auto-negotiate to full line speed/power if not already operating at full capability.

## Notes:

- Wake behavior:
  - An APM wake event (PM\_PME message) due to reception of a Magic Packet is not generated when the function is in D0<sub>active</sub> state.
  - Any APM wake up previously active remains active when moving from D3 to D0. That is, APM enable is loaded from NVM and is not reset by any reset but POR.
  - WAKE# pin is never toggled for an APM wake event when a function is in D0.
- If APM wake is required in D3, software driver should not disable APM wake-up via clearing the PFPM\_APM.APME bit on entry into D0. Otherwise, APM wake following a system crash and entry into S3, S4, or S5 system power management state are not enabled. Following entry into D0, software device driver can activate the wake-up filters by writing to the Wake Up Filter Control (PFPM\_WUFC) register.

### 5.1.3.2.1 Entry to a D0a State

D0a is entered from either the D0u state (by writing a 1b to the *Memory Access Enable* or the *I/O Access Enable* bit, or the *BME* bit of the PCI Command configuration register) or from the D3<sub>hot</sub> state (by configuration software writing a value of 00b to the *Power State* field of the PCI PM configuration registers while primary or secondary accesses is enabled). The receive and transmit flows of the appropriate LAN function are enabled.

### 5.1.3.3 D3 State (PCI-PM D3<sub>hot</sub>)

The E810 functions can transition to D3 when the system writes a 11b to the *Power State* field of the Power Management Control/Status Register (PMCSR). Any wake-up filter settings that were enabled before entering this state are maintained. The E810 does not clear any bit in the PCIe configuration space of a function during the function's transition to D3 state. While in D3, the appropriate function of the E810 does not generate master cycles.

Configuration and message requests are the only TLPs accepted by a function in the D3<sub>hot</sub> state. All other received requests must be handled as unsupported requests, and all received completions are handled as unexpected completions. If an error caused by a received TLP (such as an unsupported request) is detected while in D3<sub>hot</sub> and reporting is enabled, the link must be returned to L0 if it is not already in L0, and an error message must be sent. See section 5.3.1.4.1 in the *PCIe Base Specification*.

#### 5.1.3.3.1 Entry to D3 State

Transition to D3 state is through a configuration write to the *Power State* field of the PMCSR PCIe configuration register.

Prior to transition from D0 to the D3 state, the device driver disables scheduling of further tasks to the E810. It masks all interrupts, and it does not write to the Transmit Descriptor Tail register or to the Receive Descriptor Tail register.

If wake up capability is needed, system software should enable wake capability by setting to 1b the *PME\_En* bit in the PMCSR PCIe configuration register of the PF. After Wake capability is enabled the software device driver should set up the required wake up functionality using the flow described in [Section 5.3.5](#) prior to the D3 transition.

**Notes:**

- The PMCSR.*PME\_En* bit setting can be overridden via the PFPM\_APM.*APME* bit.
- If operation during D3<sub>cold</sub> is required, even when wake capability is not required (for example, for manageability operation), system should also set the *Auxiliary (AUX) Power PM Enable* bit in the PCIe Device Control register.

If all PCI functions are programmed into D3 state, the E810 attempts to bring its PCIe link into the L1 link state. As part of the transition into L1 state, the E810 suspends scheduling of new host TLPs, MCTP over PCIe VDMs is not suspended. The E810 waits for the completion of all previous TLPs it has sent. Any receive packets that have not been transferred into system memory are kept in the device (and discarded later on D3 exit). Any transmit packets that have not been sent can still be transmitted (assuming the Ethernet link is up).

In preparation for a possible transition to D3<sub>cold</sub> state, the device driver might disable up to all but one of its LAN ports (LAN disable) and/or transition the remaining link(s) to GbE speed (if supported by the network interface).

### 5.1.3.3.2 Exit from D3 State

A D3 state is followed by either a D0u state (in preparation for a D0a state) or by a transition to Dr state (PCI-PM D3<sub>cold</sub> state). To transition back to D0u, the system writes a 00b to the *Power State* field of the Power Management Control/Status Register (PMCSR). Transition to Dr state is through PE\_RST\_N assertion.

The *No\_Soft\_Reset* bit in the PCIe Power Management Control/Status (PMCSR) register in the E810 is always set to 1b to indicate that the E810 does not perform an internal reset on transition from D3<sub>hot</sub> to D0, so that transition does not disrupt the proper operation of other active functions. Software is not required to re-initialize the function's configuration space after a transition from D3<sub>hot</sub> to D0 (the function is in the D0 state).

The function is reset if the Link state had transition to the L2/L3 Ready state, on transition from D3<sub>cold</sub> to D0, if FLR is asserted, or if transition D3<sub>hot</sub> to D0 is caused by assertion of PCIe reset (PE\_RST pin).

### 5.1.3.4 Dr State (D3<sub>cold</sub>)

Transition to Dr state is initiated on system power-up. Dr state begins with the assertion of the internal power detection circuit (LAN\_PWR\_GOOD) and ends after the completion of the NVM auto-load.

Any wake-up settings that were enabled before entering this reset state are maintained.

The system can maintain PE\_RST\_N asserted for an arbitrary time. The de-assertion (rising edge) of PE\_RST\_N causes a transition to D0u state.

While in Dr state, the E810 can maintain functionality (for WoL or manageability) or can enter a Dr Disable state (if no WoL and no manageability) for minimal device power. The Dr Disable mode is described in [Section 5.1.3.4.1](#).

#### 5.1.3.4.1 Dr Disable Mode

The E810 enters a Dr disable mode on transition to D3<sub>cold</sub> state when it does not need to maintain any functionality. The conditions to enter either state are:

- The device (all PCI functions) is in Dr state.
- APM WOL is inactive for all PCI functions.

- Pass-through manageability is disabled.

Entry into Dr disable is usually done on assertion of PCIe PE\_RST\_N. It can also be possible to enter Dr disable mode by reading the NVM while already in Dr state. The usage model for this later case is on system power-up, assuming that manageability and wake up are not required. Once the device enters Dr state on power-up, the NVM is read. If the NVM contents determine that the conditions to enter Dr disable are met, the device then enters this mode (assuming that PCIe PE\_RST\_N is still asserted).

Exit from Dr disable is through de-assertion of PCIe PE\_RST\_N.

If Dr disable mode is entered from D3 state, the platform can remove the E810 power. If the platform removes the E810 power, it must remove all power rails from the device if it needs to use this capability. Exit from this state is through power-up cycle to the E810.

**Note:** The state of the TX\_DIS (Optical module Tx disable connected to SDP pins) or any of the other SDP pins is undefined once power is removed from the device.

#### 5.1.3.4.2 Entry to Dr State

Dr entry on platform power-up is as follows:

- Assertion of the internal power detection circuit (LAN\_PWR\_GOOD). Device power is kept to a minimum by keeping the network interfaces in low power.
- The NVM is then read and determines device configuration.
- If the *APM Enable* bit in the NVM is set, APM wake up is enabled (for each port independently).
- If the *MNG Enable* bit in the NVM word is set, pass-through manageability is enabled.
- Each of the LAN ports can be enabled if required for WoL or manageability. See [Section 5.2](#) for exact condition to enable a port.
- The PCIe link is not enabled in Dr state following system power up (since PE\_RST\_N is asserted).

Entry to Dr state from D0a state is through assertion of the PE\_RST\_N signal. An ACPI transition to the G2/S5 state is reflected in a device transition from D0a to Dr state. The transition can be orderly (such as a user selected a shut down operating system option), in which case the device driver can intervene. Or, it can be an emergency transition (like power button override), in which case, the device driver is not notified.

Transition from D3 state to Dr state is done by assertion of PE\_RST\_N signal. Prior to that, the system initiates a transition of the PCIe link from L1 state to either the L2 or L3 state (assuming all functions were already in D3 state). The link enters L2 state if PCI-PM PME is enabled.

#### 5.1.3.5 Protocol Engine Power Save Modes

Internally, the E810 supports two modes to reduce component power opportunistically by disabling the internal RDMA Protocol Engine (PE) via PE Clock Gating.

If the RDMA functionality is available, but not activated by software (for example, when PCIe reset is asserted), the E810 supports clock gating the PE block. Hardware determines whether RDMA is enabled if the GLHMC\_PEHTEOBJSZ register is programmed to any non-zero value. GLHMC\_PEHTEOBJSZ is reset by CORER. As with power gating, register accesses which would be decoded to the PE block are handled gracefully. Write transactions are silently discarded, and read accesses return deterministic values (0xDEADBEEF).

## 5.2 Network Interfaces Power Management

The E810 disables a network interface and transitions the interface into low-power state in the following cases:

- All LAN ports are in LAN disable mode as a result of the DEV\_DIS\_N pin.
- Low power state functionality as described in [Section 5.1.1](#).

When the E810 is in low-power state, it asserts the respective TX\_DIS pin (connected to an SDP pin) to enable powering down an external PHY or optical module as well.

The E810 enters Low Power Idle (LPI) mode on transmit or receive independently whenever the device detects no data is scheduled for transmission, or the link partner indicates no data is pending for reception

Low Power Idle (LPI) mode defined in IEEE802.3az enables power saving by switching off part of E810 functionality when no data needs to be transmitted or/and received. Decision on whether the E810 transmit path should enter Low Power Idle mode or exit Low Power Idle mode is done according to need to transmit. Information on whether Link Partner has entered Low Power Idle mode is detected by the E810 and utilized for power saving in the receive circuitry.

When no data needs to be transmitted a request to enter transmit Low Power Idle is issued on the internal xxMII TX interface causing the Backplane PHY to transmit sleep symbols for a predefined period of time followed by a quiet period. During LPI the Backplane PHY periodically transmits refresh symbols that are used by the link partner to update adaptive filters and timing circuits in order to maintain link integrity. This quiet-refresh cycle continues until transmission of "normal inter-frame" encoding on the internal xxMII TX interface. The Backplane PHY communicates to the link partner the move to link active state by sending Wake symbols for a predefined period of time. The PHY then enters normal operating state where data or idle symbols are transmitted.

In the receive direction, entering Low Power Idle mode is triggered by the reception of sleep symbols from the link partner. This signals that the link partner is about to enter Low Power Idle mode. After sending the sleep symbols, the link partner ceases transmission. When the Link partner initiates the move to LPI the Backplane PHY indicates "assert low power idle" on the internal xxMII RX interface and the E810 receiver disables functionality to reduce power consumption.

### 5.2.1 Low Power Link Up (LPLU)

Auto-negotiation enables establishment of link speed at the Highest Common Denominator (HCD). When all PCIe functions belonging to a port are in Dx low power state, and the E810 is connected to an auxiliary power supply and main power is down, power saving might be more important than performance.

The E810 supports a mode where it auto-negotiates to the Lowest Common Denominator (LCD) link speed (that is, the lowest commonly-supported speed) in low power states. Initially, in this mode, the E810 attempts to negotiate to the lowest link rate. If the link partner does not support the lowest link rate, the E810 auto-negotiates to the lowest link rate advertised by the link partner.

### 5.2.1.1 LPLU-Related Link Speed Change

Figure 5-3 describes the flow for changing the link speed when entering/exiting LPLU state.

The E810 attempts to lower the link to the lowest commonly-supported speed when entering to LPLU state. Entering LPLU state, and switching to a lower link speed is done by clearing the relevant bits in the auto-negotiation advertised capabilities in the (internal/external) PHY configuration (advertising only the lowest common speed), and triggering an auto-negotiation process. The device is expected to link at lower speed as higher speeds are not advertised as supported.

Similarly, exiting LPLU state and switching to a higher link speed is done by setting the relevant bits in the auto-negotiation advertised capabilities in the PHY configuration, and restarting auto-negotiation. The device is now expected to link at the highest common speed.

**Note:** Given the above, a temporary link loss (and a disruption to traffic) is expected when entering/exiting LPLU state.

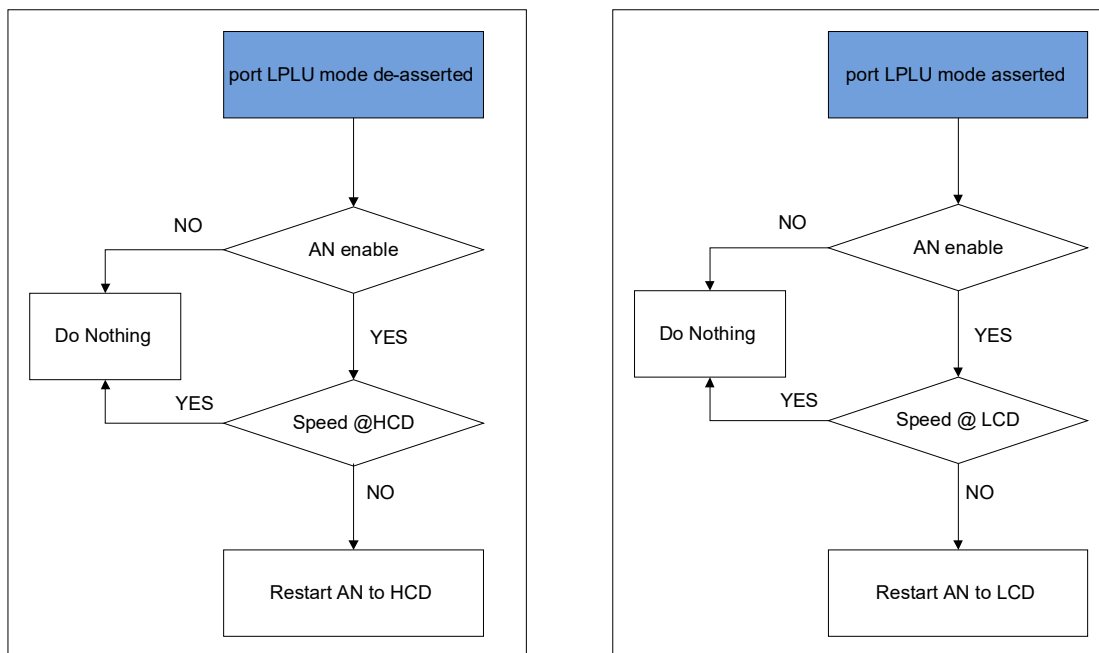

Figure 5-3. Link Speed Change on LPLU Assert/Clear

## 5.3 Wake-Up

The E810 supports wake up functionality in accordance with the APM and ACPI specifications. The following list provides a high-level view of the functionality supported in each specification, while the following sub-section provide more details and elaboration.

- Advanced Power Management (APM) wake-up (enabled via `PFPM_APM.APME`), which means support for wake from S5 (Soft Off) states using the well-known Magic Packet wake packet format.
- ACPI wake-up capabilities (enabled via `PMCSR.PME_En`):
  - Link State Change (*LNKC*) wake-up, which means the ability to wake up the host from S5 when a LAN link state goes up.
  - Magic Packet (*MAG*) wake-up, which means support for wake from S5 (Soft Off) states using the well-known Magic Packet wake packet format.
  - Firmware Reset (*FW\_RST\_WK*) wake-up, which means the ability to wake up the host from S5 when an EMPR event occurs.
  - Manageability (*MNG*) wake-up, which means the ability for the EMP to wake up the host from S5, on its own initiative. No usage model is actually defined for this option.

These wake-up mechanisms are basically controlled by the PF via the corresponding bit in the `PFPM_WUFC` and `PFPM_WUS` registers.

### 5.3.1 Advanced Power Management Wake-Up

This feature has existed in the 10/100 Mb/s NICs for several generations. System was activated from S3, S4, or S5 low power states on reception of a Magic Packet, which is a broadcast or unicast packet with an explicit data pattern. On reception of a Magic Packet, the E810 can wake up the system by also asserting the PCIe `PE_WAKE_N` signal and optionally via an in-band `PM_PME` message.

APM wake-up operation is controlled by the per-PF APM Control (`PFPM_APM`) register. At power-up, the E810 reads the *APM Enable* bit from the NVM into the *APM Enable* (`PFPM_APM.APME`) bit. This bit is used to enable WoL by overriding the *PME\_En* bit. This bit controls enabling of the APM wake-up. Software enables or disables APM wake-up using the flows described in [Section 5.3.5.1](#) and [Section 5.3.5.2](#), respectively.

When APM wake-up is enabled, the E810 checks all incoming packets passing L2 filters (BCST, MCST, UCST) for Magic Packets. See [Section 5.3.3.1.1](#) for a definition of Magic Packets. BCST and UCST (according to `PFPM_SAL/H` that are loaded from NVM and properly assigned by firmware to the `PRTPM_SAL/H` registers) Magic Packet filtering is enabled by default. To enable promiscuous MCST Magic Packets, `WoL PRTPM_SAH.MC_MAG_EN` must be set to 1b.

Once the E810 receives a matching Magic Packet, and the `PFPM_APM.APME` bit is set to 1b, it executes the ACPI flow described in [Section 5.3.5.3](#).

**Note:** When the `PFPM_APM.APME` bit is set, a wake event is issued (`PE_WAKE_N` pin is asserted and a `PM_PME` PCIe message is issued), even if the `PMCSR.PME_En` bit in configuration space is cleared. To disable system wake-up when `PMCSR.PME_En` is cleared, software driver should clear the `PFPM_APM.APME` bit after power-up or PCIe reset.

## 5.3.2 ACPI Power Management Wake-Up

The E810 supports ACPI power management-based wake-up. It can generate system wake-up events from a number of sources:

- Detection of a change in network link (cable connected or disconnected).
- Firmware Reset (*FW\_RST\_WK*) wake-up, which means the ability to wake up the host from S5 when an EMPR event occurs.
- Magic Packet (*MAG*) wake-up, which means support for wake from S5 (Soft Off) states using the well-known Magic Packet wake packet format.
- Manageability (*MNG*) wake up, which means the ability for the EMP to wake up the host from S5, on its own initiative. No usage model is actually defined for this option.

**Note:** ACPI wake-up operation is controlled by the per-PF Wake Up Filter Control (PFPM\_WUFC) register, and wake-up status is reported in the per PF Wake Up Status (PFPM\_WUS) register. In the PCIe configuration space, the PMCSR register supports wake up. Software enables ACPI wake-up using the flow described in [Section 5.3.5](#).

## 5.3.3 Wake-Up Filters

The E810 supports issuing wake-up indication to the Host on reception of non-errored packets when the device is in D3 low power state or in Dr with WoL enabled, using Magic Packet filters set from NVM.

Support of wake-up in Dr is only if the *AUX\_PWR* bit is asserted.

### 5.3.3.1 Wake-Up Filter Types

Magic Packets are detected per-PF by the E810 as a possible wake-up.

#### 5.3.3.1.1 Magic Packet

Magic Packets are defined in <http://support.amd.com/TechDocs/20213.pdf> as:

“Once the LAN controller has been put into the Magic Packet mode, it scans all incoming frames addressed to the node for a specific data sequence. This sequence indicates to the controller that this is a Magic Packet frame. A Magic Packet frame must also meet the basic requirements for the LAN technology chosen, such as Source Address, Destination Address (which can be the receiving station's IEEE address or a Multicast address which includes the Broadcast address), and CRC. A Magic Packet must also be a valid non error L2 packet. The specific data sequence consists of 16 repetitions of the IEEE address of this node, with no breaks or interruptions. This sequence can be located anywhere within the packet, but must be preceded by a synchronization stream. The synchronization stream allows the scanning state machine to be much simpler. The synchronization stream is defined as 6 bytes of 0xFF. The device will also accept a Broadcast frame, as long as the 16 repetitions of the IEEE address match the address of the machine to be awakened.”

The E810 expects the destination address to either:

- Be the broadcast address (FF.FF.FF.FF.FF.FF).
- Match the value of the port L2 Ethernet destination MAC Address (DA) set by firmware to the relevant filters PRTPM\_SAL/H.

On power-up, the firmware loads the PRTPM\_SAL/H addresses from NVM, each address entry contains:

- MAC Address for Magic Packet filtering.
- Address Valid (AV) indication.
- Promiscuous Multicast magic filtering enable (MC) indicating the L2 destination address can be any multicast address.
- The PF number (*PF\_NUM*) to be reported if a Magic Packet matches this filter.

The firmware uses the PFGEN\_PORTNUM registers to map the per PF MAC Address to the relevant ports.

The E810 searches for the contents of the port's Ethernet Destination MAC Address Receive Address as the embedded IEEE address. It considers any non-0xFF byte after a series of at least 6 0xFFs to be the start of the IEEE address for comparison purposes. For example, it catches the case of 7 0xFFs followed by the IEEE address). As soon as one of the first 96 bytes after a string of 0xFFs do not match, it continues to search for another set of at least 6 0xFFs followed by the 16 copies of the IEEE address later in the packet.

**Note:** This definition precludes the first byte of the destination address from being FF.

A Magic Packet's destination address must match the address filtering enabled in the configuration registers, with the exception that broadcast packets are considered to match even if broadcast packet reception is not enabled. If APM wake-up (wake-up by a Magic Packet) is enabled in the NVM, the E810 starts up with the Ethernet MAC Destination Address loaded from the NVM. This enables the E810 to accept packets with the matching IEEE address before the software device driver loads.

**Table 5-1. Magic Packet Structure**

Offset	# of Bytes	Field	Value	Action	Comment
0	6	Destination Address		Compare	MAC header – processed by main address filter.
6	6	Source Address		Skip	
12	T=(0/4/8)	Possible STag		Skip	
12 + T	S=(0/4)	Possible VLAN Tag		Skip	
12 + T + S	D=(0/8)	Possible Length + LLC/SNAP Header		Skip	
12 + T+ S + D	2	Type		Skip	
Any	6	Synchronizing Stream	FF*6+	Compare	
Any+6	96	16 copies of Node Address	A*16	Compare	Compared to relevant Station Addresses (PRTPM_SAH, PRTPM_SAL) registers.

### 5.3.4 Wake-Up and Virtualization

When operating in a virtualized environment, all wake-up capabilities are managed by a single entity (such as the VMM or an IOVM). In an IOV architecture, the physical (PF) driver controls wake-up and none of the Virtual Machines (VMs) has direct access to the wake-up registers. The wake-up registers are not replicated per VF.

## 5.3.5 Wake-Up Flows

### 5.3.5.1 Wake-Up Enable Flow

A WoL register set exists in each PF. Each set consists of the following wake-up filters and registers:

- PFPM\_WUC — Wake Up Control Register.
- PFPM\_WUS — Wake Up Status Register.

On power-up, values loaded from the NVM into the following per PF register define enablement of APM wake-up functionality:

- The NVM *APM Enable* bit is loaded to the PFPM\_APM.APME register bit to enable detection of a Magic Packet destined to the PF.

**Note:** The *EN\_APM\_D0* bit also enables the wake functionality in ACPI mode while the device is in D0. Therefore, if any of the ACPI wake filters are enabled (See [Section 5.3.2](#)) and wake events in D0 are not desired, *EN\_APM\_D0* must be cleared by the software. Similarly, if software wishes to enable wake events in D0, the *EN\_APM\_D0* bit must be set by the software in addition to enabling the relevant ACPI wake filters.

### 5.3.5.2 Wake-Up Disable Flow

Once the E810 wakes the system following transition to D0, the software driver can disable Wake-on-LAN directly by:

1. Clearing all the pending wake-up status bits in the Wake Up Status (PFPM\_WUS) register.
2. Clearing the relevant bits in the PFPM\_WUC register.

**Note:** This flow is not used by regular Intel drivers.

### 5.3.5.3 ACPI Wake-Up Flow

Once wake up is enabled, the E810 monitors the enabled wake functions. If at least one of the enabled wake events occurs, the E810 does the following:

- Sets the *PME\_Status* bit in the PFPM\_WUS and PCI PMCSR registers.
- Sets the proper bit, corresponding to the wake reason in PFPM\_WUS:
  - *LINKC* for link status change.
  - *MAG* for Magic Packet reception.
  - *MNG* for general manageability wake-up.
  - *FW\_RST\_WK* for EMP reset event.
- If the *PME\_En* bit in the PMCSR configuration register is set, asserts PE\_WAKE\_N and/or sends a PM\_PME PCIe message.

**Note:** The PE\_WAKE\_N signal remains asserted, PM\_PME Messages are periodically sent to the host, and the E810 ignores any subsequent ACPI wake-up packets and link change events for that function until the operating system either writes a 1b to the *PME\_Status* bit of the PMCSR register or writes a 0b to the *PME\_En* bit, or until de-assertion of PERST.

**NOTE:**      *This page intentionally left blank.*

## Chapter 6 Non-Volatile Memory Map

**Note:** In the tables of this chapter, contents of the **Default NVM Value** column might not reflect the value programmed in the specific NVM image provided to the customer.

### 6.1 NVM Organization

**Note:** All the offsets in this chapter are relative to the E810 Configuration region. This region is located in the flash at offset 4 KB as described in [Section 3.4.2.1](#). So to obtain the actual offset in the flash, 0x800 should be added to the requested word address.

#### 6.1.1 NVM Map High Level

**Table 6-1. Flat NVM Map - High Level**

Area	Section	Size (Words)	Description
Shadow RAM - Non-Preserved	Init Module	256	Pointers to other sections and legacy software word.
Shadow RAM - Preserved	PFA Area	12K	A set of TLV sections as described in section TBD containing all the information that should be preserved across updates.
Shadow RAM - Non-Preserved	Auto-Load Sections	Variable	Sections containing the auto-loaded registers at different resets.
	EMP Configuration Sections	Variable	Sections containing configurations of the EMP. Includes EMP SR settings, manageability sections and OEM sections.
Shadow Ram - Second Copy	SRb	32K	A second copy of the Shadow RAM for updates.
Flash	NVM Bank 1		Signed section containing the basic map from which all the other maps are generated via adaptive NVM. It also contains a copy of the Shadow RAM and extended mini-loader.
	NVM Bank 2		A second copy of the NVM Bank for updates.
	OROM Section		Signed section containing the Option ROM image.
	OROM Section - Second Copy		A second copy of the OROM section for updates.
	Extended TLVs - 1 <sup>st</sup> Copy		Extension of the PFA module.
	Extended TLVs - 2 <sup>nd</sup> Copy		
	Scratch Pad Area		Areas used for data not double banked.

## 6.1.2 NVM Header

Table 6-2 lists the format of the NVM Header section. It includes words with specific content and pointers to the first level of NVM modules.

- Items which are pointers to modules end with the pointer in their name.
  - The pointer to non-Shadow RAM modules that are part of NVM bank are relative to the beginning of the Flash, assuming 1st NVM bank is valid. In case the 2nd NVM bank is valid, there is a need to add NVM Bank Area Size to the pointer.
  - The pointer to Shadow RAM modules are relative to the beginning of the Shadow RAM.
- The "For Section [Auth]" column indicates the following for modules pointed to by pointers in the header:
  - Auth - The pointed module is authenticated.
  - Adaptive - Format of pointed module is Authenticated, but content can be changed by adaptive NVM flows.
  - RW - The module is read/write.

A read-only item can be written only when in the blank Flash programming mode.

- The "CSR Format" column indicates whether the pointed module uses the formats described in [Section 6.1.3.](#)
- The "Module is in Shadow RAM" column indicates whether the module is mapped into the basic banks mirrored into the internal Shadow RAM. If marked as No, the most significant bit of the pointer (Bit 15) must be set to 1b to indicate that the pointer value (in Bits 14:0) is expressed in 4 KB sector units. Otherwise, it is expressed in word units.

**Table 6-2. NVM Header Map**

Word Address	Pointed Module/Word Name	For Section [Auth]	Accessed by	Loading Trigger	CSR Format	Module is in Shadow RAM
0x00	NVM Control Word 1		EMP	POR		
0x01	Non-Persistent End Pointer		EMP		No	Yes

### 6.1.3 Structure of NVM Modules

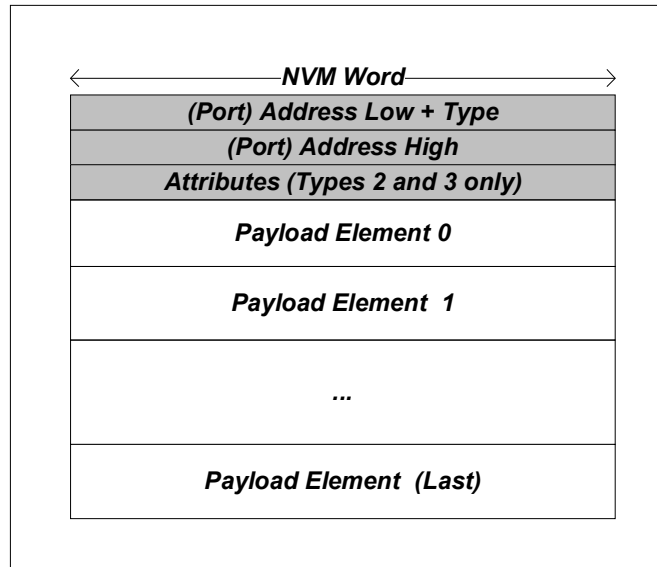

An NVM module read by the EMP to configure hardware (as listed [Table 6-2](#)) is built according to one of the following structures:

- **Fixed Functionality Structure** — Each NVM word is allocated to one or more fixed fields, and the contents of the NVM word are loaded to fixed CSRs in the E810. In [Table 6-2](#), these modules are referred to as CSR format = No modules.
- **Flexible Functionality Module** — The structure defines the device address or addresses into which the NVM words are loaded. Therefore, the module might be used for different purposes based on its contents. In [Table 6-2](#), these modules are referred as CSR format = Yes modules.

The remainder of this section describes the structure of the contents of a flexible functionality module (excluding the module header described in [Section 6.1.5](#)). The general structure of the module is shown in [Figure 6-1](#).

A CSR format module can be made of a mix of repeating Type 1, 2, 3 and 4 segments. Type 5 should be kept separate. Each segment is described by its own header (the shaded fields in [Figure 6-1](#)).

A sideband CSR format module includes a special Type F - subtype 0 segment, which includes the information needed to access the sideband module. The rest of the module can be made of a mix of repeating Type 1, 2, and 5 segments. This kind of module can only be loaded by firmware without any hardware acceleration. The Type F segment can repeat several times inside the module and is used to change access parameters to the sideband module. The sideband CSR format module is described in [Section 6.1.3.6](#).

**Figure 6-1. Structure of a Flexible Functionality Module**

Following are descriptions of the fields in [Figure 6-1](#):

- **(Port) Address** — A 28-bit value that defines the starting address to which data DWords are loaded. Serves as either a direct address to load into (Types 1 and 2), or as an indirect address referred to as a port address (Type 3 and 4). A port is made of a 32-bit address register followed by data registers of total size width. Address low is a 12-bit field mapped to Word[15:4].
- **Type** — A 4-bit command field mapped to Word[3:0] bits that defines the type of flexible module. Descriptions are as follows:
  - **Type 1 (0001b)** — Loads a single 32-bit data segment.
  - **Type 2 (0010b)** — Load a set of 32-bit data DWords into consecutive addresses.
  - **Type 3 (0011b)** — Loads a set of 32-bit data DWords through an address port.
  - **Type 4 (0100b)** — Loads, through an address port, a sequence of data blocks into arbitrary addresses.
  - **Type 5 (0101b)** - Loads a single 64-bit data segment.
  - **Type F (1111b)** - Used to define access parameters to sideband module.
- **Attributes** — A 16-bit optional word that defines attributes of the module:
  - **Width** — A 3-bit field mapped to Word[2:0] bits that describes the width (in 32-bit DWords) of a data element.
    - 000b = Data is 32-bits wide.
    - 001b = Data is 64-bits wide.
    - 010b = Data is 128-bits wide.
    - 011b = Data is 256-bits wide.
    - Else = Reserved.

- **Skip** — A 2-bit field mapped to Word[4:3] bits that describes the number of address bytes to be skipped for getting the address of the next payload element (Type 2) or port register involved (Type 3 or 4).
  - 00b = Skip 4 bytes.
  - 01b = Skip 8 x 4 bytes = 32 bytes.
  - 10b = Skip 32 x 4 bytes = 128 bytes.
  - 11b = Skip 0 bytes.
- **Length** — An 11-bit field mapped to Word[15:5] bits that contains the number of data elements, each of *Width* bits. Length of zero is illegal.
- **Payload Elements** — A sequence of address or data elements to be loaded into the E810. The structure of the *Payload* field varies with each type and is described in the sections that follow.

### 6.1.3.1 Type 1 Module

Used to specify a single 32-bit data segment.

- The *Address* field defines the address into which the 32-bit data is loaded. See [Figure 6-2](#).

The common use of a Type 1 module is to concatenate a list of such structure to load a set of 32-bit values into various CSRs.

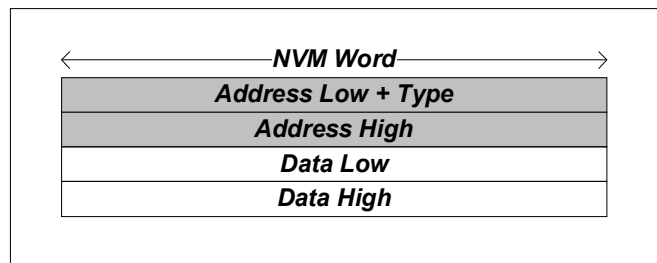

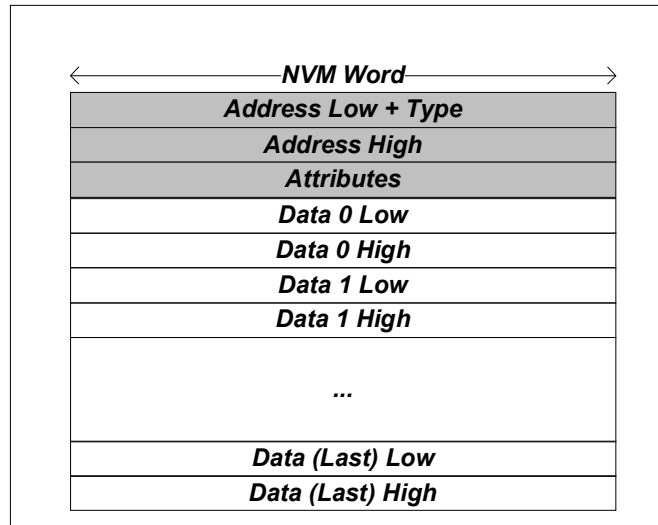

Figure 6-2. Structure of a Type 1 Module

### 6.1.3.2 Type 2 Module

Used to load a sequence of data into consecutive addresses, such as a memory array. See [Figure 6-3](#).

- The *Address* field defines the first address to be loaded. Data is loaded as width-size elements into consecutive addresses.
- The *Attributes* field applies the following information:
  - *Width* = 000b
  - *Skip* = see previous description
  - *Length* = see previous description

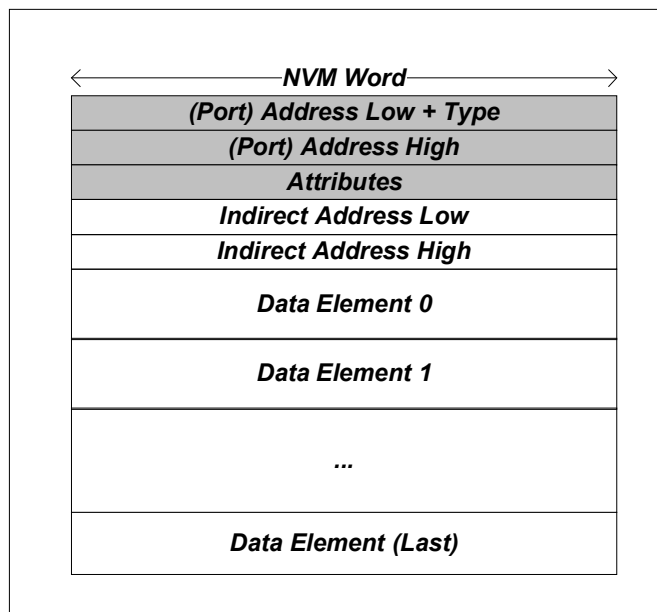

**Figure 6-3. Structure of a Type 2 Module**

### 6.1.3.3 Type 3 Module

Used to load a sequence of data through an address port.

Figure 6-4 shows the structure of a Type 3 module. The following fields have special values:

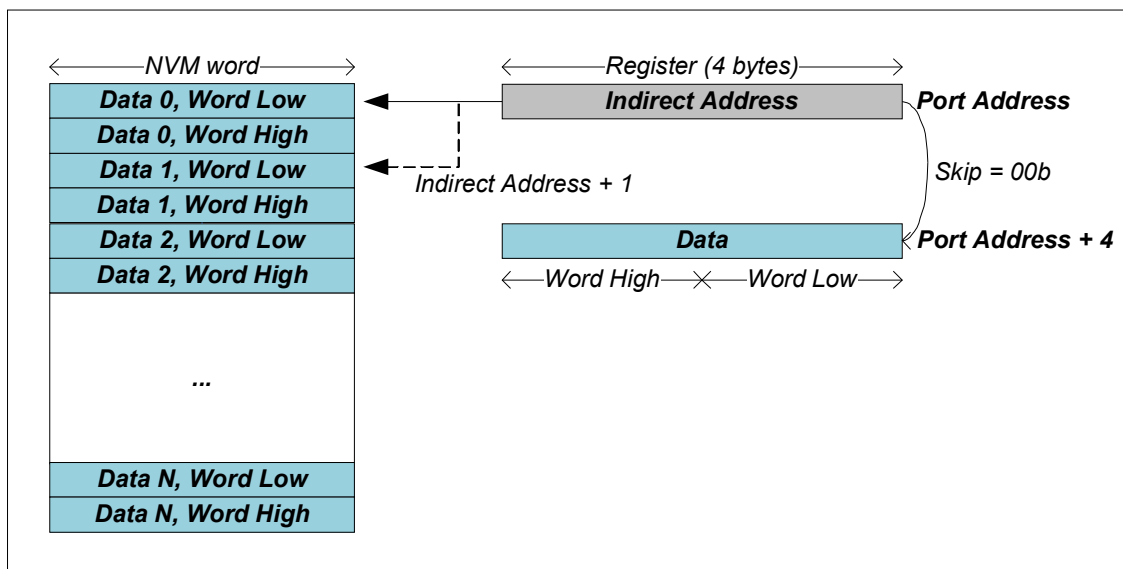

- The *Port Address* field defines the address of the port address register through which address/data is loaded. The Port Address register is followed by the Port Data registers.
- The *Attributes* field applies with the following fields:
  - *Width* — The size of a single data element written into the port during one port load cycle.
  - *Length* — Number of data elements written through the port.
  - *Skip* — Encodes the number of bytes between the addresses of the port registers involved.
- The *Indirect Address* field defines the first consecutive address to write to. It is written into the Port Address register for the first item and from then on the indirect address is increased (by the E810) with each write of a new data element from the list. Consecutive data elements are written into the port.
- The *Data Element* fields are made of length elements, each of the width DWords. Each port load cycle handles one data element

**Figure 6-4. Structure of a Type 3 Module**

The following figures describe two cases of using a Type 3 module:

- [Figure 6-5](#) shows a case of loading 32-bit values into a Global (GL) port.
- [Figure 6-6](#) shows a case of loading 64-bit values into a PRT port.

**Figure 6-5. Access Through a Type 3 Module of 32-Bit Wide Data Elements**

Figure 6-6. Access Through a Type 3 Module of 64-Bit Wide per-Port Data Elements

### 6.1.3.4 Type 4 Module

Used to load, through an address port, a sequence of scattered data elements at arbitrary addresses.

Figure 6-7 shows the structure of a Type 4 module. The following fields have special values:

- The *Port Address* field defines the address of the port address register through which address/data is loaded. The port address register is followed by the port data registers.
- The *Attributes* field applies with the following fields:
  - *Width* – The size of a single data element written into the port during one port load cycle.
  - *Length* – Number of data elements written through the port, not including the indirect address words (the words colored in gray in Figure 6-8 and Figure 6-9).
  - *Skip* – Encodes the number of bytes between the addresses of the port registers involved.
- The *Indirect Address* fields define the address that the following data element is written into. It is written into the Port Address register.
- The *Data Element* is written into the port data register. The sequence of writing (the *Indirect Address* and its *Data Element*) into the port is repeated per each data element (length times).

**Figure 6-7. Structure of a Type 4 Module**

The following figures show two cases of using a Type 4 module:

- [Figure 6-8](#) shows a case of loading 32-bit values into a global (GL) port.
- [Figure 6-9](#) shows a case of loading 64-bit values into a PRT port.

Figure 6-8. Access Through a Type 4 Module of 32-Bit Wide Data Elements

Figure 6-9. Access Through a Type 4 Module of 64-Bit Wide per-Port Data Elements

### 6.1.3.5 Type 5 Module

Used to load, a single 64-bit data segment addressed by 32-bit address. Firmware handles this module type without any hardware acceleration. It is intended for loading into external IPs.

Figure 6-10. Structure of a Type 5 Module

### 6.1.3.6 Type F Module

This is a special type, which is not used to directly load a specific address, but it is used to indicate specific access conditions for the register in the auto-load module. Specifically, subtype 0 within Type F module indicates that this module is used to load sideband device. A Type F module should be followed by one or more Type 1,2 or 5 modules, which indicates the actual data to load. Figure 6-11 describes the format of Type F, subtype 0.

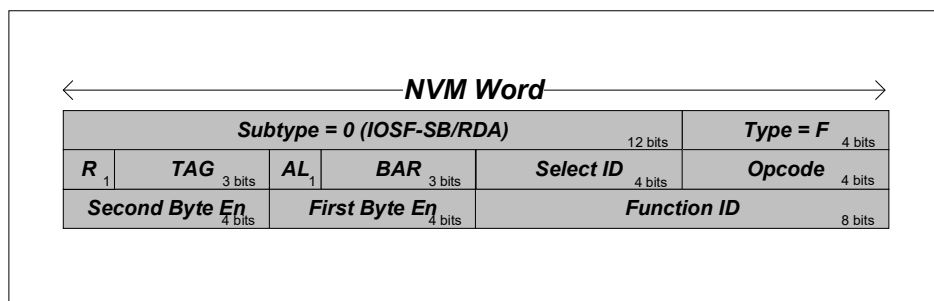

Figure 6-11. Structure of a Type F Module

Two additional 16-bit words are attached to Type F, subtype 0, with the following indications:

- **Opcode** — A 4-bit value that defines the sideband opcode that is used for loading the data in the following Type 1, 2, or 5 modules. Type 1 and 5 should typically use post or non-posted MWr or CRWr opcodes. Type 2 might use posted or non-posted MBWr opcode.
- **Select ID** - Indicates the sideband device to be loaded.
- **BAR** - Indicates BAR number of the sideband address (ignored - set to zero).

- **AL** — Address length flag. Indicates the length of the sideband address. For a 16-bit address, the 16 low significant bits are taken from the 28 bits of Type 1, 2, or 5 address. For a 48-bit address, the 28 bits of Type 1, 2, or 5 address are taken and padded with 20 bits of 0.
  - 0 = 16-bit address
  - 1 = 48-bit address
- **TAG** - Indicates TAG field of the sideband command (ignored - set to zero).
- **R** - Reserved. Set to 0.
- **Function ID** - Indicates the function ID of the sideband transaction (ignored - set to zero).
- **First Byte Enable** - Indicates the byte enable bits for the first 32 bits word written.
- **Second Byte Enable** - Indicates the byte enable bits for the second 32 bits word written.

Figure 6-12 illustrates the format of a Type F Auto-Load section.

Figure 6-12. Type F Auto-Load Section

### 6.1.3.7 Format of the Hardware Modules in Flash

Some modules are not loaded directly from the Shadow RAM but read from Flash to the local RAM by firmware before loading to the hardware. Such modules could be too big to be copied to the local RAM as a single chunk. They could also be too big to be loaded with the hardware accelerator in a single run.

The module structure described shown in Figure 6-13 allows reading the module from NVM in chunks, which fit the allocated buffer in the local RAM and can be sent to the hardware accelerator. The chunk size is up to 4 KB. All length values are in 16-bit words not including the length itself. The firmware reads the module content chunk by chunk to the local RAM and runs the hardware accelerator for the loaded chunk.

Figure 6-13. Format of Hardware Modules in Flash

### 6.1.3.8 Auto-Generated Pointers

Type 1 and Type 2 items are generated by the auto map generation tool from the project’s register database. These items are automatically mapped into the Registers Auto-Load NVM modules according to their loading trigger (see Table 6-2) and with no possibility to perform manual changes.

EMP code and software tools cannot accommodate these variations in mapping offset. Hence, they need a fixed method for accessing some predefined Type 1/2 items. The Auto-Generated Pointers module is pointed to by NVM Word 0x07. It lists the mapping address in NVM of the pre-defined Type 1/2 items via a 2-word structure per item.

The word address in Shadow RAM of an item is given by the sum of the contents of its two associated words: pointer + offset. If the item is relative to an array of registers and/or to a register with a scope different than global, the offset is given for the first data word of the Type 1/2 array, for array instance [0] and scope instance [0].

In the Auto-Generated Pointers module, the location of the 2-word structures relative to an item is made invariant along the project’s life. The alias name of the Type 1/2 register appears in the names of the two words in the structure.

See Auto-Generated Pointers module on the detailed NVM map for the list of auto-generated pointers (Section 6.3.68).

## 6.1.4 NVM Integrity Checks by Software

This section describes the NVM integrity fields inserted in the E810 NVM map to provide a basic detection of a faulty Flash part.

A software checksum is performed by the PF driver just after completion of its initialization sequence. It covers only PFA modules and the init section modules, which are mapped into Shadow RAM.

If the checks fails, another try is attempted, and if it fails again, the PF driver disables Tx/Rx operations with the E810.

Modules mapped outside the Shadow RAM are signed, except for the scratch pad areas. EMP is responsible for checking the signature of the modules at POR/EMPR.

### 6.1.4.1 Software Checksum

The Software Checksum section (*TLV Type 0x3F* in PFA) covers the PFA content (reserved words included).

The Software Checksum word in the TLV above is computed such that after adding all the covered words, including the Software Checksum word itself, the sum is 0xBABA.

Each time software tools are modifying one of these areas, EMP updates the *Software Checksum* field accordingly.

Each time EMP is updating the contents of one of these areas by its own initiative (not as part of an NVM Update AQ command) or for handling an MC command received over SMBus or NC-SI, it also updates the *Software Checksum* field accordingly.

The software device driver can check if the checksum is valid using the NVM Checksum Command (0x0706). See [Section 3.4.10.7](#).

## 6.1.5 Header of NVM Modules

### 6.1.5.1 Header of All NVM Modules Mapped to Shadow RAM

Modules read by hardware do not contain pointers to sub-modules and they are not authenticated.

**Table 6-3. NVM Header of Modules Mapped to Shadow RAM**

Number of Words	Field or Segment Name	Description and Comments
1	Module Length	Length of the module contents expressed in words ( <i>Module Length</i> field excluded). It must be set to N. Modules are size limited to the size of the Shadow RAM (64 KB).
N	Word 1	
	Word 2	
	...	
	Word N	

## 6.1.5.2 Header of Authenticated NVM Modules

This section concerns the following modules:

- NVM Bank (pointed by NVM word 0x42).
- Option ROM (pointed by NVM word 0x44).

For the NVM Bank, the first 330 words listed in [Table 6-4](#) are mapped at the beginning of the module.

For the Option ROM, the first 330 words listed in [Table 6-4](#) are mapped at the end of the area allocated to the module (at its trailer), though for the sake of the authentication, these words are mapped at the module's header, as listed in [Table 6-4](#).

In [Table 6-4](#), fields colored in cyan are protected by the authentication signature.

**Table 6-4. Header of Authenticated NVM Modules**

Number of Words	Field or Segment Name	Description and Comments
64	CSS Header	Refer to <a href="#">Section 3.4.9.2</a> .
128	RSA Public Key	Refer to <a href="#">Section 3.4.9</a> . This field is skipped due to SHA256 Hash computing.
2	RSA Exponent	Refer to <a href="#">Section 3.4.9</a> . This field is skipped due to SHA256 Hash computing.
128	Encrypted SHA256 Hash	Refer to <a href="#">Section 3.4.9</a> . This field is skipped due to SHA256 Hash computing.
1	E810 Blank NVM Device ID	A unique, Intel-provided Device ID that identifies the E810 controller among other Intel controllers. It must be set to 0x1590 in 25x25 mm package and 0x1598 in the 21x21 mm package.
2	Max Module Area	It is the maximum Flash area expressed in words that can be used by the module, starting from CSS header (included). It is set to 580K words (1160 KB) for an EMP and PE image modules and to 4K words (8 KB) for other authenticated modules.
2	Current Module Area	It is the Flash area expressed in words that is currently used by the module, starting from CSS header (included).
1	Module Format Version + CRC8	Bit 15 = CRC8 field is used. Set to 1b if a CRC8 is computed over the module, set to 0b otherwise. It is not used and must always be set to 0b. Bits 14:8 = Module format version. Set to 0x02 to use the currently-defined format. Bits 7:0 = CRC8 value.
1	Code Revision	Bits 15:8 = Major revision number. Bits 7:0 = Minor revision number.
1	Reserved Spare Word	Must be zeroed.
N		

## 6.1.5.3 Module TypeIDs

Each module has a TypeID. The TypeID uniquely identifies the module. The TypeID is used in admin commands to access the module. All modules can be read through the TypeID without knowing the exact location of the module in the NVM. PFA modules that allow direct update can be written using their TypeID.

Table 6-5 list the TypeIDs of all of the modules in the NVM.

**Table 6-5. Module TypeID Table**

Module TypeID	Section	In PFA	Read Only
0x00	Reserved (Has special meaning in admin commands)		N/A
0x03	GFID Module	No	N/A
0x06	RO PCIR Registers Auto-Load Module		RO
0x07	Auto Generated Pointers Module		RO
0x08	PCIR Registers Auto-Load Module		RO
0x09	EMP Global Module		RO
0x0A	Guarded Zone Module		RO

0x14E	WA Enable Flags	Yes	RO
0x14F	FRU Data TLV	Yes	RO
0xFFFF	Padding Module	Yes	RO

### 6.1.5.4 Preserved Fields Area Structure

The PFA is a structure built as a set of TLVs as follows:

- PFA Header
  - First word of PFA is the Length. Current value is 23 KB in Words (0x2F00).
- PFA Sub-Modules Format
  - The PFA Sub-Modules is in Type-Length-Data (TVL) Format.
  - Every *TLV Type* appears only once.
  - TLVs can come in any order, in Shadow RAM or in the Extension TLV area.
  - TLVs Format:
    - TypeID — 1 Word (taken from [Table 6-5](#) only types that exists in PFA).
    - Length — 1 Word: Max area provisioned for the section.
    - Data — A variable number of words according to the *Length* field.

## 6.1.6 Adaptive NVM Structures

### 6.1.6.1 Metadata Structure

Metadata is a structure within the signed area that describes the different features, immediate fields and information on how to modify them.

The structure of the metadata is as follows:

Section Length (1W)	Super Feature Module Offset (1W)	Immediate Module Offset (1W)	Reserved (1W)
Features Fields Module			
Super-features Fields Module			
Immediate Fields Module			
Description Text Module			
CRC8 (1W)			

#### 6.1.6.1.1 Feature Fields Module

The feature fields module contains the following sub-modules:

- Features Header Array
  - Contain a list of features, where each feature specifies number of options and fields.
  - Points to feature configuration pointer array and feature field description.
- Features Configuration Option Array
  - Contain a list of options, where each option points to a feature data array.
- Features Field Descriptor Array
  - Contain a list of fields, where each field is identified by its NVM address and mask.

- Features Data Array
  - Contains a list of data per field.

Figure 6-14 describes the connection between the various feature tables.

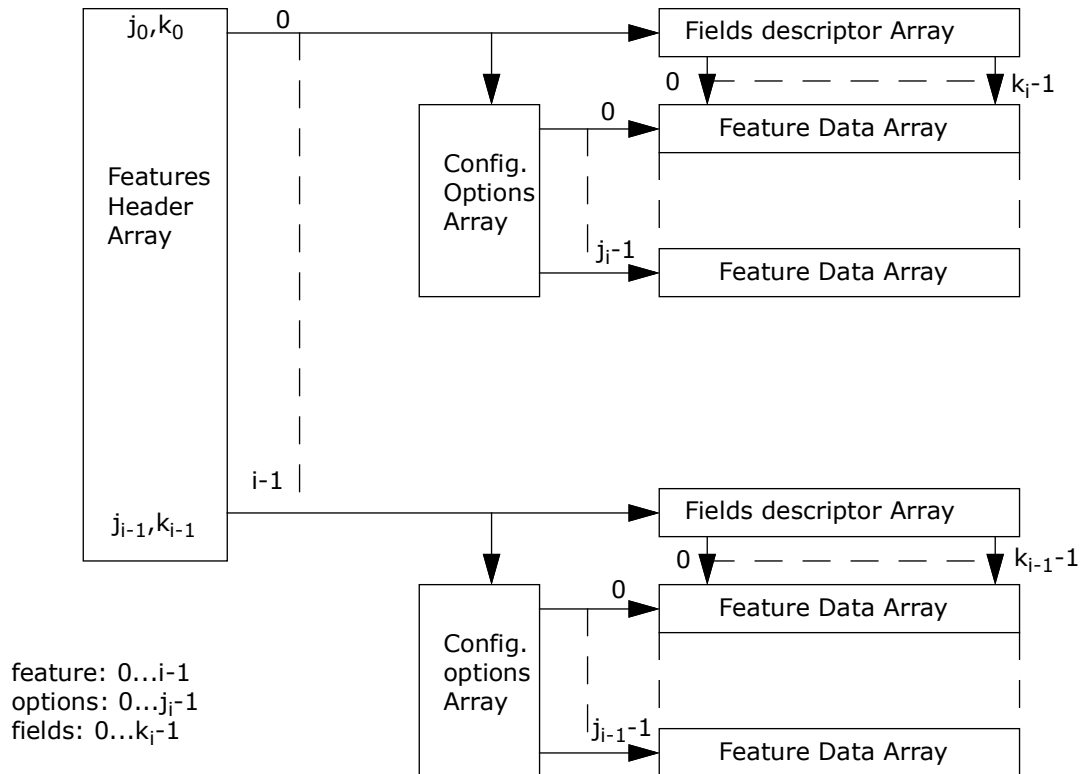

Figure 6-14. Feature Tables Diagram

### 6.1.6.1.1.1 Features Header Array

The features header array is built as follows:

Number of Features (1W)						
Feature ID (0) 1W	Pointer <sup>1</sup> to Description Text 1W	Feature (0) Flags 1W	Number of Options 1W	Number of Fields 1W	Pointer to Options Array 1W	Pointer to Fields Descriptor Array 1W
Feature ID (1) 1W	Pointer to Description Text 1W	Feature (1) Flags 1W	Number of Options 1W	Number of Fields 1W	Pointer to Options Array 1W	Pointer to Fields Descriptor Array 1W
...						
Feature ID (n) 1W	Pointer to Description Text 1W	Feature (n) Flags 1W	Number of Options 1W	Number of Fields 1W	Pointer to Options Array 1W	Pointer to Fields Descriptor Array 1W

1. The pointer is the word offset inside the metadata.

The feature flags are as follows:

Bit(s)	Content
15:4	Reserved
3	DWord
2	Hidden <sup>1</sup>
1	Reserved
0	OEM <sup>2</sup>

1. The hidden flag is set by default for features included in a super-feature.
2. Feature cannot be set by software as adaptive NVM feature. It is set during map generation per OEM.

### 6.1.6.1.1.2 Features Configuration Option Array

The features configuration option array is described as follows:

Option ID (0) 1W	Pointer <sup>1</sup> to Option Description Text 1W	Pointer in Features Data Array 1W
Option ID (1) 1W	Pointer to Option Description Text 1W	Pointer in Features Data Array 1W
...	...	...
Option ID (n) 1W	Pointer to Option Description Text 1W	Pointer in Features Data Array 1W

1. The pointer is the word offset inside the metadata.

### 6.1.6.1.1.3 Feature Field Descriptor Array – Case 1

- DWord flag = 0
- $i = 0 \dots \text{Number of features} - 1$
- $j = 0 \dots \text{Number of fields} - 1$

Field[0] (0) Address <sup>1</sup> 2W	Field[0] (0) Mask 1W	...	Field[0] (j) Address 2W	Field[0] (j) Mask 1W
Field[1] (0) Address 2W	Field[1] (0) Mask 1W	...	Field[1] (j) Address 2W	Field[1] (j) Mask 1W
Field[i] (0) Address 2W	Field[i] (0) Mask 1W	...	Field[i] (j) Address 2W	Field[i] (j) Mask 1W

1. The address is the absolute word address from the beginning of the NVM.

### 6.1.6.1.1.4 Feature Field Descriptor Array – Case 2 (Generic)

- DWord flag = 1
- $i = 0 \dots \text{Number of features} - 1$
- $j = 0 \dots \text{Number of fields} - 1$

Field[0] (0) Address <sup>1</sup> 2W	Field[0] (0) Mask LSB 1W	Field[0] (0) Mask MSB 1W	Reserved 2W	...	Field[0] (j) Address 2W	Field[0] (j) Mask LSB 1W	Field[0] (j) Mask MSB 1W	Reserved 2W
Field[1] (0) Address 2W	Field[1] (0) Mask LSB 1W	Field[1] (0) Mask MSB 1W	Reserved 2W	...	Field[1] (j) Address 2W	Field[1] (j) Mask LSB 1W	Field[1] (j) Mask MSB 1W	Reserved 2W
Field[i] (0) Address 2W	Field[i] (0) Mask LSB 1W	Field[i] (0) Mask MSB 1W	Reserved 2W	...	Field[i] (j) Address 2W	Field[i] (j) Mask LSB 1W	Field[i] (j) Mask MSB 1W	Reserved 2W

1. The address is the absolute word address from the beginning of the NVM.

### 6.1.6.1.1.5 Feature Field Descriptor Array – Case 2

- DWord flag = 1
  - If field is a POR CSR:
    - THEN the CSR address is attached.
    - ELSE 0xFFFFFFFF to other fields of this feature.
- i = 0...Number of features -1
- j = 0...Number of fields -1

Field[0] (0) Address <sup>1</sup> 2W	Field[0] (0) Mask LSB 1W	Field[0] (0) Mask MSB 1W	Field[0] (0), CSR Address <sup>2</sup> LSB 1W	Field[0] (0) CSR Address MSB 1W	...	Field[0] (j) Address 2W	Field[0] (j) Mask LSB 1W	Field[0] (j) Mask MSB 1W	Field[0] (j) CSR Address LSB 1W	Field[0] (j) CSR Address MSB 1W
Field[1] (0) Address 2W	Field[1] (0) Mask LSB 1W	Field[1] (0) Mask MSB 1W	Field[1] (0) CSR Address LSB 1W	Field[1] (0) CSR Address MSB 1W	...	Field[1] (j) Address 2W	Field[1] (j) Mask LSB 1W	Field[1] (j) Mask MSB 1W	Field[1] (j) CSR Address LSB 1W	Field[1] (j) CSR Address MSB 1W
Field[i] (0) Address 2W	Field[i] (0) Mask LSB 1W	Field[i] (0) Mask MSB 1W	Field[i] (0) CSR Address LSB 1W	Field[i] (0) CSR Address MSB 1W	...	Field[i] (j) Address 2W	Field[i] (j) Mask LSB 1W	Field[i] (j) Mask MSB 1W	Field[i] (j) CSR Address LSB 1W	Field[i] (j) CSR Address MSB 1W

1. The address is the absolute word address from the beginning of the NVM.
2. The CSR address is added to enable E810 firmware patches (update CSR on next reset). The CSR address is the physical address of this CSR.

### 6.1.6.1.1.6 Feature Data Array

The fourth part of a featured fields module includes a 3D (ixjxk) feature data array.

Each data cell is by default 1W width.

If a DWord is set, it is 2W.

- i = 0...Number of features -1
- j = 0...Number of options -1
- k = 0...Number of fields -1

**Note:** Number of options and Number of fields are feature-dependent. See [Section 6.1.6.1.1.1](#).

Feature(0)			
Data[0] (0)	Data[0] (1)	...	Data[0] (k)
Data[1] (0)	Data[1] (1)	...	Data[1] (k)
Data[j] (0)	Data[j] (1)	...	Data[j] (k)
Feature(1)			
Data[0] (0)	Data[0] (1)	...	Data[0] (k)
Data[1] (0)	Data[1] (1)	...	Data[1] (k)
Data[j] (0)	Data[j] (1)	...	Data[j] (k)
Feature(i)			
Data[0] (0)	Data[0] (1)	...	Data[0] (k)
Data[1] (0)	Data[1] (1)	...	Data[1] (k)
Data[j] (0)	Data[j] (1)	...	Data[j] (k)

### 6.1.6.1.2 Super-Feature Fields Module Structure

The super-feature fields module contains the following sub-modules:

- Super-Features Header Array
  - Contains a list of super-features, where for each super-feature, the number of options and number of Feature Configuration IDs (FCIDs) is specified.
  - Points to Super-features Configuration Option Array.
- Super-Features Configuration Option Array
  - Contain a list of options, where each options points to a Super-Features Data Array.
- Super-Features Data Array
  - Contain a list of (Feature ID, Feature Configuration option number) pairs.

Figure 6-15 describes the connection between the various feature tables.

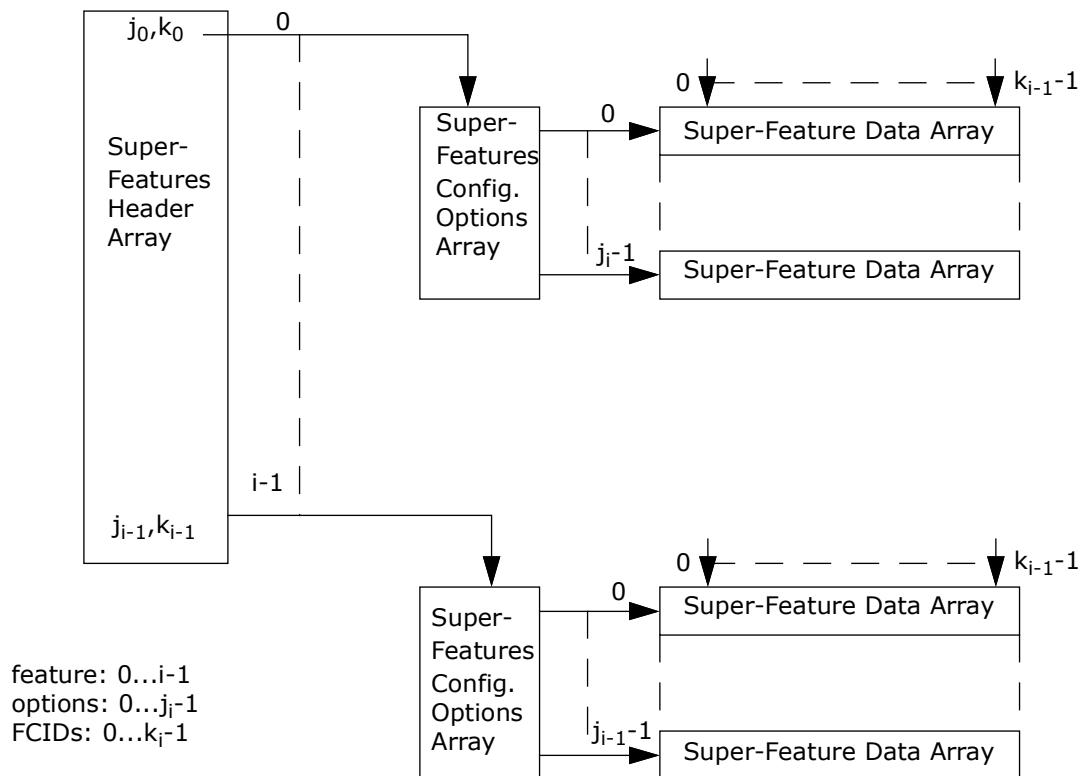

Figure 6-15. Super-Feature Tables Diagram

### 6.1.6.1.2.1 Super-Feature Header Array

Number of Super-Features (1W)					
Super-feature ID (0) 1W	Pointer <sup>1</sup> to Description Text 1W	Feature (0) Flags <sup>2</sup> 1W	Number of Options 1W	Number of selectable FCIDs 1W	Pointer to Options Array 1W
Super-feature ID (1) 1W	Pointer to Description Text 1W	Feature (1) Flags 1W	Number of Options 1W	Number of Selectable FCIDs 1W	Pointer to Options Array1W
...					
Super-feature ID (n) 1W	Pointer to Description Text 1W	Feature (n) Flags 1W	Number of Options 1W	Number of Selectable FCIDs 1W	Pointer to Options Array 1W

1. The pointer is the word offset inside the metadata.
2. Feature flags bit 0 is the OEM flag. Other bits are reserved in this DCR.

### 6.1.6.1.2.2 Super-Feature Configuration Option Array

Super-feature Option ID (0) 1W	Pointer <sup>1</sup> to Option Description Text 1W	Pointer in Super-Features Data Array 1W
Super-feature Option ID (1) 1W	Pointer to Option Description Text 1W	Pointer in Super-Features Data Array 1W
...		
Super-feature Option ID (n) 1W	Pointer to Option Description Text 1W	Pointer in Super-Features Data Array 1W

1. The pointer is the word offset inside the metadata.

### 6.1.6.1.2.3 Super-Feature Data Array

3D (ixjxk) super-feature data array with a 2W data size.

- i = 0...Number of super-features -1
- j = 0...Number of options -1
- k = 0...Number of FCIDs -1

Super-Feature(0)			
Data[0] (0) 2W	Data[0] (1) 2W	...	Data[0] (k) 2W
Data[1] (0) 2W	Data[1] (1) 2W	...	Data[1] (k) 2W
Data[j] (0) 2W	Data[j] (1) 2W	...	Data[j] (k) 2W
Super-Feature(1)			
Data[0] (0) 2W	Data[0] (1) 2W	...	Data[0] (k) 2W
Data[1] (0) 2W	Data[1] (1) 2W	...	Data[1] (k) 2W
Data[j] (0) 2W	Data[j] (1) 2W	...	Data[j] (k) 2W
Super-Feature(i)			
Data[0] (0) 2W	Data[0] (1) 2W	...	Data[0] (k) 2W
Data[1] (0) 2W	Data[1] (1) 2W	...	Data[1] (k) 2W
Data[j] (0) 2W	Data[j] (1) 2W	...	Data[j] (k) 2W

### 6.1.6.1.3 Immediate Fields Module

The immediate ID allows to change predefined fields through management commands without knowing their location in the NVM. The location is written in the module specified as follows:

Number of Immediate Fields (1W)					
Immediate ID (0) 1W	Pointer <sup>1</sup> to Description Text 1W	Immediate Flags 1W	Mask 1W	Word Address <sup>2</sup> LSB 1W	Word Address MSB 1W
Immediate ID (1) 1W	Pointer to Description Text 1W	Immediate Flags 1W	Mask 1W	Word Address LSB 1W	Word Address MSB 1W
...					
Immediate ID (i) <sup>3</sup> 1W	Pointer to Description Text 1W	Immediate Flags (i) <sup>3</sup> 1W	Mask 1W	Word Address LSB 1W	Word Address MSB 1W

1. The pointer is the word offset inside the metadata.
2. Word address is the word offset inside the metadata.
3. i=0...Number of immediate fields-1.

The immediate fields module flags are as follows:

Bit(s)	Content
15:5	Reserved
4	Always preserved <sup>1</sup>
3	Pattern=0
2	Hidden
1	Reserved
0	OEM <sup>2</sup>

1. This flag indicates that this field is preserved in case of partial preservation.
2. Feature cannot be set by software as adaptive NVM feature. It is set during map generation per OEM.

### 6.1.6.1.4 Description Text Module

Description (0) Length 1W	X words description in ASCII
Description (1) Length 1W	Y words description in ASCII
...	...
Description (n) Length 1W	Z words description in ASCII

### 6.1.6.2 Feature Configuration

This section contains the current configurations chosen for the specific image. It is stored in the PFA with a *TLV Type* of 0x49.

<b>Section Length 1W</b>	FCID (0) 2W	FCID (1) 2W	...	FCID (n) 2W
--------------------------	-------------	-------------	-----	-------------

Section Length is in word units, excluding the section length itself.

FCID is the feature configuration ID and consists of these four bytes:

- Feature Major #
- Feature Minor #
- Configuration Major #
- Configuration Minor #

FCID also represents the order of features in the adaptive NVM tool.

**Notes:**

- Super-features have FCID = 0xFXXX (0xFFFF value is reserved).
- Super-feature FCIDs should precede subordinated features FCIDs (or feature FCIDs placeholders).
- The feature configuration section can be finished by an end-of-list string of 0xFFFF + padding zeros.

### 6.1.6.3 Immediate Field Values

This section contains the current configurations chosen for the specific image that are immediate fields. It is stored in the PFA and pointed from address 0x4E.

Section Length is in word units and excludes the section length itself.

Immediate ID has 1 Word – Major # (1B) and Minor # (1B).

The immediate ID number should be unique on a per-project step.

- n=0...Number of immediate fields-1.
- The immediate field configuration section can be finished by an end-of-list string of 0xFFFF + padding zeros.

<b>Section Length 1W</b>	Immediate Field ID (0) 2W	Data (0) 1W	...	Immediate Field ID (n) 1W	Data (n) 1W
--------------------------	---------------------------	-------------	-----	---------------------------	-------------

## 6.2 PLDM Header

### 6.2.1 PLDM Header Section

This section is part of the PLDM package header. The PLDM header is not part of the NVM image.

**Table 6-6. PLDM Header Section Summary Table**

Word Address	Used By	Word Name	Section Reference
0x0000	HW	PackageHeaderIdentifier_0	<a href="#">6.2.1.1</a>
0x0001	HW	PackageHeaderIdentifier_1	<a href="#">6.2.1.2</a>
0x0002	HW	PackageHeaderIdentifier_2	<a href="#">6.2.1.3</a>

### 6.2.1.1 PackageHeaderIdentifier\_0 (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageHeaderIdentifier	0x18F0	

### 6.2.1.2 PackageHeaderIdentifier\_1 (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageHeaderIdentifier	0x18F0	

### 6.2.1.3 PackageHeaderIdentifier\_2 (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageHeaderIdentifier	0x7DCB	

### 6.2.1.4 PackageHeaderIdentifier\_3 (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageHeaderIdentifier	0x4349	

### 6.2.1.5 PackageHeaderIdentifier\_4 (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageHeaderIdentifier	0x0098	

### 6.2.1.6 PackageHeaderIdentifier\_5 (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageHeaderIdentifier	0x2FA0	

### 6.2.1.7 PackageHeaderIdentifier\_6 (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageHeaderIdentifier	0x9A05	

### 6.2.1.8 PackageHeaderIdentifier\_7 (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageHeaderIdentifier	0x02CA	

### 6.2.1.9 FormatRevision\_HeaderSize\_LSB (0x0008)

Bit(s)	Field Name	Default NVM Value	Description
15:8	HeaderSize_LSB		
7:0	FormatRevision	0x01	

### 6.2.1.10 Headersize\_MSB (0x0009)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ReleaseDateTimeUTC_offset_LSB	0x0	timestamp104 byte 0.
7:0	Headersize_MSB		

### 6.2.1.11 ReleaseDateTime\_0 (0x000A)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ReleaseDateTimeMsec_0	0x0	timestamp104 byte 2.
7:0	ReleaseDateTimeUTC_offset_MSB_by	0x0	timestamp104 byte 1.

### 6.2.1.12 ReleaseDateTime\_1 (0x000B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ReleaseDateTimeMsec_1_2	0x0	timestamp104 byte 3:4.

### 6.2.1.13 ReleaseDateTime\_2 (0x000C)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ReleaseDateTimeMin	0x0	timestamp104 byte 6.
7:0	ReleaseDateTimeSec	0x0	timestamp104 byte 5.

### 6.2.1.14 ReleaseDateTime\_3 (0x000D)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ReleaseDateTimeDay	0x0	timestamp104 byte 8.
7:0	ReleaseDateTimeHour	0x0	timestamp104 byte 7.

### 6.2.1.15 ReleaseDateTime\_4 (0x000E)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ReleaseDateTimeYear_LSB	0x0	timestamp104 byte 10.
7:0	ReleaseDateTimeMonth	0x0	timestamp104 byte 9.

### 6.2.1.16 ReleaseDateTime\_5 (0x000F)

Bit(s)	Field Name	Default NVM Value	Description
15:12	ReleaseDateTime UTC Resolution	0x2	timestamp104 byte 12 [7:4]. Resolution is minutes.
11:8	ReleaseDateTime Resolution	0x7	timestamp104 byte 12 [3:0]. Resolution is minutes.
7:0	ReleaseDateTimeYear_MSB	0x0	timestamp104 byte 11.

### 6.2.1.17 ComponentBitmapBitLength (0x0010)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentBitmapBitLength	0x8	

### 6.2.1.18 PackageVersionStringType\_Length (0x0011)

Bit(s)	Field Name	Default NVM Value	Description
15:8	PackageVersionStringLength	0x13	Assuming a string length of 31. The last byte is part of the Firmware Device Identification Area.
7:0	PackageVersionStringType	0x1	

### 6.2.1.19 PackageVersionString\_0 (0x0012)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageVersionString_0	0x2E30	Dev-stater major followed by a period (ASCII). Default value: "0."

### 6.2.1.20 PackageVersionString\_1 (0x0013)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageVersionString_1	0x3030	Dev-stater minor (ASCII). Default value: "0."

### 6.2.1.21 PackageVersionString\_2 (0x0014)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageVersionString_2	0x2820	Space and open parenthesis (ASCII). " ("

### 6.2.1.22 PackageVersionString\_3 (0x0015)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageVersionString_3	0x7830	Hex prefix (ASCII). "0x"

### 6.2.1.23 PackageVersionString\_4 (0x0016)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageVersionString_4	0x3030	Bytes 7-6 of EETTrackID (ASCII). "00"

### 6.2.1.24 PackageVersionString\_5 (0x0017)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageVersionString_5	0x3030	Bytes 5-4 of EETTrackID (ASCII). "00"

### 6.2.1.25 PackageVersionString\_6 (0x0018)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageVersionString_6	0x3030	Bytes 3-2 of EETTrackID (ASCII). "00"

### 6.2.1.26 PackageVersionString\_7 (0x0019)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageVersionString_7	0x3030	Bytes 1-0 of EETTrackID (ASCII). "00"

### 6.2.1.27 PackageVersionString\_8 (0x001A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageVersionString_8	0x0029	Close parenthesis and null terminator (ASCII). ")<null>"

### 6.2.1.28 DeviceIDRecordCount and Last Byte of PackageVersionString (0x001B)

Bit(s)	Field Name	Default NVM Value	Description
15:8	DeviceIDRecordCount	0x1	
7:0	PackageVersionString Last Byte	0x0	

### 6.2.1.29 Recordlength (0x0x001C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	RecordLength		<p>Length in: 1 Byte unit</p> <p>First Section -&gt; Word: PLDM Header -&gt; Recordlength</p> <p>Last Section -&gt; Word: PLDM Header -&gt; FirmwareDevicePackageData - Additional TLVs - IBA TLV - Version</p> <p>The total length in bytes for this record. The length shall include the <i>RecordLength</i>, <i>DescriptorCount</i>, <i>DeviceUpdateOptionFlags</i>, <i>ComponentImageSetVersionStringType</i>, <i>ComponentSetVersionStringLength</i>, <i>FirmwareDevicePackageDataLength</i>, <i>ApplicableComponents</i>, <i>ComponentImageSetVersionString</i>, <i>RecordDescriptors</i>, and <i>FirmwareDevicePackageData</i> fields.</p>

### 6.2.1.30 DescriptorCount and DeviceUpdateOptionFlags LSB (0x001D)

Bit(s)	Field Name	Default NVM Value	Description
15:9	DeviceUpdateOptionFlags LSB	0x0	Bits [31:24] reserved.
8	DeviceUpdateOptionFlags LSB - Continue Component Updates After Failure	0b	Bits [31:24] reserved.
7:0	DescriptorCount	0x1	The number of descriptors included within the <i>RecordDescriptors</i> field for this record.

### 6.2.1.31 DeviceUpdateOptionFlags - Middle (0x001E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	DeviceUpdateOptionFlaDeviceUpdateOptionFlags - Middles -Middle	0x0	Bits [23:8] reserved.

### 6.2.1.32 DeviceUpdateOptionFlags - MSB and String Type (0x001F)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ComponentImageSetVersionStringType	0x1	<p>Valid values are:</p> <p>0x0 = Unknown</p> <p>0x1 = ASCII</p> <p>0x2 = UTF-8</p> <p>0x3 = UTF-16</p> <p>0x4 = UTF-16LE</p> <p>0x5 = UTF-16BE</p>
7:0	DeviceUpdateOptionFlags - MSB	0x0	

### 6.2.1.33 ComponentImageSetVersionStringLength and FirmwareDevicePackageDataLength - LSB (0x0020)

Bit(s)	Field Name	Default NVM Value	Description
15:8	FirmwareDevicePackageDataLength - LSB		
7:0	ComponentImageSetVersionStringLength	0x12	

### 6.2.1.34 FirmwareDevicePackageDataLength - MSB and ApplicableComponents (0x0021)

Bit(s)	Field Name	Default NVM Value	Description
15:11	Reserved ApplicableComponents	0x0	
10	FW Link topology ApplicableComponent	0b	0b = Non Applicable 1b = Applicable
9	OROM ApplicableComponent	1b	0b = Non Applicable 1b = Applicable
8	NVM ApplicableComponent	1b	0b = Non Applicable 1b = Applicable
7:0	FirmwareDevicePackageDataLength - MSB		

### 6.2.1.35 ComponentImageSetVersionString\_0 (0x0022)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_0	0x2E30	Dev-stater major followed by period (ASCII). Default value: "0."

### 6.2.1.36 ComponentImageSetVersionString\_1 (0x0023)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_1	0x3030	Dev-stater minor (ASCII). Default value: "00"

### 6.2.1.37 ComponentImageSetVersionString\_2 (0x0024)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_2	0x2820	Space and open parenthesis (ASCII). " ("

### 6.2.1.38 ComponentImageSetVersionString\_3 (0x0025)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_3	0x7830	Hex prefix (ASCII). "0x"

### 6.2.1.39 ComponentImageSetVersionString\_4 (0x0026)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_4	0x3030	Bytes 3 of EETTrackID (ASCII). "00"

### 6.2.1.40 ComponentImageSetVersionString\_5 (0x0027)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_5	0x3030	Bytes 2 of EETTrackID (ASCII). "00"

### 6.2.1.41 ComponentImageSetVersionString\_6 (0x0028)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_6	0x3030	Bytes 1 of EETTrackID (ASCII). "00"

### 6.2.1.42 ComponentImageSetVersionString\_7 (0x0029)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_7	0x3030	Bytes 0 of EETTrackID (ASCII). "00"

### 6.2.1.43 ComponentImageSetVersionString\_8 (0x002A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_8	0x0029	Close parenthesis and null terminator (ASCII). ")<null>"

### 6.2.1.44 InitialDescriptorType (0x002B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	InitialDescriptorType	0x0	<p>Indicates the type of the Initial descriptor.</p> <p>The initial descriptor for a device must be defined by one of the following (PCI Vendor ID, IANA Enterprise ID, UUID, PnP Vendor ID, or ACPI Vendor ID).</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>0x0 = PCI Vendor ID</li> <li>0x1 = IANA Enterprise ID</li> <li>0x2 = UUID</li> <li>0x3 = PnP Vendor ID</li> <li>0x4 = ACPI Vendor ID</li> <li>0x100 = PCI Device ID</li> <li>0x101 = PCI Subsystem Vendor ID</li> <li>0x102 = PCI Subsystem ID</li> <li>0x103 = PCI Revision ID</li> <li>0x104 = PnP Product Identifier</li> <li>0x105 = ACPI Product Identifier</li> <li>0xFFFF = Vendor Defined</li> </ul>

### 6.2.1.45 InitialDescriptorLength (0x002C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	InitialDescriptorLength	0x2	Indicates the length, in bytes, of the <i>InitialDescriptorData</i> field.

### 6.2.1.46 InitialDescriptorData (0x002D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	VendorID	0x8086	PCI Vendor ID assigned to the FD vendor.

### 6.2.1.47 AdditionalDescriptorType - DeviceID (0x002E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	AdditionalDescriptorType	0x100	<p>Indicates the type of the Initial descriptor.</p> <p>The initial descriptor for a device must be defined by one of the following (PCI Vendor ID, IANA Enterprise ID, UUID, PnP Vendor ID, or ACPI Vendor ID).</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>0x0 = PCI Vendor ID</li> <li>0x1 = IANA Enterprise ID</li> <li>0x2 = UUID</li> <li>0x3 = PnP Vendor ID</li> <li>0x4 = ACPI Vendor ID</li> <li>0x100 = PCI Device ID</li> <li>0x101 = PCI Subsystem Vendor ID</li> <li>0x102 = PCI Subsystem ID</li> <li>0x103 = PCI Revision ID</li> <li>0x104 = PnP Product Identifier</li> <li>0x105 = ACPI Product Identifier</li> <li>0xFFFF = Vendor Defined</li> </ul>

### 6.2.1.48 AdditionalDescriptorLength - DeviceID (0x002F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	AdditionalDescriptorLength	0x2	Indicates the length, in bytes, of the <i>InitialDescriptorData</i> field.

### 6.2.1.49 AdditionalDescriptorIdentifierData - Device ID (0x0030)

Bit(s)	Field Name	Default NVM Value	Description
15:0	DeviceID		PCI Vendor ID assigned to the FD vendor.

### 6.2.1.50 AdditionalDescriptorType - SubVendorID (0x0031)

Bit(s)	Field Name	Default NVM Value	Description
15:0	AdditonalDescriptorType	0x101	<p>Indicates the type of the Initial descriptor.</p> <p>The initial descriptor for a device must be defined by one of the following (PCI Vendor ID, IANA Enterprise ID, UUID, PnP Vendor ID, or ACPI Vendor ID).</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>0x0 = PCI Vendor ID</li> <li>0x1 = IANA Enterprise ID</li> <li>0x2 = UUID</li> <li>0x3 = PnP Vendor ID</li> <li>0x4 = ACPI Vendor ID</li> <li>0x100 = PCI Device ID</li> <li>0x101 = PCI Subsystem Vendor ID</li> <li>0x102 = PCI Subsystem ID</li> <li>0x103 = PCI Revision ID</li> <li>0x104 = PnP Product Identifier</li> <li>0x105 = ACPI Product Identifier</li> <li>0xFFFF = Vendor Defined</li> </ul>

### 6.2.1.51 AdditionalDescriptorLength - SubVendorID (0x0032)

Bit(s)	Field Name	Default NVM Value	Description
15:0	AdditonalDescriptorLength	0x2	Indicates the length, in bytes, of the <i>InitialDescriptorData</i> field.

### 6.2.1.52 AdditionalDescriptorIdentifierData - SubVendorID (0x0033)

Bit(s)	Field Name	Default NVM Value	Description
15:0	SubVendorID		PCI Vendor ID assigned to the FD vendor.

### 6.2.1.53 AdditionalDescriptorType - SubSystemD (0x0034)

Bit(s)	Field Name	Default NVM Value	Description
15:0	AdditonalDescriptorType	0x102	<p>Indicates the type of the Initial descriptor.</p> <p>The initial descriptor for a device must be defined by one of the following (PCI Vendor ID, IANA Enterprise ID, UUID, PnP Vendor ID, or ACPI Vendor ID).</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>0x0 = PCI Vendor ID</li> <li>0x1 = IANA Enterprise ID</li> <li>0x2 = UUID</li> <li>0x3 = PnP Vendor ID</li> <li>0x4 = ACPI Vendor ID</li> <li>0x100 = PCI Device ID</li> <li>0x101 = PCI Subsystem Vendor ID</li> <li>0x102 = PCI Subsystem ID</li> <li>0x103 = PCI Revision ID</li> <li>0x104 = PnP Product Identifier</li> <li>0x105 = ACPI Product Identifier</li> <li>0xFFFF = Vendor Defined</li> </ul>

### 6.2.1.54 AdditionalDescriptorLength - SubSystemD (0x0035)

Bit(s)	Field Name	Default NVM Value	Description
15:0	AdditonalDescriptorLength	0x2	Indicates the length, in bytes, of the <i>InitialDescriptorData</i> field.

### 6.2.1.55 AdditionalDescriptorIdentifierData - SubSystemD (0x0036)

Bit(s)	Field Name	Default NVM Value	Description
15:0	SubSystemD		PCI Vendor ID assigned to the FD vendor.

### 6.2.1.56 FirmwareDevicePackageData - Header (0x0037)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:2	Reserved	0x0	Reserved.
1	O-ROM Version to be Set in VPD	0x0	<ul style="list-style-type: none"> <li>0b = Do not set O-ROM version in VPD.</li> <li>1b = Set O-ROM version in VPD.</li> </ul>
0	PFA Preserve	0x0	PFA Preserve (default mode). Should be set to zero

### 6.2.1.57 FirmwareDevicePackageData - GFID TLV Type (0x0038)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Type	0x0001	CURRENT_GFID

### 6.2.1.58 FirmwareDevicePackageData - GFID TLV Length (0x0039)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Length		

### 6.2.1.59 FirmwareDevicePackageData - GFID TLV Value - Current GFID IANA (0x003A)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value-IANA		

### 6.2.1.60 FirmwareDevicePackageData - GFID TLV Value - Current GFID DeviceID (0x003B)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value - device ID		

### 6.2.1.61 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros (0x003C)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.62 FirmwareDevicePackageData - GFID TLV Value - Current GFID.SOFTFUSE (0x003D)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:5	Reserved		Reserved for future use.
4:3	MaxBW		Restrict to 50G. Relevant only if soft fuse is applied.
2:1	NumOfPorts		For future use and compatibility. Relevant only if soft fuse is applied.
0	ApplyFuses		"Soft" Firmware Fuse 0b = Fuses not applied. 1b = Fuses applied.

### 6.2.1.63 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros1 (0x003E)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.64 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros2 (0x003F)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.65 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros3 (0x0040)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.66 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros4 (0x0041)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.67 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros5 (0x0042)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.68 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros6 (0x0043)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.69 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros7 (0x0044)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.70 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros8 (0x0045)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.71 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros9 (0x0046)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.72 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros10 (0x0047)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.73 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros11 (0x0048)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.74 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros12 (0x0049)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the GetPackageData command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.75 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros13 (0x004A)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.76 FirmwareDevicePackageData - GFID TLV Value - Current GFID Zeros14 (0x004B)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.77 FirmwareDevicePackageData - GFID TLV Value - Current GFID IANA (0x004C)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value-IANA		

### 6.2.1.78 FirmwareDevicePackageData - GFID TLV Value - Current GFID DeviceID (0x004D)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value - device ID		

### 6.2.1.79 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros (0x004E)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.80 FirmwareDevicePackageData - GFID TLV Value - Original GFID.SOFTFUSE (0x004F)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:5	Reserved		Reserved for future use.
4:3	MaxBW		Restrict to 50G. Relevant only if soft fuse is applied.
2:1	NumOfPorts		For future use and compatibility. Relevant only if soft fuse is applied.
0	ApplyFuses		"Soft" Firmware Fuse 0b = Fuses not applied. 1b = Fuses applied.

### 6.2.1.81 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros1 (0x0050)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.82 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros2 (0x0051)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.83 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros3 (0x0052)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.84 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros4 (0x0053)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.85 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros5 (0x0054)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.86 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros6 (0x0055)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.87 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros7 (0x0056)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.88 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros8 (0x0057)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.89 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros9 (0x0058)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.90 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros10 (0x0059)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.91 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros11 (0x005A)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.92 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros12 (0x005B)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.93 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros13 (0x005C)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.94 FirmwareDevicePackageData - GFID TLV Value - Original GFID Zeros14 (0x005D)

An optional data field that can be provided within the firmware update package that the UA transfers to the FD during the firmware update process. The UA has no knowledge of what data is contained within this field, and simply passes the contents of this field when the FD requests it via the *GetPackageData* command response.

If the *FirmwareDevicePackageDataLength* field is set to 0x0000, this field contains no data and is zero bytes in length.

Bit(s)	Field Name	Default NVM Value	Description
15:0	TLV Value	0x0	

### 6.2.1.95 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - Update Type (0x005E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - Update Type	1x10	

### 6.2.1.96 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - Update Length (0x005F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - Update Length	0x13	

### 6.2.1.97 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - TLV Type (0x0060)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - TLV Type	0x127	

### 6.2.1.98 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - Update Offset (0x0061)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - Update Offset	0x0	

### 6.2.1.99 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - Data Length (0x0062)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - Data Length	0x10	

### 6.2.1.100 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_0 (0x0063)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_0	0x2E30	Dev-stater major followed by period (ASCII). Default value: "0."

### 6.2.1.101 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_1 (0x0064)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_1	0x3030	Dev-stater minor (ASCII). Default value: "00"

### 6.2.1.102 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_2 (0x0065)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_2	0x2820	Space and open parenthesis (ASCII). " ("

### 6.2.1.103 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_3 (0x0066)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_3	0x7830	Hex prefix (ASCII). "0x"

### 6.2.1.104 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_4 (0x0067)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_4	0x3030	Bytes 3 of EETTrackID (ASCII). "00"

### 6.2.1.105 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_5 (0x0068)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_5	0x3030	Bytes 2 of EETTrackID (ASCII). "00"

### 6.2.1.106 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_6 (0x0069)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_6	0x3030	Bytes 1 of EETTrackID (ASCII). "00"

### 6.2.1.107 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_7 (0x006A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_7	0x3030	Bytes 0 of EETTrackID (ASCII). "00"

### 6.2.1.108 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_8 (0x006B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_8	0x0029	Close parenthesis and null terminator (ASCII). ")<null>"

### 6.2.1.109 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_9 (0x006C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_9	0x0	Null padding.

### 6.2.1.110 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_10 (0x006D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_10	0x0	Null padding.

### 6.2.1.111 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_11 (0x006E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_11	0x0	Null padding.

### 6.2.1.112 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_12 (0x006F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_12	0x0	Null padding.

### 6.2.1.113 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_13 (0x0070)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_13	0x0	Null padding.

### 6.2.1.114 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_14 (0x0071)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_14	0x0	Null padding.

### 6.2.1.115 FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString\_15 (0x0072)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - ComponentImageSetVersionString_15	0x0	Null padding.

### 6.2.1.116 FirmwareDevicePackageData - Additional TLVs - PXE TLV - Update Type (0x0073)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PXE TLV - Update Type	0x10	

### 6.2.1.117 FirmwareDevicePackageData - Additional TLVs - PXE TLV - Update Length (0x0074)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PXE TLV - Update Length	0x4	

### 6.2.1.118 FirmwareDevicePackageData - Additional TLVs - PXE TLV - TLV Type (0x0075)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PXE TLV - TLV Type	0x32	

### 6.2.1.119 FirmwareDevicePackageData - Additional TLVs - PXE TLV - Update Offset (0x0076)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PXE TLV - Update Offset	0x0	

### 6.2.1.120 FirmwareDevicePackageData - Additional TLVs - PXE TLV - Data Length (0x0077)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PXE TLV - Data Length	0x1	

### 6.2.1.121 FirmwareDevicePackageData - Additional TLVs - PXE TLV - Version (0x0078)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Major Version	0x02	
11:8	Minor Version	0x02	
7:0	Build Number	0x01	

### 6.2.1.122 FirmwareDevicePackageData - Additional TLVs - CIVD TLV - Update Type (0x0079)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - CIVD TLV - Update Type	0x10	

### 6.2.1.123 FirmwareDevicePackageData - Additional TLVs - CIVD TLV - Update Length (0x007A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - CIVD TLV - Update Length	0x5	

### 6.2.1.124 FirmwareDevicePackageData - Additional TLVs - CIVD TLV - TLV Type (0x007B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - PLDM TLV - TLV Type	0x132	

### 6.2.1.125 FirmwareDevicePackageData - Additional TLVs - CIVD TLV - Update Offset (0x007C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - CIVD TLV - Update Offset	0x0	

### 6.2.1.126 FirmwareDevicePackageData - Additional TLVs - CIVD TLV - Data Length (0x007D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - CIVD TLV - Data length	0x2	

### 6.2.1.127 FirmwareDevicePackageData - Additional TLVs - CIVD TLV - Version High (0x007E)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Major	0x01	
7:0	Build	0x0B	

### 6.2.1.128 FirmwareDevicePackageData - Additional TLVs - CIVD TLV - Version Low (0x007F)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Build	0x17	
7:0	Patch	0x00	

### 6.2.1.129 Reserved (0x0080 - 0x00A8)

### 6.2.1.130 FirmwareDevicePackageData - Additional TLVs - VPD Update - Update Type (0x00A9)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - VPD update - Update Type	0x11	

### 6.2.1.131 FirmwareDevicePackageData - Additional TLVs - VPD Update - Update Length (0x00AA)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - VPD update - Update Length	0x08	

### 6.2.1.132 FirmwareDevicePackageData - Additional TLVs - VPD Update - VPD V0 Key (0x00AB)

Bit(s)	Field Name	Default NVM Value	Description
15:0	V0 Key	0x3056	

### 6.2.1.133 FirmwareDevicePackageData - Additional TLVs - VPD Update - Data Length (0x00AC)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Length	0xC	

### 6.2.1.134 FirmwareDevicePackageData - Additional TLVs - VPD Update - V0 Key Data 0 (0x00AD)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - VPD Update - V0 Key Data	0x4646	

### 6.2.1.135 FirmwareDevicePackageData - Additional TLVs - VPD Update - V0 Key Data 1 (0x00AE)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - VPD Update - V0 Key Data	0x3256	

### 6.2.1.136 FirmwareDevicePackageData - Additional TLVs - VPD Update - V0 Key Data 2 (0x00AF)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - VPD Update - V0 Key Data	0x2E30	

### 6.2.1.137 FirmwareDevicePackageData - Additional TLVs - VPD Update - V0 Key Data 3 (0x00B0)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - VPD Update - V0 Key Data	0x3030	

### 6.2.1.138 FirmwareDevicePackageData - Additional TLVs - VPD Update - V0 Key Data 4 (0x00B1)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - VPD Update - V0 Key Data	0x302E	

### 6.2.1.139 FirmwareDevicePackageData - Additional TLVs - VPD Update - V0 Key Data 5 (0x00B2)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - VPD Update - V0 Key Data	0x0030	

### 6.2.1.140 FirmwareDevicePackageData - Additional TLVs (0x00B3)

Raw data module length: variable

Used for TLVs that do not exist explicitly in the PLDM header in the map.

### 6.2.1.141 FirmwareDevicePackageData - Additional TLVs - IBA TLV - Update Type (0x00B4)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - IBA TLV - Update Type	0x10	

### 6.2.1.142 FirmwareDevicePackageData - Additional TLVs - IBA TLV - Update Length (0x00B5)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - IBA TLV - Update Length	0x4	

### 6.2.1.143 FirmwareDevicePackageData - Additional TLVs - IBA TLV - TLV Type (0x00B6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - IBA TLV - TLV Type	0x33	

### 6.2.1.144 FirmwareDevicePackageData - Additional TLVs - IBA TLV - Update Offset (0x00B7)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - IBA TLV - Update Offset	0x0	

### 6.2.1.145 FirmwareDevicePackageData - Additional TLVs - IBA TLV - Data Length (0x00B8)

Bit(s)	Field Name	Default NVM Value	Description
15:0	FirmwareDevicePackageData - Additional TLVs - IBA TLV - Data Length	0x1	

### 6.2.1.146 FirmwareDevicePackageData - Additional TLVs - IBA TLV - Version (0x00B9)

Bit(s)	Field Name	Default NVM Value	Description
15:14	Signature		
13	Allow PXE Disable		0b = Ignore PXE Disable – PXE is always load regardless the settings in bits 2:0 in Main Setup Options word. 1b = Allow PXE Disable – PXE is loaded when bits 2:0 in Main Setup Options are set to 0 (PXE enabled on this port).
12:5	Reserved	0x0	
4	iSCSI Boot		
3	EFI EBD Driver		
2	RPL		
1	PXE/UNDI Driver		
0	PXE Base Code		

### 6.2.1.147 ComponentImageCount (0x00BA)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageCount	0x3	

### 6.2.1.148 ComponentClassification (0x00BB)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentClassification	0xA	Valid values are: 0x0 = Unknown 0x1 = Other 0x2 = Driver 0x3 = Configuration Software 0x4 = Application Software 0x5 = Instrumentation 0x6 = Firmware/BIOS 0x7 = Diagnostic Software 0x8 = Operating System 0x9 = Middleware 0xA = Firmware 0xB = BIOS/FCode 0xC = Support/Service Pack 0xD = Software Bundle

### 6.2.1.149 ComponentIdentifier (0x00BC)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentIdentifier	0x6	Valid values are: 0x1 = TLV Extension 0x2 = Link Topology Scratch Pad Area 0x3 = Descriptor Block 0x5 = OROM 0x6 = NVM 0x8 = Topology Netlist

### 6.2.1.150 ComponentComparisonStamp LSB (0x00BD)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentComparisonStamp Low	0x0	

### 6.2.1.151 ComponentComparisonStamp MSB (0x00BE)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentComparisonStamp High	0x0	

### 6.2.1.152 ComponentOptions (0x00BF)

Bit(s)	Field Name	Default NVM Value	Description
15:2	Reserved	0x0	Reserved.
1	Use Component Comparison Stamp	1b	0b = Disabled 1b = Enabled
0	Force Update	1b	0b = Disabled 1b = Enabled

### 6.2.1.153 RequestedComponentActivationMethod (0x00C0)

Bit(s)	Field Name	Default NVM Value	Description
15:6	Reserved		Reserved.
5	AC Power Cycle	0b	0b = Disabled 1b = Enabled
4	DC Power Cycle	0b	0b = Disabled 1b = Enabled
3	System Reboot	1b	0b = Disabled 1b = Enabled
2	Medium-Specific Reset	0b	0b = Disabled 1b = Enabled
1	Self-Contained	0b	0b = Disabled 1b = Enabled
0	Automatic	0b	0b = Disabled 1b = Enabled

### 6.2.1.154 ComponentLocationOffset LSB (0x00C1)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentLocationOffset	0x0	

### 6.2.1.155 ComponentLocationOffset MSB (0x00C2)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentLocationOffset	0x0	

### 6.2.1.156 ComponentSize LSB (0x00C3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentSize LSB	0x0	

### 6.2.1.157 ComponentSize MSB (0x00C4)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentSize MSB	0x0	

### 6.2.1.158 ComponentVersionStringTypeAndLength (0x00C5)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ComponentVersionStringLength	0x12	
7:0	ComponentVersionStringType	0x1	Valid values are: 0x0 = Unknown 0x1 = ASCII 0x2 = UTF-8 0x3 = UTF-16 0x4 = UTF-16LE 0x5 = UTF-16BE

### 6.2.1.159 ComponentVersionString - Dev Starter Major (0x00C6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Dev Starter Major	0x3030	

### 6.2.1.160 ComponentVersionString - Dev Starter Minor (0x00C7)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Dev Starter Minor	0x3030	

### 6.2.1.161 ComponentVersionString - EETRACK-ID MSB (0x00C8)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - EETRACK-ID MSB	0x3030	MSB of EETRACK-ID. [17:0] bits of the EETRACK-ID (in ASCII).

### 6.2.1.162 ComponentVersionString - EETRACK-ID LSB (0x00C9)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - EETRACK-ID LSB	0x3030	

### 6.2.1.163 ComponentVersionString - Dot and Srev Byte 7 (0x00CA)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ComponentVersionString - Srev Byte7	0x30	MSB of 8-byte SREV version (in ASCII).
7:0	ComponentVersionString - Dot	0x2E	

### 6.2.1.164 ComponentVersionString - Srev Bytes 6-5 (0x00CB)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Srev Bytes 6-5	0x3030	

### 6.2.1.165 ComponentVersionString - Srev Bytes 4-3 (0x00CC)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Srev Bytes 4-3	0x3030	

### 6.2.1.166 ComponentVersionString - Srev Bytes 2-1 (0x00CD)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Srev Bytes 2-1	0x3030	

### 6.2.1.167 ComponentVersionString - Srev Byte 0 and Null (0x00CE)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ComponentVersionString - Null	0x0	
7:0	ComponentVersionString - Srev LSB	0x30	LSB of 8-byte SREV version (in ASCII).

### 6.2.1.168 ComponentClassification (0x00CF)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentClassification	0xA	Valid values are: 0x0 = Unknown 0x1 = Other 0x2 = Driver 0x3 = Configuration Software 0x4 = Application Software 0x5 = Instrumentation 0x6 = Firmware/BIOS 0x7 = Diagnostic Software 0x8 = Operating System 0x9 = Middleware 0xA = Firmware 0xB = BIOS/FCode 0xC = Support/Service Pack 0xD = Software Bundle

### 6.2.1.169 ComponentIdentifier (0x00D0)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentIdentifier	0x5	Valid values are: 0x1 = TLV Extension 0x2 = Link Topology Scratch Pad Area 0x3 = Descriptor Block 0x5 = OROM 0x6 = NVM 0x8 = Topology Netlist

### 6.2.1.170 ComponentComparisonStamp LSB (0x00D1)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentComparisonStamp Low	0x0	

### 6.2.1.171 ComponentComparisonStamp MSB (0x00D2)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentComparisonStamp High	0x0	

### 6.2.1.172 ComponentOptions (0x00D3)

Bit(s)	Field Name	Default NVM Value	Description
15:2	Reserved	0x0	Reserved.
1	Use Component Comparison Stamp	1b	0b = Disabled 1b = Enabled
0	Force Update	1b	0b = Disabled 1b = Enabled

### 6.2.1.173 RequestedComponentActivationMethod (0x00D4)

Bit(s)	Field Name	Default NVM Value	Description
15:6	Reserved	0x0	Reserved.
5	AC Power Cycle	0b	0b = Disabled 1b = Enabled
4	DC Power Cycle	0b	0b = Disabled 1b = Enabled
3	System Reboot	0b	0b = Disabled 1b = Enabled
2	Medium-Specific Reset	0b	0b = Disabled 1b = Enabled
1	Self-Contained	0b	0b = Disabled 1b = Enabled
0	Automatic	0b	0b = Disabled 1b = Enabled

### 6.2.1.174 ComponentLocationOffset LSB (0x00D5)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentLocationOffset	0x0	

### 6.2.1.175 ComponentLocationOffset MSB (0x00D6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentLocationOffset	0x0	

### 6.2.1.176 ComponentSize LSB (0x00D7)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentSize LSB	0x0	

### 6.2.1.177 ComponentSize MSB (0x00D8)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentSize MSB	0x0	

### 6.2.1.178 ComponentVersionStringTypeAndLength (0x00D9)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ComponentVersionStringLength	0x12	
7:0	ComponentVersionStringType	0x1	Valid values are: 0x0 = Unknown 0x1 = ASCII 0x2 = UTF-8 0x3 = UTF-16 0x4 = UTF-16LE 0x5 = UTF-16BE

### 6.2.1.179 ComponentVersionString- CIVD High MSB (0x00DA)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - CIVD High MSB	0x3030	

### 6.2.1.180 ComponentVersionString - CIVD High LSB (0x00DB)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - CIVD High LSB	0x3030	

### 6.2.1.181 ComponentVersionString - CIVD Low MSB (0x00DC)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - CIVD Low MSB	0x3030	

### 6.2.1.182 ComponentVersionString - CIVD Low LSB (0x00DD)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - CIVD Low LSB	0x3030	

### 6.2.1.183 ComponentVersionString - Dot and Srev Byte 7 (0x00DE)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ComponentVersionString - Srev Byte7	0x30	MSB of 8-byte SREV version (in ASCII).
7:0	ComponentVersionString - Dot	0x2E	

### 6.2.1.184 ComponentVersionString - Srev Bytes 6-5 (0x00DF)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Srev Bytes 6-5	0x3030	

### 6.2.1.185 ComponentVersionString - Srev Bytes 4-3 (0x00E0)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Srev Bytes 4-3	0x3030	

### 6.2.1.186 ComponentVersionString - Srev Bytes 2-1 (0x00E1)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Srev Bytes 2-1	0x3030	

### 6.2.1.187 ComponentVersionString - Srev Byte 0 and Null (0x00E2)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ComponentVersionString - Null	0x0	
7:0	ComponentVersionString - Srev LSB	0x30	LSB of 8-byte SREV version (in ASCII).

### 6.2.1.188 ComponentClassification (0x00E3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentClassification	0xA	Valid values are: 0x0 = Unknown 0x1 = Other 0x2 = Driver 0x3 = Configuration Software 0x4 = Application Software 0x5 = Instrumentation 0x6 = Firmware/BIOS 0x7 = Diagnostic Software 0x8 = Operating System 0x9 = Middleware 0xA = Firmware 0xB = BIOS/FCode 0xC = Support/Service Pack 0xD = Software Bundle

### 6.2.1.189 ComponentIdentifier (0x00E4)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentIdentifier	0x8	Valid values are: 0x1 = TLV Extension 0x2 = Link Topology Scratch Pad Area 0x3 = Descriptor Block 0x5 = OROM 0x6 = NVM 0x8 = Topology Netlist

### 6.2.1.190 ComponentComparisonStamp LSB (0x00E5)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentComparisonStamp Low	0x0	

### 6.2.1.191 ComponentComparisonStamp MSB (0x00E6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentComparisonStamp High	0x0	

### 6.2.1.192 ComponentOptions (0x00E7)

Bit(s)	Field Name	Default NVM Value	Description
15:2	Reserved	0x0	Reserved.
1	Use Component Comparison Stamp	0b	0b = Disabled 1b = Enabled
0	Force Update	0b	0b = Disabled 1b = Enabled

### 6.2.1.193 RequestedComponentActivationMethod (0x00E8)

Bit(s)	Field Name	Default NVM Value	Description
15:6	Reserved		Reserved.
5	AC Power Cycle	0b	0b = Disabled 1b = Enabled
4	DC Power Cycle	0b	0b = Disabled 1b = Enabled
3	System Reboot	1b	0b = Disabled 1b = Enabled
2	Medium-Specific Reset	0b	0b = Disabled 1b = Enabled
1	Self-Contained	0b	0b = Disabled 1b = Enabled
0	Automatic	0b	0b = Disabled 1b = Enabled

### 6.2.1.194 ComponentLocationOffset LSB (0x00E9)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentLocationOffset	0x0	Points to Link Topology Netlist CSS Header Section. For Link Topology Netlist CSS Header inner structure, see <a href="#">Section 6.3.111</a>

### 6.2.1.195 ComponentLocationOffset MSB (0x00EA)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentLocationOffset	0x0	

### 6.2.1.196 ComponentSize LSB (0x00EB)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentSize LSB	0x0	

### 6.2.1.197 ComponentSize MSB (0x00EC)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentSize MSB	0x0	

### 6.2.1.198 ComponentVersionStringTypeAndLength (0x00ED)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ComponentVersionStringLength	0x2A	
7:0	ComponentVersionStringType	0x1	Valid values are: 0x0 = Unknown 0x1 = ASCII 0x2 = UTF-8 0x3 = UTF-16 0x4 = UTF-16LE 0x5 = UTF-16BE

### 6.2.1.199 ComponentVersionString- ReleaseVersion Major Bytes 7-6 (0x00EE)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - ReleaseVersion Major Bytes 7-6	0x3030	

### 6.2.1.200 ComponentVersionString - ReleaseVersion Major Bytes 5-4 (0x00EF)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - ReleaseVersion Major Bytes 5-4	0x3030	

### 6.2.1.201 ComponentVersionString - ReleaseVersion Major Bytes 3-2 (0x00F0)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - ReleaseVersion Major Bytes 3-2	0x3030	

### 6.2.1.202 ComponentVersionString - ReleaseVersion Major Bytes 1-0 (0x00F1)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - ReleaseVersion Major Bytes 1-0	0x3030	

### 6.2.1.203 ComponentVersionString - Dot and ReleaseVersion Minor Byte 7 (0x00F2)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ComponentVersionString -Dot and ReleaseVersion Minor Byte 7	0x30	
7:0	ComponentVersionString - Dot	0x2E	

### 6.2.1.204 ComponentVersionString - ReleaseVersion Minor Bytes 6-5 (0x00F3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - ReleaseVersion Minor Bytes 6-5	0x3030	

### 6.2.1.205 ComponentVersionString - ReleaseVersion Minor Bytes 4-3 (0x00F4)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - ReleaseVersion Minor Bytes 4-3	0x3030	

### 6.2.1.206 ComponentVersionString - ReleaseVersion Minor Bytes 2-1 (0x00F5)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - ReleaseVersion Minor Bytes 2-1	0x3030	

### 6.2.1.207 ComponentVersionString - ReleaseVersion Minor Byte 0 and Dot (0x00F6)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ComponentVersionString - Dot	0x2E	
7:0	ComponentVersionString -Dot and ReleaseVersion Minor Byte 0	0x30	

### 6.2.1.208 ComponentVersionString - ReleaseVersion Type Bytes 7-6 (0x00F7)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - ReleaseVersion Type Bytes 7-6	0x3030	

### 6.2.1.209 ComponentVersionString - ReleaseVersion Type Bytes 5-4 (0x00F8)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - ReleaseVersion Type Bytes 5-4	0x3030	

### 6.2.1.210 ComponentVersionString - ReleaseVersion Type Bytes 3-2 (0x00F9)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - ReleaseVersion Type Bytes 3-2	0x3030	

### 6.2.1.211 ComponentVersionString - ReleaseVersion Type Bytes 0-1 (0x00FA)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - ReleaseVersion Type Bytes 0-1	0x3030	

### 6.2.1.212 ComponentVersionString - Dot and Customer Netlist IANA Byte 7 (0x00FB)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ComponentVersionString - Customer Netlist IANA Byte 7	0x30	
7:0	ComponentVersionString - Dot	0x2E	

### 6.2.1.213 ComponentVersionString - Customer Netlist IANA Bytes 6-5 (0x00FC)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Customer Netlist IANA Byte 6-5	0x3030	

### 6.2.1.214 ComponentVersionString - Customer Netlist IANA Bytes 4-3 (0x00FD)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Customer Netlist IANA Byte 4-3	0x3030	

### 6.2.1.215 ComponentVersionString - Customer Netlist IANA Bytes 2-1 (0x00FE)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Customer Netlist IANA Byte 2-1	0x3030	

### 6.2.1.216 ComponentVersionString - Customer Netlist IANA Byte 0 and Dot (0x00FF)

Bit(s)	Field Name	Default NVM Value	Description
15:8	ComponentVersionString - Dot	0x2E	
7:0	ComponentVersionString - Customer Netlist IANA Byte 0	0x30	

### 6.2.1.217 ComponentVersionString - Customer Netlist Version Bytes 3-2 (0x0100)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Customer Netlist Version Bytes 3-2	0x3030	

### 6.2.1.218 ComponentVersionString - Customer Netlist Version Bytes 1-0 (0x0101)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Customer Netlist Version Bytes 1-0	0x3030	

### 6.2.1.219 ComponentVersionString - Nulls (0x0102)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentVersionString - Nulls	0x0	

### 6.2.1.220 PackageHeaderChecksum - LSB (0x0103)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageHeaderChecksum		CRC-32: Start Section -> Word: PLDM Header -> PackageHeaderIdentifier_0 End Section -> Word: PLDM Header -> ComponentVersionString - Nulls

### 6.2.1.221 PackageHeaderChecksum - MSB (0x0104)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PackageHeaderChecksum		

## 6.3 NVM Content

**Caution:** In the tables of this section, contents of the NVM Default Value column might not reflect the value programmed in the specific NVM image provided to the customer.

### 6.3.1 NVM General Summary

**Table 6-7. NVM General Summary Table**

NVM Section	Section Reference
SPI Descriptor Section	6.3.2
Init Module Section	6.3.3
PFA Header Section	6.3.4
PFA Features Module Section	6.3.5
Feature Configuration Padding Module Section	6.3.6
PFA Immediate Values Module Section	6.3.7
Immediate Fields Padding Module Section	6.3.8
PFA VPD Module Section	6.3.9
PFA MNG Filter Section	6.3.10
PFA PT Configuration 0 Section	6.3.11
PFA PT Configuration 1 Section	6.3.12
PFA PT Configuration 2 Section	6.3.13
PFA PT Configuration 3 Section	6.3.14
PFA PT Configuration 4 Section	6.3.15
PFA PT Configuration 5 Section	6.3.16
PFA PT Configuration 6 Section	6.3.17
PFA PT Configuration 7 Section	6.3.18
Original EETrack ID Section	6.3.19
IBA Capabilities Module Section	6.3.20
PXE Setup Options Module Section	6.3.21
PXE Configuration Customization Options Module Section	6.3.22
PXE Version Module Section	6.3.23
VLAN Module Section	6.3.24
Boot Configuration Block Section	6.3.25
PBA Header Section	6.3.26
PBA Block Section	6.3.27
PCIR Registers PFA Auto-Load Module Section	6.3.28
POR Registers PFA Auto-Load Module Section	6.3.29
PSM Preserved Section	6.3.30
MinSrev Section	6.3.31

Factory Settings Area Section	6.3.118
Guarded Zone Section	6.3.119

## 6.3.2 SPI Descriptor Section

**Table 6-8. SPI Descriptor Section Summary Table**

Word Offset	Description	Section Reference
0x0000	SPI Flash Descriptor	6.3.2.1

### 6.3.2.1 SPI Flash Descriptor (0x0000)

Raw data module length: 2048 words

### 6.3.3 Init Module Section

This is the NVM header module that contains pointers to all other first-level sections. It also includes words that are relative to the whole NVM map.

**Table 6-9. Init Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	NVM Control Word 1	6.3.3.1
0x0001	Non-Persistent End Pointer	6.3.3.2
0x0002	Last PFA Word Pointer	6.3.3.3
0x0003	GFID Pointer	6.3.3.4
0x0004 - 0x0006	Reserved	6.3.3.5
0x0007	Auto Generated Pointers Pointer	6.3.3.6
0x0008	Reserved	6.3.3.7
0x0009	EMP Global Module Pointer	6.3.3.8
0x000A	Guarded Zone Pointer	6.3.3.9
0x000B	EMP Image Pointer	6.3.3.10
0x000C - 0x000D	Reserved	6.3.3.11
0x000E	Manageability Module Pointer	6.3.3.12
0x000F	EMP Settings Module Pointer	6.3.3.13
0x0010	SW Compatibility Word 1	6.3.3.14

### 6.3.3.1 NVM Control Word 1 (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Reserved	0x0	Reserved.
7:6	Bank Validity	01b	The <i>Bank Validity (Signature)</i> field indicates to the device that there is a valid NVM present. If it is not 01b, the other bits in this word are ignored, no further NVM read is performed, and the default values are used for the configuration space IDs. Valid values are: 00b = Value 0x0 01b = Shadow Ram Bank Valid 10b = Value 0x2 11b = Value 0x3
5	Valid NVM Bank Index	0b	First Bank is located at offset 128KB (pointed by 1st NVM bank pointer). Second Bank is located at 128K + NVM Bank Area Size * 4K. Valid values are: 0b = First Bank 1b = Second Bank
4	Valid TLV Extension Bank Index	0b	First Bank is located at offset 128KB (pointed by 1st NVM bank pointer). Second Bank is located at 128K + NVM Bank Area Size * 4K. Valid values are: 0b = First Bank 1b = Second Bank
3	Valid OROM Bank Index	0b	First Bank is located at offset 128KB (pointed by 1st NVM bank pointer). Second Bank is located at 128K + NVM Bank Area Size * 4K. Valid values are: 0b = First Bank 1b = Second Bank
2:0	Reserved	000b	Reserved.

### 6.3.3.2 Non-Persistent End Pointer (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units. Only the 4 KB sector unit is supported for this pointer.
14:0	Non-Persistent End Pointer	0x7FFF	Pointer to the end of the non-persistent Shadow RAM area

### 6.3.3.3 Last PFA Word Pointer (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units. Only the 4 KB sector unit is supported for this pointer.
14:0	Last PFA Word Pointer	0x0	Pointer to the end of the PFA excluding the PCI ALT module.

### 6.3.3.4 GFID Pointer (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	PCIR GFID Module Pointer	0x0	Points to GFID Module Section. For GFID Module inner structure, see <a href="#">Section 6.3.64</a> .

### 6.3.3.5 Reserved (0x0004 - 0x0006)

### 6.3.3.6 Auto-Generated Pointers Pointer (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	Auto-Generated Pointers Module Pointer	0x0	Points to Auto-Generated Pointers Module Section. For Auto-Generated Pointers Module inner structure, see <a href="#">Section 6.3.68</a> .

### 6.3.3.7 Reserved (0x0008)

### 6.3.3.8 EMP Global Module Pointer (0x0009)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	EMP Global Module Pointer	0x0	Points to EMP Global Module Section. For EMP Global Module inner structure, see <a href="#">Section 6.3.94</a> .

### 6.3.3.9 Guarded Zone Pointer (0x000A)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	Guarded Zone Pointer	0x0	Points to Guarded Zone Section. For Guarded Zone inner structure, see <a href="#">Section 6.3.119</a> .

### 6.3.3.10 EMP Image Pointer (0x000B)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	EMP Image Pointer	0x7FFF	Points to EMP Image Section. For EMP Image inner structure, see <a href="#">Section 6.3.101</a> .

### 6.3.3.11 Reserved (0x000C - 0x000D)

### 6.3.3.12 Manageability Module Pointer (0x000E)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	Manageability Configuration Module Pointer	0x0	Points to Manageability Module Header Section. For Manageability Module Header inner structure, see <a href="#">Section 6.3.65</a> .

### 6.3.3.13 EMP Settings Module Pointer (0x000F)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	EMP Module Pointer	0x0	Points to EMP Settings Module Header Section. For EMP Settings Module Header inner structure, see <a href="#">Section 6.3.95</a> .

### 6.3.3.14 SW Compatibility Word 1 (0x0010)

Five words in the NVM image are reserved for compatibility information. New bits within these fields are defined as the need arises for determining software compatibility between various hardware revisions.

Bit(s)	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11	LOM	0b	Indicates whether the NVM attached to LAN silicon contains dedicated module for Option ROM. Used by Option ROM update applications. 0b = NIC (Attached flash contains module for Option ROM). 1b = LOM (Attached flash has no module for Option ROM).
10	Server	1b	Legacy – not currently used. 0b = Client 1b = Server
9	Reserved	0b	Reserved.

Bit(s)	Field Name	Default NVM Value	Description
8	OEM/Retail	0b	Legacy – not currently used. 0b = Retail 1b = OEM
7:0	Reserved	0x0	Reserved.

### 6.3.3.15 SW Compatibility Word 2 (0x0011)

Five words in the NVM image are reserved for compatibility information. New bits within these fields are defined as the need arises for determining software compatibility between various hardware revisions.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.16 SW Compatibility Word 3 (0x0012)

Five words in the NVM image are reserved for compatibility information. New bits within these fields are defined as the need arises for determining software compatibility between various hardware revisions.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.17 SW Compatibility Word 4 (0x0013)

Five words in the NVM image are reserved for compatibility information. New bits within these fields are defined as the need arises for determining software compatibility between various hardware revisions.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.18 SW Compatibility Word 5 (0x0014)

Five words in the NVM image are reserved for compatibility information. New bits within these fields are defined as the need arises for determining software compatibility between various hardware revisions.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.19 Reserved (0x0015 - 0x0016)

### 6.3.3.20 Reserved - Boot Block Virtual Pointer (0x0017)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.21 Software Reserved Word 1 - Dev Starter Version (0x0018)

Dev\_Starter map version used to produce this image. This word must be filled manually. Used for upgrade/downgrade algorithm.

Bit(s)	Field Name	Default NVM Value	Description
15:12	Major	0x0	NVM major version - Customer set.
11:8	Decimal Point	0x0	Decimal point, used by automatic NVM reading tools. Must be always set to 0x0.
7:0	Minor	0x0	NVM minor version - Increased upon each release to customer.

### 6.3.3.22 Software Reserved Word 2 (0x0019)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Reserved	0xFF	Reserved.
7	WoL Control Port 7	1b	Wake-on-LAN feature for Port 7. 0b = Supported and enabled. 1b = Disabled or not supported.
6	WoL Control Port 6	1b	Wake-on-LAN feature for Port 6. 0b = Supported and enabled. 1b = Disabled or not supported.
5	WoL Control Port 5	1b	Wake-on-LAN feature for Port 5. 0b = Supported and enabled. 1b = Disabled or not supported.
4	WoL Control Port 4	1b	Wake-on-LAN feature for Port 4. 0b = Supported and enabled. 1b = Disabled or not supported.
3	WoL Control Port 3	1b	Wake-on-LAN feature for Port 3. 0b = Supported and enabled. 1b = Disabled or not supported.
2	WoL Control Port 2	1b	Wake-on-LAN feature for Port 2. 0b = Supported and enabled. 1b = Disabled or not supported.
1	WoL Control Port 1	1b	Wake-on-LAN feature for Port 1. 0b = Supported and enabled. 1b = Disabled or not supported.
0	WoL Control Port 0	1b	Wake-on-LAN feature for Port 0. 0b = Supported and enabled. 1b = Disabled or not supported.

### 6.3.3.23 Software Reserved Word 3 (0x001A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.24 Software Reserved Word 4 - OEM Product Version Address Block Pointer (0x001B)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	OEM Product Version Address Block Pointer	0x0	

### 6.3.3.25 Software Reserved Word 5 (0x001C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.26 Software Reserved Word 6 (0x001D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.27 Software Reserved Word 7 (0x001E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.28 Software Reserved Word 8 (0x001F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.29 Software Reserved Word 9 (0x0020)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.30 Software Reserved Word 10 (0x0021)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.31 Software Reserved Word 11 (0x0022)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.32 Software Reserved Word 12 (0x0023)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.33 Software Reserved Word 13 (0x0024)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.34 Software Reserved Word 14 (0x0025)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.35 Software Reserved Word 15 (0x0026)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.36 Software Reserved Word 16 (0x0027)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.37 Software Reserved Word 17 (0x0028)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.38 Software Reserved Word 18 - Map Version (0x0029)

Automatically generated by the tool.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Map Version		

### 6.3.3.39 Software Reserved Word 19 - NVM Image Version (0x002A)

Automatically generated by the tool.

Bit(s)	Field Name	Default NVM Value	Description
15:0	NVM Image Version		

### 6.3.3.40 Software Reserved Word 20 - NVM Structure Version (0x002B)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Major	0x0	NVM major version.
11:8	Decimal Point	0x0	Decimal point, used by automatic NVM reading tools. Must be always set to 0x0.
7:0	Minor	0x0	NVM Structure minor version.

### 6.3.3.41 Software Reserved Word 21 - FCoE Offload (0x002C)

This word is for Platform/NIC/LOM specific settings.

Bit(s)	Field Name	Default NVM Value	Description
15:2	Reserved	0x3FFF	Reserved.
1	FCoE Offload	1b	This bit indicates to software if the device supports FCoE Offload. 0b = FCoE Offload Enabled. 1b = FCoE Offload Disabled.
0	Reserved	1b	Reserved.

### 6.3.3.42 Software Reserved Word 22 - EETRACK ID 1 (0x002D)

This word is for the first word of the eTrack\_ID number written by EEPROM Manager Tool.

Bit(s)	Field Name	Default NVM Value	Description
15:0	eTrack_ID Word 1	0xFFFF	EEPROM Manager Tool writes a unique 32-bit <i>eTrack_ID</i> number in two sequential NVM words. The <i>eTrack_ID</i> is written when EEPROM Manager Tool creates an image on the Intel network. The <i>eTrack_ID</i> DB tracks NVM images back to a specific SCM build.

### 6.3.3.43 Software Reserved Word 23 - EETRACK ID 2 (0x002E)

This word is for the second word of the eTrack\_ID number written by EEPROM Manager Tool.

Bit(s)	Field Name	Default NVM Value	Description
15:0	eTrack_ID Word 2		

### 6.3.3.44 Reserved (0x002F)

### 6.3.3.45 Reserved - PXE Configuration Virtual Pointer (0x0030)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.46 Reserved - PXE Configuration Customization Virtual Pointer (0x0031)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.47 Reserved - PXE Version Virtual Word (0x0032)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.48 Reserved (0x033)

### 6.3.3.49 Software Reserved Word 24 - Original EETRACK ID 1 (0x0034)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Original EETRACK ID 1	0x0	

### 6.3.3.50 Software Reserved Word 25 - Original EETRACK ID 2 (0x0035)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Original EETRACK ID 2	0x0	

### 6.3.3.51 Reserved (0x0036)

### 6.3.3.52 Reserved - VLAN Configuration Block Virtual Pointer (0x0037)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.53 Reserved (0x0038 - 0x003A)

### 6.3.3.54 GLOBR Registers Auto-Load Pointer (0x003B)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	GLOBR Registers Auto-Load Module Pointer	0x7FFF	Points to GLOBR Registers Auto-Load Module Section. For GLOBR Registers Auto-Load Module inner structure, see <a href="#">Section 6.3.58</a> .

### 6.3.3.55 CORER Registers Auto-Load Pointer (0x003C)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	CORER Registers Auto-Load Module Pointer	0x7FFF	Points to CORER Registers Auto-Load Module Section. For CORER Registers Auto-Load Module inner structure, see <a href="#">Section 6.3.56</a> .

### 6.3.3.56 PHY Configuration Scripts (DNL) Pointer (0x003D)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	DNL Pointer	0x7FFF	Points to DL Scripts Section. For DL Scripts inner structure, see <a href="#">Section 6.3.96</a> .

### 6.3.3.57 Reserved (0x003E)

### 6.3.3.58 Reserved - Checksum (0x003F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0x0	Reserved.

### 6.3.3.59 Preserved Field Area Pointer (0x0040)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	PFA Pointer	0x7FFF	Points to PFA Header Section. For PFA Header inner structure, see <a href="#">Section 6.3.4</a> .

### 6.3.3.60 HLP SR Module Pointer (0x0041)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	HLP Module Pointer	0x0	

### 6.3.3.61 1st NVM Bank Pointer (0x0042)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	1st NVM Bank Pointer	0x7FFF	

### 6.3.3.62 NVM Bank Area Size (0x0043)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11:0	NVM Bank Area Size	0x41A	Size expressed in 4 KB sector units.

### 6.3.3.63 1st OROM Bank Pointer (0x0044)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	1st OROM Bank Pointer	0x0	Pointer to first OROM section (not swapped when section changes) <b>Note:</b> This value is fixed to 4224 KB - need to be manually changed if location of section changes. Points to OROM Section. For OROM inner structure, see <a href="#">Section 6.3.108</a> .

### 6.3.3.64 OROM Bank Area Size (0x0045)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11:0	OROM Bank Area Size	0x7D	Size expressed in 4 KB sector units.

### 6.3.3.65 1st TLV Extension Bank Pointer (0x0046)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	1st TLV Extension Bank Pointer	0x0	Pointer to first TLV extension section (not swapped when section changes) <b>Note:</b> This value is fixed to 4224 KB - need to be manually changed if location of section changes. Points to Link Topology Netlist CSS Header Section. For Link Topology Netlist CSS Header inner structure, see <a href="#">Section 6.3.111</a> .

### 6.3.3.66 TLV Extension Bank Area Size (0x0047)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11:0	TLV Extension Bank Area Size	0x7	Size expressed in 4 KB sector units.

### 6.3.3.67 EMP SR Settings Pointer (0x0048)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	EMP SR Settings Pointer	07FFF	Points to EMP SR Settings Module Header Section. For EMP SR Settings Module Header inner structure, see <a href="#">Section 6.3.61</a> .

### 6.3.3.68 Reserved (0x0049)

### 6.3.3.69 PE CORER Registers Auto-Load Pointer (0x004A)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	PE CORER Config Pointer	07FFF	Points to PE CORER Registers Section. For PE CORER Registers inner structure, see <a href="#">Section 6.3.59</a> .

### 6.3.3.70 Link Topology Scratch Pad Area Pointer (0x004B)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	Link Topology Scratch Pad Area Pointer	07FFF	Points to Link Topology Scratch Pad Area Section. For Link Topology Scratch Pad Area inner structure, see <a href="#">Section 6.3.115</a> .

### 6.3.3.71 Link Topology Scratch Pad Area Size (0x004C)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11:0	Link Topology Scratch Pad Area Size	0x5	Size expressed in 4 KB sector units.

### 6.3.3.72 Configuration Metadata Pointer (0x004D)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	Configuration Metadata Pointer	07FFF	Points to Configuration Metadata Section. For Configuration Metadata inner structure, see <a href="#">Section 6.3.99</a> .

### 6.3.3.73 Reserved (0x004E - 0x004F)

### 6.3.3.74 FW Scratch Pad Area Pointer (0x0050)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	FW Scratch Pad Area Pointer	07FFF	Points to FW Scratch Pad Area Section. For FW Scratch Pad Area inner structure, see <a href="#">Section 6.3.116</a> .

### 6.3.3.75 FW Scratch Pad Area Size (0x0051)

Bit(s)	Field Name	Default NVM Value	Description
15:10	Reserved	0x0	Reserved.
9:0	FW Scratch Pad Area Size	0x40	Size expressed in 4 KB sector units.

### 6.3.3.76 Reserved (0x0052 - 0x0053)

### 6.3.3.77 Analog PHY Configuration Module Pointer (0x0054)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	Internal PHY Configuration Module Pointer	07FFF	Points to Analog PHY Configuration Section. For Analog PHY Configuration inner structure, see <a href="#">Section 6.3.98</a> .

### 6.3.3.78 Soft SKUs (0x0055)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0x0	Reserved.

### 6.3.3.79 Extended CORER Registers Auto-Load Pointer (0x0056)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	Extended CORER Registers Auto-Load Module Pointer	07FFF	Points to Ext. CORER Registers Auto-Load Module Section. For Ext. CORER Registers Auto-Load Module inner structure, see <a href="#">Section 6.3.93</a> .

### 6.3.3.80 Recovery Firmware Pointer (0x0057)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	Recovery Firmware Pointer	0x0	Points to Recovery FW CSS Header Section. For Recovery FW CSS Header inner structure, see <a href="#">Section 6.3.86</a> .

### 6.3.3.81 Control Pipe Package Pointer (0x0058)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	Control Pipe Package Pointer	07FFF	Points to Control Pipe Package Section. For Control Pipe Package inner structure, see <a href="#">Section 6.3.100</a> .

### 6.3.3.82 Reserved (0x0059 - 0x005A)

### 6.3.3.83 DCB Rx Module Pointer (0x005B)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	DCB Rx Module Pointer	07FFF	Points to DCB Rx Module Section. For DCB Rx Module inner structure, see <a href="#">Section 6.3.89</a> .

### 6.3.3.84 DCB Tx Module Pointer (0x005C)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	DCB Tx Module Pointer	07FFF	Points to DCB Tx Module Section. For DCB Tx Module inner structure, see <a href="#">Section 6.3.90</a> .

### 6.3.3.85 Allowlist Pointer (0x005D)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	Allowlist Pointer	07FFF	Points to Allowlist Section. For Allowlist inner structure, see <a href="#">Section 6.3.97</a> .

### 6.3.3.86 Sideband Auto-Load Pointer (0x005E)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	Sideband Auto-Load Pointer	07FFF	Points to Sideband Bus Auto-Load Section. For Sideband Bus Auto-Load inner structure, see <a href="#">Section 6.3.60</a> .

### 6.3.3.87 RDE Dictionaries Pointer (0x005F)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	RDE Dictionaries Pointer	07FFF	Points to RDE Dictionaries Section. For RDE Dictionaries inner structure, see <a href="#">Section 6.3.102</a> .

### 6.3.3.88 Reserved (0x0060 - 0x0061)

### 6.3.3.89 Factory Settings Size (0x0062)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11:0	Factory Settings Size	0xD	Size expressed in 4 KB sector units.

### 6.3.3.90 Mailbox Register Auto-Load Pointer (0x0063)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0x0	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	Mailbox Register Auto-Load Pointer	0x7FFF	Points to Mailbox Register Auto-Load Module Section. For Mailbox Register Auto-Load Module inner structure, see <a href="#">Section 6.3.57</a> .

### 6.3.3.91 QoS DCB Auto-Load Section Pointer (0x0064)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0x1	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	QoS DCB Auto-Load Section Pointer	0x7FFF	Points to QoS DCB Auto-Load Section. For QoS DCB Auto-Load Section inner structure, see <a href="#">Section 6.3.91</a> .

### 6.3.3.92 QoS no-DCB Auto-Load Section Pointer (0x0065)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0x1	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	QoS no- DCB Auto-Load Section Pointer	0x7FFF	Points to QoS no-DCB Auto-Load Section. For QoS no-DCB Auto-Load Section inner structure, see <a href="#">Section 6.3.92</a> .

### 6.3.3.93 Spare NVM Header Words1 (0x0066)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.94 Spare NVM Header Words2 (0x0067)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.3.95 External Topology Device Image 0 Pointer (0x0068)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0x1	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	External Topology Device Image 0 Pointer	0x7FFF	Points to External Topology Device Image 0 Section. For External Topology Device Image 0 inner structure, see <a href="#">Section 6.3.103</a> .

### 6.3.3.96 External Topology Device Image 1 Pointer (0x0069)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0x1	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	External Topology Device Image 1 Pointer	0x7FFF	Points to External Topology Device Image 0 Section. For External Topology Device Image 0 inner structure, see <a href="#">Section 6.3.104</a> .

### 6.3.3.97 External Topology Device Image 2 Pointer (0x006A)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0x1	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	External Topology Device Image 2 Pointer	0x7FFF	Points to External Topology Device Image 0 Section. For External Topology Device Image 0 inner structure, see <a href="#">Section 6.3.105</a> .

### 6.3.3.98 External Topology Device Image 3 Pointer (0x006B)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0x1	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	External Topology Device Image 3 Pointer	0x7FFF	Points to External Topology Device Image 0 Section. For External Topology Device Image 0 inner structure, see <a href="#">Section 6.3.106</a> .

### 6.3.3.99 Spare NVM Header Words[n] (0x006C + 1\*n, n=7...154)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

## 6.3.4 PFA Header Section

Preserved fields area header.

**Table 6-10. PFA Header Section Summary Table**

Word Offset	Description	Section Reference
0x0000	PFA Length	6.3.4.1

### 6.3.4.1 PFA Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PFA Length	0x2F00	

## 6.3.5 PFA Features Module Section

**Table 6-11. PFA Features Module Section Summary Table**

Word Offset	Description	Section Reference
0x0101	Sub Module Type - Features	6.3.5.1

### 6.3.5.1 Sub Module Type - Features (0x0101)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x49	Valid values are: 0x49 = Feature Configuration

## 6.3.6 Feature Configuration Padding Module Section

Table 6-12. Feature Configuration Padding Module Section Summary Table

Word Offset	Description	Section Reference
0x0000	Sub Module Type - Padding	6.3.6.1
0x0001	Length	6.3.6.2
0x0002	Padding	6.3.6.3

### 6.3.6.1 Sub Module Type - Padding (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0xFFFF	Valid values are: 0xFFFF = Padding Module

### 6.3.6.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: Feature Configuration Padding Module -> Sub Module Type Padding Last Section -> Word: Feature Configuration Padding Module -> Padding

### 6.3.6.3 Padding (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	[New Field]		

## 6.3.7 PFA Immediate Values Module Section

Table 6-13. PFA Immediate Values Module Section Summary Table

Word Offset	Description	Section Reference
0x0901	Sub Module Type - Immediate	6.3.7.1

### 6.3.7.1 Sub Module Type - Immediate (0x0901)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x4E	Valid values are: 0x4E = Immediate Configuration

## 6.3.8 Immediate Fields Padding Module Section

Table 6-14. Immediate Fields Padding Module Section Summary Table

Word Offset	Description	Section Reference
0x0000	Sub Module Type Padding	6.3.8.1
0x0001	Length	6.3.8.2
0x0002	Padding	6.3.8.3

### 6.3.8.1 Sub Module Type Padding (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0xFFFF	Valid values are: 0xFFFF = Padding Module

### 6.3.8.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: Immediate Fields Padding Module -> Sub Module Type Padding Last Section -> Word: Immediate Fields Padding Module -> Padding

### 6.3.8.3 Padding (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	[New Field]	0xFFFF	

## 6.3.9 PFA VPD Module Section

VPD area. Vital product data loaded by OEM. It contains RO and RW info about the NIC/LOM.

**Table 6-15. PFA VPD Module Section Summary Table**

Word Offset	Description	Section Reference
0x0F01	Sub Module Type - VPD	6.3.9.1
0x0F02	Length	6.3.9.2
0x0F03	VPD Data	6.3.9.3

### 6.3.9.1 Sub Module Type - VPD (0x0F01)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x2F	Valid values are: 0x2F = VPD Module

### 6.3.9.2 Length (0x0F02)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: PFA VPD Module -> Sub Module Type - VPD Last Section -> Word: PFA VPD Module -> VPD Data

### 6.3.9.3 VPD Data (0x0F03)

Raw data module length: 512 words

## 6.3.10 PFA MNG Filter Section

Table 6-16. PFA MNG Filter Section Summary Table

Word Offset	Description	Section Reference
0x0000	Sub Module Type - MNG Filter	6.3.10.1
0x0001	Section Length	6.3.10.2
0x0002	Flexible Filter Data	6.3.10.3

### 6.3.10.1 Sub Module Type - MNG Filter (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x107	Valid values are: 0x107 = MNG Filters

### 6.3.10.2 Section Length (0x0001)

The length of the section in words. Note that section length does not include a count for the section length word.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1 First Section -> Word: PFA MNG Filter -> Section Length Last Section -> Word: PFA MNG Filter -> Flexible Filter Data

### 6.3.10.3 Flexible Filter Data (0x0002)

Raw data module length: variable

## 6.3.11 PFA PT Configuration 0 Section

Pass-through filters of Port 0 PFA section header.

**Table 6-17. PFA PT Configuration 0 Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Sub Module Type PT Module 0	6.3.11.1
0x0001	Section Length	6.3.11.2
0x0002 + 2*n, n=0...3	LAN IPv4 Address (LSB) MIPAF0	6.3.11.3
0x0003 + 2*n, n=0...3	LAN IPv4 Address (MSB) MIPAF0	6.3.11.4
0x000A + 2*n, n=0...15	LAN Flexible Filter Port	6.3.11.5
0x000B + 2*n, n=0...15	LAN Flexible Filter Port - Modifiers	6.3.11.6
0x002A + 1*n, n=0...7	LAN VLAN Filter	6.3.11.7
0x0032	LAN MANC Value LSB	6.3.11.8
0x0033	LAN MANC Value MSB	6.3.11.9
0x0034	Receive Enable 1 - LRXEN1	6.3.11.10
0x0035	Receive Enable 2 - LRXEN2	6.3.11.11
0x0036	LAN MNGONLY LSB	6.3.11.12
0x0037	LAN MNGONLY MSB	6.3.11.13
0x0038 + 4*n, n=0...6	Manageability Decision Filters LSB	6.3.11.14
0x0039 + 4*n, n=0...6	Manageability Decision Filters MSB	6.3.11.15
0x003A + 4*n, n=0...6	Manageability Extended Decision Filters LSB	6.3.11.16
0x003B + 4*n, n=0...6	Manageability Extended Decision Filters MSB	6.3.11.17
0x0054 + 2*n, n=0...3	Manageability EtherType Filter (METF) LSB	6.3.11.18
0x0055 + 2*n, n=0...3	Manageability EtherType Filter (METF) MSB	6.3.11.19
0x005C	ARP Response IPv4 Address LSB	6.3.11.20
0x005D	ARP Response IPv4 Address MSB	6.3.11.21
0x005E + 8*n, n=0...3	IPv6 Address Bytes 0-1	6.3.11.22
0x005F + 8*n, n=0...3	IPv6 Address Bytes 2-3	6.3.11.23
0x0060 + 8*n, n=0...3	IPv6 Address Bytes 4-5	6.3.11.24
0x0061 + 8*n, n=0...3	IPv6 Address Bytes 6-7	6.3.11.25
0x0062 + 8*n, n=0...3	IPv6 Address Bytes 8-9	6.3.11.26
0x0063 + 8*n, n=0...3	IPv6 Address Bytes 10-11	6.3.11.27
0x0064 + 8*n, n=0...3	IPv6 Address Bytes 12-13	6.3.11.28
0x0065 + 8*n, n=0...3	IPv6 Address Bytes 14-15	6.3.11.29
0x007E	Manageability Special Modifiers LSB	6.3.11.30
0x007F	Manageability Special Modifiers MSB	6.3.11.31

### 6.3.11.1 Sub Module Type PT Module 0 (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x108	Valid values are: 0x108 = Pass-Through Control Words Structure 0

### 6.3.11.2 Section Length (0x0001)

The length of the section in words. Note that section length does not include a count for the section length word.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1 First Section -> Word: PFA PT Configuration 0 -> Section Length Last Section -> Word: PFA PT Configuration 0 -> Manageability Special Modifiers MSB

### 6.3.11.3 LAN IPv4 Address (LSB) MIPAF0[n] (0x0002 + 2\*n, n=0...3)

Bit(s)	Field Name	Default NVM Value	Description
15:8	IPv4 Address, Byte 1	0xFF	
7:0	IPv4 Address, Byte 0	0xFF	

### 6.3.11.4 LAN IPv4 Address (MSB) MIPAF0[n] (0x0003 + 2\*n, n=0...3)

Bit(s)	Field Name	Default NVM Value	Description
15:8	IPv4 Address, Byte 3	0xFF	
7:0	IPv4 Address, Byte 4	0xFF	

### 6.3.11.5 LAN Flexible Filter Port[n] (0x000A + 2\*n, n=0...15)

Bit(s)	Field Name	Default NVM Value	Description
15:0	LAN UDP Flexible Filter Port0	0xFFFF	

### 6.3.11.6 LAN Flexible Filter Port - Modifiers[n] (0x000B + 2\*n, n=0...15)

Bit(s)	Field Name	Default NVM Value	Description
15:3	Reserved		Reserved.
2	Source Destination	0b	0b = Destination 1b = Source
1	Accept TCP	0b	If set, filter match if packet is TCP. 0b = Filter 1b = Accept
0	Accept UDP	0b	If set, filter match if packet is UDP. 0b = Filter 1b = Accept

### 6.3.11.7 LAN VLAN Filter[n] (0x002A + 1\*n, n=0...7)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11:0	VLAN Filter 0 Value	0xFFF	

### 6.3.11.8 LAN MANC Value LSB (0x0032)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0x0	Reserved.

### 6.3.11.9 LAN MANC Value MSB (0x0033)

Bit(s)	Field Name	Default NVM Value	Description
15:11	Reserved	0x0	Reserved.
10	NET_TYPE	0b	
9	FIXED_NET_TYPE	0b	
8	Reserved	0b	Reserved.
7	EN_XSUM_FILTER	0b	Should be used to set the RBCR.EN_XSUM_FILTER <sub>n</sub> bit, where <i>n</i> is the port number).
6:0	Reserved	0x0	Reserved.

### 6.3.11.10 Receive Enable 1 - LRXEN1 (0x0034)

Bit(s)	Field Name	Default NVM Value	Description
15:9	Receive Enable Byte 12	0x0	BMC SMBus secondary address.
8	Reserved	0b	Reserved.
7	Enable BMC Dedicated	0b	When set, the BMC will receive traffic sent to the MAC Address defined in MMAH/MMAL[3]. The Firmware configures MDEF, MDEF_EXT (7) to dedicated MAC configured into MMAL/H (3) to implement this mode.
6	Reserved	1b	Reserved.
5:4	Notification Method	00b	This field is valid only in the section of port 0 and defines the notification method for all ports. Valid values are: 00b = SMBus Alert 01b = Asynchronous Notify 10b = Direct Receive 11b = Reserved
3	Enable ARP Response	0b	When set, the firmware offloads ARP handling sent to the IP Address defined in ARP Response IPv4 Address NVM words. The Firmware uses MDEF, MDEF_EXT (6) and MIPAF4[3] to implement this mode.
2	Enable Status Reporting	0b	
1	Enable Receive All	0b	
0	Enable Receive TCO	0b	

### 6.3.11.11 Receive Enable 2 - LRXEN2 (0x0035)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Receive Enable Byte 14	0x0	Alert value.
7:0	Receive Enable Byte 13	0x0	Interface data.

### 6.3.11.12 LAN MNGONLY LSB (0x0036)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Reserved	0x0	Reserved.
7:0	Exclusive to MNG	0x0	

### 6.3.11.13 LAN MNGONLY MSB (0x0037)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0x0	Reserved.

### 6.3.11.14 Manageability Decision Filters LSB[n] (0x0038 + 4\*n, n=0...6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	MDEF0_L	0x0	

### 6.3.11.15 Manageability Decision Filters MSB[n] (0x0039 + 4\*n, n=0...6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	MDEF0_M	0x0	

### 6.3.11.16 Manageability Extended Decision Filters LSB[n] (0x003A + 4\*n, n=0...6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	MDEFEXT0_L	0x0	

### 6.3.11.17 Manageability Extended Decision Filters MSB[n] (0x003B + 4\*n, n=0...6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	MDEFEXT0_M	0x0	

### 6.3.11.18 Manageability EtherType Filter (METF) LSB[n] (0x0054 + 2\*n, n=0...3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	METF0_L	0x0	Loaded to 16 LS bits of METF[0] register.

### 6.3.11.19 Manageability EtherType Filter (METF) MSB[n] (0x0055 + 2\*n, n=0...3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	METF0_M	0x0	Loaded to 16 MS bits of METF[0] register (reserved bits in the METF registers should be set in the NVM to the register default values).

### 6.3.11.20 ARP Response IPv4 Address LSB (0x005C)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Byte 1	0x0	Firmware use.
7:0	Byte 0	0x0	Firmware use.

### 6.3.11.21 ARP Response IPv4 Address MSB (0x005D)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Byte 1	0x0	Firmware use.
7:0	Byte 0	0x0	Firmware use.

### 6.3.11.22 IPv6 Address Bytes 0-1[n] (0x005E + 8\*n, n=0...3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	IPv6 Address Bytes 0-1	0x0	

### 6.3.11.23 IPv6 Address Bytes 2-3[n] (0x005F + 8\*n, n=0...3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	IPv6 Address Bytes 2-3	0x0	

### 6.3.11.24 IPv6 Address Bytes 4-5[n] (0x0060 + 8\*n, n=0...3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	IPv6 Address Bytes 4-5	0x0	

### 6.3.11.25 IPv6 Address Bytes 6-7[n] (0x0061 + 8\*n, n=0...3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	IPv6 Address Bytes 6-7	0x0	

### 6.3.11.26 IPv6 Address Bytes 8-9[n] (0x0062 + 8\*n, n=0...3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	IPv6 Address Bytes 8-9	0x0	

### 6.3.11.27 IPv6 Address Bytes 10-11[n] (0x0063 + 8\*n, n=0...3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	IPv6 Address Bytes 10-11	0x0	

### 6.3.11.28 IPv6 Address Bytes 12-13[n] (0x0064 + 8\*n, n=0...3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	IPv6 Address Bytes 12-13	0x0	

### 6.3.11.29 IPv6 Address Bytes 14-15[n] (0x0065 + 8\*n, n=0...3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	IPv6 Address Bytes 14-15	0x0	

### 6.3.11.30 Manageability Special Modifiers LSB (0x007E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	MSFM_L	0x000F	

### 6.3.11.31 Manageability Special Modifiers MSB (0x007F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	MSFM_M	0x0	

## 6.3.12 PFA PT Configuration 1 Section

Pass-through filters of Port 1 PFA section header.

**Table 6-18. PFA PT Configuration 1 Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Sub Module Type PT Module 1	6.3.12.1
0x0001	Section Length	6.3.12.2
0x0002 + 2*n, n=0...3	LAN IPv4 Address (LSB) MIPAF0	6.3.12.3
0x0003 + 2*n, n=0...3	LAN IPv4 Address (MSB) MIPAF0	6.3.12.4
0x000A + 2*n, n=0...15	LAN Flexible Filter Port	6.3.12.5
0x000B + 2*n, n=0...15	LAN Flexible Filter Port - Modifiers	6.3.12.6
0x002A + 1*n, n=0...7	LAN VLAN Filter	6.3.12.7
0x0032	LAN MANC Value LSB	6.3.12.8
0x0033	LAN MANC Value MSB	6.3.12.9
0x0034	Receive Enable 1 - LRXEN1	6.3.12.10
0x0035	Receive Enable 2 - LRXEN2	6.3.12.11
0x0036	LAN MNGONLY LSB	6.3.12.12
0x0037	LAN MNGONLY MSB	6.3.12.13
0x0038 + 4*n, n=0...6	Manageability Decision Filters LSB	6.3.12.14
0x0039 + 4*n, n=0...6	Manageability Decision Filters MSB	6.3.12.15
0x003A + 4*n, n=0...6	Manageability Extended Decision Filters LSB	6.3.12.16
0x003B + 4*n, n=0...6	Manageability Extended Decision Filters MSB	6.3.12.17
0x0054 + 2*n, n=0...3	Manageability EtherType Filter (METF) LSB	6.3.12.18
0x0055 + 2*n, n=0...3	Manageability EtherType Filter (METF) MSB	6.3.12.19
0x005C	ARP Response IPv4 Address LSB	6.3.12.20
0x005D	ARP Response IPv4 Address MSB	6.3.12.21
0x005E + 8*n, n=0...3	IPv6 Address Bytes 0-1	6.3.12.22
0x005F + 8*n, n=0...3	IPv6 Address Bytes 2-3	6.3.12.23
0x0060 + 8*n, n=0...3	IPv6 Address Bytes 4-5	6.3.12.24
0x0061 + 8*n, n=0...3	IPv6 Address Bytes 6-7	6.3.12.25
0x0062 + 8*n, n=0...3	IPv6 Address Bytes 8-9	6.3.12.26
0x0063 + 8*n, n=0...3	IPv6 Address Bytes 10-11	6.3.12.27
0x0064 + 8*n, n=0...3	IPv6 Address Bytes 12-13	6.3.12.28
0x0065 + 8*n, n=0...3	IPv6 Address Bytes 14-15	6.3.12.29
0x007E	Manageability Special Modifiers LSB	6.3.12.30
0x007F	Manageability Special Modifiers MSB	6.3.12.31

### 6.3.12.1 Sub Module Type PT Module 1 (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x109	Valid values are: 0x109 = Pass-Through Control Words Structure 1

### 6.3.12.2 Section Length (0x0001)

The length of the section in words. Note that section length does not include a count for the section length word.

For inner structure, see [Section 6.3.11.2](#).

### 6.3.12.3 LAN IPv4 Address (LSB) MIPAF0[n] (0x0002 + 2\*n, n=0...3)

For inner structure, see [Section 6.3.11.3](#).

### 6.3.12.4 LAN IPv4 Address (MSB) MIPAF0[n] (0x0003 + 2\*n, n=0...3)

For inner structure, see [Section 6.3.11.4](#).

### 6.3.12.5 LAN Flexible Filter Port[n] (0x000A + 2\*n, n=0...15)

For inner structure, see [Section 6.3.11.5](#).

### 6.3.12.6 LAN Flexible Filter Port - Modifiers[n] (0x000B + 2\*n, n=0...15)

For inner structure, see [Section 6.3.11.6](#).

### 6.3.12.7 LAN VLAN Filter[n] (0x002A + 1\*n, n=0...7)

For inner structure, see [Section 6.3.11.7](#).

### 6.3.12.8 LAN MANC Value LSB (0x0032)

For inner structure, see [Section 6.3.11.8](#).

### 6.3.12.9 LAN MANC Value MSB (0x0033)

For inner structure, see [Section 6.3.11.9](#).

### **6.3.12.10 Receive Enable 1 - LRXEN1 (0x0034)**

For inner structure, see [Section 6.3.11.10](#).

### **6.3.12.11 Receive Enable 2 - LRXEN2 (0x0035)**

For inner structure, see [Section 6.3.11.11](#).

### **6.3.12.12 LAN MNGONLY LSB (0x0036)**

For inner structure, see [Section 6.3.11.12](#).

### **6.3.12.13 LAN MNGONLY MSB (0x0037)**

For inner structure, see [Section 6.3.11.13](#).

### **6.3.12.14 Manageability Decision Filters LSB[n] (0x0038 + 4\*n, n=0...6)**

For inner structure, see [Section 6.3.11.14](#).

### **6.3.12.15 Manageability Decision Filters MSB[n] (0x0039 + 4\*n, n=0...6)**

For inner structure, see [Section 6.3.11.15](#).

### **6.3.12.16 Manageability Extended Decision Filters LSB[n] (0x003A + 4\*n, n=0...6)**

For inner structure, see [Section 6.3.11.16](#).

### **6.3.12.17 Manageability Extended Decision Filters MSB[n] (0x003B + 4\*n, n=0...6)**

For inner structure, see [Section 6.3.11.17](#).

### **6.3.12.18 Manageability EtherType Filter (METF) LSB[n] (0x0054 + 2\*n, n=0...3)**

For inner structure, see [Section 6.3.11.18](#).

**6.3.12.19 Manageability EtherType Filter (METF) MSB[n] (0x0055 + 2\*n, n=0...3)**

For inner structure, see [Section 6.3.11.19](#).

**6.3.12.20 ARP Response IPv4 Address LSB (0x005C)**

For inner structure, see [Section 6.3.11.20](#).

**6.3.12.21 ARP Response IPv4 Address MSB (0x005D)**

For inner structure, see [Section 6.3.11.21](#).

**6.3.12.22 IPv6 Address Bytes 0-1[n] (0x005E + 8\*n, n=0...3)**

For inner structure, see [Section 6.3.11.22](#).

**6.3.12.23 IPv6 Address Bytes 2-3[n] (0x005F + 8\*n, n=0...3)**

For inner structure, see [Section 6.3.11.23](#).

**6.3.12.24 IPv6 Address Bytes 4-5[n] (0x0060 + 8\*n, n=0...3)**

For inner structure, see [Section 6.3.11.24](#).

**6.3.12.25 IPv6 Address Bytes 6-7[n] (0x0061 + 8\*n, n=0...3)**

For inner structure, see [Section 6.3.11.25](#).

**6.3.12.26 IPv6 Address Bytes 8-9[n] (0x0062 + 8\*n, n=0...3)**

For inner structure, see [Section 6.3.11.26](#).

**6.3.12.27 IPv6 Address Bytes 10-11[n] (0x0063 + 8\*n, n=0...3)**

For inner structure, see [Section 6.3.11.27](#).

**6.3.12.28 IPv6 Address Bytes 12-13[n] (0x0064 + 8\*n, n=0...3)**

For inner structure, see [Section 6.3.11.28](#).

**6.3.12.29 IPv6 Address Bytes 14-15[n] (0x0065 + 8\*n, n=0...3)**

For inner structure, see [Section 6.3.11.29](#).

### **6.3.12.30 Manageability Special Modifiers LSB (0x007E)**

For inner structure, see [Section 6.3.11.30](#).

### **6.3.12.31 Manageability Special Modifiers MSB (0x007F)**

For inner structure, see [Section 6.3.11.31](#).

### 6.3.13 PFA PT Configuration 2 Section

Pass-through filters of Port 2 PFA section header.

**Table 6-19. PFA PT Configuration 2 Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Sub Module Type PT Module 2	6.3.13.1
0x0001	Section Length	6.3.13.2
0x0002 + 2*n, n=0...3	LAN IPv4 Address (LSB) MIPAF0	6.3.13.3
0x0003 + 2*n, n=0...3	LAN IPv4 Address (MSB) MIPAF0	6.3.13.4
0x000A + 2*n, n=0...15	LAN Flexible Filter Port	6.3.13.5
0x000B + 2*n, n=0...15	LAN Flexible Filter Port - Modifiers	6.3.13.6
0x002A + 1*n, n=0...7	LAN VLAN Filter	6.3.13.7
0x0032	LAN MANC Value LSB	6.3.13.8
0x0033	LAN MANC Value MSB	6.3.13.9
0x0034	Receive Enable 1 - LRXEN1	6.3.13.10
0x0035	Receive Enable 2 - LRXEN2	6.3.13.11
0x0036	LAN MNGONLY LSB	6.3.13.12
0x0037	LAN MNGONLY MSB	6.3.13.13
0x0038 + 4*n, n=0...6	Manageability Decision Filters LSB	6.3.13.14
0x0039 + 4*n, n=0...6	Manageability Decision Filters MSB	6.3.13.15
0x003A + 4*n, n=0...6	Manageability Extended Decision Filters LSB	6.3.13.16
0x003B + 4*n, n=0...6	Manageability Extended Decision Filters MSB	6.3.13.17
0x0054 + 2*n, n=0...3	Manageability EtherType Filter (METF) LSB	6.3.13.18
0x0055 + 2*n, n=0...3	Manageability EtherType Filter (METF) MSB	6.3.13.19
0x005C	ARP Response IPv4 Address LSB	6.3.13.20
0x005D	ARP Response IPv4 Address MSB	6.3.13.21
0x005E + 8*n, n=0...3	IPv6 Address Bytes 0-1	6.3.13.22
0x005F + 8*n, n=0...3	IPv6 Address Bytes 2-3	6.3.13.23
0x0060 + 8*n, n=0...3	IPv6 Address Bytes 4-5	6.3.13.24
0x0061 + 8*n, n=0...3	IPv6 Address Bytes 6-7	6.3.13.25
0x0062 + 8*n, n=0...3	IPv6 Address Bytes 8-9	6.3.13.26
0x0063 + 8*n, n=0...3	IPv6 Address Bytes 10-11	6.3.13.27
0x0064 + 8*n, n=0...3	IPv6 Address Bytes 12-13	6.3.13.28
0x0065 + 8*n, n=0...3	IPv6 Address Bytes 14-15	6.3.13.29
0x007E	Manageability Special Modifiers LSB	6.3.13.30
0x007F	Manageability Special Modifiers MSB	6.3.13.31

### 6.3.13.1 Sub Module Type PT Module 2 (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x10A	Valid values are: 0x10A = Pass-Through Control Words Structure 2

### 6.3.13.2 Section Length (0x0001)

The length of the section in words. Note that section length does not include a count for the section length word.

For inner structure, see [Section 6.3.11.2](#).

### 6.3.13.3 LAN IPv4 Address (LSB) MIPAF0[n] (0x0002 + 2\*n, n=0...3)

For inner structure, see [Section 6.3.11.3](#).

### 6.3.13.4 LAN IPv4 Address (MSB) MIPAF0[n] (0x0003 + 2\*n, n=0...3)

For inner structure, see [Section 6.3.11.4](#).

### 6.3.13.5 LAN Flexible Filter Port[n] (0x000A + 2\*n, n=0...15)

For inner structure, see [Section 6.3.11.5](#).

## 6.3.19 Original EETrack ID Section

Original EETrack ID PFA section.

**Table 6-25. Original EETrack ID Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Sub Module Type - Original EETrackID	6.3.19.1
0x0001	Length	6.3.19.2
0x0002	Original EETrackID MSB	6.3.19.3
0x0003	Original EETrackID LSB	6.3.19.4

### 6.3.19.1 Sub Module Type - Original EETrackID (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x10C	Valid values are: 0x10C = Original EETrack ID

### 6.3.19.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: Original EETrack ID -> Sub Module Type - Original EETrackID Last Section -> Word: Original EETrack ID -> Original EETrackID LSB

### 6.3.19.3 Original EETrackID MSB (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	EETrackID - MSB	0x0	

### 6.3.19.4 Original EETrackID LSB (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	EETrackID - MLB	0x0	

## 6.3.20 IBA Capabilities Module Section

Table 6-26. IBA Capabilities Module Section Summary Table

Word Offset	Description	Section Reference
0x0000	Sub Module Type - IBA Capabilities	6.3.20.1
0x0001	Length	6.3.20.2
0x0002	IBA Capabilities	6.3.20.3

### 6.3.20.1 Sub Module Type - IBA Capabilities (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x33	Valid values are: 0x33 = IBA Capabilities

### 6.3.20.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: IBA capabilities Module -> Sub Module Type - IBA Capabilities Last Section -> Word: IBA capabilities Module -> IBA Capabilities

### 6.3.20.3 IBA Capabilities (0x0002)

This word of the NVM is used to enumerate the boot technologies that have been programmed into the Flash. This is updated by Flash configuration tools and is not updated or read by IBA.

Bit(s)	Field Name	Default NVM Value	Description
15:14	Signature	01b	Signature Must be set to 01b to indicate that this word has been programmed by the agent or other configuration software.
13	Allow PXE Disable	0x0	If set to 0b, PXE is always loaded regardless the settings in Bits 2:0 in Main Setup Options word. If set to 1b, PXE is loaded when Bits 2:0 in Main Setup Options word are set to 0 (PXE enabled on this port). 0b = Ignore PXE Disable 1b = Allow PXE Disable
12:6	Reserved	0x0	Reserved. Must be 0.
5	Reserved	0b	FCoE boot code is present if set to 1b. 0b = Not Present 1b = Present
4	iSCSI Boot	0b	iSCSI is present if set to 1b. 0b = Not Present 1b = Present
3	EFI EBD Driver	0b	EFI UNDI driver is present if set to 1b. 0b = Not Present 1b = Present

<b>Bit(s)</b>	<b>Field Name</b>	<b>Default NVM Value</b>	<b>Description</b>
2	RPL	0b	RPL module is present if set to 1b. Reserved bit for devices. 0b = Not Present 1b = Present
1	PXE/UNDI Driver	1b	PXE UNDI driver is present if set to 1b. 0b = Not Present 1b = Present
0	PXE Base Code	1b	PXE Base Code is present if set to 1b. 0b = Not Present 1b = Present

## 6.3.21 PXE Setup Options Module Section

Table 6-27. PXE Setup Options Module Section Summary Table

Word Offset	Description	Section Reference
0x0000	Sub Module Type - PXE Setup	6.3.21.1
0x0001	Length	6.3.21.2
0x0002 + 1*n, n=0...7	Setup Options PCI Function	6.3.21.3

### 6.3.21.1 Sub Module Type - PXE Setup (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x30	Valid values are: 0x30 = PXE Setup Options

### 6.3.21.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: PXE Setup Options Module -> Sub Module Type - PXE Setup Last Section -> Word: PXE Setup Options Module -> Setup Options PCI Function

### 6.3.21.3 Setup Options PCI Function[n] (0x0002 + 1\*n, n=0...7)

The main setup options for PF n are stored in this word. These options are those that can be changed by the user using the Control-S setup menu.

Bit(s)	Field Name	Default NVM Value	Description
15:13	Reserved	0x0	Reserved. Must be 0x0.
12:10	FSD	000b	Bits 12-10 control forcing speed and duplex during driver operation. 000b = Auto-negotiate 001b = 10 Mb/s half duplex 010b = 100 Mb/s half duplex 011b = Not valid (treated as 000b) 100b = 10 Mb/s full duplex 101b = 100 Mb/s full duplex 111b = 1000 Mb/s full duplex. Only applicable for copper-based adapters. Not applicable to 10 GbE. Default value is 000b.
9	Reserved	0b	Reserved to legacy OS Wakeup Support (for 82559-based adapters only), which is not supported in the E810.
8	DSM	1b	Display Setup Message If the bit is set to 1b, the Press Control-S message is displayed after the title message. Default value is 1b.

Bit(s)	Field Name	Default NVM Value	Description
7:6	PT	0b	<p>Prompt Time</p> <p>These bits control how long the Press Control-S setup prompt message is displayed, if enabled by DIM.</p> <p>00b = 2 seconds (default) 01b = 3 seconds 10b = 5 seconds 11b = 0 seconds</p> <p><b>Note:</b> The Ctrl-S message is not displayed if 0 seconds prompt time is selected.</p>
5	iSCSI Boot Disabled	0b	<p>When this bit is set and adapter port is neither iSCSI primary nor secondary, setup code must not be loaded. Otherwise iSCSI banner and Setup menu should be accessible as in current design.</p> <p>0b = Enabled 1b = Disabled</p> <p>This bit must be changed at factory level and not be altered by any end-customer tools.</p> <p>For regular NIC and LOM design, this bit should be always cleared in the NVM image. Otherwise, iSCSI setup will not be accessible for the user.</p>
4:3	DBS	00b	<p>Default Boot Selection</p> <p>These bits select which device is the default boot device. These bits are only used if the agent detects that the BIOS does not support boot order selection or if the MODE field of word 31h is set to MODE_LEGACY.</p> <p>00b = Network boot, then local boot (default) 01b = Local boot, then network boot 10b = Network boot only 11b = Local boot only</p>
2:0	PS	000b	<p>Protocol Select</p> <p>These bits select the active boot protocol.</p> <p>000b = PXE (default value) 001b = RPL (only if RPL is in the Flash) 010b = iSCSI Primary 011b = iSCSI Secondary 100b = FCoE</p> <p>All other values are reserved.</p> <p>Only the default value of 000b should be initially programmed into the adapter. Other values should only be set by configuration utilities.</p>

## 6.3.22 PXE Configuration Customization Options Module Section

**Table 6-28. PXE Configuration Customization Options Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Sub Module Type - PXE Configuration Customization Options	6.3.22.1
0x0001	Length	6.3.22.2
0x0002 + 1*n, n=0...7	Configuration Customization Options PCI Function	6.3.22.3

### 6.3.22.1 Sub Module Type - PXE Configuration Customization Options (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x31	Valid values are: 0x31 = PXE Configuration Customization Options

### 6.3.22.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: PXE Configuration Customization Options Module -> Sub Module Type - PXE Configuration Customization Options Last Section -> Word: PXE Configuration Customization Options Module -> Configuration Customization Options PCI Function

### 6.3.22.3 Configuration Customization Options PCI Function[n] (0x0002 + 1\*n, n=0...7)

It contains settings that can be programmed by an OEM or network administrator to customize the operation of the software. These settings cannot be changed from within the Control-S setup menu. The lower byte contains settings that would typically be configured by a network administrator using an external utility; these settings generally control which setup menu options are changeable. The upper byte is generally settings that would be used by an OEM to control the operation of the agent in a LOM environment, although there is nothing in the agent to prevent their use on a NIC implementation. The default value for this word is 0x4000.

Bit(s)	Field Name	Default NVM Value	Description
15:14	Signature	01b	Signature Must be set to 01b to indicate that this word has been programmed by the agent or other configuration software.
13:12	Reserved	00b	Reserved. Must be 0b.

Bit(s)	Field Name	Default NVM Value	Description
11	Continuous Retry	0b	<p>Selects Continuous Retry operation.</p> <p>If this bit is set, IBA does NOT transfer control back to the BIOS if it fails to boot due to a network error (such as failure to receive DHCP replies). Instead, it restarts the PXE boot process again. If this bit is set, the only way to cancel PXE boot is for the user to press ESC on the keyboard. Retry is not attempted due to hardware conditions such as an invalid NVM checksum or failing to establish link.</p> <p>0b = Disable (default) 1b = Enable</p>
10:8	Operating mode	000b	<p>Selects the agent's boot order setup mode.</p> <p>This field changes the agent default behavior in order to make it compatible with systems that do not completely support the BBS and PnP Expansion ROM standards. Valid values and their meanings are:</p> <p>000b = Normal behavior. The agent attempts to detect BBS and PnP Expansion ROM support as it normally does.</p> <p>001b = Force legacy mode. The agent does not attempt to detect BBS or PnP Expansion ROM supports in the BIOS and assumes the BIOS is not compliant. The user can change the BIOS boot order in the Setup Menu.</p> <p>010b = Force BBS mode. The agent assumes the BIOS is BBS compliant, even though it might not be detected as such by the agent's detection code. The user CANNOT change the BIOS boot order in the Setup Menu.</p> <p>011b = Force PnP Int18 mode. The agent assumes the BIOS allows boot order setup for PnP Expansion ROMs and hooks interrupt 0x18 (to inform the BIOS that the agent is a bootable device) in addition to registering as a BBS IPL device. The user CANNOT change the BIOS boot order in the Setup Menu.</p> <p>100b = Force PnP Int19 mode. The agent assumes the BIOS allows boot order setup for PnP Expansion ROMs and hook interrupt 0x19 (to inform the BIOS that the agent is a bootable device) in addition to registering as a BBS IPL device. The user CANNOT change the BIOS boot order in the Setup Menu.</p> <p>101b = Reserved for future use. If specified, is treated as a value of 000b. 110b = Reserved for future use. If specified, is treated as a value of 000b. 111b = Reserved for future use. If specified, is treated as a value of 000b.</p>
7:6	Reserved	00b	Reserved. Must be 00b
5	Disable Flash Update	0b	<p>Disable Flash Update</p> <p>If this bit is set to 1b, the user is not allowed to update the flash image using PROSet.</p> <p>0b = Enable Flash Update (default) 1b = Disable Flash Update</p>
4	Disable Legacy OS Wakeup Menu	0b	<p>Disable Legacy Wakeup Support</p> <p>If this bit is set to 1b, the user is not allowed to change the Legacy OS Wakeup Support menu option.</p> <p>0b = Enable Legacy Wakeup Support (default) 1b = Disable Legacy Wakeup Support</p> <p>Default value is 0b.</p>
3	Disable Boot Selection Menu	0b	<p>Disable Boot Selection</p> <p>If this bit is set to 1b, the user is not allowed to change the boot order menu option.</p> <p>0b = Enable (default) 1b = Disable</p>
2	Disable Protocol Selection Menu	0b	<p>Disable Protocol Select</p> <p>If set to 1b, the user is not allowed to change the boot protocol.</p> <p>0b = Enable (default) 1b = Disable</p>

Bit(s)	Field Name	Default NVM Value	Description
1	Disable Title Message Display	0b	Disable Title Message If this bit is set to 1b, the title message displaying the version of the Boot Agent is suppressed; the Control-S message is also suppressed. This is for OEMs who do not wish the boot agent to display any messages at system boot. 0b = Enable (default) 1b = Disable
0	Setup Menu	0b	Disable Setup Menu If this bit is set to 1b, the user is not allowed to invoke the setup menu by pressing Control-S. In this case, the NVM can only be changed via an external program. 0b = Enable (default) 1b = Disable

### 6.3.23 PXE Version Module Section

Table 6-29. PXE Version Module Section Summary Table

Word Offset	Description	Section Reference
0x0000	Sub Module Type - PXE Version	6.3.23.1
0x0001	Length	6.3.23.2
0x0002	PXE Version	6.3.23.3

#### 6.3.23.1 Sub Module Type - PXE Version (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x32	Valid values are: 0x32 = PXE version

#### 6.3.23.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: PXE version Module -> Sub Module Type - PXE version Last Section -> Word: PXE version Module -> PXE Version

#### 6.3.23.3 PXE Version (0x0002)

Word 0x32 of the NVM is used to store the version of the boot agent that is stored in the Flash image. When the Boot Agent loads, it can check this value to determine if any first-time configuration needs to be performed. The agent then updates this word with its version. Some diagnostic tools to report the version of the Boot Agent in the Flash also read this word.

Bit(s)	Field Name	Default NVM Value	Description
15:12	Major Version	0x0	PXE Boot Agent Major Version. Default value is 0.
11:8	Minor Version	0x0	PXE Boot Agent Minor Version. Default value is 0.
7:0	Build Number	0x0	PXE Boot Agent Build Number. Default value is 0.

## 6.3.24 VLAN Module Section

Table 6-30. VLAN Module Section Summary Table

Word Offset	Description	Section Reference
0x0000	Sub Module Type - VLAN	6.3.24.1
0x0001	Length	6.3.24.2
0x0002	VLAN Block Signature	6.3.24.3
0x0003	Structure Version and Size	6.3.24.4
0x0004	Port 0 VLAN Tag	6.3.24.5
0x0005	Port 1 VLAN Tag	6.3.24.6
0x0006	Port 2 VLAN Tag	6.3.24.7
0x0007	Port 3 VLAN Tag	6.3.24.8
0x0008	Port 4 VLAN Tag	6.3.24.9
0x0009	Port 5 VLAN Tag	6.3.24.10
0x000A	Port 6 VLAN Tag	6.3.24.11
0x000B	Port 7 VLAN Tag	6.3.24.12

### 6.3.24.1 Sub Module Type - VLAN (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x37	Valid values are: 0x37 = VLAN Configuration

### 6.3.24.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: VLAN Module -> Sub Module Type - VLAN Last Section -> Word: VLAN Module -> Port 7 VLAN Tag

### 6.3.24.3 VLAN Block Signature (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	VLAN Block Signature	0x4C56	'V'=0x56, 'L' = 0x4C

### 6.3.24.4 Structure Version and Size (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Structure Version and Size	0x0C	Total byte size of the configuration block. 0x06 = 1-port adapter 0x08 = 2-port adapter 0x0C = 4-port adapter (default)
7:0	Structure Version	0x01	The version of this structure. Should be set to 0x01.

### 6.3.24.5 Port 0 VLAN Tag (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:13	VLAN Priority	0x0	The value of VLAN priority (0-7).
12	Reserved	0b	This field is reserved and must be set to 0x0.
11:0	VLAN Tag ID	0x0	The value of VLAN ID (1-4095). 0 means no VLAN configured for port.

### 6.3.24.6 Port 1 VLAN Tag (0x0005)

For inner structure, see [Section 6.3.24.5](#).

### 6.3.24.7 Port 2 VLAN Tag (0x0006)

For inner structure, see [Section 6.3.24.5](#).

### 6.3.24.8 Port 3 VLAN Tag (0x0007)

For inner structure, see [Section 6.3.24.5](#).

### 6.3.24.9 Port 4 VLAN Tag (0x0008)

For inner structure, see [Section 6.3.24.5](#).

### 6.3.24.10 Port 5 VLAN Tag (0x0009)

For inner structure, see [Section 6.3.24.5](#).

### 6.3.24.11 Port 6 VLAN Tag (0x000A)

For inner structure, see [Section 6.3.24.5](#).

### 6.3.24.12 Port 7 VLAN Tag (0x000B)

For inner structure, see [Section 6.3.24.5](#).

## 6.3.25 Boot Configuration Block Section

Table 6-31. Boot Configuration Block Section Summary Table

Word Offset	Description	Section Reference
0x0000	Sub Module Type	6.3.25.1
0x0001	Length	6.3.25.2
0x0002	Combo Image Version High	6.3.25.3
0x0003	Combo Image Version Low	6.3.25.4

### 6.3.25.1 Sub Module Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x132	Valid values are: 0x132 = CIVD

### 6.3.25.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: Boot Configuration Block -> Sub Module Type Last Section -> Word: Boot Configuration Block -> Combo Image Version Low

### 6.3.25.3 Combo Image Version High (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Major	0x0	
7:0	Build	0x0	

### 6.3.25.4 Combo Image Version Low (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Build	0x0	
7:0	Patch	0x0	

## 6.3.26 PBA Header Section

Table 6-32. PBA Header Section Summary Table

Word Offset	Description	Section Reference
0x0000	Sub Module Type - PBA	6.3.26.1
0x0001	Length	6.3.26.2

### 6.3.26.1 Sub Module Type - PBA (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x16	Valid values are: 0x16 = PBA block

### 6.3.26.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit First Section -> Word: PBA Block -> PBA Section Length Last Section -> Word: PBA Block -> Word5

## 6.3.27 PBA Block Section

The PBA block contains the complete PBA number, including the dash and the first digit of the 3-digit suffix.

**Table 6-33. PBA Block Section Summary Table**

Word Offset	Description	Section Reference
0x0000	PBA Section Length	6.3.27.1
0x0001	Word1	6.3.27.2
0x0002	Word2	6.3.27.3
0x0003	Word3	6.3.27.4
0x0004	Word4	6.3.27.5
0x0005	Word5	6.3.27.6

### 6.3.27.1 PBA Section Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PBA Section Length Field	0x6	Length in words of the PBA Block.

### 6.3.27.2 Word1 (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Word1 Field		PBA Number stored in hexadecimal ASCII values.

### 6.3.27.3 Word2 (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Word2 Field		PBA Number stored in hexadecimal ASCII values.

### 6.3.27.4 Word3 (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Word3 Field		PBA Number stored in hexadecimal ASCII values.

### 6.3.27.5 Word4 (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Word4 Field		PBA Number stored in hexadecimal ASCII values.

### 6.3.27.6 Word5 (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Word5 Field		PBA Number stored in hexadecimal ASCII values.

## 6.3.28 PCIR Registers PFA Auto-Load Module Section

Table 6-34. PCIR Registers PFA Auto-Load Module Section Summary Table

Word Offset	Description	Section Reference
0x0000	PCIR Registers Auto-Load Type	6.3.28.1
0x0001	Module Length	6.3.28.2
0x0002 - 0x0014	NVM contents for PFINT_ALLOC_PCI	6.3.28.3
0x0015 - 0x0027	NVM contents for PFPCI_SUBSYSID	6.3.28.4
0x0028 - 0x003A	NVM contents for PF_VT_PFALLOC_HIF	6.3.28.5
0x003B - 0x004D	NVM contents for PFPCI_DEVID	6.3.28.6
0x004E - 0x0052	NVM contents for GLPCI_CAPCTRL	6.3.28.7
0x0053 - 0x0054	NVM contents for GLPCI_CAPSUP	6.3.28.8
0x0055 - 0x0056	NVM contents for GLPCI_LINKCAP	6.3.28.9
0x0057 - 0x005A	NVM contents for GLPCI_VENDORID	6.3.28.10
0x005B - 0x005E	NVM contents for GLPCI_SUBVENID	6.3.28.11
0x005F - 0x0071	NVM contents for PFPCI_CNF	6.3.28.12
0x0072 - 0x0075	Reserved	6.3.28.13
0x0075 - 0x0088	NVM contents for PF_VT_PFALLOC_PCIE	6.3.28.14

### 6.3.28.1 PCIR Registers Auto-Load Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x113	Valid values are: 0x113 = PCIR Registers Auto-load

### 6.3.28.2 Module Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 2 First Section -> Word: PCIR Registers PFA Auto-Load Module -> PCIR Registers Auto-Load Type Last Section -> Word: PCIR Registers PFA Auto-Load Module -> Starting Address Low at PF_VT_PFALLOC_PCIE, for PF[0]

### 6.3.28.3 PFINT\_ALLOC\_PCI (0x0002 - 0x0014)

#### 6.3.28.3.1 Starting Address Low at PFINT\_ALLOC\_PCI (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFINT_ALLOC_PCI, for PF[0]	0x9D800	
3:0	Type	0x2	

#### 6.3.28.3.2 Starting Address High at PFINT\_ALLOC\_PCI (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFINT_ALLOC_PCI, for PF[0]		

#### 6.3.28.3.3 Attributes at PFINT\_ALLOC\_PCI (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.28.3.4 Data Low of PFINT\_ALLOC\_PCI[PF] (0x0005 + 2\*PF, PF=0...7)

#### 6.3.28.3.5 Data High of PFINT\_ALLOC\_PCI[PF] (0x0006 + 2\*PF, PF=0...7)

### 6.3.28.4 PFPCI\_SUBSYSID (0x0015 - 0x0027)

#### 6.3.28.4.1 Starting Address Low at PFPCI\_SUBSYSID (0x0015)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFPCI_SUBSYSID, for PF[0]	0x9D880	
3:0	Type	0x2	

### 6.3.28.4.2 Starting Address High at PFPCI\_SUBSYSID (0x0016)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFPCI_SUBSYSID, for PF[0]		

### 6.3.28.4.3 Attributes at PFPCI\_FUNC2[PF] (0x0017)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.28.4.4 Data Low of PFPCI\_SUBSYSID[PF] (0x0018 + 2\*PF, PF=0...7)

### 6.3.28.4.5 Data High of PFPCI\_SUBSYSID[PF] (0x0019 + 2\*PF, PF=0...7)

## 6.3.28.5 PF\_VT\_PFALLOC\_HIF (0x0028 - 0x003A)

### 6.3.28.5.1 Starting Address Low at PF\_VT\_PFALLOC\_HIF (0x0028)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PF_VT_PFALLOC_HIF, for PF[0]	0x9DD80	
3:0	Type	0x2	

### 6.3.28.5.2 Starting Address High at PF\_VT\_PFALLOC\_HIF (0x0029)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PF_VT_PFALLOC_HIF, for PF[0]		

### 6.3.28.5.3 Attributes at PF\_VT\_PFALLOC\_HIF (0x002A)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.28.5.4 Data Low of PF\_VT\_PFALLOC\_HIF[PF] (0x002B + 2\*PF, PF=0...7)**

**6.3.28.5.5 Data High of PF\_VT\_PFALLOC\_HIF[PF] (0x002C + 2\*PF, PF=0...7)**

**6.3.28.6 PFPCI\_DEVID (0x003B - 0x004D)**

**6.3.28.6.1 Starting Address Low at PFPCI\_DEVID (0x003B)**

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFPCI_DEVID, for PF[0]	0x9DE00	
3:0	Type	0x2	

**6.3.28.6.2 Starting Address High at PFPCI\_DEVID (0x003C)**

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFPCI_DEVID, for PF[0]		

**6.3.28.6.3 Attributes at PFPCI\_DEVID (0x003D)**

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.28.6.4 Data Low of PFPCI\_DEVID[PF] (0x003E + 2\*PF, PF=0...7)**

**6.3.28.6.5 Data High of PFPCI\_DEVID[PF] (0x003F + 2\*PF, PF=0...7)**

**6.3.28.7 GLPCI\_CAPCTRL (0x004E - 0x0052)**

**6.3.28.7.1 Starting Address Low at GLPCI\_CAPCTRL (0x004E)**

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_CAPCTRL	0x9DE88	
3:0	Type	0X2	

### 6.3.28.7.2 Starting Address High at GLPCI\_CAPCTRL (0x004F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLPCI_CAPCTRL		

### 6.3.28.7.3 Attributes at GLPCI\_CAPCTRL (0x0050)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x3	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.28.7.4 Data Low of GLPCI\_CAPCTRL (0x0051)

### 6.3.28.7.5 Data High of GLPCI\_CAPCTRL (0x0052)

### 6.3.28.8 GLPCI\_CAPSUP (0x0053 - 0x0054)

#### 6.3.28.8.1 Data Low of GLPCI\_CAPSUP (0x0053)

#### 6.3.28.8.2 Data High of GLPCI\_CAPSUP (0x0054)

### 6.3.28.9 GLPCI\_LINKCAP (0x0055 - 0x0056)

#### 6.3.28.9.1 Data Low of GLPCI\_LINKCAP (0x0055)

#### 6.3.28.9.2 Data High of GLPCI\_LINKCAP (0x0056)

### 6.3.28.10 GLPCI\_VENDORID (0x0057 - 0x005A)

#### 6.3.28.10.1 Address Low at GLPCI\_VENDORID (0x0057)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_VENDORID	0x9DEC8	
3:0	Type	0x1	

### 6.3.28.10.2 Address High at GLPCI\_VENDORID (0x0058)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLPCI_VENDORID		

### 6.3.28.10.3 Data Low of GLPCI\_VENDORID (0x0059)

### 6.3.28.10.4 Data High of GLPCI\_VENDORID (0x005A)

## 6.3.28.11 GLPCI\_SUBVENID (0x005B - 0x005E)

### 6.3.28.11.1 Address Low at GLPCI\_SUBVENID (0x005B)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_SUBVENID	0x9DEE8	
3:0	Type	0x1	

### 6.3.28.11.2 Address High at GLPCI\_SUBVENID (0x005C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLPCI_SUBVENID		

### 6.3.28.11.3 Data Low of GLPCI\_SUBVENID (0x005D)

### 6.3.28.11.4 Data High of GLPCI\_SUBVENID (0x005E)

## 6.3.28.12 PFPCI\_CNF (0x005F - 0x0071)

### 6.3.28.12.1 Starting Address Low at PFPCI\_CNF (0x005F)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFPCI_CNF, for PF[0]	0x9DF00	
3:0	Type	0x2	

### 6.3.28.12.2 Starting Address High at PFPCI\_CNF (0x0060)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFPCI_CNF, for PF[0]		

### 6.3.28.12.3 Attributes at PFPCI\_CNF (0x0061)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.28.12.4 Data Low of PFPCI\_CNF[PF] (0x0062 + 2\*PF, PF=0...7)

### 6.3.28.12.5 Data High of PFPCI\_CNF[PF] (0x0063 + 2\*PF, PF=0...7)

## 6.3.28.13 Reserved (0x0072 - 0x0075)

## 6.3.28.14 PF\_VT\_PFALLOC\_PCIE (0x0076 - 0x0088)

### 6.3.28.14.1 Starting Address Low at PF\_VT\_PFALLOC\_PCIE (0x0076)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PF_VT_PFALLOC_PCIE, for PF[0]	0xBE080	
3:0	Type	0x2	

### 6.3.28.14.2 Starting Address High at PF\_VT\_PFALLOC\_PCIE (0x0077)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PF_VT_PFALLOC_PCIE, for PF[0]		

### 6.3.28.14.3 Attributes at PF\_VT\_PFALLOC\_PCIE (0x0078)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.28.14.4 Data Low of PF\_VT\_PFALLOC\_PCIE[PF] (0x0079 + 2\*PF, PF=0...7)**

**6.3.28.14.5 Data High of PF\_VT\_PFALLOC\_PCIE[PF] (0x007A + 2\*PF, PF=0...7)**

## 6.3.29 POR Registers PFA Auto-Load Module Section

Register addresses and values loaded at Power-On Reset (POR).

**Table 6-35. POR Registers PFA Auto-Load Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	POR Registers Auto-Load Type	6.3.29.1
0x0001	Module Length	6.3.29.2
0x0002 - 0x0012	NVM contents for GLGEN_GPIO_CTL	6.3.29.3
0x0013 - 0x0025	NVM contents for PFPCI_FUNC	6.3.29.4
0x0026 - 0x0038	NVM contents for PFPM_WUC	6.3.29.5
0x0039 - 0x003C	NVM contents for GLPCI_LBARCTRL	6.3.29.6
0x003D - 0x0040	NVM contents for GLPCI_CNF	6.3.29.7
0x0041 - 0x0044	NVM contents for GL_MNG_HWARB_CTRL	6.3.29.8
0x0045 - 0x0057	Reserved	6.3.29.9
0x0058 - 0x006A	NVM contents for PFPM_APM	6.3.29.10
0x006B - 0x007D	NVM contents for PRTGEN_CNF	6.3.29.11
0x007E - 0x008D	Reserved	6.3.29.12
0x008E - 0x009D	NVM contents for PRTGEN_CNF2	6.3.29.13
0x009E - 0x00A8	Reserved	6.3.29.14
0x00A9 - 0x00AC	NVM contents for GL_PWR_MODE_CTL	6.3.29.15

### 6.3.29.1 POR Registers Auto-Load Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x118	Valid values are: 0x118 =POR Registers Auto-load

### 6.3.29.2 Module Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 2 First Section -> Word: POR Registers PFA Auto-Load Module -> POR Registers Auto-Load Type Last Section -> Word: POR Registers PFA Auto-Load Module -> Address Low at GL_PWR_MODE_CTL

### 6.3.29.3 GLGEN\_GPIO\_CTL (0x0002 - 0x0012)

#### 6.3.29.3.1 Starting Address Low at GLGEN\_GPIO\_CTL (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLGEN_GPIO_CTL	0x880C8	
3:0	Type	0x2	

#### 6.3.29.3.2 Starting Address High at GLGEN\_GPIO\_CTL (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLGEN_GPIO_CTL		

#### 6.3.29.3.3 Attributes at GLGEN\_GPIO\_CTL (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x7	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.29.3.4 Data Low of GLGEN\_GPIO\_CTL[n] (0x0005 + 2\*n, n=0...6)

#### 6.3.29.3.5 Data High of GLGEN\_GPIO\_CTL[n] (0x0006 + 2\*n, n=0...6)

### 6.3.29.4 PFPCI\_FUNC (0x0013 - 0x0025)

#### 6.3.29.4.1 Starting Address Low at PFPCI\_FUNC (0x0013)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFPCI_FUNC, for PF[0]	0x9D980	
3:0	Type	0x2	

#### 6.3.29.4.2 Starting Address High at PFPCI\_FUNC (0x0014)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFPCI_FUNC, for PF[0]		

### 6.3.29.4.3 Attributes at PFPCI\_FUNC (0x0015)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.29.4.4 Data Low of PFPCI\_FUNC[PF] (0x0016 + 2\*PF, PF=0...7)

### 6.3.29.4.5 Data High of PFPCI\_FUNC[PF] (0x0017 + 2\*PF, PF=0...7)

## 6.3.29.5 PFPM\_WUC (0x0026 - 0x0038)

### 6.3.29.5.1 Starting Address Low at PFPM\_WUC 0x0026)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFPM_WUC, for PF[0]	0x9DC80	
3:0	Type	0x2	

### 6.3.29.5.2 Starting Address High at PFPM\_WUC (0x0027)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFPM_WUC, for PF[0]		

### 6.3.29.5.3 Attributes at PFPM\_WUC - 0x0028

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.29.5.4 Data Low of PFPM\_WUC[PF] (0x0029 + 2\*PF, PF=0...7)

### 6.3.29.5.5 Data High of PFPM\_WUC[PF] (0x002A + 2\*PF, PF=0...7)

### 6.3.29.6 GLPCI\_LBARCTRL (0x0039 - 0x003C)

#### 6.3.29.6.1 Address Low at GLPCI\_LBARCTRL (0x0039)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_LBARCTRL	0x9DE74	
3:0	Type	0x1	

#### 6.3.29.6.2 Address High at GLPCI\_LBARCTRL (0x003A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLPCI_LBARCTRL		

#### 6.3.29.6.3 Data Low of GLPCI\_LBARCTRL (0x003B)

#### 6.3.29.6.4 Data High of GLPCI\_LBARCTRL (0x003C)

### 6.3.29.7 GLPCI\_CNF (0x003D - 0x0040)

#### 6.3.29.7.1 Address Low at GLPCI\_CNF (0x003D)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_CNF	0x9DEA0	
3:0	Type	0x1	

#### 6.3.29.7.2 Address High at GLPCI\_CNF (0x003E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLPCI_CNF		

#### 6.3.29.7.3 Data Low of GLPCI\_CNF (0x003F)

#### 6.3.29.7.4 Data High of GLPCI\_CNF (0x0040)

### 6.3.29.8 GL\_MNG\_HWARB\_CTRL (0x0041 - 0x0044)

#### 6.3.29.8.1 Address Low at GL\_MNG\_HWARB\_CTRL (0x0041)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_MNG_HWARB_CTRL	0xB6130	
3:0	Type	0x1	

#### 6.3.29.8.2 Address High at GL\_MNG\_HWARB\_CTRL (0x0042)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_MNG_HWARB_CTRL		

#### 6.3.29.8.3 Data Low of GL\_MNG\_HWARB\_CTRL (0x0043)

#### 6.3.29.8.4 Data High of GL\_MNG\_HWARB\_CTRL (0x0044)

### 6.3.29.9 Reserved (0x0045 - 0x0057)

### 6.3.29.10 PFPM\_APM (0x0058 - 0x006A)

#### 6.3.29.10.1 Starting Address Low at PFPM\_APM (0x0058)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFPM_APM, for PF[0]	0xB8080	
3:0	Type	0x2	

#### 6.3.29.10.2 Starting Address High at PFPM\_APM (0x0059)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFPM_APM, for PF[0]		

### 6.3.29.10.3 Attributes at PFPM\_APM (0x005A)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.29.10.4 Data Low of PFPM\_APM[PF] (0x005B + 2\*PF, PF=0...7)

### 6.3.29.10.5 Data High of PFPM\_APM[PF] (0x005C + 2\*PF, PF=0...7)

## 6.3.29.11 PRTGEN\_CNF (0x006B - 0x007D)

### 6.3.29.11.1 Starting Address Low at PRTGEN\_CNF (0x006B)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PRTGEN_CNF, for PRT[0]	0xB8120	
3:0	Type	0x2	

### 6.3.29.11.2 Starting Address High at PRTGEN\_CNF (0x006C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PRTGEN_CNF, for PRT[0]		

### 6.3.29.11.3 Attributes at PRTGEN\_CNF (0x006D)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x18	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.29.11.4 Data Low of PRTGEN\_CNF[PRT] (0x006E + 2\*PRT, PRT=0...7)

### 6.3.29.11.5 Data High of PRTGEN\_CNF[PRT] (0x006F + 2\*PRT, PRT=0...7)

## 6.3.29.12 Reserved (0x007E - 0x008D)

### 6.3.29.13 PRTGEN\_CNF2 (0x008E - 0x009D)

6.3.29.13.1 Data Low of PRTGEN\_CNF2[PRT] (0x008E + 2\*PRT, PRT=0...7)

6.3.29.13.2 Data High of PRTGEN\_CNF2[PRT] (0x008F + 2\*PRT, PRT=0...7)

### 6.3.29.14 Reserved (0x009E - 0x00A8)

### 6.3.29.15 GL\_PWR\_MODE\_CTL (0x00A9 - 0x00AC)

#### 6.3.29.15.1 Address Low at GL\_PWR\_MODE\_CTL (0x00A9)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_PWR_MODE_CTL	0xB820C	
3:0	Type	0x1	

#### 6.3.29.15.2 Address High at GL\_PWR\_MODE\_CTL (0x00AA)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_PWR_MODE_CTL		

#### 6.3.29.15.3 Data Low of GL\_PWR\_MODE\_CTL (0x00AB)

#### 6.3.29.15.4 Data High of GL\_PWR\_MODE\_CTL (0x00AC)

### 6.3.30 PSM Preserved Section

Tx-Scheduler parameters.

**Table 6-36. PSM Preserved Section Summary Table**

Word Offset	Description	Section Reference
0x0000	PSM Preserved Type	6.3.30.1
0x0001	PSM Preserved Length	6.3.30.2
0x0002	Logical Layer Config	6.3.30.3
0x0003 + 1*n, n=0...8	Logical Layer Structure	6.3.30.4
0x000C	Max_RDMA_Qsets	6.3.30.5
0x000D + 4*n, n=0...7	Logical L2/L3 CIR/EIR	6.3.30.6
0x000E + 4*n, n=0...7	Logical L4/L5 CIR/EIR	6.3.30.7
0x000F + 4*n, n=0...7	Logical L6/L7 CIR/EIR	6.3.30.8
0x0010 + 4*n, n=0...7	Logical L8/L9 CIR/EIR	6.3.30.9
0x002D + 1*n, n=0...7	Node Allocation per Layer	6.3.30.10

#### 6.3.30.1 PSM Preserved Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x119	Valid values are: 0x119 = PSM preserved

#### 6.3.30.2 PSM Preserved Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 2 First Section -> Word: PSM preserved -> PSM Preserved Type Last Section -> Word: PSM preserved -> Node Allocation per Layer Section length in words.

#### 6.3.30.3 Logical Layer Config (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:14	Reserved	00b	Reserved.
13	L8_L9_SRL	0b	Selects if SRL is used in Physical L8 vs. Physical L9. 0b = L8 1b = L9
12	L6_L7_SRL	0b	Selects if SRL is used in Physical L6 vs. Physical L7. 0b = L6 1b = L7

Bit(s)	Field Name	Default NVM Value	Description
11	L4_L5_SRL	0b	Selects if SRL is used in Physical L4 vs. Physical L5. 0b = L4 1b = L5
10	L2_L3_SRL	0b	Selects if SRL is used in Physical L2 vs. Physical L3. 0b = L2 1b = L3
9	MFP	0b	0b = False 1b = True
8	DCB	1b	0b = False 1b = True
7:4	Number of Logical Layers	0x9	Including port, DCB, MFP and leaf layers.
3:0	Number of Physical Layers	0x9	Device dependent.

### 6.3.30.4 Logical Layer Structure[n] (0x0003 + 1\*n, n=0...8)

Nine structures, one for each logical layer.

Bit(s)	Field Name	Default NVM Value	Description
15:13	Allocation Chunk Size	001b	Valid values are: 000b = N/A 001b = 2 011b = 4 111b = 8
12:0	Maximum Number of Nodes in the Logical Layer	0x8	2 - 4096 depends on the Layer ID and flattening setting based on Logical to Physical layer association.

### 6.3.30.5 Max\_RDMA\_Qsets (0x000C)

Bit(s)	Field Name	Default NVM Value	Description
15:10	Reserved	0x0	Reserved.
9:0	Max_RDMA_Qsets_Index	0x1FF	Max index of RDMA QSets.

### 6.3.30.6 Logical L2/L3 CIR/EIR[n] (0x000D + 4\*n, n=0...7)

Allocation to PF of dedicated L2/L3 Rate Limiter profiles.

Bit(s)	Field Name	Default NVM Value	Description
15:8	L3 CIR/EIR	0x1	L3 EIR/CIR RL profiles.
7:0	L2 CIR/EIR	0x1	L2 EIR/CIR RL profiles.

### 6.3.30.7 Logical L4/L5 CIR/EIR[n] (0x000E + 4\*n, n=0...7)

Allocation to PF of dedicated L4/L5 Rate Limiter profiles.

Bit(s)	Field Name	Default NVM Value	Description
15:8	L5 CIR/EIR	0x2	L5 EIR/CIR RL profiles.
7:0	L4 CIR/EIR	0x1	L4 EIR/CIR RL profiles.

### 6.3.30.8 Logical L6/L7 CIR/EIR[n] (0x000F + 4\*n, n=0...7)

Allocation to PF of dedicated L6/L7 Rate Limiter profiles.

Bit(s)	Field Name	Default NVM Value	Description
15:8	L7 CIR/EIR	0x8	L7 EIR/CIR RL profiles. <b>Note:</b> Max dedicated profiles is 255 out of 256.
7:0	L6 CIR/EIR	0x4	L6 EIR/CIR RL profiles.

### 6.3.30.9 Logical L8/L9 CIR/EIR[n] (0x0010 + 4\*n, n=0...7)

Allocation to PF of dedicated L8/L9 Rate Limiter profiles.

Bit(s)	Field Name	Default NVM Value	Description
15:8	L9 CIR/EIR	0x20	L9 EIR/CIR RL profiles. <b>Note:</b> Max dedicated profiles is 255 out of 1024.
7:0	L8 CIR/EIR	0x10	L8 EIR/CIR RL profiles. <b>Note:</b> Max dedicated profiles is 255 out of 512.

### 6.3.30.10 Node Allocation per Layer[n] (0x002D + 1\*n, n=0...7)

Allocation of nodes for each PF. Allocation is uniform to all PFs.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Node Allocation for Layer n	0x1	Number of nodes of Layer n allocated to each valid PF.

### 6.3.31 MinSrev Section

Table 6-37. MinSrev Section Summary Table

Word Offset	Description	Section Reference
0x0000	MinSrev Module Type	6.3.31.1
0x0001	Length	6.3.31.2
0x0002	Validity	6.3.31.3
0x0003	NVM MinSrev LSB	6.3.31.4
0x0004	NVM MinSrev MSB	6.3.31.5
0x0005	OROM MinSrev LSB	6.3.31.6
0x0006	OROM MinSrev MSB	6.3.31.7

#### 6.3.31.1 MinSrev Module Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x130	Valid values are: 0x130 = MinSrev Module

#### 6.3.31.2 Length (0x0001)

Length of section.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 2 First Section -> Word: MinSrev -> MinSrev Module Type Last Section -> Word: MinSrev -> OROM MinSrev MSB Section length in words

#### 6.3.31.3 Validity (0x0002)

Validity of MinSrev words.

Bit(s)	Field Name	Default NVM Value	Description
15:2	Reserved	0x0	Reserved.
1	OROM	0b	OROM MinSrev valid.
0	NVM	0b	NVM MinSrev valid.

### 6.3.31.4 NVM MinSrev LSB (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	MinSrev LSB	0x0	NVM MinSrev

### 6.3.31.5 NVM MinSrev MSB (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	MinSrev MSB	0x0	NVM MinSrev

### 6.3.31.6 OROM MinSrev LSB (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	MinSrev LSB	0x0	OROM MinSrev

### 6.3.31.7 OROM MinSrev MSB (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:0	MinSrev MSB	0x0	OROM MinSrev

## 6.3.32 PF MAC Address Section

PF/Port MAC Address PFA section.

**Table 6-38. PF MAC Address Section Summary Table**

Word Offset	Description	Section Reference
0x0000	PCI Serial ID MAC Address Module Type	6.3.32.1
0x0001	Length	6.3.32.2
0x0002	GLPCI_SERL0	6.3.32.3
0x0003	GLPCI_SERL1	6.3.32.4
0x0004	GLPCI_SERH0	6.3.32.5
0x0005	GLPCI_SERH1	6.3.32.6
0x0006	PF MAC Address Module Type	6.3.32.7
0x0007	Section Header	6.3.32.8
0x0008 + 4*n, n=0...7	PFPM_SAL0	6.3.32.9
0x0009 + 4*n, n=0...7	PFPM_SAL1	6.3.32.10
0x000A + 4*n, n=0...7	PFPM_SAH0	6.3.32.11
0x000B + 4*n, n=0...7	PFPM_SAH1	6.3.32.12

### 6.3.32.1 PCI Serial ID MAC Address Module Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x133	Valid values are: 0x133 = PCI Serial id MAC Addresses Module

### 6.3.32.2 Length (0x0001)

Length of MAC Address section.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 2 First Section -> Word: PF MAC Address -> PCI Serial Id MAC Address Module Type Last Section -> Word: PF MAC Address -> PFPM_SAH1

### 6.3.32.3 GLPCI\_SERL0 (0x0002)

This word is loaded by firmware to GLPCI\_SERL 0:15

Bit(s)	Field Name	Default NVM Value	Description
15:0	PFPM_SAL0	0x0	See respective bits in the GLPCI_SERL register.

### 6.3.32.4 GLPCI\_SERL1 (0x00023)

This word is loaded by firmware to GLPCI\_SERL 16:31.

Bit(s)	Field Name	Default NVM Value	Description
15:0	PFPM_SAL1	0x0	See respective bits in the GLPCI_SERL register.

### 6.3.32.5 GLPCI\_SERH0 (0x0004)

This word is loaded by firmware to GLPCI\_SERH 0:15.

Bit(s)	Field Name	Default NVM Value	Description
15:0	PFPM_SAH0	0x0	See respective bits in the GLPCI_SERH register.

### 6.3.32.6 GLPCI\_SERH1 (0x0005)

This word is loaded by firmware to GLPCI\_SERH 16:31.

Bit(s)	Field Name	Default NVM Value	Description
15:0	PFPM_SAH1	0x0	See respective bits in the GLPCI_SERH register.

### 6.3.32.7 PF MAC Address Module Type (0x0006)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x10F	Valid values are: 0x10F = PF MAC Addresses Module

### 6.3.32.8 Section Header (0x0007)

Length of MAC Address section.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 2 First Section -> Word: PF MAC Address -> PF MAC Address Module Type Last Section -> Word: PF MAC Address -> PFPM_SAH1 Section length in words.

### 6.3.32.9 PFPM\_SAL0[n] (0x0008 + 4\*n, n=0...7)

This word is loaded by firmware to the appropriate PRTPM\_SAL register, bytes [1,0]. One MAC Address per enabled PF/port. This is a per-device, per-enabled-PF value allocated by manufacturing.

Bit(s)	Field Name	Default NVM Value	Description
15:0	PFPM_SAL0	0x0	See respective bits in the PRTPM_SAL register.

### 6.3.32.10 PFPM\_SAL1[n] (0x0009 + 4\*n, n=0...7)

This register is loaded by firmware to the appropriate PRTPM\_SAL register, bytes [3:2]. One MAC Address per enabled PF. This is a per-device, per-enabled-PF value allocated by manufacturing.

Bit(s)	Field Name	Default NVM Value	Description
15:0	PFPM_SAL1	0x0	See respective bits in the PRTPM_SAL register.

### 6.3.32.11 PFPM\_SAH0[n] (0x000A + 4\*n, n=0...7)

This register is loaded by firmware to the appropriate PRTPM\_SAH register, bytes [1,0]. One MAC Address per enabled PF/port. This is a per-device, per-enabled-PF value allocated by manufacturing.

Bit(s)	Field Name	Default NVM Value	Description
15:0	PFPM_SAH0	0x0	See respective bits in the PRTPM_SAH register.

### 6.3.32.12 PFPM\_SAH1[n] (0x000B + 4\*n, n=0...7)

This register is loaded by firmware to the appropriate PRTPM\_SAH register, bytes [3:2]. One MAC Address per enabled PF/port. This is a per-device, per-enabled-PF value allocated by manufacturing.

Bit(s)	Field Name	Default NVM Value	Description
15:0	PFPM_SAH1	0x0	See respective bits in the PRTPM_SAH register.

### 6.3.33 MNG MAC Address Section

Manageability MAC Address PFA section.

**Table 6-39. MNG MAC Address Section Summary Table**

Word Offset	Description	Section Reference
0x0000	MNG MAC Address Module Type	6.3.33.1
0x0001	Section Header - Length	6.3.33.2
0x0002 + 3*n, n=0...31	LAN Ethernet MAC Address (LSB) MMAL	6.3.33.3
0x0003 + 3*n, n=0...31	LAN Ethernet MAC Address (Mid) MMAL	6.3.33.4
0x0004 + 3*n, n=0...31	LAN Ethernet MAC Address (MSB) MMAH	6.3.33.5

#### 6.3.33.1 MNG MAC Address Module Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x110	Valid values are: 0x110 = MNG MAC Addresses Module

#### 6.3.33.2 Section Header - Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 2 First Section -> Word: MNG MAC Address -> MNG MAC Address Module Type Last Section -> Word: MNG MAC Address -> LAN Ethernet MAC Address (MSB) MMAH Section length in words.

#### 6.3.33.3 LAN Ethernet MAC Address (LSB) MMAL[n] (0x0002 + 3\*n, n=0...31)

This word is loaded by the firmware to the 16 LS bits of the MMAL[0-3] register of Port n. The index equals 4\*Port#+ MAC#. It is used as the MAC Address when dedicated MAC Address mode is used in legacy SMBus. This is a per-device, per-port value allocated by manufacturing.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Ethernet MAC Address, Byte 1	0xFF	
7:0	Ethernet MAC Address, Byte 0	0xFF	

### 6.3.33.4 LAN Ethernet MAC Address (Mid) MMAL[n] (0x0003 + 3\*n, n=0...31)

This word is loaded by the firmware to the 16 MS bits of the MMAL[0-3] register of Port n. The index equals 4\*Port# + MAC#. It is used as the MAC Address when dedicated MAC Address mode is used in legacy SMBus. This is a per-device, per-port value allocated by manufacturing.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Ethernet MAC Address, Byte 3	0xFF	
7:0	Ethernet MAC Address, Byte 2	0xFF	

### 6.3.33.5 LAN Ethernet MAC Address (MSB) MMAH[n] (0x0004 + 3\*n, n=0...31)

This word is loaded by the firmware to the MMAH register of Port n. The index equals 4\*Port# + MAC#. It is used as the MAC Address when dedicated MAC Address mode is used in legacy SMBus. This is a per-device, per-port value allocated by manufacturing.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Ethernet MAC Address, Byte 5	0xFF	
7:0	Ethernet MAC Address, Byte 4	0xFF	

## 6.3.34 FW Logging Defaults Section

UART debug defaults.

**Table 6-40. FW Logging Defaults Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Sub Module Type	6.3.34.1
0x0001	Section Length	6.3.34.2
0x0002	UART Control	6.3.34.3
0x0003	Module Logging Enable [n=0]	6.3.34.4
0x0004	Module Logging Enable [n=1]	6.3.34.5
0x0005	Module Logging Enable [n=2]	6.3.34.6
0x0006	Module Logging Enable [n=3]	6.3.34.7
0x0007	Module Logging Enable [n=4]	6.3.34.8
0x0008	Module Logging Enable [n=5]	6.3.34.9
0x0009	Module Logging Enable [n=6]	6.3.34.10
0x000A	Module Logging Enable [n=7]	6.3.34.11

### 6.3.34.1 Sub Module Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x11D	Valid values are: 0x11D = UART Debug

### 6.3.34.2 Section Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 2 First Section -> Word: FW Logging Defaults -> Sub Module Type Last Section -> Word: FW Logging Defaults -> Module Logging Enable [n=7] Section length in words.

### 6.3.34.3 UART Control (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:1	Reserved	0x0	Reserved.
0	UART Logging Enable	0b	0b = Disabled 1b = Enabled

### 6.3.34.4 Module Logging Enable [n=0] (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15	Module Link Topology Detection Error Logging Enable	1b	0b = Disabled 1b = Enabled
14	Module Link Topology Detection Warning Logging Enable	0b	0b = Disabled 1b = Enabled
13	Module Link Topology Detection Normal Logging Enable	0b	0b = Disabled 1b = Enabled
12	Module Link Topology Detection Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
11	Module Link Management Error Logging Enable	1b	0b = Disabled 1b = Enabled
10	Module Link Management Warning Logging Enable	0b	0b = Disabled 1b = Enabled
9	Module Link Management Normal Logging Enable	1b	0b = Disabled 1b = Enabled
8	Module Link Management Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
7	Module Control Error Logging Enable	1b	0b = Disabled 1b = Enabled
6	Module Control Warning Logging Enable	1b	0b = Disabled 1b = Enabled
5	Module Control Normal Logging Enable	1b	0b = Disabled 1b = Enabled
4	Module Control Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
3	Module General Error Logging Enable	1b	0b = Disabled 1b = Enabled
2	Module General Warning Logging Enable	1b	0b = Disabled 1b = Enabled
1	Module General Normal Logging Enable	0b	0b = Disabled 1b = Enabled
0	Module General Verbose Logging Enable	0b	0b = Disabled 1b = Enabled

### 6.3.34.5 Module Logging Enable [n=1] (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15	Module MDIO Error Logging Enable	0b	0b = Disabled 1b = Enabled
14	Module MDIO Warning Logging Enable	0b	0b = Disabled 1b = Enabled
13	Module MDIO Normal Logging Enable	0b	0b = Disabled 1b = Enabled
12	Module MDIO Verbose Logging Enable	0b	0b = Disabled 1b = Enabled

Bit(s)	Field Name	Default NVM Value	Description
11	Module SDP Error Logging Enable	0b	0b = Disabled 1b = Enabled
10	Module SDP Warning Logging Enable	0b	0b = Disabled 1b = Enabled
9	Module SDP Normal Logging Enable	0b	0b = Disabled 1b = Enabled
8	Module SDP Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
7	Module I2C Error Logging Enable	0b	0b = Disabled 1b = Enabled
6	Module I2C Warning Logging Enable	0b	0b = Disabled 1b = Enabled
5	Module I2C Normal Logging Enable	0b	0b = Disabled 1b = Enabled
4	Module I2C Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
3	Module Dreadnought Lake Error Logging Enable	1b	0b = Disabled 1b = Enabled
2	Module Dreadnought Lake Warning Logging Enable	0b	0b = Disabled 1b = Enabled
1	Module Dreadnought Lake Normal Logging Enable	0b	0b = Disabled 1b = Enabled
0	Module Dreadnought Lake Verbose Logging Enable	0b	0b = Disabled 1b = Enabled

### 6.3.34.6 Module Logging Enable [n=2] (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15	Module DCBx Error Logging Enable	1b	0b = Disabled 1b = Enabled
14	Module DCBx Warning Logging Enable	0b	0b = Disabled 1b = Enabled
13	Module DCBx Normal Logging Enable	0b	0b = Disabled 1b = Enabled
12	Module DCBx Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
11	Module LLDP Error Logging Enable	1b	0b = Disabled 1b = Enabled
10	Module LLDP Warning Logging Enable	0b	0b = Disabled 1b = Enabled
9	Module LLDP Normal Logging Enable	0b	0b = Disabled 1b = Enabled
8	Module LLDP Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
7	Module HDMA Error Logging Enable	0b	0b = Disabled 1b = Enabled
6	Module HDMA Warning Logging Enable	0b	0b = Disabled 1b = Enabled

Bit(s)	Field Name	Default NVM Value	Description
5	Module HDMA Normal Logging Enable	1b	0b = Disabled 1b = Enabled
4	Module HDMA Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
3	Module Admin Queue Error Logging Enable	1b	0b = Disabled 1b = Enabled
2	Module Admin Queue Warning Logging Enable	0b	0b = Disabled 1b = Enabled
1	Module Admin Queue Normal Logging Enable	0b	0b = Disabled 1b = Enabled
0	Module Admin Queue Verbose Logging Enable	0b	0b = Disabled 1b = Enabled

### 6.3.34.7 Module Logging Enable [n=3] (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15	Module Authentication Error Logging Enable	1b	0b = Disabled 1b = Enabled
14	Module Authentication Warning Logging Enable	0b	0b = Disabled 1b = Enabled
13	Module Authentication Normal Logging Enable	0b	0b = Disabled 1b = Enabled
12	Module Authentication Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
11	Module NVM Error Logging Enable	1b	0b = Disabled 1b = Enabled
10	Module NVM Warning Logging Enable	0b	0b = Disabled 1b = Enabled
9	Module NVM Normal Logging Enable	0b	0b = Disabled 1b = Enabled
8	Module NVM Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
7	Module NetProxy -> XLR Error Logging Enable	1b	0b = Disabled 1b = Enabled
6	Module NetProxy -> XLR Warning Logging Enable	1b	0b = Disabled 1b = Enabled
5	Module NetProxy -> XLR Normal Logging Enable	1b	0b = Disabled 1b = Enabled
4	Module NetProxy -> XLR Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
3	Module DCB Error Logging Enable	1b	0b = Disabled 1b = Enabled
2	Module DCB Warning Logging Enable	0b	0b = Disabled 1b = Enabled
1	Module DCB Normal Logging Enable	0b	0b = Disabled 1b = Enabled
0	Module DCB Verbose Logging Enable	0b	0b = Disabled 1b = Enabled

### 6.3.34.8 Module Logging Enable [n=4] (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15	Module Switch Error Logging Enable	1b	0b = Disabled 1b = Enabled
14	Module Switch Warning Logging Enable	0b	0b = Disabled 1b = Enabled
13	Module Switch Normal Logging Enable	0b	0b = Disabled 1b = Enabled
12	Module Switch Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
11	Module Parser Error Logging Enable	1b	0b = Disabled 1b = Enabled
10	Module Parser Warning Logging Enable	0b	0b = Disabled 1b = Enabled
9	Module Parser Normal Logging Enable	0b	0b = Disabled 1b = Enabled
8	Module Parser Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
7	Module IOSF Error Logging Enable	1b	0b = Disabled 1b = Enabled
6	Module IOSF Warning Logging Enable	0b	0b = Disabled 1b = Enabled
5	Module IOSF Normal Logging Enable	0b	0b = Disabled 1b = Enabled
4	Module IOSF Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
3	Module VPD Error Logging Enable	1b	0b = Disabled 1b = Enabled
2	Module VPD Warning Logging Enable	0b	0b = Disabled 1b = Enabled
1	Module VPD Normal Logging Enable	0b	0b = Disabled 1b = Enabled
0	Module VPD Verbose Logging Enable	0b	0b = Disabled 1b = Enabled

### 6.3.34.9 Module Logging Enable [n=5] (0x0008)

Bit(s)	Field Name	Default NVM Value	Description
15	Module Post Error Logging Enable	1b	0b = Disabled 1b = Enabled
14	Module Post Warning Logging Enable	0b	0b = Disabled 1b = Enabled
13	Module Post Normal Logging Enable	0b	0b = Disabled 1b = Enabled
12	Module Post Verbose Logging Enable	0b	0b = Disabled 1b = Enabled

Bit(s)	Field Name	Default NVM Value	Description
11	Module ACL Error Logging Enable	1b	0b = Disabled 1b = Enabled
10	Module ACL Warning Logging Enable	0b	0b = Disabled 1b = Enabled
9	Module ACL Normal Logging Enable	0b	0b = Disabled 1b = Enabled
8	Module ACL Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
7	Module TX Queue Management Error Logging Enable	1b	0b = Disabled 1b = Enabled
6	Module TX Queue Management Warning Logging Enable	0b	0b = Disabled 1b = Enabled
5	Module TX Queue Management Normal Logging Enable	0b	0b = Disabled 1b = Enabled
4	Module TX Queue Management Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
3	Module Scheduler Error Logging Enable	1b	0b = Disabled 1b = Enabled
2	Module Scheduler Warning Logging Enable	0b	0b = Disabled 1b = Enabled
1	Module Scheduler Normal Logging Enable	0b	0b = Disabled 1b = Enabled
0	Module Scheduler Verbose Logging Enable	0b	0b = Disabled 1b = Enabled

### 6.3.34.10 Module Logging Enable [n=6] (0x0009)

Bit(s)	Field Name	Default NVM Value	Description
15	Module Synce Error Logging Enable	1b	0b = Disabled 1b = Enabled
14	Module Synce Warning Logging Enable	0b	0b = Disabled 1b = Enabled
13	Module Synce Normal Logging Enable	0b	0b = Disabled 1b = Enabled
12	Module Synce Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
11	Module Manageability Error Logging Enable	1b	0b = Disabled 1b = Enabled
10	Module Manageability Warning Logging Enable	0b	0b = Disabled 1b = Enabled
9	Module Manageability Normal Logging Enable	0b	0b = Disabled 1b = Enabled
8	Module Manageability Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
7	Module Task Dispatcher Error Logging Enable	1b	0b = Disabled 1b = Enabled
6	Module Task Dispatcher Warning Logging Enable	0b	0b = Disabled 1b = Enabled

Bit(s)	Field Name	Default NVM Value	Description
5	Module Task Dispatcher Normal Logging Enable	0b	0b = Disabled 1b = Enabled
4	Module Task Dispatcher Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
3	Module Watchdog Error Logging Enable	1b	0b = Disabled 1b = Enabled
2	Module Watchdog Warning Logging Enable	0b	0b = Disabled 1b = Enabled
1	Module Watchdog Normal Logging Enable	0b	0b = Disabled 1b = Enabled
0	Module Watchdog Verbose Logging Enable	0b	0b = Disabled 1b = Enabled

### 6.3.34.11 Module Logging Enable [n=7] (0x000A)

Bit(s)	Field Name	Default NVM Value	Description
15	Module Version Error Logging Enable	1b	0b = Disabled 1b = Enabled
14	Module Version Warning Logging Enable	0b	0b = Disabled 1b = Enabled
13	Module Version Normal Logging Enable	0b	0b = Disabled 1b = Enabled
12	Module Version Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
11	Module PF Registration Error Logging Enable	1b	0b = Disabled 1b = Enabled
10	Module PF Registration Warning Logging Enable	0b	0b = Disabled 1b = Enabled
9	Module PF Registration Normal Logging Enable	0b	0b = Disabled 1b = Enabled
8	Module PF Registration Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
7	Module Time Sync Error Logging Enable	1b	0b = Disabled 1b = Enabled
6	Module Time Sync Warning Logging Enable	0b	0b = Disabled 1b = Enabled
5	Module Time Sync Normal Logging Enable	0b	0b = Disabled 1b = Enabled
4	Module Time Sync Verbose Logging Enable	0b	0b = Disabled 1b = Enabled
3	Module Health Error Logging Enable	1b	0b = Disabled 1b = Enabled
2	Module Health Warning Logging Enable	0b	0b = Disabled 1b = Enabled
1	Module Health Normal Logging Enable	0b	0b = Disabled 1b = Enabled
0	Module Health Verbose Logging Enable	0b	0b = Disabled 1b = Enabled

## 6.3.35 1588 Parameters Section

1588 functionality parameters.

**Table 6-41. 1588 Parameters Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Type	6.3.35.1
0x0001	Length	6.3.35.2
0x0002	1588 Timer Ownership	6.3.35.3
0x0003	1588 Functionality Enablement 0-7	6.3.35.4
0x0004	1588 Functionality Enablement 8-15	6.3.35.5
0x0005	1588 Functionality Enablement 16-19	6.3.35.6

### 6.3.35.1 Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x4F	Valid values are: 0x4F = 1588 Parameters

### 6.3.35.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 2 First Section -> Word: 1588 parameters -> Type Last Section -> Word: 1588 parameters -> 1588 Functionality Enablement 16-19 Section length in words.

### 6.3.35.3 1588 Timer Ownership (0x0002)

1588 timer ownership by PF.

Bit(s)	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11	T1owned	0b	0b = Disabled 1b = Enabled
10:8	T1owner	000b	Timer 1 PF owner. 000b = Owned by PF 0 001b = Owned by PF 1 010b = Owned by PF 2 011b = Owned by PF 3 100b = Owned by PF 4 101b = Owned by PF 5 011b = Owned by PF 6 111b = Owned by PF 7

Bit(s)	Field Name	Default NVM Value	Description
7:4	Reserved	0x0	Reserved.
3	T0owned	0b	0b = Disabled 1b = Enabled
2:0	T0owner	000b	Timer 0 PF owner. 000b = Owned by PF 0 001b = Owned by PF 1 010b = Owned by PF 2 011b = Owned by PF 3 100b = Owned by PF 4 101b = Owned by PF 5 011b = Owned by PF 6 111b = Owned by PF 7

### 6.3.35.4 1588 Functionality Enablement 0-7 (0x0003)

1588 functionality enablement per port.

Bit(s)	Field Name	Default NVM Value	Description
15:14	P7	00b	Port 7 same list as Port 0.
13:12	P6	00b	Port 6 same list as Port 0.
11:10	P5	00b	Port 5 same list as Port 0.
9:8	P4	00b	Port 4 same list as Port 0.
7:6	P3	00b	Port 3 same list as Port 0.
5:4	P2	00b	Port 2 same list as Port 0.
3:2	P1	00b	Port 1 same list as Port 0.
1:0	P0	00b	Port 0. 00b = Disabled 01b = Reserved 10b = Timer 0 11b = Timer 1

### 6.3.35.5 1588 Functionality Enablement 8-15 (0x0004)

1588 functionality enablement per port.

Bit(s)	Field Name	Default NVM Value	Description
15:14	P15	00b	Port 15 same list as Port 8.
13:12	P14	00b	Port 14 same list as Port 8.
11:10	P13	00b	Port 13 same list as Port 8.
9:8	P12	00b	Port 12 same list as Port 8.
7:6	P11	00b	Port 11 same list as Port 8.
5:4	P10	00b	Port 10 same list as Port 8.
3:2	P9	00b	Port 9 same list as Port 8.

Bit(s)	Field Name	Default NVM Value	Description
1:0	P8	00b	Port 8. 00b = Disabled 01b = Reserved 10b = Timer 0 11b = Timer 1

### 6.3.35.6 1588 Functionality Enablement 16-19 (0x0005)

1588 functionality enablement per port.

Bit(s)	Field Name	Default NVM Value	Description
15:8	Reserved	0x0	Reserved.
7:6	P19	00b	Port 19 same list as Port 16.
5:4	P18	00b	Port 18 same list as Port 16.
3:2	P17	00b	Port 17 same list as Port 16.
1:0	P16	00b	Port 16. 00b = Disabled 01b = Reserved 10b = Timer 0 11b = Timer 1

### 6.3.36 MD Link Topology Section

This is the Ethernet Link topology description of the motherboard. Link topology is described in Section 3.3.

**Table 6-42. MD Link Topology Section Summary Table**

Word Offset	Description	Section Reference
0x0000	FW MNG Link Topology Module Type	6.3.36.1
0x0001	FW MNG Link Topology Module Length	6.3.36.2
0x0002	Generic Info	6.3.36.3
0x0003	Netlist Version	6.3.36.4
0x0004 + 1*n, n=0...15	Pair PHY Type	6.3.36.5
0x0014	Port Bitmap 0	6.3.36.6
0x0015	Port Bitmap 1	6.3.36.7

#### 6.3.36.1 FW MNG Link Topology Module Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x120	Valid values are: 0x120 = FW MNG Link Topology

#### 6.3.36.2 FW MNG Link Topology Module Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 2 First Section -> Word: MD Link Topology -> FW MNG Link Topology Module Type Last Section -> Word: MD Link Topology -> Port Bitmap 1 Section length in words.

#### 6.3.36.3 Generic Info (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Netlist Map Version	0x1	The version of the Netlist field definition.
7:1	Reserved	0x0	Reserved.

Bit(s)	Field Name	Default NVM Value	Description
0	Load Mode	1b	<p>Netlist Loading Mode</p> <p>0b = Normal Mode</p> <p>1b = Resolution Mode</p> <p>Controls the steps taken at netlist load time. Valid only for the motherboard's netlist. There are two modes:</p> <ul style="list-style-type: none"> <li>• <b>Normal Mode</b> — The active Port Options are loaded.</li> <li>• <b>Resolution Mode</b> — The active Port Options of non-innermost PHY nodes is updated and then the active Port Options are loaded. The update is performed based on matching the active Port Option of the connected Innermost PHY. If the Port Option was forced, the active option is not updated.</li> </ul>

### 6.3.36.4 Netlist Version (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Netlist Version	0x0	The version of the netlist.

### 6.3.36.5 Pair PHY Type[n] (0x0004 + 1\*n, n=0...15)

Bit(s)	Field Name	Default NVM Value	Description
15:12	PHY 2*n+1 Reserved	0x0	
11:8	PHY 2*n+1 Active Option	0x0	The PHY active port option
7:4	PHY 2*n Reserved	0x0	
3:0	PHY 2*n Active Option	0x0	The PHY active port option.

### 6.3.36.6 Port Bitmap 0 (0x0014)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Port Bitmap 0	0x0	

### 6.3.36.7 Port Bitmap 1 (0x0015)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Reserved	0x0	Reserved.
3:0	Port Bitmap 1	0x0	

## 6.3.37 LLDP Preserved Section

Table 6-43. LLDP Preserved Section Summary Table

Word Offset	Description	Section Reference
0x0000	Type	6.3.37.1
0x0001	Length	6.3.37.2
0x0002	LLDP Admin Status 0	6.3.37.3
0x0003	LLDP Admin Status 1	6.3.37.4

### 6.3.37.1 Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x129	Valid values are: 0x129 = LLDP Preserved

### 6.3.37.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 2 First Section -> Word: LLDP Preserved -> Type Last Section -> Word: LLDP Preserved -> LLDP Admin Status 1 Section length in words.

### 6.3.37.3 LLDP Admin Status 0 (0x0002)

Defines status of LLDP agent. Each LAN port has independent status.

- 3: Both receive and transmit enabled.
- 2: LLDP is configured for transmits only.
- 1: LLDP is configured for receives only.
- 0: LLDP agent is disabled.

Bit(s)	Field Name	Default NVM Value	Description
15:12	Port 3	0xF	Defines status of LLDP agent. Applies to LAN Port 3.
11:8	Port 2	0xF	Defines status of LLDP agent. Applies to LAN Port 2.
7:4	Port 1	0xF	Defines status of LLDP agent. Applies to LAN Port 1.
3:0	Port 0	0xF	Defines status of LLDP agent. Applies to LAN Port 0.

### 6.3.37.4 LLDP Admin Status 1 (0x0003)

Defines status of LLDP agent. Each LAN port has independent status.

- 3: Both receive and transmit enabled.
- 2: LLDP is configured for transmits only.
- 1: LLDP is configured for receives only.
- 0: LLDP agent is disabled.

Bit(s)	Field Name	Default NVM Value	Description
15:12	Port 7	0xF	Defines status of LLDP agent. Applies to LAN Port 7.
11:8	Port 6	0xF	Defines status of LLDP agent. Applies to LAN Port 6.
7:4	Port 5	0xF	Defines status of LLDP agent. Applies to LAN Port 5.
3:0	Port 4	0xF	Defines status of LLDP agent. Applies to LAN Port 4.

### 6.3.38 RDE Module Section

LLDP Preserved.

**Table 6-44. RDE Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Type	6.3.38.1
0x0001	Length	6.3.38.2
0x0002 + 1*n, n=0...31	AssetTag	6.3.38.3

#### 6.3.38.1 Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x131	Valid values are: 0x131 = RDE Module

#### 6.3.38.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: RDE Module -> Type Last Section -> Word: RDE Module -> AssetTag30 Section length in words.

#### 6.3.38.3 AssetTag[n] (0x0002 + 1\*n, n=0...31)

Defines status of LLDP agent. Each LAN port has independent status.

- 3: Both receive and transmit enabled.
- 2: LLDP is configured for transmits only.
- 1: LLDP is configured for receives only.
- 0: LLDP agent is disabled.

Bit(s)	Field Name	Default NVM Value	Description
15:0	AssetTag	0x0	Defines status of LLDP agent. Applies to LAN Port 0.

## 6.3.39 Identical Content as PLDM Header ComponentImageSetVersionString Section

**Table 6-45. Identical Content as PLDM Header ComponentImageSetVersionString Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Sub Module Type	6.3.39.1
0x0001	Length	6.3.39.2
0x0002	ComponentImageSetVersionString_0	6.3.39.3
0x0003	ComponentImageSetVersionString_1	6.3.39.4
0x0004	ComponentImageSetVersionString_2	6.3.39.5
0x0005	ComponentImageSetVersionString_3	6.3.39.6
0x0006	ComponentImageSetVersionString_4	6.3.39.7
0x0007	ComponentImageSetVersionString_5	6.3.39.8
0x0008	ComponentImageSetVersionString_6	6.3.39.9
0x0009	ComponentImageSetVersionString_7	6.3.39.10
0x000A	ComponentImageSetVersionString_8	6.3.39.11
0x000B	ComponentImageSetVersionString_9	6.3.39.12
0x000C	ComponentImageSetVersionString_10	6.3.39.13
0x000D	ComponentImageSetVersionString_11	6.3.39.14
0x000E	ComponentImageSetVersionString_12	6.3.39.15
0x000F	ComponentImageSetVersionString_13	6.3.39.16
0x0010	ComponentImageSetVersionString_14	6.3.39.17
0x0011	ComponentImageSetVersionString_15	6.3.39.18

### 6.3.39.1 Sub Module Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x127	Valid values are: 0x127 = PLDM Component Image Set Version String

### 6.3.39.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: Identical content as PLDM header ComponentImageSetVersionString -> Sub Module Type Last Section -> Word: Identical content as PLDM header ComponentImageSetVersionString -> ComponentImageSetVersionString15

### 6.3.39.3 ComponentImageSetVersionString\_0 (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_0	0x2E30	Dev-stater major followed by period (ASCII). Default value: "0."

### 6.3.39.4 ComponentImageSetVersionString\_1 (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_1	0x3030	Dev-stater minor (ASCII). Default value: "00"

### 6.3.39.5 ComponentImageSetVersionString\_2 (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_2	0x2820	Space and open parenthesis (ASCII). " ("

### 6.3.39.6 ComponentImageSetVersionString\_3 (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_3	0x7830	Hex prefix (ASCII). "0x"

### 6.3.39.7 ComponentImageSetVersionString\_4 (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_4	0x3030	Bytes 7-6 of EETTrackID (ASCII). "00"

### 6.3.39.8 ComponentImageSetVersionString\_5 (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_5	0x3030	Bytes 5-4 of EETTrackID (ASCII). "00"

### 6.3.39.9 ComponentImageSetVersionString\_6 (0x0008)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_6	0x3030	Bytes 3-2 of EETTrackID (ASCII). "00"

### 6.3.39.10 ComponentImageSetVersionString\_7 (0x0009)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_7	0x3030	Bytes 1-0 of EETTrackID (ASCII). "00"

### 6.3.39.11 ComponentImageSetVersionString\_8 (0x000A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_8	0x0029	Close parenthesis and null terminator (ASCII). ")<null>"

### 6.3.39.12 ComponentImageSetVersionString\_9 (0x000B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_9	0x0000	Null padding.

### 6.3.39.13 ComponentImageSetVersionString\_10 (0x000C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_10	0x0000	Null padding.

### 6.3.39.14 ComponentImageSetVersionString\_11 (0x000D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_11	0x0000	Null padding.

### 6.3.39.15 ComponentImageSetVersionString\_12 (0x000E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_12	0x0000	Null padding.

### 6.3.39.16 ComponentImageSetVersionString\_13 (0x000F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_13	0x0000	Null padding.

### 6.3.39.17 ComponentImageSetVersionString\_14 (0x0010)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_14	0x0000	Null padding.

### 6.3.39.18 ComponentImageSetVersionString\_15 (0x0011)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ComponentImageSetVersionString_15	0x0000	Null padding.

## 6.3.40 Software Checksum Module Section

The Software Checksum field covers the PFA portion of Shadow RAM contents (reserved words included). Its value is computed such that after adding all the covered words, including the software Checksum word itself, the sum is 0xBABA.

The checksum word is used to ensure that the base NVM image is a valid image. The initial value in the 16-bit summing register should be 0x0000 and the carry bit should be ignored after each addition.

This word is verified and recalculated by Firmware upon Checksum AQC.

**Table 6-46. Software Checksum Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Sub Module Type - Checksum	6.3.40.1
0x0001	Checksum Module Length	6.3.40.2
0x0002	Checksum	6.3.40.3

### 6.3.40.1 Sub Module Type - Checksum (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x3F	Valid values are: 0x3F = Checksum

### 6.3.40.2 Checksum Module Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: Software Checksum Module -> Sub Module Type - Checksum Last Section -> Word: Software Checksum Module -> Checksum

### 6.3.40.3 Checksum (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Checksum		Checksum word. Calculated so that checksum over PFA is 0xBABA.

## 6.3.41 RDMA Control Section

Table 6-47. RDMA Control Section Summary Table

Word Offset	Description	Section Reference
0x0000	RDMA Control Module Type	6.3.41.1
0x0001	Length	6.3.41.2
0x0002	RDMA Control Settings	6.3.41.3

### 6.3.41.1 RDMA Control Module Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x135	Valid values are: 0x135 = RDMA Control Module

### 6.3.41.2 Length (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: RDMA Control -> RDMA Control Module Type Last Section -> Word: RDMA Control -> RDMA Control Settings

### 6.3.41.3 RDMA Control Settings (0x0002)

Bits	Field Name	Default NVM Value	Description
15:5	Reserved	0x0	Reserved.
4	High Port Count RDMA Control Override Value	0b	Enable or disable. 0b = Disabled 1b = Enabled
3	High Port Count RDMA Control Override Enable	0b	Enable/Disable alternative configuration request for 5 ports or higher. 0b = Disabled 1b = Enabled
2	Low Port Count RDMA Control Override Value	0b	Enable or disable. 0b = Disabled 1b = Enabled
1	Low port count RDMA Control Override Enable	0b	Enable/Disable alternative configuration request for 4 ports or lower. 0b = Disabled 1b = Enabled
0	RDMA Topology Setting	0b	Enable or disable. 0b = Disabled 1b = Enabled

## 6.3.42 Link Default Override Mask Section

Table 6-48. Link Default Override Mask Section Summary Table

Word Offset	Description	Section Reference
0x0000	Link Default Override Mask Type	6.3.42.1
0x0001	Length	6.3.42.2
0x0002 + 10*n, n=0...7	Port Options 0	6.3.42.3
0x0003 + 10*n, n=0...7	Port Options 1	6.3.42.4
0x0004 + 10*n, n=0...7	Port PHY Types 0	6.3.42.5
0x0005 + 10*n, n=0...7	Port PHY Types 1	6.3.42.6
0x0006 + 10*n, n=0...7	Port PHY Types 2	6.3.42.7
0x0007 + 10*n, n=0...7	Port PHY Types 3	6.3.42.8
0x0008 + 10*n, n=0...7	Port PHY Types 4	6.3.42.9
0x0009 + 10*n, n=0...7	Port PHY Types 5	6.3.42.10
0x000A + 10*n, n=0...7	Port PHY Types 6	6.3.42.11
0x000B + 10*n, n=0...7	Port PHY Types 7	6.3.42.12

### 6.3.42.1 Link Default Override Mask Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x134	Valid values are: 0x134 = Link Default Override Mask

### 6.3.42.2 Length (0x0001)

Length of section.

Bits	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: Link Default Override Mask -> Link Default Override Mask Type Last Section -> Word: Link Default Override Mask -> Port PHY Types 7 Words

### 6.3.42.3 Port Options 0[n] (0x0002 + 10\*n, n=0...7)

Port link options.

Bits	Field Name	Default NVM Value	Description
15	Auto FEC Enable	1b	When <i>Override Enable</i> bit is set, the <i>Auto FEC Enable</i> bit is taken from here and not from the topology netlist.
14	LESM Enable	1b	When <i>Override Enable</i> bit is set, the <i>LESM Enable</i> bit is taken from here and not from the topology netlist.
13:10	Reserved	0xF	Reserved.
9:8	PAUSE Ability	00b	When <i>Override Enable</i> bit is set, the <i>PAUSE Ability</i> bits are taken from here and not from the topology netlist.
7:6	Reserved	11b	Reserved.
5	EEE Enable Override	0b	When <i>Override Enable</i> bit is set, the EEE can be enabled or disabled according to this bit, assuming that the PHY_TYPE is supporting EEE. 0b = Disable 1b = Enable
4	Disable Automatic Link on Startup Override	0b	When <i>Override Enable</i> bit is set, the "Disable Automatic Link on Startup" feature is taken from here and not from the link topology. 0b = Automatic Link on Startup feature is enabled. 1b = Automatic Link on Startup feature is disabled.
3	Override Enable	0b	Enables the override ability from PFA for this port. When this bit is set for a specific port, the parameters of this port are taken from the PFA and not from the link topology structures. 0b = Disable 1b = Enable
2	Port Disable Behavior Mode	0b	Controls how to disable the port when requested. 0b = Disables only the host. 1b = Disables all usages.
1	EPCT ability to Change Lenient/Strict Enable	0b	EPCT ability to change Lenient/Strict mode.
0	Lenient/Strict Mode	0b	0b - Lenient 1b = Strict

### 6.3.42.4 Port Options 1[n] (0x0003 + 10\*n, n=0...7)

Port PHY options.

Bits	Field Name	Default NVM Value	Description
15:14	Reserved	11b	Reserved.
13	Override FEC Setting	0b	
12	Override LESM Enable	0b	
11	Override PAUSE Setting	0b	
10	Override EEE Setting	0b	
9	Override "Disable Automatic Link on Startup"	0b	
8	Override PHY Types	0b	
7	FIRE_CODE_25_ABILITY	1b	Controls KR FEC ability advertisement for 25G KR1/CR1. 0b = FEC Disabled 1b = FEC Enabled (advertised)

Bits	Field Name	Default NVM Value	Description
6	RS_528_ABILITY	1b	Controls RS FEC ability advertisement for 25G KR1/CR1. 0b = FEC Disabled 1b = FEC Enabled (advertised)
5	No-FEC	0b	
4	RS_544_REQUEST	0b	Controls RS FEC 544 capability request for 25G/50G lanes KR/KR-S/KR1/CR/CR-S/CR1. 0b = FEC Disabled 1b = FEC Enabled (requested)
3	FIRE_CODE_25_REQUEST	1b	Controls KR FEC capability request for 25G lanes KR/KR-S/KR1/CR/CR-S/CR1. 0b = FEC Disabled 1b = FEC Enabled (requested)
2	RS_528_REQUEST	1b	Controls RS FEC 528 capability request for 25G lanes KR/KR-S/KR1/CR/CR-S/CR1. 0b = FEC Disabled 1b = FEC Enabled (requested)
1	FIRE_CODE_10_REQUEST	0b	Controls FEC capability request for 10G KR and 40G KR4/CR4. 0b = FEC Disabled 1b = FEC Enabled (requested)
0	FIRE_CODE_10_ABILITY Enable	0b	Controls FEC capability advertisement for 10G KR and 40G KR4/CR4. 0b = FEC Disabled 1b = FEC Enabled (advertised)

### 6.3.42.5 Port PHY Types 0[n] (0x0004 + 10\*n, n=0...7)

PHY types. 8 Words per port. 8 ports.

Bits	Field Name	Default NVM Value	Description
15	10GBASE-LR	1b	
14	10GBASE-SR	1b	
13	10G-SFI-DA	1b	
12	10GBASE-T	1b	
11	5GBASE-KR	1b	
10	5GBASE-T	1b	
9	2.5GBASE-KX	1b	
8	2.5GBASE-X	1b	
7	2.5GBASE-T	1b	
6	1G-SGMII	1b	
5	1000BASE-KX	1b	
4	1000BASE-LX	1b	
3	1000BASE-SX	1b	
2	1000BASE-T	1b	
1	100M-SGMII	1b	
0	100BASE-TX	1b	

### 6.3.42.6 Port PHY Types 1[n] (0x0005 + 10\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15	40GBASE-SR4	1b	
14	40GBASE-CR4	1b	
13	25G-AUI-C2C	1b	
12	25G-AUI-AOC\ACC	1b	
11	25GBASE-KR1	1b	
10	25GBASE-KR-S	1b	
9	25GBASE-KR	1b	
8	25GBASE-LR	1b	
7	25GBASE-SR	1b	
6	25GBASE-CR1	1b	
5	25GBASE-CR-S	1b	
4	25GBASE-CR	1b	
3	25GBASE-T	1b	
2	10G-SFI-C2C	1b	
1	10G-SFI-AOC\ACC	1b	
0	10GBASE-KR\CR1	1b	

### 6.3.42.7 Port PHY Types 2[n] (0x0006 + 10\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15	50GBASE-LR	1b	
14	50GBASE-FR	1b	
13	50GBASE-SR	1b	
12	50GBASE-CP	1b	
11	50G-AUI2	1b	
10	50G-AUI2-AOC\ACC	1b	
9	50G-LAUI2	1b	
8	50G-LAUI2-AOC\ACC	1b	
7	50GBASE-KR2	1b	
6:5	Reserved	11b	Reserved.
4	50GBASE-CR2	1b	
3	40G-XLAUI	1b	
2	40G-XLAUI-AOC\ACC	1b	
1	40GBASE-KR4	1b	
0	40GBASE-LR4	1b	

### 6.3.42.8 Port PHY Types 3[n] (0x0007 + 10\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15	100GBASE-DR	1b	
14	100GBASE-SR2	1b	
13	100GBASE-CP2	1b	
12	100GBASE-KP-PAM4	1b	
11	Reserved	1b	Reserved.
10	100G-AUI4	1b	
9	100G-AUI4-AOC\ACC	1b	
8	100G-CAUI4	1b	
7	100G-CAUI-AOC\ACC	1b	
6	100GBASE-KR4	1b	
5	100GBASE-LR4	1b	
4	100GBASE-SR4	1b	
3	100GBASE-CR4	1b	
2	50G-AUI1	1b	
1	50G-AUI1-AOC\ACC	1b	
0	50GBASE-KR-PAM4	1b	

### 6.3.42.9 Port PHY Types 4[n] (0x0008 + 10\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15	400GBASE-FR8	1b	
14	200G-AUI8	1b	
13	200G-AUI8-AOC\ACC	1b	
12	200G-AUI4	1b	
11	200G-AUI4-AOC\ACC	1b	
10	200GBASE-KR4-PAM4	1b	
9	200GBASE-DR4	1b	
8	200GBASE-LR4	1b	
7	200GBASE-FR4	1b	
6	200GBASE-SR4	1b	
5	200GBASE-CR4-PAM4	1b	
4	100G-AUI2	1b	
3	100G-AUI2-AOC\ACC	1b	
2:1	Reserved	11b	Reserved.
0	100GBASE-KR2-PAM4	1b	

### 6.3.42.10 Port PHY Types 5[n] (0x0009 + 10\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15:4	Reserved	0xFFFF	Reserved.
3	400G-AUI8	1b	
2	400G-AUI8-AOC\ACC	1b	
1	400GBASE-DR8	1b	
0	400GBASE-LR8	1b	

### 6.3.42.11 Port PHY Types 6[n] (0x000A + 10\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.42.12 Port PHY Types 7[n] (0x000B + 10\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.43 RDE Ethernet MTU Section

Table 6-49. RDE Ethernet MTU Section Summary Table

Word Offset	Description	Section Reference
0x0000	RDE Ethernet MTU Type	6.3.43.1
0x0001	Length	6.3.43.2
0x0002 + 1*n, n=0...7	Ethernet MTU Size	6.3.43.3

#### 6.3.43.1 RDE Ethernet MTU Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x136	Valid values are: 0x136 = RDE Ethernet MTU Type

#### 6.3.43.2 Length (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: RDE Ethernet MTU -> RDE Ethernet MTU Type Last Section -> Word: RDE Ethernet MTU -> Ethernet MTU size

#### 6.3.43.3 Ethernet MTU Size[n] (0x0002 + 1\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15:0	Ethernet MTU Size	0xFFFF	

## 6.3.44 Default DCB Parameters Section

Table 6-50. Default DCB Parameters Section Summary Table

Word Offset	Description	Section Reference
0x0000	Default DCB Parameters Type	6.3.44.1
0x0001	Length	6.3.44.2
0x0002	Ports 0-3 Mode	6.3.44.3
0x0003	Ports 4-7 Mode	6.3.44.4

### 6.3.44.1 Default DCB Parameters Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x137	Valid values are: 0x137 = Default DCB Parameters Type

### 6.3.44.2 Length (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: Default DCB Parameters -> Default DCB Parameters Type Last Section -> Word: Default DCB Parameters -> Ports 4-7 Mode

### 6.3.44.3 Ports 0-3 Mode (0x0002)

Bits	Field Name	Default NVM Value	Description
15:12	Port 3 Mode	0x1	Default DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 3
11:8	Port 2 Mode	0x1	Default DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 2
7:4	Port 1 Mode	0x1	Default DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 1
3:0	Port 0 Mode	0x1	Default DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 0

### 6.3.44.4 Ports 4-7 Mode (0x0003)

Bits	Field Name	Default NVM Value	Description
15:12	Port 7 Mode	0x1	Default DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 7
11:8	Port 6 Mode	0x1	Default DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 6
7:4	Port 5 Mode	0x1	Default DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 5
3:0	Port 4 Mode	0x1	Default DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 4

## 6.3.45 Current DCB Parameters Section

Table 6-51. Current DCB Parameters Section Summary Table

Word Offset	Description	Section Reference
0x0000	Current DCB Parameters Type	6.3.45.1
0x0001	Length	6.3.45.2
0x0002	Ports 0-3 Mode	6.3.45.3
0x0003	Ports 4-7 Mode	6.3.45.4

### 6.3.45.1 Current DCB Parameters Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x138	Valid values are: 0x138 = Current DCB Parameters Type

### 6.3.45.2 Length (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: Current DCB Parameters -> Current DCB Parameters Type Last Section -> Word: Current DCB Parameters -> Ports 4-7 Mode

### 6.3.45.3 Ports 0-3 Mode (0x0002)

Bits	Field Name	Default NVM Value	Description
15:12	Port 3 Mode	0xF	Current DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 3
11:8	Port 2 Mode	0xF	Current DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 2
7:4	Port 1 Mode	0xF	Current DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 1
3:0	Port 0 Mode	0xF	Current DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 0

### 6.3.45.4 Ports 4-7 Mode (0x0003)

Bits	Field Name	Default NVM Value	Description
15:12	Port 7 Mode	0xF	Current DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 7
11:8	Port 6 Mode	0xF	Current DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 6
7:4	Port 5 Mode	0xF	Current DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 5
3:0	Port 4 Mode	0xF	Current DCB Mode to apply default DCB settings after link up or not. Applies to LAN Port 4

## 6.3.46 HII Port Disable by Function Section

Table 6-52. HII Port Disable by Function Section Summary Table

Word Offset	Description	Section Reference
0x0000	Type	6.3.46.1
0x0001	Length	6.3.46.2
0x0002	HII Port Disable by Function	6.3.46.3

### 6.3.46.1 Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x139	Valid values are: 0x139 = HII Port Disable by Function

### 6.3.46.2 Length (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: HII Port Disable by Function -> Type Last Section -> Word: HII Port Disable by Function -> HII Port Disable by Function

### 6.3.46.3 HII Port Disable by Function (0x0002)

Bits	Field Name	Default NVM Value	Description
15:8	Reserved	0x0	Reserved.
7	HII port disable by function 7	0b	When the bit is set, the firmware should disable the port that is associated with the PF according to PFGEN_PORTNUM. 0b = Port Enabled 1b = Port Disabled
6	HII port disable by function 6	0b	When the bit is set, the firmware should disable the port that is associated with the PF according to PFGEN_PORTNUM. 0b = Port Enabled 1b = Port Disabled
5	HII port disable by function 5	0b	When the bit is set, the firmware should disable the port that is associated with the PF according to PFGEN_PORTNUM. 0b = Port Enabled 1b = Port Disabled
4	HII port disable by function 4	0b	When the bit is set, the firmware should disable the port that is associated with the PF according to PFGEN_PORTNUM. 0b = Port Enabled 1b = Port Disabled
3	HII port disable by function 3	0b	When the bit is set, the firmware should disable the port that is associated with the PF according to PFGEN_PORTNUM. 0b = Port Enabled 1b = Port Disabled

Bits	Field Name	Default NVM Value	Description
2	HII port disable by function 2	0b	When the bit is set, the firmware should disable the port that is associated with the PF according to PFGEN_PORTNUM. 0b = Port Enabled 1b = Port Disabled
1	HII port disable by function 1	0b	When the bit is set, the firmware should disable the port that is associated with the PF according to PFGEN_PORTNUM. 0b = Port Enabled 1b = Port Disabled
0	HII port disable by function 0	0b	When the bit is set, the firmware should disable the port that is associated with the PF according to PFGEN_PORTNUM. 0b = Port Enabled 1b = Port Disabled

## 6.3.47 NetlistMinSrev Section

Table 6-53. NetlistMinSrev Section Summary Table

Word Offset	Description	Section Reference
0x0000	NetlistMinSrev Module Type	6.3.47.1
0x0001	Length	6.3.47.2
0x0002	Validity	6.3.47.3
0x0003	Netlist MinSrev LSB	6.3.47.4
0x0004	Netlist MinSrev MSB	6.3.47.5

### 6.3.47.1 NetlistMinSrev Module Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x146	Valid values are: 0x146 = NetlistMinSrev Module Type

### 6.3.47.2 Length (0x0001)

Length of section.

Bits	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 2 First Section -> Word: NetlistMinSrev -> NetlistMinSrev Module Type Last Section -> Word: NetlistMinSrev -> Netlist MinSrev MSB Section length in words

### 6.3.47.3 Validity (0x0002)

Validity of MinSrev words.

Bits	Field Name	Default NVM Value	Description
15:1	Reserved	0x0	Reserved.
0	Netlist	0b	Netlist MinSrev valid.

### 6.3.47.4 Netlist MinSrev LSB (0x0003)

Bits	Field Name	Default NVM Value	Description
15:0	MinSrev LSB	0x0	Netlist MinSrev.

### 6.3.47.5 Netlist MinSrev MSB (0x0004)

Bits	Field Name	Default NVM Value	Description
15:0	MinSrev MSB	0x0	Netlist MinSrev.

## 6.3.48 Tx-Scheduler Topology User Selection Section

Table 6-54. Tx-Scheduler Topology User Selection Section Summary Table

Word Offset	Description	Section Reference
0x0000	Tx Scheduler Topology User Selection Module Type	6.3.48.1
0x0001	Length	6.3.48.2
0x0002	Data	6.3.48.3

### 6.3.48.1 Tx Scheduler Topology User Selection Module Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x14B	Valid values are: 0x14B = Tx Scheduler Topology User Selection Module Type

### 6.3.48.2 Length (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 2 First Section -> Word: Tx Scheduler Topology User Selection -> Tx Scheduler Topology User Selection Module Type Last Section -> Word: Tx Scheduler Topology User Selection -> Data

### 6.3.48.3 Data (0x0002)

Bits	Field Name	Default NVM Value	Description
15:5	Reserved	0x0	
4	Topology Source	0x0	
3:0	Reserved	0x0	

## 6.3.49 LLDP Preserved 2 Section

Table 6-55. LLDP Preserved 2 Section Summary Table

Word Offset	Description	Section Reference
0x0000	LLDP Preserved 2 Module Type	6.3.49.1
0x0001	Length	6.3.49.3
0x0002	LLDP Control 0	6.3.49.3
0x0003	LLDP Control 1	6.3.49.4
0x0004	Port 0 - Chassis ID Subtype & Chassis ID Length	6.3.49.5
0x0005 + 1*n, n=0...15	Port 0 - Chassis ID	6.3.49.6
0x0015	Port 0 - Port ID Subtype & Port ID Length	6.3.49.7
0x0016 + 1*n, n=0...15	Port 0 - Port ID	6.3.49.8
0x0026 + 1*n, n=0...1	Port 0 - Management Address IPv4	6.3.49.9
0x0028 + 1*n, n=0...7	Port 0 - Management Address IPv6	6.3.49.10
0x0030 + 1*n, n=0...2	Port 0 - Management Address MAC	6.3.49.11
0x0033	Port 0 - Management VLAN ID	6.3.49.12
0x0034	Port 1 - Chassis ID Subtype & Chassis ID Length	6.3.49.13
0x0035 + 1*n, n=0...15	Port 1 - Chassis ID	6.3.49.14
0x0045	Port 1 - Port ID Subtype & Port ID Length	6.3.49.15
0x0046 + 1*n, n=0...15	Port 1 - Port ID	6.3.49.16
0x0056 + 1*n, n=0...1	Port 1 - Management Address IPv4	6.3.49.17
0x0058 + 1*n, n=0...7	Port 1 - Management Address IPv6	6.3.49.18
0x0060 + 1*n, n=0...2	Port 1 - Management Address MAC	6.3.49.19
0x0063	Port 1 - Management VLAN ID	6.3.49.20
0x0064	Port 2 - Chassis ID Subtype & Chassis ID Length	6.3.49.21
0x0065 + 1*n, n=0...15	Port 2 - Chassis ID	6.3.49.22
0x0075	Port 2 - Port ID Subtype & Port ID Length	6.3.49.23
0x0076 + 1*n, n=0...15	Port 2 - Port ID	6.3.49.24
0x0086 + 1*n, n=0...1	Port 2 - Management Address IPv4	6.3.49.25
0x0088 + 1*n, n=0...7	Port 2 - Management Address IPv6	6.3.49.26
0x0090 + 1*n, n=0...2	Port 2 - Management Address MAC	6.3.49.27
0x0093	Port 2 - Management VLAN ID	6.3.49.28
0x0094	Port 3 - Chassis ID Subtype & Chassis ID Length	6.3.49.29
0x0095 + 1*n, n=0...15	Port 3 - Chassis ID	6.3.49.30
0x00A5	Port 3 - Port ID Subtype & Port ID Length	6.3.49.31
0x00A6 + 1*n, n=0...15	Port 3 - Port ID	6.3.49.32
0x00B6 + 1*n, n=0...1	Port 3 - Management Address IPv4	6.3.49.33
0x00B8 + 1*n, n=0...7	Port 3 - Management Address IPv6	6.3.49.34
0x00C0 + 1*n, n=0...2	Port 3 - Management Address MAC	6.3.49.35

**Table 6-55. LLDP Preserved 2 Section Summary Table**

Word Offset	Description	Section Reference
0x00C3	Port 3 - Management VLAN ID	6.3.49.36
0x00C4	Port 4 - Chassis ID Subtype & Chassis ID Length	6.3.49.37
0x00C5 + 1*n, n=0...15	Port 4 - Chassis ID	6.3.49.38
0x00D5	Port 4 - Port ID Subtype & Port ID Length	6.3.49.39
0x00D6 + 1*n, n=0...15	Port 4 - Port ID	6.3.49.40
0x00E6 + 1*n, n=0...1	Port 4 - Management Address IPv4	6.3.49.41
0x00E8 + 1*n, n=0...7	Port 4 - Management Address IPv6	6.3.49.42
0x00F0 + 1*n, n=0...2	Port 4 - Management Address MAC	6.3.49.43
0x00F3	Port 4 - Management VLAN ID	6.3.49.44
0x00F4	Port 5 - Chassis ID Subtype & Chassis ID Length	6.3.49.45
0x00F5 + 1*n, n=0...15	Port 5 - Chassis ID	6.3.49.46
0x0105	Port 5 - Port ID Subtype & Port ID Length	6.3.49.47
0x0106 + 1*n, n=0...15	Port 5 - Port ID	6.3.49.48
0x0116 + 1*n, n=0...1	Port 5 - Management Address IPv4	6.3.49.49
0x0118 + 1*n, n=0...7	Port 5 - Management Address IPv6	6.3.49.50
0x0120 + 1*n, n=0...2	Port 5 - Management Address MAC	6.3.49.51
0x0123	Port 5 - Management VLAN ID	6.3.49.52
0x0124	Port 6 - Chassis ID Subtype & Chassis ID Length	6.3.49.53
0x0125 + 1*n, n=0...15	Port 6 - Chassis ID	6.3.49.54
0x0135	Port 6 - Port ID Subtype & Port ID Length	6.3.49.55
0x0136 + 1*n, n=0...15	Port 6 - Port ID	6.3.49.56
0x0146 + 1*n, n=0...1	Port 6 - Management Address IPv4	6.3.49.57
0x0148 + 1*n, n=0...7	Port 6 - Management Address IPv6	6.3.49.58
0x0150 + 1*n, n=0...2	Port 6 - Management Address MAC	6.3.49.59
0x0153	Port 6 - Management VLAN ID	6.3.49.60
0x0154	Port 7 - Chassis ID Subtype & Chassis ID Length	6.3.49.61
0x0155 + 1*n, n=0...15	Port 7 - Chassis ID	6.3.49.62
0x0165	Port 7 - Port ID Subtype & Port ID Length	6.3.49.63
0x0166 + 1*n, n=0...15	Port 7 - Port ID	6.3.49.64
0x0176 + 1*n, n=0...1	Port 7 - Management Address IPv4	6.3.49.65
0x0178 + 1*n, n=0...7	Port 7 - Management Address IPv6	6.3.49.66
0x0180 + 1*n, n=0...2	Port 7 - Management Address MAC	6.3.49.67
0x0183	Port 7 - Management VLAN ID	6.3.49.68
0x0184 + 1*n, n=0...123	Reserved	6.3.49.69

### 6.3.49.1 LLDP Preserved 2 Module Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x14D	Valid values are: 0x14D = LLDP Preserved 2

### 6.3.49.2 Length (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 2 First Section -> Word: LLDP Preserved 2 -> LLDP Preserved 2 Module Type Last Section -> Word: LLDP Preserved 2 -> Reserved 123 Section length in words

### 6.3.49.3 LLDP Control 0 (0x0002)

Bits	Field Name	Default NVM Value	Description
15:1	Reserved	0x0	Reserved. <b>Note:</b> This field is preserved by Intel NVM Update tool.
0	Adapter LLDP Disable	0b	Disables FW LLDP Agent for all ports. 0b = Adapter allows FW LLDP Agent to be enabled. 1b = Adapter does not allow LLDP FW LLDP Agent to be enabled. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.4 LLDP Control 1 (0x0003)

Bits	Field Name	Default NVM Value	Description
15	Port 7 LLDP Disable Valid	0b	Is <i>Port 7 LLDP Disabled</i> bit valid. 0b = Bit is invalid. 1b = Bit is valid. <b>Note:</b> This field is preserved by Intel NVM Update tool.
14	Port 6 LLDP Disable Valid	0b	Is <i>Port 6 LLDP Disabled</i> bit valid. 0b = Bit is invalid. 1b = Bit is valid. <b>Note:</b> This field is preserved by Intel NVM Update tool.
13	Port 5 LLDP Disable Valid	0b	Is <i>Port 5 LLDP Disabled</i> bit valid. 0b = Bit is invalid. 1b = Bit is valid. <b>Note:</b> This field is preserved by Intel NVM Update tool.
12	Port 4 LLDP Disable Valid	0b	Is <i>Port 4 LLDP Disabled</i> bit valid. 0b = Bit is invalid. 1b = Bit is valid. <b>Note:</b> This field is preserved by Intel NVM Update tool.

Bits	Field Name	Default NVM Value	Description
11	Port 3 LLDP Disable Valid	0b	Is <i>Port 3 LLDP Disabled</i> bit valid. 0b = Bit is invalid. 1b = Bit is valid. <b>Note:</b> This field is preserved by Intel NVM Update tool.
10	Port 2 LLDP Disable Valid	0b	Is <i>Port 2 LLDP Disabled</i> bit valid. 0b = Bit is invalid. 1b = Bit is valid. <b>Note:</b> This field is preserved by Intel NVM Update tool.
9	Port 1 LLDP Disable Valid	0b	Is <i>Port 1 LLDP Disabled</i> bit valid. 0b = Bit is invalid. 1b = Bit is valid. <b>Note:</b> This field is preserved by Intel NVM Update tool.
8	Port 0 LLDP Disable Valid	0b	Is <i>Port 0 LLDP Disabled</i> bit valid. 0b = Bit is invalid. 1b = Bit is valid. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7	Port 7 LLDP Disable	0b	The pending FW LLDP Status for Port 7. 0b = FW LLDP Agent enabled. 1b = FW LLDP Agent disabled. <b>Note:</b> This field is preserved by Intel NVM Update tool.
6	Port 6 LLDP Disable	0b	The pending FW LLDP Status for Port 6. 0b = FW LLDP Agent enabled. 1b = FW LLDP Agent disabled. <b>Note:</b> This field is preserved by Intel NVM Update tool.
5	Port 5 LLDP Disable	0b	The pending FW LLDP Status for Port 5. 0b = FW LLDP Agent enabled. 1b = FW LLDP Agent disabled. <b>Note:</b> This field is preserved by Intel NVM Update tool.
4	Port 4 LLDP Disable	0b	The pending FW LLDP Status for Port 4. 0b = FW LLDP Agent enabled. 1b = FW LLDP Agent disabled. <b>Note:</b> This field is preserved by Intel NVM Update tool.
3	Port 3 LLDP Disable	0b	The pending FW LLDP Status for Port 3. 0b = FW LLDP Agent enabled. 1b = FW LLDP Agent disabled. <b>Note:</b> This field is preserved by Intel NVM Update tool.
2	Port 2 LLDP Disable	0b	The pending FW LLDP Status for Port 2. 0b = FW LLDP Agent enabled. 1b = FW LLDP Agent disabled. <b>Note:</b> This field is preserved by Intel NVM Update tool.
1	Port 1 LLDP Disable	0b	The pending FW LLDP Status for Port 1. 0b = FW LLDP Agent enabled. 1b = FW LLDP Agent disabled. <b>Note:</b> This field is preserved by Intel NVM Update tool.
0	Port 0 LLDP Disable	0b	The pending FW LLDP Status for Port 0. 0b = FW LLDP Agent enabled. 1b = FW LLDP Agent disabled. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.5 Port 0 - Chassis ID Subtype & Chassis ID length (0x0004)

Bits	Field Name	Default NVM Value	Description
15:8	Chassis ID Subtype	0x0	The IEEE 802.1AB-2009 Chassis ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Chassis ID Length	0x0	The number of bytes from the <i>Chassis ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Chassis ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.6 Port 0 - Chassis ID[n] (0x0005 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Chassis ID	0x0	The Chassis ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.7 Port 0 - Port ID Subtype & Port ID Length (0x0015)

Bits	Field Name	Default NVM Value	Description
15:8	Port ID Subtype	0x0	The IEEE 802.1AB-2009 Port ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Port ID Length	0x0	The number of bytes from the <i>Port ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Port ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.8 Port 0 - Port ID[n] (0x0016 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Port ID	0x0	The Port identification to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.9 Port 0 - Management Address IPv4[n] (0x0026 + 1\*n, n=0...1)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv4	0x0	The IPv4 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.10 Port 0 - Management Address IPv6[n] (0x0028 + 1\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv6	0x0	The IPv6 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.11 Port 0 - Management Address MAC[n] (0x0030 + 1\*n, n=0...2)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address MAC	0x0	The management MAC Address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.12 Port 0 - Management VLAN ID (0x0033)

Bits	Field Name	Default NVM Value	Description
15:0	Management VLAN ID	0x0	The management VLAN ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.13 Port 1 - Chassis ID Subtype & Chassis ID length (0x0034)

Bits	Field Name	Default NVM Value	Description
15:8	Chassis ID Subtype	0x0	The IEEE 802.1AB-2009 Chassis ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Chassis ID Length	0x0	The number of bytes from the <i>Chassis ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Chassis ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.14 Port 1 - Chassis ID[n] (0x0035 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Chassis ID	0x0	The Chassis ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.15 Port 1 - Port ID Subtype & Port ID Length (0x0045)

Bits	Field Name	Default NVM Value	Description
15:8	Port ID Subtype	0x0	The IEEE 802.1AB-2009 Port ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Port ID Length	0x0	The number of bytes from the <i>Port ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Port ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.16 Port 1 - Port ID[n] (0x0046 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Port ID	0x0	The Port identification to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.17 Port 1 - Management Address IPv4[n] (0x0056 + 1\*n, n=0...1)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv4	0x0	The IPv4 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.18 Port 1 - Management Address IPv6[n] (0x0058 + 1\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv6	0x0	The IPv6 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.19 Port 1 - Management Address MAC[n] (0x0060 + 1\*n, n=0...2)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address MAC	0x0	The management MAC Address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.20 Port 1 - Management VLAN ID (0x0063)

Bits	Field Name	Default NVM Value	Description
15:0	Management VLAN ID	0x0	The management VLAN ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.21 Port 2 - Chassis ID Subtype & Chassis ID length (0x0064)

Bits	Field Name	Default NVM Value	Description
15:8	Chassis ID Subtype	0x0	The IEEE 802.1AB-2009 Chassis ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Chassis ID Length	0x0	The number of bytes from the <i>Chassis ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Chassis ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.22 Port 2 - Chassis ID[n] (0x0065 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Chassis ID	0x0	The Chassis ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.23 Port 2 - Port ID Subtype & Port ID Length (0x0075)

Bits	Field Name	Default NVM Value	Description
15:8	Port ID Subtype	0x0	The IEEE 802.1AB-2009 Port ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Port ID Length	0x0	The number of bytes from the <i>Port ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Port ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.24 Port 2 - Port ID[n] (0x0076 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Port ID	0x0	The Port identification to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.25 Port 2 - Management Address IPv4[n] (0x0086 + 1\*n, n=0...1)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv4	0x0	The IPv4 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.26 Port 2 - Management Address IPv6[n] (0x0088 + 1\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv6	0x0	The IPv6 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.27 Port 2 - Management Address MAC[n] (0x0090 + 1\*n, n=0...2)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address MAC	0x0	The management MAC Address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.28 Port 2 - Management VLAN ID (0x0093)

Bits	Field Name	Default NVM Value	Description
15:0	Management VLAN ID	0x0	The management VLAN ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.29 Port 3 - Chassis ID Subtype & Chassis ID length (0x0094)

Bits	Field Name	Default NVM Value	Description
15:8	Chassis ID Subtype	0x0	The IEEE 802.1AB-2009 Chassis ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Chassis ID Length	0x0	The number of bytes from the <i>Chassis ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Chassis ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.30 Port 3 - Chassis ID[n] (0x0095 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Chassis ID	0x0	The Chassis ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.31 Port 3 - Port ID Subtype & Port ID Length (0x00A5)

Bits	Field Name	Default NVM Value	Description
15:8	Port ID Subtype	0x0	The IEEE 802.1AB-2009 Port ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Port ID Length	0x0	The number of bytes from the <i>Port ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Port ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.32 Port 3 - Port ID[n] (0x00A6 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Port ID	0x0	The Port identification to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.33 Port 3 - Management Address IPv4[n] (0x00B6 + 1\*n, n=0...1)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv4	0x0	The IPv4 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.34 Port 3 - Management Address IPv6[n] (0x00B8 + 1\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv6	0x0	The IPv6 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.35 Port 3 - Management Address MAC[n] (0x00C0 + 1\*n, n=0...2)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address MAC	0x0	The management MAC Address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.36 Port 3 - Management VLAN ID (0x00C3)

Bits	Field Name	Default NVM Value	Description
15:0	Management VLAN ID	0x0	The management VLAN ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.37 Port 4 - Chassis ID Subtype & Chassis ID length (0x00C4)

Bits	Field Name	Default NVM Value	Description
15:8	Chassis ID Subtype	0x0	The IEEE 802.1AB-2009 Chassis ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Chassis ID Length	0x0	The number of bytes from the <i>Chassis ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Chassis ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.38 Port 4 - Chassis ID[n] (0x00C5 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Chassis ID	0x0	The Chassis ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.39 Port 4 - Port ID Subtype & Port ID Length (0x00D5)

Bits	Field Name	Default NVM Value	Description
15:8	Port ID Subtype	0x0	The IEEE 802.1AB-2009 Port ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Port ID Length	0x0	The number of bytes from the <i>Port ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Port ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.40 Port 4 - Port ID[n] (0x00D6 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Port ID	0x0	The Port identification to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.41 Port 4 - Management Address IPv4[n] (0x00E6 + 1\*n, n=0...1)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv4	0x0	The IPv4 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.42 Port 4 - Management Address IPv6[n] (0x00E8 + 1\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv6	0x0	The IPv6 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.43 Port 4 - Management Address MAC[n] (0x00F0 + 1\*n, n=0...2)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address MAC	0x0	The management MAC Address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.44 Port 4 - Management VLAN ID (0x00F3)

Bits	Field Name	Default NVM Value	Description
15:0	Management VLAN ID	0x0	The management VLAN ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.45 Port 5 - Chassis ID Subtype & Chassis ID length (0x00F4)

Bits	Field Name	Default NVM Value	Description
15:8	Chassis ID Subtype	0x0	The IEEE 802.1AB-2009 Chassis ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Chassis ID Length	0x0	The number of bytes from the <i>Chassis ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Chassis ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.46 Port 5 - Chassis ID[n] (0x00F5 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Chassis ID	0x0	The Chassis ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.47 Port 5 - Port ID Subtype & Port ID Length (0x0105)

Bits	Field Name	Default NVM Value	Description
15:8	Port ID Subtype	0x0	The IEEE 802.1AB-2009 Port ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Port ID Length	0x0	The number of bytes from the <i>Port ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Port ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.48 Port 5 - Port ID[n] (0x0106 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Port ID	0x0	The Port identification to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.49 Port 5 - Management Address IPv4[n] (0x0116 + 1\*n, n=0...1)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv4	0x0	The IPv4 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.50 Port 5 - Management Address IPv6[n] (0x0118 + 1\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv6	0x0	The IPv6 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.51 Port 5 - Management Address MAC[n] (0x0120 + 1\*n, n=0...2)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address MAC	0x0	The management MAC Address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.52 Port 5 - Management VLAN ID (0x0123)

Bits	Field Name	Default NVM Value	Description
15:0	Management VLAN ID	0x0	The management VLAN ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.53 Port 6 - Chassis ID Subtype & Chassis ID length (0x00124)

Bits	Field Name	Default NVM Value	Description
15:8	Chassis ID Subtype	0x0	The IEEE 802.1AB-2009 Chassis ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Chassis ID Length	0x0	The number of bytes from the <i>Chassis ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Chassis ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.54 Port 6 - Chassis ID[n] (0x0125 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Chassis ID	0x0	The Chassis ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.55 Port 6 - Port ID Subtype & Port ID Length (0x0135)

Bits	Field Name	Default NVM Value	Description
15:8	Port ID Subtype	0x0	The IEEE 802.1AB-2009 Port ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Port ID Length	0x0	The number of bytes from the <i>Port ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Port ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.56 Port 6 - Port ID[n] (0x0136 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Port ID	0x0	The Port identification to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.57 Port 6 - Management Address IPv4[n] (0x0146 + 1\*n, n=0...1)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv4	0x0	The IPv4 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.58 Port 6 - Management Address IPv6[n] (0x0148 + 1\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv6	0x0	The IPv6 management address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.59 Port 6 - Management Address MAC[n] (0x0150 + 1\*n, n=0...2)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address MAC	0x0	The management MAC Address to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.60 Port 6 - Management VLAN ID (0x0153)

Bits	Field Name	Default NVM Value	Description
15:0	Management VLAN ID	0x0	The management VLAN ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.61 Port 7 - Chassis ID Subtype & Chassis ID length (0x00154)

Bits	Field Name	Default NVM Value	Description
15:8	Chassis ID Subtype	0x0	The IEEE 802.1AB-2009 Chassis ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Chassis ID Length	0x0	The number of bytes from the <i>Chassis ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Chassis ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.62 Port 7 - Chassis ID[n] (0x0155 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Chassis ID	0x0	The Chassis ID to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.63 Port 7 - Port ID Subtype & Port ID Length (0x0165)

Bits	Field Name	Default NVM Value	Description
15:8	Port ID Subtype	0x0	The IEEE 802.1AB-2009 Port ID subtype to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.
7:0	Port ID Length	0x0	The number of bytes from the <i>Port ID</i> fields that should be used in transmitted LLDP. Value is limited by number of the Port ID words in section. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.64 Port 7 - Port ID[n] (0x0166 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:0	Port ID	0x0	The Port identification to be transmitted from this endpoint. <b>Note:</b> This field is preserved by Intel NVM Update tool.

### 6.3.49.65 Port 7 - Management Address IPv4[n] (0x0176 + 1\*n, n=0...1)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv4	0x0	The IPv4 management address to be transmitted from this endpoint. <i>Note:</i> This field is preserved by Intel NVM Update tool.

### 6.3.49.66 Port 7 - Management Address IPv6[n] (0x0178 + 1\*n, n=0...7)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address IPv6	0x0	The IPv6 management address to be transmitted from this endpoint. <i>Note:</i> This field is preserved by Intel NVM Update tool.

### 6.3.49.67 Port 7 - Management Address MAC[n] (0x0180 + 1\*n, n=0...2)

Bits	Field Name	Default NVM Value	Description
15:0	Management Address MAC	0x0	The management MAC Address to be transmitted from this endpoint. <i>Note:</i> This field is preserved by Intel NVM Update tool.

### 6.3.49.68 Port 7 - Management VLAN ID (0x0183)

Bits	Field Name	Default NVM Value	Description
15:0	Management VLAN ID	0x0	The management VLAN ID to be transmitted from this endpoint. <i>Note:</i> This field is preserved by Intel NVM Update tool.

### 6.3.49.69 Reserved[n] (0x0184 + 1\*n, n=0...123)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved	0x0	Reserved.

## 6.3.50 WA Enable TLV Section

Table 6-56. WA Enable TLV Section Summary Table

Word Offset	Description	Section Reference
0x0000	Type	6.3.50.1
0x0001	Length	6.3.50.2
0x0002	WA Enable Flags	6.3.50.3

### 6.3.50.1 Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x14E	Valid values are: 0x14E = WA Enable

### 6.3.50.2 Length (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 2 First Section -> Word: WA Enable TLV -> Type Last Section -> Word: WA Enable TLV -> WA Enable Flags

### 6.3.50.3 WA Enable Flags (0x0002)

Bits	Field Name	Default NVM Value	Description
15:1	Reserved	0x0	Reserved
0	WAKE_N is OD	0b	WAKE_N is Open Drain 0b = Disabled - WAKE_N pin is not implemented as Open Drain. Firmware will disable pin output when wake event isn't triggered. 1b = Enabled - WAKE_N pin is implemented Open Drain. Pin remains with output enable. <b>Note:</b> When 0 the NVM should contain an auto-load setting OE_OVER for the WAKE_N pin.

### 6.3.51 FRU Data Section

Table 6-57. FRU Data Section Summary Table

Word Offset	Description	Section Reference
0x0000	Type	6.3.51.1
0x0001	Length	6.3.51.2
0x0002	Actual Section Length	6.3.51.3
0x0003	Board Serial Number Size	6.3.51.4
0x0004 + 1*n, n=0...6	Board Serial Number	6.3.51.5
0x000B	Board Part Number Size	6.3.51.6
0x000C + 1*n, n=0...4	Board Part Number	6.3.51.7
0x0011	Board Product Name Size	6.3.51.8
0x0012 + 1*n, n=0...15	Board Product Name	6.3.51.9
0x0022	Board Manufacturing Date Size	6.3.51.10
0x0023 + 1*n, n=0...1	Board Manufacturing Date	6.3.51.11
0x0025 + 1*n, n=0...474	Reserved	6.3.51.12

#### 6.3.51.1 Type (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Type	0x14F	

#### 6.3.51.2 Length (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: FRU Data -> Type Last Section -> Word: FRU Data -> Reserved 474

#### 6.3.51.3 Actual Section Length (0x0002)

Bits	Field Name	Default NVM Value	Description
15:0	Actual Section Length	0x22	

### 6.3.51.4 Board Serial Number Size (0x0003)

Bits	Field Name	Default NVM Value	Description
15:8	Type	0x1	
7:0	Size in Bytes	0xE	

### 6.3.51.5 Board Serial Number[n] (0x0004 + 1\*n, n=0...6)

Bits	Field Name	Default NVM Value	Description
15:8	Byte 1	0x20	
7:0	Byte 0	0x20	

### 6.3.51.6 Board Part Number Size (0x000B)

Bits	Field Name	Default NVM Value	Description
15:8	Type	0x2	
7:0	Size in Bytes	0x9	

### 6.3.51.7 Board Part Number[n] (0x000C + 1\*n, n=0...4)

Bits	Field Name	Default NVM Value	Description
15:8	Byte 1	0x20	
7:0	Byte 0	0x20	

### 6.3.51.8 Board Product Name Size (0x0011)

Bits	Field Name	Default NVM Value	Description
15:8	Type	0x3	
7:0	Size in Bytes	0x20	

### 6.3.51.9 Board Product Name[n] (0x0012 + 1\*n, n=0...15)

Bits	Field Name	Default NVM Value	Description
15:8	Byte 1	0x20	
7:0	Byte 0	0x20	

### 6.3.51.10 Board Manufacturing Date Size (0x0022)

Bits	Field Name	Default NVM Value	Description
15:8	Type	0x4	
7:0	Size in Bytes	0x3	

### 6.3.51.11 Board Manufacturing Date[n] (0x0023 + 1\*n, n=0...1)

Bits	Field Name	Default NVM Value	Description
15:0	Board Manufacturing Date	0x0	

### 6.3.51.12 Reserved[n] (0x0025 + 1\*n, n=0...474)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved	0xFF	Reserved.

## 6.3.52 SyncE DPLL Input Settings Section

**Table 6-58. SyncE DPLL Input Settings Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Sub Module Type SyncE DPLL Input	6.3.52.1
0x0001	Section Length	6.3.52.2
0x0002	Entry Count and Version	6.3.52.3
0x0003	Control Flags	6.3.52.4
0x0004	Frequency LSB 0	6.3.52.5
0x0005	Frequency MSB 0	6.3.52.6
0x0006	Input and DPLL Index 0	6.3.52.7
0x0007	Node Part Number and Parameter Type 0	6.3.52.8
0x0008	Parameter Value 0	6.3.52.9
0x0009	Frequency LSB 1	6.3.52.10
0x000A	Frequency MSB 1	6.3.52.11
0x000B	Input and DPLL Index 1	6.3.52.12
0x000C	Node Part Number and Parameter Type 1	6.3.52.13
0x000D	Parameter Value 1	6.3.52.14
0x000E	Frequency LSB 2	6.3.52.15
0x000F	Frequency MSB 2	6.3.52.16
0x0010	Input and DPLL Index 2	6.3.52.17
0x0011	Node Part Number and Parameter Type 2	6.3.52.18
0x0012	Parameter Value 2	6.3.52.19
0x0013	Frequency LSB 3	6.3.52.20
0x0014	Frequency MSB 3	6.3.52.21
0x0015	Input and DPLL Index 3	6.3.52.22
0x0016	Node Part Number and Parameter Type 3	6.3.52.23
0x0017	Parameter Value 3	6.3.52.24
0x0018	Frequency LSB 4	6.3.52.25
0x0019	Frequency MSB 4	6.3.52.26
0x001A	Input and DPLL Index 4	6.3.52.27
0x001B	Node Part Number and Parameter Type 4	6.3.52.28
0x001C	Parameter Value 4	6.3.52.29
0x001D	Frequency LSB 5	6.3.52.30
0x001E	Frequency MSB 5	6.3.52.31
0x001F	Input and DPLL Index 5	6.3.52.32
0x0020	Node Part Number and Parameter Type 5	6.3.52.33
0x0021	Parameter Value 5	6.3.52.34
0x0022	Frequency LSB 6	6.3.52.35

### 6.3.52.1 Sub Module Type SyncE DPLL Input (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0x150	Valid values are: 0x150 = SyncE DPLL Input

### 6.3.52.2 Section Length (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 2 First Section -> Word: SyncE DPLL Input Settings -> Sub Module Type SyncE DPLL Input Last Section -> Word: SyncE DPLL Input Settings -> Parameter Value 63

### 6.3.52.3 Entry Count and Version (0x0002)

Bits	Field Name	Default NVM Value	Description
15:8	Version	0x0	
7:0	Entry Count	0xD	The number of entries (n).

### 6.3.52.4 Control Flags (0x0003)

Bits	Field Name	Default NVM Value	Description
15:1	Reserved	0x7FFF	Reserved.
0	Enable Flag	1b	Valid values are: 0b = BW and PSL setting is disabled. 1b = BW and PSL setting is enabled.

### 6.3.52.5 Frequency LSB 0 (0x0004)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency LSB	0x1	

### 6.3.52.6 Frequency MSB 0 (0x0005)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency MSB	0x0	

### 6.3.52.7 Input and DPLL Index 0 (0x0006)

Bits	Field Name	Default NVM Value	Description
15:8	Input Index	0xFF	The input index, 0xFF - for all inputs.
7:0	DPLL Index	0xFF	The DPLL index, 0xFF - for all DPLLs.

### 6.3.52.8 Node Part Number and Parameter Type 0 (0x0007)

Bits	Field Name	Default NVM Value	Description
15:8	Node Part Number	0x24	0x24 = ZL80032
7:0	Parameter Type	0x1	This field indicates of which parameter the <i>Parameter Value</i> field holds: 0x1 = Bandwidth (the value of <i>dpll_bw_var</i> register). 0x2 = Phase Slope Limit (the value of <i>dpll_psl</i> register). 0x3 = TIE Clear (the value of <i>dpll_ctrl_x::tie_clear</i> bit field). 0x4 = Holdover Bandwidth (the value of <i>dpll_ho_filter::bw</i> bit field).

### 6.3.52.9 Parameter Value 0 (0x0008)

Bits	Field Name	Default NVM Value	Description
15:0	Parameter Value	0x4F	The value of the parameter specified in the <i>Parameter Type</i> field of Node Part Number and Parameter Type register.

### 6.3.52.10 Frequency LSB 1 (0x0009)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency LSB	0x1	

### 6.3.52.11 Frequency MSB 1 (0x000A)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency MSB	0x0	

### 6.3.52.12 Input and DPLL Index 1 (0x000B)

Bits	Field Name	Default NVM Value	Description
15:8	Input Index	0xFF	The input index, 0xFF - for all inputs.
7:0	DPLL Index	0xFF	The DPLL index, 0xFF - for all DPLLs.

### 6.3.52.13 Node Part Number and Parameter Type 1 (0x000C)

Bits	Field Name	Default NVM Value	Description
15:8	Node Part Number	0x24	0x24 = ZL80032
7:0	Parameter Type	0x2	This field indicates of which parameter the <i>Parameter Value</i> field holds: 0x1 = Bandwidth (the value of <i>dpll_bw_var</i> register). 0x2 = Phase Slope Limit (the value of <i>dpll_psl</i> register). 0x3 = TIE Clear (the value of <i>dpll_ctrl_x::tie_clear</i> bit field). 0x4 = Holdover Bandwidth (the value of <i>dpll_ho_filter::bw</i> bit field).

### 6.3.52.14 Parameter Value 1 (0x000D)

Bits	Field Name	Default NVM Value	Description
15:0	Parameter Value	0x375	The value of the parameter specified in the <i>Parameter Type</i> field of Node Part Number and Parameter Type register.

### 6.3.52.15 Frequency LSB 2 (0x000E)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency LSB	0x9680	

### 6.3.52.16 Frequency MSB 2 (0x000F)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency MSB	0x98	

### 6.3.52.17 Input and DPLL Index 2 (0x0010)

Bits	Field Name	Default NVM Value	Description
15:8	Input Index	0xFF	The input index, 0xFF - for all inputs.
7:0	DPLL Index	0xFF	The DPLL index, 0xFF - for all DPLLs.

### 6.3.52.18 Node Part Number and Parameter Type 2 (0x0011)

Bits	Field Name	Default NVM Value	Description
15:8	Node Part Number	0x24	0x24 = ZL80032
7:0	Parameter Type	0x1	This field indicates of which parameter the <i>Parameter Value</i> field holds: 0x1 = Bandwidth (the value of <i>dpll_bw_var</i> register). 0x2 = Phase Slope Limit (the value of <i>dpll_psl</i> register). 0x3 = TIE Clear (the value of <i>dpll_ctrl_x::tie_clear</i> bit field). 0x4 = Holdover Bandwidth (the value of <i>dpll_ho_filter::bw</i> bit field).

### 6.3.52.19 Parameter Value 2 (0x0012)

Bits	Field Name	Default NVM Value	Description
15:0	Parameter Value	0x81	The value of the parameter specified in the <i>Parameter Type</i> field of Node Part Number and Parameter Type register.

### 6.3.52.20 Frequency LSB 3 (0x0013)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency LSB	0x9680	

### 6.3.52.21 Frequency MSB 3 (0x0014)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency MSB	0x98	

### 6.3.52.22 Input and DPLL Index 3 (0x0015)

Bits	Field Name	Default NVM Value	Description
15:8	Input Index	0xFF	The input index, 0xFF - for all inputs.
7:0	DPLL Index	0xFF	The DPLL index, 0xFF - for all DPLLs.

### 6.3.52.23 Node Part Number and Parameter Type 3 (0x0016)

Bits	Field Name	Default NVM Value	Description
15:8	Node Part Number	0x24	0x24 = ZL80032
7:0	Parameter Type	0x2	This field indicates of which parameter the <i>Parameter Value</i> field holds: 0x1 = Bandwidth (the value of <i>dpll_bw_var</i> register). 0x2 = Phase Slope Limit (the value of <i>dpll_psl</i> register). 0x3 = TIE Clear (the value of <i>dpll_ctrl_x::tie_clear</i> bit field). 0x4 = Holdover Bandwidth (the value of <i>dpll_ho_filter::bw</i> bit field).

### 6.3.52.24 Parameter Value 3 (0x0017)

Bits	Field Name	Default NVM Value	Description
15:0	Parameter Value	0x1D4C	The value of the parameter specified in the <i>Parameter Type</i> field of Node Part Number and Parameter Type register.

### 6.3.52.25 Frequency LSB 4 (0x0018)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency LSB	0xCD65	

### 6.3.52.26 Frequency MSB 4 (0x0019)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency MSB	0x1D	

### 6.3.52.27 Input and DPLL Index 4 (0x001A)

Bits	Field Name	Default NVM Value	Description
15:8	Input Index	0xFF	The input index, 0xFF - for all inputs.
7:0	DPLL Index	0xFF	The DPLL index, 0xFF - for all DPLLs.

### 6.3.52.28 Node Part Number and Parameter Type 4 (0x001B)

Bits	Field Name	Default NVM Value	Description
15:8	Node Part Number	0x24	0x24 = ZL80032
7:0	Parameter Type	0x1	This field indicates of which parameter the <i>Parameter Value</i> field holds: 0x1 = Bandwidth (the value of <i>dppll_bw_var</i> register). 0x2 = Phase Slope Limit (the value of <i>dppll_psl</i> register). 0x3 = TIE Clear (the value of <i>dppll_ctrl_x::tie_clear</i> bit field). 0x4 = Holdover Bandwidth (the value of <i>dppll_ho_filter::bw</i> bit field).

### 6.3.52.29 Parameter Value 4 (0x001C)

Bits	Field Name	Default NVM Value	Description
15:0	Parameter Value	0x81	The value of the parameter specified in the <i>Parameter Type</i> field of Node Part Number and Parameter Type register.

### 6.3.52.30 Frequency LSB 5 (0x001D)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency LSB	0xCD65	

### 6.3.52.31 Frequency MSB 5 (0x001E)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency MSB	0x1D	

### 6.3.52.32 Input and DPLL Index 5 (0x001F)

Bits	Field Name	Default NVM Value	Description
15:8	Input Index	0xFF	The input index, 0xFF - for all inputs.
7:0	DPLL Index	0xFF	The DPLL index, 0xFF - for all DPLLs.

### 6.3.52.33 Node Part Number and Parameter Type 5 (0x0020)

Bits	Field Name	Default NVM Value	Description
15:8	Node Part Number	0x24	0x24 = ZL80032
7:0	Parameter Type	0x2	This field indicates of which parameter the <i>Parameter Value</i> field holds: 0x1 = Bandwidth (the value of <i>dpll_bw_var</i> register). 0x2 = Phase Slope Limit (the value of <i>dpll_psl</i> register). 0x3 = TIE Clear (the value of <i>dpll_ctrl_x::tie_clear</i> bit field). 0x4 = Holdover Bandwidth (the value of <i>dpll_ho_filter::bw</i> bit field).

### 6.3.52.34 Parameter Value 5 (0x0021)

Bits	Field Name	Default NVM Value	Description
15:0	Parameter Value	0x1D4C	The value of the parameter specified in the <i>Parameter Type</i> field of Node Part Number and Parameter Type register.

### 6.3.52.35 Frequency LSB 6 (0x0022)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency LSB	0x1	

### 6.3.52.36 Frequency MSB 6 (0x0023)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency MSB	0x0	

### 6.3.52.37 Input and DPLL Index 6 (0x0024)

Bits	Field Name	Default NVM Value	Description
15:8	Input Index	0xFF	The input index, 0xFF - for all inputs.
7:0	DPLL Index	0xFF	The DPLL index, 0xFF - for all DPLLs.

### 6.3.52.38 Node Part Number and Parameter Type 6 (0x0025)

Bits	Field Name	Default NVM Value	Description
15:8	Node Part Number	0x24	0x24 = ZL80032
7:0	Parameter Type	0x4	This field indicates of which parameter the <i>Parameter Value</i> field holds: 0x1 = Bandwidth (the value of <i>dppl_bw_var</i> register). 0x2 = Phase Slope Limit (the value of <i>dppl_psl</i> register). 0x3 = TIE Clear (the value of <i>dppl_ctrl_x::tie_clear</i> bit field). 0x4 = Holdover Bandwidth (the value of <i>dppl_ho_filter::bw</i> bit field).

### 6.3.52.39 Parameter Value 6 (0x0026)

Bits	Field Name	Default NVM Value	Description
15:0	Parameter Value	0xE	The value of the parameter specified in the <i>Parameter Type</i> field of Node Part Number and Parameter Type register.

### 6.3.52.40 Frequency LSB 7 (0x0027)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency LSB	0xCD65	

### 6.3.52.41 Frequency MSB 7 (0x0028)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency MSB	0x1D	

### 6.3.52.42 Input and DPLL Index 7 (0x0029)

Bits	Field Name	Default NVM Value	Description
15:8	Input Index	0xFF	The input index, 0xFF - for all inputs.
7:0	DPLL Index	0xFF	The DPLL index, 0xFF - for all DPLLs.

### 6.3.52.43 Node Part Number and Parameter Type 7 (0x002A)

Bits	Field Name	Default NVM Value	Description
15:8	Node Part Number	0x24	0x24 = ZL80032
7:0	Parameter Type	0x4	This field indicates of which parameter the <i>Parameter Value</i> field holds: 0x1 = Bandwidth (the value of <i>dpll_bw_var</i> register). 0x2 = Phase Slope Limit (the value of <i>dpll_psl</i> register). 0x3 = TIE Clear (the value of <i>dpll_ctrl_x::tie_clear</i> bit field). 0x4 = Holdover Bandwidth (the value of <i>dpll_ho_filter::bw</i> bit field).

### 6.3.52.44 Parameter Value 7 (0x002B)

Bits	Field Name	Default NVM Value	Description
15:0	Parameter Value	0x8	The value of the parameter specified in the <i>Parameter Type</i> field of Node Part Number and Parameter Type register.

### 6.3.52.45 Frequency LSB 8 (0x002C)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency LSB	0x9680	

### 6.3.52.46 Frequency MSB 8 (0x002D)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency MSB	0x98	

### 6.3.52.47 Input and DPLL Index 8 (0x002E)

Bits	Field Name	Default NVM Value	Description
15:8	Input Index	0xFF	The input index, 0xFF - for all inputs.
7:0	DPLL Index	0x0	The DPLL index, 0xFF - for all DPLLs.

### 6.3.52.48 Node Part Number and Parameter Type 8 (0x002F)

Bits	Field Name	Default NVM Value	Description
15:8	Node Part Number	0x24	0x24 = ZL80032
7:0	Parameter Type	0x4	This field indicates of which parameter the <i>Parameter Value</i> field holds: 0x1 = Bandwidth (the value of <i>dppll_bw_var</i> register). 0x2 = Phase Slope Limit (the value of <i>dppll_psl</i> register). 0x3 = TIE Clear (the value of <i>dppll_ctrl_x::tie_clear</i> bit field). 0x4 = Holdover Bandwidth (the value of <i>dppll_ho_filter::bw</i> bit field).

### 6.3.52.49 Parameter Value 8 (0x0030)

Bits	Field Name	Default NVM Value	Description
15:0	Parameter Value	0x8	The value of the parameter specified in the <i>Parameter Type</i> field of Node Part Number and Parameter Type register.

### 6.3.52.50 Frequency LSB 9 (0x0031)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency LSB	0x9680	

### 6.3.52.51 Frequency MSB 9 (0x0032)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency MSB	0x98	

### 6.3.52.52 Input and DPLL Index 9 (0x0033)

Bits	Field Name	Default NVM Value	Description
15:8	Input Index	0xFF	The input index, 0xFF - for all inputs.
7:0	DPLL Index	0x1	The DPLL index, 0xFF - for all DPLLs.

### 6.3.52.53 Node Part Number and Parameter Type 9 (0x0034)

Bits	Field Name	Default NVM Value	Description
15:8	Node Part Number	0x24	0x24 = ZL80032
7:0	Parameter Type	0x4	This field indicates of which parameter the <i>Parameter Value</i> field holds: 0x1 = Bandwidth (the value of <i>dpll_bw_var</i> register). 0x2 = Phase Slope Limit (the value of <i>dpll_psl</i> register). 0x3 = TIE Clear (the value of <i>dpll_ctrl_x::tie_clear</i> bit field). 0x4 = Holdover Bandwidth (the value of <i>dpll_ho_filter::bw</i> bit field).

### 6.3.52.54 Parameter Value 9 (0x0035)

Bits	Field Name	Default NVM Value	Description
15:0	Parameter Value	0xE	The value of the parameter specified in the <i>Parameter Type</i> field of Node Part Number and Parameter Type register.

### 6.3.52.55 Frequency LSB 10 (0x0036)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency LSB	0x3E8	

### 6.3.52.56 Frequency MSB 10 (0x0037)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency MSB	0x0	

### 6.3.52.57 Input and DPLL Index 10 (0x0038)

Bits	Field Name	Default NVM Value	Description
15:8	Input Index	0xFF	The input index, 0xFF - for all inputs.
7:0	DPLL Index	0xFF	The DPLL index, 0xFF - for all DPLLs.

### 6.3.52.58 Node Part Number and Parameter Type 10 (0x0039)

Bits	Field Name	Default NVM Value	Description
15:8	Node Part Number	0x24	0x24 = ZL80032
7:0	Parameter Type	0x4	This field indicates of which parameter the <i>Parameter Value</i> field holds: 0x1 = Bandwidth (the value of <i>dppll_bw_var</i> register). 0x2 = Phase Slope Limit (the value of <i>dppll_psl</i> register). 0x3 = TIE Clear (the value of <i>dppll_ctrl_x::tie_clear</i> bit field). 0x4 = Holdover Bandwidth (the value of <i>dppll_ho_filter::bw</i> bit field).

### 6.3.52.59 Parameter Value 10 (0x003A)

Bits	Field Name	Default NVM Value	Description
15:0	Parameter Value	0xE	The value of the parameter specified in the <i>Parameter Type</i> field of Node Part Number and Parameter Type register.

### 6.3.52.60 Frequency LSB 11 (0x003B)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency LSB	0xFFFF	

### 6.3.52.61 Frequency MSB 11 (0x003C)

Bits	Field Name	Default NVM Value	Description
15:0	Frequency MSB	0xFFFF	

### 6.3.52.62 Input and DPLL Index 11 (0x003D)

Bits	Field Name	Default NVM Value	Description
15:8	Input Index	0xFF	The input index, 0xFF - for all inputs.
7:0	DPLL Index	0xFF	The DPLL index, 0xFF - for all DPLLs.

### 6.3.52.63 Node Part Number and Parameter Type 11 (0x003E)

Bits	Field Name	Default NVM Value	Description
15:8	Node Part Number	0xFF	0x24 = ZL80032
7:0	Parameter Type	0xFF	This field indicates of which parameter the <i>Parameter Value</i> field holds: 0x1 = Bandwidth (the value of <i>dppl_bw_var</i> register). 0x2 = Phase Slope Limit (the value of <i>dppl_psl</i> register). 0x3 = TIE Clear (the value of <i>dppl_ctrl_x::tie_clear</i> bit field). 0x4 = Holdover Bandwidth (the value of <i>dppl_ho_filter::bw</i> bit field).

### 6.3.52.64 Parameter Value 11 (0x003F)

Bits	Field Name	Default NVM Value	Description
15:0	Parameter Value	0xFFFF	The value of the parameter specified in the <i>Parameter Type</i> field of Node Part Number and Parameter Type register.

## 6.3.53 Padding Module Section

Table 6-59. Padding Module Section Summary Table

Word Offset	Description	Section Reference
0x0000	Sub Module Type - Padding	6.3.53.1
0x0001	Length	6.3.53.2
0x0002	Padding	6.3.53.3

### 6.3.53.1 Sub Module Type - Padding (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Sub Module Type	0xFFFF	Valid values are: 0xFFFF - Padding Module

### 6.3.53.2 Length (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: Padding module -> Sub Module Type - Padding Last Section -> Word: Padding module -> Padding

### 6.3.53.3 Padding (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	[New Field]	0xFFFF	

## 6.3.54 PCIR Type 1/2 Section

Table 6-60. PCIR Type 1/2 Section Summary Table

Word Offset	Description	Section Reference
0x0000 - 0x0003	NVM contents for GLPCI_PWRDATA	6.3.54.1
0x0004 - 0x0008	NVM contents for GLPCI_PMSUP	6.3.54.2
0x0009 - 0x000A	NVM contents for GLPCI_REVID	6.3.54.3
0x000B - 0x000E	Reserved	6.3.54.4

### 6.3.54.1 GLPCI\_PWRDATA (0x0000 - 0x00003)

#### 6.3.54.1.1 Address Low at GLPCI\_PWRDATA (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_PWRDATA	0x9DE7C	
3:0	Type	0x1	

#### 6.3.54.1.2 Address High at GLPCI\_PWRDATA (0x000')

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLPCI_PWRDATA		

#### 6.3.54.1.3 Data Low of GLPCI\_PWRDATA (0x0002)

#### 6.3.54.1.4 Data High of GLPCI\_PWRDATA (0x0003)

### 6.3.54.2 GLPCI\_PMSUP (0x0004 - 0x0008)

#### 6.3.54.2.1 Starting Address Low at GLPCI\_PMSUP (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_PMSUP	0x9DE94	
3:0	Type	0x2	

### 6.3.54.2.2 Starting Address High at GLPCI\_PMSUP (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLPCI_PMSUP		

### 6.3.54.2.3 Attributes at GLPCI\_PMSUP (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x2	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.54.2.4 Data Low of GLPCI\_PMSUP (0x0007)

### 6.3.54.2.5 Data High of GLPCI\_PMSUP (0x0008)

## 6.3.54.3 GLPCI\_REVID (0x0009 - 0x000A)

### 6.3.54.3.1 Data Low of GLPCI\_REVID (0x0009)

### 6.3.54.3.2 Data High of GLPCI\_REVID (0x000A)

### 6.3.54.4 Reserved (0x000B - 0x000E)

## 6.3.55 POR Type 1/2 Section

Table 6-61. POR Type 1/2 Section Summary Table

Word Offset	Description	Section Reference
0x0000 - 0x0021	Reserved	6.3.55.1

### 6.3.55.1 Reserved (0x0000 - 0x0021)

## 6.3.56 CORER Registers Auto-Load Module Section

Default setup to registers and internal memories that load on CORER events.

**Table 6-62. CORER Registers Auto-Load Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Module Length	6.3.56.1
0x0001 - 0x0013	NVM contents for PRT_TDPUL2TAGSEN	6.3.56.2
0x0014 - 0x0026	NVM contents for GL_SWT_L2TAGTXIB	6.3.56.3
0x0027 - 0x0039	NVM contents for GL_SWT_L2TAGRXEB	6.3.56.4
0x003A - 0x003D	NVM contents for GL_RDPU_CNTRL	6.3.56.5
0x003E - 0x0050	NVM contents for PFLAN_DB_QALLOC	6.3.56.6
0x0051 - 0x0063	NVM contents for PFLAN_CP_QALLOC	6.3.56.7
0x0064 - 0x0067	NVM contents for GLDCB_GENC	6.3.56.8
0x0068 - 0x018F	Reserved	6.3.56.9
0x0190 - 0x0194	NVM contents for GLTSYN_SYNC_DLAY	6.3.56.10
0x0195 - 0x0196	NVM contents for GLTSYN_HH_DLAY	6.3.56.11
0x0197 - 0x019B	NVM contents for GLTPB_PACING_25G	6.3.56.12
0x019C - 0x019D	NVM contents for GLTPB_PACING_10G	6.3.56.13
0x019E - 0x019F	NVM contents for GLTPB_PORT_PACING_SPEED	6.3.56.14
0x01A0 - 0x01A7	Reserved	6.3.56.15
0x01A8 - 0x01CA	NVM contents for GLRPB_DHW	6.3.56.16
0x01CB - 0x01ED	NVM contents for GLRPB_DLW	6.3.56.17
0x01EE - 0x020D	NVM contents for GLRPB_DPS	6.3.56.18
0x020E - 0x021D	NVM contents for GLRPB_SPS	6.3.56.19
0x021E - 0x0230	NVM contents for GLRPB_SHW	6.3.56.20
0x0231 - 0x0240	NVM contents for GLRPB_SLW	6.3.56.21
0x0241 - 0x0244	Reserved	6.3.56.22
0x0245 - 0x0287	NVM contents for GLRPB_TCHW	6.3.56.23
0x0288 - 0x02C7	NVM contents for GLRPB_TCLW	6.3.56.24
0x02C8 - 0x02DA	NVM contents for PRTDCB_TCUPM_REG_PE_HB_DTHR	6.3.56.25
0x02DB - 0x02ED	NVM contents for PRTDCB_TCUPM_WAIT_PFC_PE_HB_DTHR	6.3.56.26
0x02EE - 0x0330	NVM contents for TCDCB_TCUPM_WAIT_PE_HB_DTHR	6.3.56.27
0x0331 - 0x0335	NVM contents for GLDCB_TCUPM_NO_EXCEED_DIS	6.3.56.28
0x0336 - 0x0337	NVM contents for GLDCB_TCUPM_WB_DIS	6.3.56.29
0x0338 - 0x034A	NVM contents for GLHMC_PFPESDPART_FPMAT	6.3.56.30
0x034B - 0x038D	NVM contents for GLHMC_VFSDPART_FPMAT	6.3.56.31
0x038E - 0x03D0	NVM contents for GLDCB_RETSTCC	6.3.56.32
0x03D1 - 0x03E3	NVM contents for PRTDCB_RPPMC	6.3.56.33
0x03E4 - 0x03E8	NVM contents for GLDCB_RSPMC	6.3.56.34

**Table 6-62. CORER Registers Auto-Load Module Section Summary Table [continued]**

0x526B	ANA_MERGE Data	6.3.56.115

### 6.3.56.1 Module Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1 First Section -> Word: CORER Registers Auto-Load Module -> Module Length Last Section -> Word: CORER Registers Auto-Load Module -> ANA_MERGE Data

### 6.3.56.2 PRT\_TDPUL2TAGSEN (0x0001 - 0x0013)

#### 6.3.56.2.1 Starting Address Low at PRT\_TDPUL2TAGSEN (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PRT_TDPUL2TAGSEN, for PRT[0]	0x40BA0	
3:0	Type	0x2	

#### 6.3.56.2.2 Starting Address High at PRT\_TDPUL2TAGSEN (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PRT_TDPUL2TAGSEN, for PRT[0]		

#### 6.3.56.2.3 Attributes at PRT\_TDPUL2TAGSEN (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.56.2.4 Data Low of PRT\_TDPUL2TAGSEN[PRT] (0x0004 + 2\*PRT, PRT=0...7)**

**6.3.56.2.5 Data High of PRT\_TDPUL2TAGSEN[PRT] (0x0005 + 2\*PRT, PRT=0...7)**

**6.3.56.3 GL\_SWT\_L2TAGTXIB (0x0014 - 0x0026)**

**6.3.56.3.1 Starting Address Low at GL\_SWT\_L2TAGTXIB (0x0014)**

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_SWT_L2TAGTXIB	0x492E8	
3:0	Type		

**6.3.56.3.2 Starting Address High at GL\_SWT\_L2TAGTXIB (0x0015)**

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_SWT_L2TAGTXIB		

**6.3.56.3.3 Attributes at GL\_SWT\_L2TAGTXIB (0x0016)**

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.56.3.4 Data Low of GL\_SWT\_L2TAGTXIB[n] (0x0017 + 2\*n, n=0...7)**

**6.3.56.3.5 Data High of GL\_SWT\_L2TAGTXIB[n] (0x0018 + 2\*n, n=0...7)**

### 6.3.56.4 GL\_SWT\_L2TAGRXEB (0x0027 - 0x0039)

#### 6.3.56.4.1 Starting Address Low at GL\_SWT\_L2TAGRXEB (0x0027)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_SWT_L2TAGRXEB	0x52000	
3:0	Type	0x2	

#### 6.3.56.4.2 Starting Address High at GL\_SWT\_L2TAGRXEB (0x0028)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_SWT_L2TAGRXEB		

#### 6.3.56.4.3 Attributes at GL\_SWT\_L2TAGRXEB (0x0029)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.4.4 Data Low of GL\_SWT\_L2TAGRXEB[n] (0x002A + 2\*n, n=0...7)

#### 6.3.56.4.5 Data High of GL\_SWT\_L2TAGRXEB[n] (0x002B + 2\*n, n=0...7)

### 6.3.56.5 GL\_RDPU\_CNTRL (0x003A - 0x003D)

#### 6.3.56.5.1 Address Low at GL\_RDPU\_CNTRL (0x003A)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_RDPU_CNTRL	0x52054	
3:0	Type	0x1	

### 6.3.56.5.2 Address High at GL\_RDPU\_CNTRL (0x003B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_RDPU_CNTRL		

### 6.3.56.5.3 Reserved (0x003C - 0x003D)

### 6.3.56.6 PFLAN\_DB\_QALLOC (0x003E - 0x0050)

#### 6.3.56.6.1 Starting Address Low at PFLAN\_DB\_QALLOC (0x003E)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFLAN_DB_QALLOC, for PF[0]	0x75680	
3:0	Type	0x2	

#### 6.3.56.6.2 Starting Address High at PFLAN\_DB\_QALLOC (0x003F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFLAN_DB_QALLOC, for PF[0]		

#### 6.3.56.6.3 Attributes at PFLAN\_DB\_QALLOC (0x0040)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.6.4 Data Low of PFLAN\_DB\_QALLOC[PF] (0x0041 + 2\*PF, PF=0...7)

#### 6.3.56.6.5 Data High of PFLAN\_DB\_QALLOC[PF] (0x0042 + 2\*PF, PF=0...7)

### 6.3.56.7 PFLAN\_CP\_QALLOC (0x0051 - 0x0063)

#### 6.3.56.7.1 Starting Address Low at PFLAN\_CP\_QALLOC (0x0051)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFLAN_CP_QALLOC, for PF[0]	0x75700	
3:0	Type	0x2	

#### 6.3.56.7.2 Starting Address High at PFLAN\_CP\_QALLOC (0x0052)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFLAN_CP_QALLOC, for PF[0]		

#### 6.3.56.7.3 Attributes at PFLAN\_CP\_QALLOC (0x0053)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.7.4 Data Low of PFLAN\_CP\_QALLOC[PF] (0x0054 + 2\*PF, PF=0...7)

#### 6.3.56.7.5 Data High of PFLAN\_CP\_QALLOC[PF] (0x0055 + 2\*PF, PF=0...7)

### 6.3.56.8 GLDCB\_GENC (0x0064 - 0x0067)

#### 6.3.56.8.1 Address Low at GLDCB\_GENC (0x0064)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLDCB_GENC	0x83044	
3:0	Type	0x1	

### 6.3.56.8.2 Address High at GLDCB\_GENC (0x0065)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLDCB_GENC		

### 6.3.56.8.3 Data Low of GLDCB\_GENC (0x0066)

### 6.3.56.8.4 Data High of GLDCB\_GENC (0x0067)

### 6.3.56.9 Reserved (0x0068 - 0x018F)

### 6.3.56.10 GLTSYN\_SYNC\_DLAY (0x0190 - 0x0194)

#### 6.3.56.10.1 Starting Address Low at GLTSYN\_SYNC\_DLAY (0x0190)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLTSYN_SYNC_DLAY	0x88818	
3:0	Type	0x2	

#### 6.3.56.10.2 Starting Address High at GLTSYN\_SYNC\_DLAY (0x0191)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLTSYN_SYNC_DLAY		

#### 6.3.56.10.3 Attributes at GLTSYN\_SYNC\_DLAY (0x0192)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x2	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.10.4 Data Low of GLTSYN\_SYNC\_DLAY (0x0193)

#### 6.3.56.10.5 Data High of GLTSYN\_SYNC\_DLAY (0x0194)

### 6.3.56.11 GLTSYN\_HH\_DLAY (0x0195 - 0x0196)

#### 6.3.56.11.1 Data Low of GLTSYN\_HH\_DLAY (0x0195)

#### 6.3.56.11.2 Data High of GLTSYN\_HH\_DLAY (0x0196)

### 6.3.56.12 GLTPB\_PACING\_25G (0x0197 - 0x019B)

#### 6.3.56.12.1 Starting Address Low at GLTPB\_PACING\_25G (0x0197)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLTPB_PACING_25G	0x994E0	
3:0	Type	0x2	

#### 6.3.56.12.2 Starting Address High at GLTPB\_PACING\_25G (0x0198)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLTPB_PACING_25G		

#### 6.3.56.12.3 Attributes at GLTPB\_PACING\_25G (0x0199)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x3	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.12.4 Data Low of GLTPB\_PACING\_25G (0x019A)

#### 6.3.56.12.5 Data High of GLTPB\_PACING\_25G (0x019B)

### 6.3.56.13 GLTPB\_PACING\_10G (0x019C - 0x019D)

#### 6.3.56.13.1 Data Low of GLTPB\_PACING\_10G (0x019C)

#### 6.3.56.13.2 Data High of GLTPB\_PACING\_10G (0x019D)

### 6.3.56.14 GLTPB\_PORT\_PACING\_SPEED (0x019E - 0x019F)

#### 6.3.56.14.1 Data Low of GLTPB\_PORT\_PACING\_SPEED (0x019E)

#### 6.3.56.14.2 Data High of GLTPB\_PORT\_PACING\_SPEED (0x019F)

### 6.3.56.15 Reserved (0x01A0 - 0x01A7)

### 6.3.56.16 GLRPB\_DHW (0x01A8 - 0x01CA)

#### 6.3.56.16.1 Starting Address Low at GLRPB\_DHW (0x01A8)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLRPB_DHW	0xAC000	
3:0	Type	0x2	

#### 6.3.56.16.2 Starting Address High at GLRPB\_DHW (0x01A9)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLRPB_DHW		

#### 6.3.56.16.3 Attributes at GLRPB\_DHW (0x01AA)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x10	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.16.4 Data Low of GLRPB\_DHW[n] (0x01AB + 2\*n, n=0...15)

#### 6.3.56.16.5 Data High of GLRPB\_DHW[n] (0x01AC + 2\*n, n=0...15)

### 6.3.56.17 GLRPB\_DLW (0x01CB - 0x01ED)

#### 6.3.56.17.1 Starting Address Low at GLRPB\_DLW (0x01CB)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLRPB_DLW	0xAC044	
3:0	Type	0x2	

#### 6.3.56.17.2 Starting Address High at GLRPB\_DLW (0x01CC)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLRPB_DLW		

#### 6.3.56.17.3 Attributes at GLRPB\_DLW (0x01CD)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x28	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.17.4 Data Low of GLRPB\_DLW[n] (0x01CE + 2\*n, n=0...15)

#### 6.3.56.17.5 Data High of GLRPB\_DLW[n] (0x01CF + 2\*n, n=0...15)

### 6.3.56.18 GLRPB\_DPS (0x01EE - 0x020D)

#### 6.3.56.18.1 Data Low of GLRPB\_DPS[n] (0x01EE + 2\*n, n=0...15)

#### 6.3.56.18.2 Data High of GLRPB\_DPS[n] (0x01EF + 2\*n, n=0...15)

### 6.3.56.19 GLRPB\_SPS (0x020E - 0x021D)

#### 6.3.56.19.1 Data Low of GLRPB\_SPS[n] (0x020E + 2\*n, n=0...7)

#### 6.3.56.19.2 Data High of GLRPB\_SPS[n] (0x020F + 2\*n, n=0...7)

## 6.3.56.20 GLRPB\_SHW (0x021E - 0x0230)

### 6.3.56.20.1 Starting Address Low at GLRPB\_SHW (0x021E)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLRPB_SHW	0xAC120	
3:0	Type	0x2	

### 6.3.56.20.2 Starting Address High at GLRPB\_SHW (0x021F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLRPB_SHW		

### 6.3.56.20.3 Attributes at GLRPB\_SHW (0x0220)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x10	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.20.4 Data Low of GLRPB\_SHW[n] (0x0221 + 2\*n, n=0...7)

### 6.3.56.20.5 Data High of GLRPB\_SHW[n] (0x0222 + 2\*n, n=0...7)

## 6.3.56.21 GLRPB\_SLW (0x0231 - 0x0240)

### 6.3.56.21.1 Data Low of GLRPB\_SLW[n] (0x0231 + 2\*n, n=0...7)

### 6.3.56.21.2 Data High of GLRPB\_SLW[n] (0x0232 + 2\*n, n=0...7)

### 6.3.56.22 Reserved (0x0241 - 0x0244)

### 6.3.56.23 GLRPB\_TCHW (0x0245 - 0x0287)

#### 6.3.56.23.1 Starting Address Low at GLRPB\_TCHW (0x0245)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLRPB_TCHW	0xAC330	
3:0	Type	0x2	

#### 6.3.56.23.2 Starting Address High at GLRPB\_TCHW (0x0246)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLRPB_TCHW		

#### 6.3.56.23.3 Attributes at GLRPB\_TCHW (0x0247)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x40	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.23.4 Data Low of GLRPB\_TCHW[n] (0x0248 + 2\*n, n=0...31)

#### 6.3.56.23.5 Data High of GLRPB\_TCHW[n] (0x0249 + 2\*n, n=0...31)

### 6.3.56.24 GLRPB\_TCLW (0x0288 - 0x02C7)

#### 6.3.56.24.1 Data Low of GLRPB\_TCLW[n] (0x0288 + 2\*n, n=0...31)

#### 6.3.56.24.2 Data High of GLRPB\_TCLW[n] (0x0289 + 2\*n, n=0...31)

### 6.3.56.25 PRTDCB\_TCUPM\_REG\_PE\_HB\_DTHR (0x02C8 - 0x02DA)

#### 6.3.56.25.1 Starting Address Low at PRTDCB\_TCUPM\_REG\_PE\_HB\_DTHR (0x02C8)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PRTDCB_TCUPM_REG_PE_HB_DTHR, for PRT[0]	0xBC420	
3:0	Type	0x2	

#### 6.3.56.25.2 Starting Address High at PRTDCB\_TCUPM\_REG\_PE\_HB\_DTHR (0x02C9)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PRTDCB_TCUPM_REG_PE_HB_DTHR, for PRT[0]		

#### 6.3.56.25.3 Attributes at PRTDCB\_TCUPM\_REG\_PE\_HB\_DTHR (0x02CA)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.25.4 Data Low of PRTDCB\_TCUPM\_REG\_PE\_HB\_DTHR[PRT] (0x02CB + 2\*PRT, PRT=0...7)

#### 6.3.56.25.5 Data High of PRTDCB\_TCUPM\_REG\_PE\_HB\_DTHR[PRT] (0x02CC + 2\*PRT, PRT=0...7)

### 6.3.56.26 PRTDCB\_TCUPM\_WAIT\_PFC\_PE\_HB\_DTHR (0x02DB - 0x02ED)

#### 6.3.56.26.1 Starting Address Low at PRTDCB\_TCUPM\_WAIT\_PFC\_PE\_HB\_DTHR (0x02DB)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PRTDCB_TCUPM_WAIT_PFC_PE_HB_DTHR, for PRT[0]	0xBC4E0	
3:0	Type	0x2	

### 6.3.56.26.2 Starting Address High at PRTDCB\_TCUPM\_WAIT\_PFC\_PE\_HB\_DTHR (0x02DC)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PRTDCB_TCUPM_WAIT_PFC_PE_HB_DTHR, for PRT[0]		

### 6.3.56.26.3 Attributes at PRTDCB\_TCUPM\_WAIT\_PFC\_PE\_HB\_DTHR (0x02DD)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.26.4 Data Low of PRTDCB\_TCUPM\_WAIT\_PFC\_PE\_HB\_DTHR[PRT] (0x02DE + 2\*PRT, PRT=0...7)

### 6.3.56.26.5 Data High of PRTDCB\_TCUPM\_WAIT\_PFC\_PE\_HB\_DTHR[PRT] (0x02DF + 2\*PRT, PRT=0...7)

## 6.3.56.27 TCDCB\_TCUPM\_WAIT\_PE\_HB\_DTHR (0x02EE - 0x0330)

### 6.3.56.27.1 Starting Address Low at TCDCB\_TCUPM\_WAIT\_PE\_HB\_DTHR (0x02EE)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of TCDCB_TCUPM_WAIT_PE_HB_DTHR	0xBC7A0	
3:0	Type	0x2	

### 6.3.56.27.2 Starting Address High at TCDCB\_TCUPM\_WAIT\_PE\_HB\_DTHR (0x02EF)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of TCDCB_TCUPM_WAIT_PE_HB_DTHR		

### 6.3.56.27.3 Attributes at TCDCB\_TCUPM\_WAIT\_PE\_HB\_DTHR (0x02F0)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x20	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.27.4 Data Low of TCDCB\_TCUPM\_WAIT\_PE\_HB\_DTHR[n] (0x02F1 + 2\*n, n=0...31)

### 6.3.56.27.5 Data High of TCDCB\_TCUPM\_WAIT\_PE\_HB\_DTHR[n] (0x02F2 + 2\*n, n=0...31)

### 6.3.56.28 GLDCB\_TCUPM\_NO\_EXCEED\_DIS (0x0331 - 0x0335)

#### 6.3.56.28.1 Starting Address Low at GLDCB\_TCUPM\_NO\_EXCEED\_DIS (0x0331)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLDCB_TCUPM_NO_EXCEED_DIS	0xBC830	
3:0	Type	0x2	

#### 6.3.56.28.2 Starting Address High at GLDCB\_TCUPM\_NO\_EXCEED\_DIS (0x0332)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLDCB_TCUPM_NO_EXCEED_DIS		

### 6.3.56.28.3 Attributes at GLDCB\_TCUPM\_NO\_EXCEED\_DIS (0x0333)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x2	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.28.4 Data Low of GLDCB\_TCUPM\_NO\_EXCEED\_DIS (0x0334)

### 6.3.56.28.5 Data High of GLDCB\_TCUPM\_NO\_EXCEED\_DIS (0x0335)

### 6.3.56.29 GLDCB\_TCUPM\_WB\_DIS (0x0336 - 0x0337)

6.3.56.29.1 Data Low of GLDCB\_TCUPM\_WB\_DIS (0x0336)

6.3.56.29.2 Data High of GLDCB\_TCUPM\_WB\_DIS (0x0337)

### 6.3.56.30 GLHMC\_PFPESDPART\_FPMAT (0x0338 - 0x034A)

6.3.56.30.1 Starting Address Low at GLHMC\_PFPESDPART\_FPMAT (0x0338)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLHMC_PFPESDPART_FPMAT	0x100880	
3:0	Type	0x2	

6.3.56.30.2 Starting Address High at GLHMC\_PFPESDPART\_FPMAT (0x0339)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLHMC_PFPESDPART_FPMAT		

6.3.56.30.3 Attributes at GLHMC\_PFPESDPART\_FPMAT (0x033A)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

6.3.56.30.4 Data Low of GLHMC\_PFPESDPART\_FPMAT[n] (0x033B + 2\*n, n=0...7)

6.3.56.30.5 Data High of GLHMC\_PFPESDPART\_FPMAT[n] (0x033C + 2\*n, n=0...7)

### 6.3.56.31 GLHMC\_VFSDPART\_FPMAT (0x034B - 0x038D)

#### 6.3.56.31.1 Starting Address Low at GLHMC\_VFSDPART\_FPMAT (0x034B)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLHMC_VFSDPART_FPMAT	0x108800	
3:0	Type	0x2	

#### 6.3.56.31.2 Starting Address High at GLHMC\_VFSDPART\_FPMAT (0x034C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLHMC_VFSDPART_FPMAT		

#### 6.3.56.31.3 Attributes at GLHMC\_VFSDPART\_FPMAT (0x034D)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x20	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.31.4 Data Low of GLHMC\_VFSDPART\_FPMAT[n] (0x034E + 2\*n, n=0...31)

#### 6.3.56.31.5 Data High of GLHMC\_VFSDPART\_FPMAT[n] (0x034F + 2\*n, n=0...31)

### 6.3.56.32 GLDCB\_RETSTCC (0x038E - 0x03D0)

#### 6.3.56.32.1 Starting Address Low at GLDCB\_RETSTCC (0x038E)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLDCB_RETSTCC	0x122140	
3:0	Type	0x2	

### 6.3.56.32.2 Starting Address High at GLDCB\_RETSTCC (0x038F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLDCB_RETSTCC		

### 6.3.56.32.3 Attributes at GLDCB\_RETSTCC (0x0390)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x20	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.32.4 Data Low of GLDCB\_RETSTCC[n] (0x0391 + 2\*n, n=0...31)

### 6.3.56.32.5 Data High of GLDCB\_RETSTCC[n] (0x0392 + 2\*n, n=0...31)

## 6.3.56.33 PRTDCB\_RPPMC (0x03D1 - 0x03E3)

### 6.3.56.33.1 Starting Address Low at PRTDCB\_RPPMC (0x03D1)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PRTDCB_RPPMC, for PRT[0]	0x122240	
3:0	Type	0x2	

### 6.3.56.33.2 Starting Address High at PRTDCB\_RPPMC (0x03D2)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PRTDCB_RPPMC, for PRT[0]		

### 6.3.56.33.3 Attributes at PRTDCB\_RPPMC (0x03D3)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.56.33.4 Data Low of PRTDCB\_RPPMC[PRT] (0x03D4 + 2\*PRT, PRT=0)**

**6.3.56.33.5 Data High of PRTDCB\_RPPMC[PRT] (0x03D5 + 2\*PRT, PRT=0)**

**6.3.56.34 GLDCB\_RSPMC (0x03E4 - 0x03E8)**

**6.3.56.34.1 Starting Address Low at GLDCB\_RSPMC (0x03E4)**

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLDCB_RSPMC	0x1223C4	
3:0	Type	0x2	

**6.3.56.34.2 Starting Address High at GLDCB\_RSPMC (0x03E5)**

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLDCB_RSPMC		

**6.3.56.34.3 Attributes at GLDCB\_RSPMC (0x03E6)**

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x2	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.56.34.4 Data Low of GLDCB\_RSPMC (0x03E7)**

**6.3.56.34.5 Data High of GLDCB\_RSPMC (0x03E8)**

### 6.3.56.37 PFINT\_TSYN\_MSK (0x03F2 - 0x0404)

#### 6.3.56.37.1 Starting Address Low at PFINT\_TSYN\_MSK (0x03F2)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFINT_TSYN_MSK, for PF[0]	0x16C980	
3:0	Type		

#### 6.3.56.37.2 Starting Address High at PFINT\_TSYN\_MSK (0x03F3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFINT_TSYN_MSK, for PF[0]		

#### 6.3.56.37.3 Attributes at PFINT\_TSYN\_MSK (0x03F4)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.37.4 Data Low of PFINT\_TSYN\_MSK[PF] (0x03F5 + 2\*PF, PF=0...7)

#### 6.3.56.37.5 Data High of PFINT\_TSYN\_MSK[PF] (0x03F6 + 2\*PF, PF=0...7)

### 6.3.56.38 GLINT\_CTL (0x0405 - 0x0408)

#### 6.3.56.38.1 Address Low at GLINT\_CTL (0x0405)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLINT_CTL	0x16CC54	
3:0	Type	0x1	

### 6.3.56.38.2 Address High at GLINT\_CTL (0x0406)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLINT_CTL		

### 6.3.56.38.3 Data Low of GLINT\_CTL (0x0407)

### 6.3.56.38.4 Data High of GLINT\_CTL (0x0408)

## 6.3.56.39 PFGEN\_PORTNUM (0x0409 - 0x041B)

### 6.3.56.39.1 Starting Address Low at PFGEN\_PORTNUM (0x0409)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFGEN_PORTNUM, for PF[0]	0x1D2400	
3:0	Type	0x2	

### 6.3.56.39.2 Starting Address High at PFGEN\_PORTNUM (0x040A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFGEN_PORTNUM, for PF[0]		

### 6.3.56.39.3 Attributes at PFGEN\_PORTNUM (0x040B)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.39.4 Data Low of PFGEN\_PORTNUM[PF] (0x040C + 2\*PF, PF=0...7)

### 6.3.56.39.5 Data High of PFGEN\_PORTNUM[PF] (0x040D + 2\*PF, PF=0...7)

### 6.3.56.40 PF\_VT\_PFALLOC (0x041C - 0x042E)

#### 6.3.56.40.1 Starting Address Low at PF\_VT\_PFALLOC (0x041C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PF_VT_PFALLOC, for PF[0]	0x1D2480	
3:0	Type	0x2	

#### 6.3.56.40.2 Starting Address High at PF\_VT\_PFALLOC (0x041D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PF_VT_PFALLOC, for PF[0]		

#### 6.3.56.40.3 Attributes at PF\_VT\_PFALLOC (0x041E)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.40.4 Data Low of PF\_VT\_PFALLOC[PF] (0x041F + 2\*PF, PF=0...7)

#### 6.3.56.40.5 Data High of PF\_VT\_PFALLOC[PF] (0x0420 + 2\*PF, PF=0...7)

### 6.3.56.41 PFLAN\_RX\_QALLOC (0x042F - 0x0441)

#### 6.3.56.41.1 Starting Address Low at PFLAN\_RX\_QALLOC (0x042F)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFLAN_RX_QALLOC, for PF[0]	0x1D2500	
3:0	Type	0x2	

### 6.3.56.41.2 Starting Address High at PFLAN\_RX\_QALLOC (0x0430)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFLAN_RX_QALLOC, for PF[0]		

### 6.3.56.41.3 Attributes at PFLAN\_RX\_QALLOC (0x0431)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.41.4 Data Low of PFLAN\_RX\_QALLOC[PF] (0x0432 + 2\*PF, PF=0...7)

### 6.3.56.41.5 Data High of PFLAN\_RX\_QALLOC[PF] (0x0433 + 2\*PF, PF=0...7)

## 6.3.56.42 PFLAN\_TX\_QALLOC (0x0442 - 0x0454)

### 6.3.56.42.1 Starting Address Low at PFLAN\_TX\_QALLOC (0x0442)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFLAN_TX_QALLOC, for PF[0]	0x1D2580	
3:0	Type	0x2	

### 6.3.56.42.2 Starting Address High at PFLAN\_TX\_QALLOC (0x0443)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFLAN_TX_QALLOC, for PF[0]		

### 6.3.56.42.3 Attributes at PFLAN\_TX\_QALLOC (0x0444)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.56.42.4 Data Low of PFLAN\_TX\_QALLOC[PF] (0x0445 + 2\*PF, PF=0...7)**

**6.3.56.42.5 Data High of PFLAN\_TX\_QALLOC[PF] (0x0446 + 2\*PF, PF=0...7)**

**6.3.56.43 PFINT\_ALLOC (0x0455 - 0x0467)**

**6.3.56.43.1 Starting Address Low at PFINT\_ALLOC (0x0455)**

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFINT_ALLOC, for PF[0]	0x1D2600	
3:0	Type	0x2	

**6.3.56.43.2 Starting Address High at PFINT\_ALLOC (0x0456)**

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFINT_ALLOC, for PF[0]		

**6.3.56.43.3 Attributes at PFINT\_ALLOC (0x0457)**

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.56.43.4 Data Low of PFINT\_ALLOC[PF] (0x0458 + 2\*PF, PF=0...7)**

**6.3.56.43.5 Data High of PFINT\_ALLOC[PF] (0x0459 + 2\*PF, PF=0...7)**

**6.3.56.44 GL\_SWT\_L2TAGCTRL (0x0468 - 0x047A)**

**6.3.56.44.1 Starting Address Low at GL\_SWT\_L2TAGCTRL (0x0468)**

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_SWT_L2TAGCTRL	0x1D2660	
3:0	Type	0x2	

### 6.3.56.44.2 Starting Address High at GL\_SWT\_L2TAGCTRL (0x0469)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_SWT_L2TAGCTRL		

### 6.3.56.44.3 Attributes at GL\_SWT\_L2TAGCTRL (0x046A)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.44.4 Data Low of GL\_SWT\_L2TAGCTRL[n] (0x046B + 2\*n, n=0...7)

### 6.3.56.44.5 Data High of GL\_SWT\_L2TAGCTRL[n] (0x046C + 2\*n, n=0...7)

## 6.3.56.45 GLDCB\_PRS\_RETSTCC (0x047B - 0x04BD)

### 6.3.56.45.1 Starting Address Low at GLDCB\_PRS\_RETSTCC (0x047B)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLDCB_PRS_RETSTCC	0x2000B0	
3:0	Type	0x2	

### 6.3.56.45.2 Starting Address High at GLDCB\_PRS\_RETSTCC (0x047C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLDCB_PRS_RETSTCC		

### 6.3.56.45.3 Attributes at GLDCB\_PRS\_RETSTCC (0x047D)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x20	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.56.45.4 Data Low of GLDCB\_PRS\_RETSTCC[n] (0x047E + 2\*n, n=0...31)**

**6.3.56.45.5 Data High of GLDCB\_PRS\_RETSTCC[n] (0x047F + 2\*n, n=0...31)**

**6.3.56.46 GLDCB\_PRS\_RSPMC (0x04BE - 0x04C1)**

**6.3.56.46.1 Address Low at GLDCB\_PRS\_RSPMC (0x04BE)**

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLDCB_PRS_RSPMC	0x200160	
3:0	Type	0x1	

**6.3.56.46.2 Address High at GLDCB\_PRS\_RSPMC (0x04BF)**

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLDCB_PRS_RSPMC		

**6.3.56.46.3 Data Low of GLDCB\_PRS\_RSPMC (0x04C0)**

**6.3.56.46.4 Data High of GLDCB\_PRS\_RSPMC (0x04C1)**

**6.3.56.47 GLRPRS\_PMCFG\_DPS (0x04C2 - 0x04E4)**

**6.3.56.47.1 Starting Address Low at GLRPRS\_PMCFG\_DPS (0x04C2)**

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLRPRS_PMCFG_DPS	0x200308	
3:0	Type	0x2	

**6.3.56.47.2 Starting Address High at GLRPRS\_PMCFG\_DPS (0x04C3)**

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLRPRS_PMCFG_DPS		

### 6.3.56.47.3 Attributes at GLRPRS\_PMCFG\_DPS (0x04C4)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x10	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.47.4 Data Low of GLRPRS\_PMCFG\_DPS[n] (0x04C5 + 2\*n, n=0...15)

### 6.3.56.47.5 Data High of GLRPRS\_PMCFG\_DPS[n] (0x04C6 + 2\*n, n=0...15)

## 6.3.56.48 GLRPRS\_PMCFG\_DHW (0x04E5 - 0x0507)

### 6.3.56.48.1 Starting Address Low at GLRPRS\_PMCFG\_DHW (0x04E5)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLRPRS_PMCFG_DHW	0x200388	
3:0	Type	0x2	

### 6.3.56.48.2 Starting Address High at GLRPRS\_PMCFG\_DHW (0x04E6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLRPRS_PMCFG_DHW		

### 6.3.56.48.3 Attributes at GLRPRS\_PMCFG\_DHW (0x04E7)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x28	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.48.4 Data Low of GLRPRS\_PMCFG\_DHW[n] (0x04E8 + 2\*n, n=0...15)

### 6.3.56.48.5 Data High of GLRPRS\_PMCFG\_DHW[n] (0x04E9 + 2\*n, n=0...15)

### 6.3.56.49 GLRPRS\_PMCFG\_DLW (0x0508 - 0x0527)

6.3.56.49.1 Data Low of GLRPRS\_PMCFG\_DLW[n] (0x0508 + 2\*n, n=0...15)

6.3.56.49.2 Data High of GLRPRS\_PMCFG\_DLW[n] (0x0509 + 2\*n, n=0...15)

### 6.3.56.50 GLRPRS\_PMCFG\_SPS (0x0528 - 0x0537)

6.3.56.50.1 Data Low of GLRPRS\_PMCFG\_SPS[n] (0x0528 + 2\*n, n=0...7)

6.3.56.50.2 Data High of GLRPRS\_PMCFG\_SPS[n] (0x0529 + 2\*n, n=0...7)

### 6.3.56.51 GLRPRS\_PMCFG\_SHW (0x0538 - 0x054A)

#### 6.3.56.51.1 Starting Address Low at GLRPRS\_PMCFG\_SHW (0x0538)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLRPRS_PMCFG_SHW	0x200448	
3:0	Type	0x2	

#### 6.3.56.51.2 Starting Address High at GLRPRS\_PMCFG\_SHW (0x0539)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLRPRS_PMCFG_SHW		

#### 6.3.56.51.3 Attributes at GLRPRS\_PMCFG\_SHW (0x053A)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x10	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.56.51.4 Data Low of GLRPRS\_PMCFG\_SHW[n] (0x053B + 2\*n, n=0...7)**

**6.3.56.51.5 Data High of GLRPRS\_PMCFG\_SHW[n] (0x053C + 2\*n, n=0...7)**

**6.3.56.52 GLRPRS\_PMCFG\_SLW (0x054B - 0x055A)**

**6.3.56.52.1 Data Low of GLRPRS\_PMCFG\_SLW[n] (0x054B + 2\*n, n=0...7)**

**6.3.56.52.2 Data High of GLRPRS\_PMCFG\_SLW[n] (0x054C + 2\*n, n=0...7)**

**6.3.56.53 GLRPRS\_PMCFG\_TCHW (0x055B - 0x059D)**

**6.3.56.53.1 Starting Address Low at GLRPRS\_PMCFG\_TCHW (0x055B)**

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLRPRS_PMCFG_TCHW	0x200588	
3:0	Type	0x2	

**6.3.56.53.2 Starting Address High at GLRPRS\_PMCFG\_TCHW (0x055C)**

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLRPRS_PMCFG_TCHW		

**6.3.56.53.3 Attributes at GLRPRS\_PMCFG\_TCHW (0x055D)**

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x40	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.56.53.4 Data Low of GLRPRS\_PMCFG\_TCHW[n] (0x055E + 2\*n, n=0...31)**

**6.3.56.53.5 Data High of GLRPRS\_PMCFG\_TCHW[n] (0x055F + 2\*n, n=0...31)**

### 6.3.56.54 GLRPRS\_PMCFG\_TCLW (0x059E - 0x05DD)

6.3.56.54.1 Data Low of GLRPRS\_PMCFG\_TCLW[n] (0x059E + 2\*n, n=0...31)

6.3.56.54.2 Data High of GLRPRS\_PMCFG\_TCLW[n] (0x059F + 2\*n, n=0...31)

### 6.3.56.55 GL\_SWT\_LAT\_SINGLE (0x05DE - 0x05E2)

#### 6.3.56.55.1 Starting Address Low at GL\_SWT\_LAT\_SINGLE (0x05DE)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_SWT_LAT_SINGLE	0x204000	
3:0	Type	0x2	

#### 6.3.56.55.2 Starting Address High at GL\_SWT\_LAT\_SINGLE (0x05DF)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_SWT_LAT_SINGLE		

#### 6.3.56.55.3 Attributes at GL\_SWT\_LAT\_SINGLE (0x05E0)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x3	
4:3	Skip	00b	
2:0	Width	000b	

6.3.56.55.4 Data Low of GL\_SWT\_LAT\_SINGLE (0x05E1)

6.3.56.55.5 Data High of GL\_SWT\_LAT\_SINGLE (0x05E2)

### 6.3.56.56 GL\_SWT\_LAT\_DOUBLE (0x05E3 - 0x05E4)

6.3.56.56.1 Data Low of GL\_SWT\_LAT\_DOUBLE (0x05E3)

6.3.56.56.2 Data High of GL\_SWT\_LAT\_DOUBLE (0x05E4)

### 6.3.56.57 GL\_SWT\_LAT\_QUAD (0x05E5 - 0x05E6)

#### 6.3.56.57.1 Data Low of GL\_SWT\_LAT\_QUAD (0x05E5)

#### 6.3.56.57.2 Data High of GL\_SWT\_LAT\_QUAD (0x05E6)

### 6.3.56.58 Reserved (0x05E7 - 0x06FF)

### 6.3.56.59 GLDCB\_SWT\_RETSTCC (0x0700 - 0x0742)

#### 6.3.56.59.1 Starting Address Low at GLDCB\_SWT\_RETSTCC (0x0700)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLDCB_SWT_RETSTCC	0x20A040	
3:0	Type	0x2	

#### 6.3.56.59.2 Starting Address High at GLDCB\_SWT\_RETSTCC (0x0701)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLDCB_SWT_RETSTCC		

#### 6.3.56.59.3 Attributes at GLDCB\_SWT\_RETSTCC (0x0702)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x20	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.59.4 Data Low of GLDCB\_SWT\_RETSTCC[n] (0x0703 + 2\*n, n=0...31)

#### 6.3.56.59.5 Data High of GLDCB\_SWT\_RETSTCC[n] (0x0704 + 2\*n, n=0...31)

### 6.3.56.60 GL\_PSTEXT\_FORCE\_PID (0x0743 - 0x074B)

#### 6.3.56.60.1 Starting Address Low at GL\_PSTEXT\_FORCE\_PID (0x0743)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_PSTEXT_FORCE_PID	0x20E000	
3:0	Type	0x2	

#### 6.3.56.60.2 Starting Address High at GL\_PSTEXT\_FORCE\_PID (0x0744)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_PSTEXT_FORCE_PID		

#### 6.3.56.60.3 Attributes at GL\_PSTEXT\_FORCE\_PID (0x0745)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x3	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.56.60.4 Data Low of GL\_PSTEXT\_FORCE\_PID[n] (0x0746 + 2\*n, n=0...2)

#### 6.3.56.60.5 Data High of GL\_PSTEXT\_FORCE\_PID[n] (0x0747 + 2\*n, n=0...2)

### 6.3.56.61 GL\_PREEXT\_FORCE\_PID (0x074C - 0x0754)

#### 6.3.56.61.1 Starting Address Low at GL\_PREEXT\_FORCE\_PID (0x074C)

Bits	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_PREEXT_FORCE_PID	0x20F000	
3:0	Type	0x2	

### 6.3.56.61.2 Starting Address High at GL\_PREEXT\_FORCE\_PID (0x074D)

Bits	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_PREEXT_FORCE_PID		

### 6.3.56.61.3 Attributes at GL\_PREEXT\_FORCE\_PID (0x074E)

Bits	Field Name	Default NVM Value	Description
15:5	Length	0x3	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.61.4 Data Low of GL\_PREEXT\_FORCE\_PID[n] (0x074F + 2\*n, n=0...2)

### 6.3.56.61.5 Data High of GL\_PREEXT\_FORCE\_PID[n] (0x0750 + 2\*n, n=0...2)

## 6.3.56.62 GL\_ACLEXT\_FORCE\_PID (0x0755 - 0x075D)

### 6.3.56.62.1 Starting Address Low at GL\_ACLEXT\_FORCE\_PID (0x0755)

Bits	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_ACLEXT_FORCE_PID	0x210000	
3:0	Type	0x2	

### 6.3.56.62.2 Starting Address High at GL\_ACLEXT\_FORCE\_PID (0x0756)

Bits	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_ACLEXT_FORCE_PID		

### 6.3.56.62.3 Attributes at GL\_ACLEXT\_FORCE\_PID (0x0757)

Bits	Field Name	Default NVM Value	Description
15:5	Length	0x3	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.56.62.4 Data Low of GL\_ACLEXT\_FORCE\_PID[n] (0x0758 + 2\*n, n=0...2)**

**6.3.56.62.5 Data High of GL\_ACLEXT\_FORCE\_PID[n] (0x0759 + 2\*n, n=0...2)**

**6.3.56.63 GL\_SWT\_SWIDFVIDX (0x075E - 0x0761)**

**6.3.56.63.1 Address Low at GL\_SWT\_SWIDFVIDX (0x075E)**

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_SWT_SWIDFVIDX	0x214114	
3:0	Type	0x1	

**6.3.56.63.2 Address High at GL\_SWT\_SWIDFVIDX (0x075F)**

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_SWT_SWIDFVIDX		

**6.3.56.63.3 Data Low of GL\_SWT\_SWIDFVIDX (0x0760)**

**6.3.56.63.4 Data High of GL\_SWT\_SWIDFVIDX (0x0761)**

**6.3.56.64 GLLAN\_RCTL\_1 (0x0762 - 0x0765)**

**6.3.56.64.1 Address Low at GLLAN\_RCTL\_1 (0x0762)**

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLLAN_RCTL_1	0x2941FC	
3:0	Type	0x1	

**6.3.56.64.2 Address High at GLLAN\_RCTL\_1 (0x0763)**

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLLAN_RCTL_1		

### 6.3.56.64.3 Data Low of GLLAN\_RCTL\_1 (0x0764)

### 6.3.56.64.4 Data High of GLLAN\_RCTL\_1 (0x0765)

## 6.3.56.65 GLLAN\_PF\_RECIPES (0x0766 - 0x0778)

### 6.3.56.65.1 Starting Address Low at GLLAN\_PF\_RECIPES (0x0766)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLLAN_PF_RECIPES	0x29420C	
3:0	Type	0x2	

### 6.3.56.65.2 Starting Address High at GLLAN\_PF\_RECIPES (0x0767)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLLAN_PF_RECIPES		

### 6.3.56.65.3 Attributes at GLLAN\_PF\_RECIPES (0x0768)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.65.4 Data Low of GLLAN\_PF\_RECIPES[n] (0x0769 + 2\*n, n=0...7)

### 6.3.56.65.5 Data High of GLLAN\_PF\_RECIPES[n] (0x076A + 2\*n, n=0...7)

## 6.3.56.66 VPDSI\_TX\_QTABLE\_PQM (0x0779 - 0x09A8)

### 6.3.56.66.1 Starting Address Low at VPDSI\_TX\_QTABLE\_PQM (0x0779)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of VPDSI_TX_QTABLE_PQM, for VP16[0]	0x2D2800	
3:0	Type	0x2	

### 6.3.56.66.2 Starting Address High at VPDSI\_TX\_QTABLE\_PQM (0x077A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of VPDSI_TX_QTABLE_PQM, for VP16[0]		

### 6.3.56.66.3 Attributes at VPDSI\_TX\_QTABLE\_PQM (0x077B)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x110	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.67 VPLAN\_DSI\_VF\_MODE (0x097C - 0x099B)

**6.3.56.67.1 Data Low of VPLAN\_DSI\_VF\_MODE[VP16] (0x097C + 2\*VP16, VP16=0...15)**

**6.3.56.67.2 Data High of VPLAN\_DSI\_VF\_MODE[VP16] (0x097D + 2\*VP16, VP16=0...15)**

### 6.3.56.68 GLCOMM\_QUANTA\_PROF (0x099C - 0x09BE)

#### 6.3.56.68.1 Starting Address Low at GLCOMM\_QUANTA\_PROF (0x099C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLCOMM_QUANTA_PROF	0x2D2D68	
3:0	Type	0x2	

#### 6.3.56.68.2 Starting Address High at GLCOMM\_QUANTA\_PROF (0x099D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLCOMM_QUANTA_PROF		

### 6.3.56.68.3 Attributes at GLCOMM\_QUANTA\_PROF (0x099E)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x18	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.68.4 Data Low of GLCOMM\_QUANTA\_PROF[n] (0x099F + 2\*n, n=0...15)

### 6.3.56.68.5 Data High of GLCOMM\_QUANTA\_PROF[n] (0x09A0+ 2\*n, n=0...15)

### 6.3.56.69 GLCOMM\_PKT\_SHAPER\_PROF (0x09BF - 0x09CE)

#### 6.3.56.69.1 Data Low of GLCOMM\_PKT\_SHAPER\_PROF[n] (0x09BF + 2\*n, n=0...7)

#### 6.3.56.69.2 Data High of GLCOMM\_PKT\_SHAPER\_PROF[n] (0x09C0 + 2\*n, n=0...7)

### 6.3.56.70 Reserved (0x09CF - 0x09DD)

### 6.3.56.71 GL\_MDCK\_CFG1\_TX\_PQM (0x09DE - 0x09E2)

#### 6.3.56.71.1 Starting Address Low at GL\_MDCK\_CFG1\_TX\_PQM (0x09DE)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_MDCK_CFG1_TX_PQM	0x2D2DF4	
3:0	Type	0x2	

#### 6.3.56.71.2 Starting Address High at GL\_MDCK\_CFG1\_TX\_PQM (0x09DF)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_MDCK_CFG1_TX_PQM		

### 6.3.56.71.3 Attributes at GL\_MDCK\_CFG1\_TX\_PQM (0x09E0)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x3	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.71.4 Data Low of GL\_MDCK\_CFG1\_TX\_PQM (0x09E1)

### 6.3.56.71.5 Data High of GL\_MDCK\_CFG1\_TX\_PQM (0x09E2)

### 6.3.56.72 Reserved (0x09E3 - 0x09E4)

### 6.3.56.73 GL\_MDCK\_EN\_TX\_PQM (0x09E5 - 0x09E6)

#### 6.3.56.73.1 Data Low of GL\_MDCK\_EN\_TX\_PQM (0x09E5)

#### 6.3.56.73.2 Data High of GL\_MDCK\_EN\_TX\_PQM (0x09E6)

### 6.3.56.74 Reserved (0x0E7 - 0x2A2B)

### 6.3.56.75 GLQF\_FD\_SIZE (0x2A2C - 0x2A2F)

#### 6.3.56.75.1 Address Low at GLQF\_FD\_SIZE (0x2A2C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLQF_FD_SIZE	0x460010	
3:0	Type	0x1	

#### 6.3.56.75.2 Address High at GLQF\_FD\_SIZE (0x2A2D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLQF_FD_SIZE		

#### 6.3.56.75.3 Data Low of GLQF\_FD\_SIZE (0x2A2E)

#### 6.3.56.75.4 Data High of GLQF\_FD\_SIZE (0x2A2F)

## 6.3.56.76 GLHMC\_PFPESDPART (0x2A30 - 0x2A42)

### 6.3.56.76.1 Starting Address Low at GLHMC\_PFPESDPART (0x2A30)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLHMC_PFPESDPART	0x520880	
3:0	Type	0x2	

### 6.3.56.76.2 Starting Address High at GLHMC\_PFPESDPART (0x2A41)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLHMC_PFPESDPART		

### 6.3.56.76.3 Attributes at GLHMC\_PFPESDPART (0x2A32)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.76.4 Data Low of GLHMC\_PFPESDPART[n] (0x2A33 + 2\*n, n=0...7)

### 6.3.56.76.5 Data High of GLHMC\_PFPESDPART[n] (0x2A34 + 2\*n, n=0...7)

## 6.3.56.77 Reserved (0x2A43 - 0x2A46)

## 6.3.56.78 GLHMC\_VFSDPART (0x2A47 - 0x2A89)

### 6.3.56.78.1 Starting Address Low at GLHMC\_VFSDPART (0x2A47)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLHMC_VFSDPART	0x528800	
3:0	Type	0x2	

### 6.3.56.78.2 Starting Address High at GLHMC\_VFSDPART (0x2A48)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLHMC_VFSDPART		

### 6.3.56.78.3 Attributes at GLHMC\_VFSDPART (0x2A49)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x20	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.78.4 Data Low of GLHMC\_VFSDPART[n] (0x2A4A + 2\*n, n=0...31)

### 6.3.56.78.5 Data High of GLHMC\_VFSDPART[n] (0x2A4B + 2\*n, n=0...31)

## 6.3.56.79 GLCOMM\_MIN\_MAX\_PKT (0x2A8A - 0x2A8D)

### 6.3.56.79.1 Address Low at GLCOMM\_MIN\_MAX\_PKT (0x2A8A)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLCOMM_MIN_MAX_PKT	0xFC064	
3:0	Type	0x1	

### 6.3.56.79.2 Address High at GLCOMM\_MIN\_MAX\_PKT (0x2A8B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLCOMM_MIN_MAX_PKT		

### 6.3.56.79.3 Data Low of GLCOMM\_MIN\_MAX\_PKT (0x2A8C)

### 6.3.56.79.4 Data High of GLCOMM\_MIN\_MAX\_PKT (0x2A8D)

### 6.3.56.80 Reserved (0x2A8E - 0x2A8F)

### 6.3.56.81 DPU\_IMEM Attributes (0x2A90)

Part of a Type 3 structure to load the DPU\_IMEM.

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x400	
4:3	Skip	00b	
2:0	Width	010b	

### 6.3.56.82 Reserved (0x2A91 - 0x2A92)

### 6.3.56.83 DPU\_IMEM Data (0x2A93)

Raw data module length: 8192 words.

Part of a Type 3 structure to load the DPU\_IMEM.

### 6.3.56.84 Reserved (0x4A93 - 0x4A94)

### 6.3.56.85 DPU\_RECIPE\_ADDRESS Attributes (0x4A95)

Part of a Type 3 structure to load the DPU\_RECIPE\_ADDRESS.

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x100	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.86 Reserved (0x4A96 - 0x4C97)

### 6.3.56.87 DPU\_RECIPE\_ADDRESS Data (0x4A98)

Raw data module length: 512 words.

Part of a Type 3 structure to load the DPU\_RECIPE\_ADDRESS.

### 6.3.56.88 Reserved (0x4C98 - 0x4C99)

### 6.3.56.89 DPU\_RECIPE\_CAM Attributes (0x4C9A)

Part of a Type 3 structure to load the DPU\_RECIPE\_CAM.

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x100	
4:3	Skip	00b	
2:0	Width	001b	

### 6.3.56.90 Reserved (0x4C9B - 0x4C9C)

### 6.3.56.91 DPU\_RECIPE\_CAM Data (0x4C9D)

Raw data module length: 1024 words.

Part of a Type 3 structure to load the DPU\_RECIPE\_CAM.

### 6.3.56.92 Reserved (0x509D - 0x509E)

### 6.3.56.93 DPU\_RECIPE\_MASK Attributes (0x509F)

Part of a Type 3 structure to load the DPU\_RECIPE\_MASK.

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x008	
4:3	Skip	00b	
2:0	Width	001b	

### 6.3.56.94 Reserved (0x50A0 - 0x50A1)

### 6.3.56.95 DPU\_RECIPE\_MASK Data (0x50A2)

Raw data module length: 32 words.

Part of a Type 3 structure to load the DPU\_RECIPE\_MASK.

### 6.3.56.96 Reserved (0x50C2 - 0x50C3)

### 6.3.56.97 ANA\_IMEM Attributes (0x50C4)

Part of a Type 3 structure to load the DPU\_IMEM.

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x28	
4:3	Skip	00b	
2:0	Width	001b	

### 6.3.56.98 Reserved (0x50C5 - 0x50C6)

### 6.3.56.99 ANA\_IMEM Data (0x50C7)

Raw data module length: 160 words.

Part of a Type 3 structure to load the DPU\_IMEM.

### 6.3.56.100 Reserved (0x5167 - 0x5168)

### 6.3.56.101 ANA\_NH Attributes (0x5169)

Part of a Type 3 structure to load the DPU\_IMEM.

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x28	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.102 Reserved (0x516A - 0x516B)

### 6.3.56.103 ANA\_NH Data (0x516C)

Raw data module length: 80 words.

Part of a Type 3 structure to load the DPU\_IMEM.

### 6.3.56.104 Reserved (0x51BC - 0x51BD)

### 6.3.56.105 ANA\_SKIP Attributes (0x51BE)

Part of a Type 3 structure to load the DPU\_IMEM.

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x28	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.106 Reserved (0x51BF - 0x51C0)

### 6.3.56.107 ANA\_SKIP Data (0x51C1)

Raw data module length: 80 words.

Part of a Type 3 structure to load the DPU\_IMEM.

### 6.3.56.108 Reserved (0x5211 - 0x5212)

### 6.3.56.109 ANA\_REPLACE Attributes (0x5213)

Part of a Type 3 structure to load the DPU\_IMEM.

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x28	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.110 Reserved (0x5214 - 0x5215)

### 6.3.56.111 ANA\_REPLACE Data (0x5216)

Raw data module length: 80 words.

Part of a Type 3 structure to load the DPU\_IMEM.

### 6.3.56.112 Reserved (0x5266 - 0x5267)

### 6.3.56.113 ANA\_MERGE Attributes (0x5268)

Part of a Type 3 structure to load the DPU\_IMEM.

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x28	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.56.114 Reserved (0x5269 - 0x526A)

### 6.3.56.115 ANA\_MERGE Data (0x526B)

Raw data module length: 80 words.

Part of a Type 3 structure to load the DPU\_IMEM.

## 6.3.57 Mailbox Register Auto-Load Module Section

**Table 6-63. Mailbox Register Auto-Load Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Module Length	6.3.57.1
0x0001	Address Low at PF0_SB_HLP_REM_DEV_CTL	6.3.57.2

Word Offset	Description	Section Reference
0x0022	Data Low of MBX_PF_VT_PFALLOC, for PF[7]	6.3.57.35
0x0023	Data High of MBX_PF_VT_PFALLOC, for PF[7]	6.3.57.36

### 6.3.57.1 Module Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1 First Section -> Word: Mailbox Register Auto-Load Module -> Module Length Last Section -> Word: Mailbox Register Auto-Load Module -> Data High of MBX_PF_VT_PFALLOC, for PF[7]

### 6.3.57.2 Address Low at PF0\_SB\_HLP\_REM\_DEV\_CTL (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PF0_SB_HLP_REM_DEV_CTL	0x2300E8	
3:0	Type	0x1	

### 6.3.57.3 Address High at PF0\_SB\_HLP\_REM\_DEV\_CTL (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PF0_SB_HLP_REM_DEV_CTL		

### 6.3.57.4 Data Low of PF0\_SB\_HLP\_REM\_DEV\_CTL (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	DEST_EN	0x0	

### 6.3.57.5 Data High of PF0\_SB\_HLP\_REM\_DEV\_CTL (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0x0	Reserved.

### 6.3.57.6 Address Low at PF\_SB\_REM\_DEV\_CTL (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PF_SB_REM_DEV_CTL	0x2300F0	
3:0	Type	0x1	

### 6.3.57.7 Address High at PF\_SB\_REM\_DEV\_CTL (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PF_SB_REM_DEV_CTL	0x0	

### 6.3.57.8 Data Low of PF\_SB\_REM\_DEV\_CTL (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	DEST_EN	0x0	

### 6.3.57.9 Data High PF\_SB\_REM\_DEV\_CTL (0x0008)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0x0	Reserved.

### 6.3.57.10 Address Low at PF0\_SB\_CPM\_REM\_DEV\_CTL (0x0009)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PF0_SB_CPM_REM_DEV_CTL	0x2300F4	
3:0	Type	0x1	

### 6.3.57.11 Address High at PF0\_SB\_CPM\_REM\_DEV\_CTL (0x000A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PF0_SB_CPM_REM_DEV_CTL		

### 6.3.57.12 Data Low of PF0\_SB\_CPM\_REM\_DEV\_CTL (0x000B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	DEST_EN	0x0	

### 6.3.57.13 Data High of PF0\_SB\_CPM\_REM\_DEV\_CTL (0x000C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0x0	Reserved.

### 6.3.57.14 Address Low at VF\_SB\_CPM\_REM\_DEV\_CTL (0x000D)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of VF_SB_CPM_REM_DEV_CTL	0x2300EC	
3:0	Type	0x1	

### 6.3.57.15 Address High at VF\_SB\_CPM\_REM\_DEV\_CTL (0x000E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of VF_SB_CPM_REM_DEV_CTL		

### 6.3.57.16 Data Low of VF\_SB\_CPM\_REM\_DEV\_CTL (0x000F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	DEST_EN	0x0	

### 6.3.57.17 Data High of VF\_SB\_CPM\_REM\_DEV\_CTL (0x0010)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0x0	Reserved.

### 6.3.57.18 Starting Address Low at MBX\_PF\_VT\_PFALLOC, for PF[0] (0x0011)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of MBX_PF_VT_PFALLOC, for PRT[0]	0x231E80	
3:0	Type	0x2	

### 6.3.57.19 Starting Address High at MBX\_PF\_VT\_PFALLOC, for PF[0] (0x0012)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of MBX_PF_VT_PFALLOC, for PRT[0]		

### 6.3.57.20 Attributes at MBX\_PF\_VT\_PFALLOC, for PF[0] (0x0013)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	0x0	
2:0	Width	0x0	

### 6.3.57.21 Data Low of MBX\_PF\_VT\_PFALLOC, for PF[0] (0x0014)

Bit(s)	Field Name	Default NVM Value	Description
15:8	LASTVF	0x0	
7:0	FIRSTVF	0x0	

### 6.3.57.22 Data High of MBX\_PF\_VT\_PFALLOC, for PF[0] (0x0015)

Bit(s)	Field Name	Default NVM Value	Description
15	VALID	0x0	
14:0	Reserved	0x0	Reserved.

### 6.3.57.23 Data Low of MBX\_PF\_VT\_PFALLOC, for PF[1] (0x0016)

Bit(s)	Field Name	Default NVM Value	Description
15:8	LASTVF	0x0	
7:0	FIRSTVF	0x0	

### 6.3.57.24 Data High of MBX\_PF\_VT\_PFALLOC, for PF[1] (0x0017)

Bit(s)	Field Name	Default NVM Value	Description
15	VALID	0x0	
14:0	Reserved	0x0	Reserved.

### 6.3.57.25 Data Low of MBX\_PF\_VT\_PFALLOC, for PF[2] (0x0018)

Bit(s)	Field Name	Default NVM Value	Description
15:8	LASTVF	0x0	
7:0	FIRSTVF	0x0	

### 6.3.57.26 Data High of MBX\_PF\_VT\_PFALLOC, for PF[2] (0x0019)

Bit(s)	Field Name	Default NVM Value	Description
15	VALID	0x0	
14:0	Reserved	0x0	Reserved.

### 6.3.57.27 Data Low of MBX\_PF\_VT\_PFALLOC, for PF[3] (0x001A)

Bit(s)	Field Name	Default NVM Value	Description
15:8	LASTVF	0x0	
7:0	FIRSTVF	0x0	

### 6.3.57.28 Data High of MBX\_PF\_VT\_PFALLOC, for PF[3] (0x001B)

Bit(s)	Field Name	Default NVM Value	Description
15	VALID	0x0	
14:0	Reserved	0x0	Reserved.

### 6.3.57.29 Data Low of MBX\_PF\_VT\_PFALLOC, for PF[4] (0x001C)

Bit(s)	Field Name	Default NVM Value	Description
15:8	LASTVF	0x0	
7:0	FIRSTVF	0x0	

### 6.3.57.30 Data High of MBX\_PF\_VT\_PFALLOC, for PF[4] (0x001D)

Bit(s)	Field Name	Default NVM Value	Description
15	VALID	0x0	
14:0	Reserved	0x0	Reserved.

### 6.3.57.31 Data Low of MBX\_PF\_VT\_PFALLOC, for PF[5] (0x001E)

Bit(s)	Field Name	Default NVM Value	Description
15:8	LASTVF	0x0	
7:0	FIRSTVF	0x0	

### 6.3.57.32 Data High of MBX\_PF\_VT\_PFALLOC, for PF[5] (0x001F)

Bit(s)	Field Name	Default NVM Value	Description
15	VALID	0x0	
14:0	Reserved	0x0	Reserved.

### 6.3.57.33 Data Low of MBX\_PF\_VT\_PFALLOC, for PF[6] (0x0020)

Bit(s)	Field Name	Default NVM Value	Description
15:8	LASTVF	0x0	
7:0	FIRSTVF	0x0	

### 6.3.57.34 Data High of MBX\_PF\_VT\_PFALLOC, for PF[6] (0x0021)

Bit(s)	Field Name	Default NVM Value	Description
15	VALID	0x0	
14:0	Reserved	0x0	Reserved.

### 6.3.57.35 Data Low of MBX\_PF\_VT\_PFALLOC, for PF[7] (0x0022)

Bit(s)	Field Name	Default NVM Value	Description
15:8	LASTVF	0x0	
7:0	FIRSTVF	0x0	

### 6.3.57.36 Data High of MBX\_PF\_VT\_PFALLOC, for PF[7] (0x0023)

Bit(s)	Field Name	Default NVM Value	Description
15	VALID	0x0	
14:0	Reserved	0x0	Reserved.

## 6.3.58 GLOBR Registers Auto-Load Module Section

Default setup to registers that load on GLOBR events.

**Table 6-64. GLOBR Registers Auto-Load Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Module Length	6.3.58.1
0x0001 - 0x0004	NVM contents for GLGEN_MAC_LINK_TOPO	6.3.58.2
0x0005 - 0x0017	Reserved	6.3.58.3
0x0018 - 0x002A	NVM contents for PRTMAC_HSEC_CTL_RX_PAUSE_ENABLE	6.3.58.4
0x002B - 0x003A	NVM contents for PRTMAC_HSEC_CTL_TX_PAUSE_ENABLE	6.3.58.5
0x003B - 0x004A	NVM contents for PRTMAC_HSEC_CTL_RX_ENABLE_GCP	6.3.58.6
0x004B - 0x005D	NVM contents for PRTMAC_HSEC_CTL_RX_CHECK_UCAST_GCP	6.3.58.7
0x005E - 0x006D	NVM contents for PRTMAC_HSEC_CTL_RX_PAUSE_DA_UCAST_PART1	6.3.58.8
0x006E - 0x007D	NVM contents for PRTMAC_HSEC_CTL_RX_PAUSE_DA_UCAST_PART2	6.3.58.9
0x007E - 0x00E6	Reserved	6.3.58.10
0x00E7 - 0x00F9	NVM contents for PRTMAC_HSEC_CTL_RX_ENABLE_GPP	6.3.58.11
0x00FA - 0x010C	Reserved	6.3.58.12
0x010D - 0x011F	NVM contents for PRTMAC_HSEC_CTL_RX_ENABLE_PPP	6.3.58.13
0x0120 - 0x0132	Reserved	6.3.58.14
0x0133 - 0x0145	NVM contents for PRTMAC_HSEC_CTL_RX_FORWARD_CONTROL	6.3.58.15
0x0146 - 0x01D5	NVM contents for PRTMAC_HSEC_CTL_TX_PAUSE_QUANTA	6.3.58.16
0x01D6 - 0x0265	NVM contents for PRTMAC_HSEC_CTL_TX_PAUSE_REFRESH_TIMER	6.3.58.17
0x0266 - 0x0278	NVM contents for PRTMAC_HSEC_CTL_TX_SA_PART1	6.3.58.18
0x0279 - 0x0288	NVM contents for PRTMAC_HSEC_CTL_TX_SA_PART2	6.3.58.19
0x0289 - 0x02E6	Reserved	6.3.58.20
0x02E7 - 0x02F9	NVM contents for PRTPM_EEER	6.3.58.21
0x02FA - 0x0309	NVM contents for PRTPM_EEEC	6.3.58.22
0x030A - 0x0355	NVM contents for PRTDCEB_FCTTVN	6.3.58.23
0x034D - 0x035C	NVM contents for PRTDCEB_FCRTV	6.3.58.24
0x035D - 0x036F	NVM contents for PRTDCEB_FCCFG	6.3.58.25
0x0370 - 0x039F	Reserved	6.3.58.26
0x03A0	Attributes at PRTGEN_CNF2, for PRT[0]	6.3.58.27
0x03A1	Data Low of PRTGEN_CNF2, for PRT[0]	6.3.58.28
0x03A2	Data High of PRTGEN_CNF2, for PRT[0]	6.3.58.29
0x03A3	Data Low of PRTGEN_CNF2, for PRT[1]	6.3.58.30
0x03A4	Data High of PRTGEN_CNF2, for PRT[1]	6.3.58.31
0x03A5	Data Low of PRTGEN_CNF2, for PRT[2]	6.3.58.32
0x03A6	Data High of PRTGEN_CNF2, for PRT[2]	6.3.58.33
0x03A7	Data Low of PRTGEN_CNF2, for PRT[3]	6.3.58.34

**Table 6-64. GLOBR Registers Auto-Load Module Section Summary Table [continued]**

Word Offset	Description	Section Reference
0x03A8	Data High of PRTGEN_CNF2, for PRT[3]	6.3.58.35
0x03A9	Data Low of PRTGEN_CNF2, for PRT[4]	6.3.58.36
0x03AA	Data High of PRTGEN_CNF2, for PRT[4]	6.3.58.37
0x03AB	Data Low of PRTGEN_CNF2, for PRT[5]	6.3.58.38
0x03AC	Data High of PRTGEN_CNF2, for PRT[5]	6.3.58.39
0x03AD	Data Low of PRTGEN_CNF2, for PRT[6]	6.3.58.40
0x03AE	Data High of PRTGEN_CNF2, for PRT[6]	6.3.58.41
0x03AF	Data Low of PRTGEN_CNF2, for PRT[7]	6.3.58.42
0x03B0	Data High of PRTGEN_CNF2, for PRT[7]	6.3.58.43

### 6.3.58.1 Module Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1 First Section -> Word: GLOBR Registers Auto-load Module -> Module Length Last Section -> Word: GLOBR Registers Auto-load Module -> Data High of PRTGEN_CNF2, for PRT[7]

### 6.3.58.2 GLGEN\_MAC\_LINK\_TOPO (0x0001 - 0x0004)

#### 6.3.58.2.1 Address Low at GLGEN\_MAC\_LINK\_TOPO (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLGEN_MAC_LINK_TOPO	0xB81DC	
3:0	Type	0x1	

#### 6.3.58.2.2 Address High at GLGEN\_MAC\_LINK\_TOPO (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLGEN_MAC_LINK_TOPO		

#### 6.3.58.2.3 Data Low of GLGEN\_MAC\_LINK\_TOPO (0x0003)

#### 6.3.58.2.4 Data High of GLGEN\_MAC\_LINK\_TOPO (0x0004)

### 6.3.58.3 Reserved (0x0005 - 0x0017)

### 6.3.58.4 PRTMAC\_HSEC\_CTL\_RX\_PAUSE\_ENABLE (0x0018 - 0x002A)

#### 6.3.58.4.1 Starting Address Low at PRTMAC\_HSEC\_CTL\_RX\_PAUSE\_ENABLE (0x0018)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PRTMAC_HSEC_CTL_RX_PAUSE_ENABLE, for PRT[0]	0x1E3180	
3:0	Type	0x2	

#### 6.3.58.4.2 Starting Address High at PRTMAC\_HSEC\_CTL\_RX\_PAUSE\_ENABLE (0x0019)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PRTMAC_HSEC_CTL_RX_PAUSE_ENABLE, for PRT[0]		

#### 6.3.58.4.3 Attributes at PRTMAC\_HSEC\_CTL\_RX\_PAUSE\_ENABLE (0x001A)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x18	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.58.4.4 Data Low of PRTMAC\_HSEC\_CTL\_RX\_PAUSE\_ENABLE[PRT] (0x001B + 2\*PRT, PRT=0...7)

#### 6.3.58.4.5 Data High of PRTMAC\_HSEC\_CTL\_RX\_PAUSE\_ENABLE[PRT] (0x001C + 2\*PRT, PRT=0...7)

### 6.3.58.5 PRTMAC\_HSEC\_CTL\_TX\_PAUSE\_ENABLE (0x002B - 0x003A)

#### 6.3.58.5.1 Data Low of PRTMAC\_HSEC\_CTL\_TX\_PAUSE\_ENABLE[PRT] (0x002B + 2\*PRT, PRT=0...7)

#### 6.3.58.5.2 Data High of PRTMAC\_HSEC\_CTL\_TX\_PAUSE\_ENABLE[PRT] (0x002C + 2\*PRT, PRT=0...7)

### 6.3.58.6 PRTMAC\_HSEC\_CTL\_RX\_ENABLE\_GCP (0x003B - 0x004A)

6.3.58.6.1 Data Low of PRTMAC\_HSEC\_CTL\_RX\_ENABLE\_GCP[PRT] (0x003B + 2\*PRT, PRT=0...7)

6.3.58.6.2 Data High of PRTMAC\_HSEC\_CTL\_RX\_ENABLE\_GCP[PRT] (0x003C + 2\*PRT, PRT=0...7)

### 6.3.58.7 PRTMAC\_HSEC\_CTL\_RX\_CHECK\_UCAST\_GCP (0x004B - 0x005D)

6.3.58.7.1 Starting Address Low at PRTMAC\_HSEC\_CTL\_RX\_CHECK\_UCAST\_GCP (0x004B)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PRTMAC_HSEC_CTL_RX_CHECK_UCAST_GCP, for PRT[0]	0x1E3200	
3:0	Type	0x2	

6.3.58.7.2 Starting Address High at PRTMAC\_HSEC\_CTL\_RX\_CHECK\_UCAST\_GCP (0x004C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PRTMAC_HSEC_CTL_RX_CHECK_UCAST_GCP, for PRT[0]		

6.3.58.7.3 Attributes at PRTMAC\_HSEC\_CTL\_RX\_CHECK\_UCAST\_GCP (0x004D)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x20	
4:3	Skip	00b	
2:0	Width	000b	

6.3.58.7.4 Reserved (0x004E - 0x005D)

### 6.3.58.8 PRTMAC\_HSEC\_CTL\_RX\_PAUSE\_DA\_UCAST\_PART 1 (0x005E - 0x006D)

6.3.58.8.1 Data Low of PRTMAC\_HSEC\_CTL\_RX\_PAUSE\_DA\_UCAST\_PART1[PRT] (0x005E + 2\*PRT, PRT=0...7)

6.3.58.8.2 Data High of PRTMAC\_HSEC\_CTL\_RX\_PAUSE\_DA\_UCAST\_PART1[PRT] (0x005F + 2\*PRT, PRT=0...7)

### 6.3.58.9 PRTMAC\_HSEC\_CTL\_RX\_PAUSE\_DA\_UCAST\_PART 2 (0x006E - 0x007D)

6.3.58.9.1 Data Low of PRTMAC\_HSEC\_CTL\_RX\_PAUSE\_DA\_UCAST\_PART2[PRT] (0x006E + 2\*PRT, PRT=0...7)

6.3.58.9.2 Data High of PRTMAC\_HSEC\_CTL\_RX\_PAUSE\_DA\_UCAST\_PART2[PRT] (0x006F + 2\*PRT, PRT=0...7)

### 6.3.58.10 Reserved (0x007E - 0x00E6)

### 6.3.58.11 PRTMAC\_HSEC\_CTL\_RX\_ENABLE\_GPP (0x00E7 - 0x00F9)

6.3.58.11.1 Starting Address Low at PRTMAC\_HSEC\_CTL\_RX\_ENABLE\_GPP (0x00E7)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PRTMAC_HSEC_CTL_RX_ENABLE_GPP, for PRT[0]	0x1E34C0	
3:0	Type	0x2	

6.3.58.11.2 Starting Address High at PRTMAC\_HSEC\_CTL\_RX\_ENABLE\_GPP (0x00E8)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PRTMAC_HSEC_CTL_RX_ENABLE_GPP, for PRT[0]		

### 6.3.58.11.3 Attributes at PRTMAC\_HSEC\_CTL\_RX\_ENABLE\_GPP (0x00E9)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.58.11.4 Data Low of PRTMAC\_HSEC\_CTL\_RX\_ENABLE\_GPP[PRT] (0x00EA + 2\*PRT, PRT=0...7)

### 6.3.58.11.5 Data High of PRTMAC\_HSEC\_CTL\_RX\_ENABLE\_GPP[PRT] (0x00EB + 2\*PRT, PRT=0...7)

### 6.3.58.12 Reserved (0x00FA - 0x010C)

### 6.3.58.13 PRTMAC\_HSEC\_CTL\_RX\_ENABLE\_PPP (0x010D - 0x011F)

#### 6.3.58.13.1 Starting Address Low at PRTMAC\_HSEC\_CTL\_RX\_ENABLE\_PPP (0x010D)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PRTMAC_HSEC_CTL_RX_ENABLE_PPP, for PRT[0]	0x1E35C0	
3:0	Type	0x2	

#### 6.3.58.13.2 Starting Address High at PRTMAC\_HSEC\_CTL\_RX\_ENABLE\_PPP (0x010E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PRTMAC_HSEC_CTL_RX_ENABLE_PPP, for PRT[0]		

### 6.3.58.13.3 Attributes at PRTMAC\_HSEC\_CTL\_RX\_ENABLE\_PPP (0x010F)

15:0	High Address Bits of PRTPM_EEER, for PRT[0]		

### 6.3.58.21.3 Attributes at PRTPM\_EEER (0x02E9)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x10	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.58.21.4 Data Low of PRTPM\_EEER[PRT] (0x02EA + 2\*PRT, PRT=0...7)

### 6.3.58.21.5 Data High of PRTPM\_EEER[PRT] (0x02EB + 2\*PRT, PRT=0...7)

### 6.3.58.22 PRTPM\_EEEC (0x02FA - 0x0309)

#### 6.3.58.22.1 Data Low of PRTPM\_EEEC[PRT] (0x02FA + 2\*PRT, PRT=0...7)

#### 6.3.58.22.2 Data High of PRTPM\_EEEC[PRT] (0x02FB + 2\*PRT, PRT=0...7)

### 6.3.58.23 PRTDCB\_FCTTVN (0x030A - 0x0355)

#### 6.3.58.23.1 Starting Address Low at PRTDCB\_FCTTVN (0x030A)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PRTDCB_FCTTVN, for PRT[0]	0x1E4580	
3:0	Type	0x2	

#### 6.3.58.23.2 Starting Address High at PRTDCB\_FCTTVN (0x030B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PRTDCB_FCTTVN, for PRT[0]		

### 6.3.58.23.3 Attributes at PRTDCB\_FCTTVN (0x030C)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x28	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.58.23.4 Data Low of PRTDCB\_FCTTVN[n,PRT] (0x030D + 19\*n + 2\*PRT, n=0...3, PRT=0...7)

### 6.3.58.23.5 Data High of PRTDCB\_FCTTVN[n,PRT] (0x030E + 19\*n + 2\*PRT, n=0...3, PRT=0...7)

### 6.3.58.24 PRTDCB\_FCRTV (0x034D - 0x035C)

#### 6.3.58.24.1 Data Low of PRTDCB\_FCRTV[PRT] (0x034D + 2\*PRT, PRT=0...7)

#### 6.3.58.24.2 Data High of PRTDCB\_FCRTV[PRT] (0x034E + 2\*PRT, PRT=0...7)

### 6.3.58.25 PRTDCB\_FCCFG (0x035D - 0x036F)

#### 6.3.58.25.1 Starting Address Low at PRTDCB\_FCCFG (0x035D)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PRTDCB_FCCFG, for PRT[0]	0x1E4640	
3:0	Type	0x2	

#### 6.3.58.25.2 Starting Address High at PRTDCB\_FCCFG (0x035E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PRTDCB_FCCFG, for PRT[0]		

### 6.3.58.25.3 Attributes at PRTDCB\_FCCFG (0x035F)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.58.25.4 Data Low of PRTDCB\_FCCFG[PRT] (0x0360 + 2\*PRT, PRT=0...7)

### 6.3.58.25.5 Data High of PRTDCB\_FCCFG[PRT] (0x0361 + 2\*PRT, PRT=0...7)

### 6.3.58.26 Reserved (0x0370 - 0x039F)

### 6.3.58.27 Attributes at PRTGEN\_CNF2, for PRT[0] (0x03A0)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.58.28 Data Low of PRTGEN\_CNF2, for PRT[0] (0x03A1)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:1	Reserved	0x0	Reserved.
0	ACTIVATE_PORT_LINK	1b	When this field is set to 0b, the port's link is powered down. This field can be used by an application to disable the link until the software device driver is loaded and enables the link. <b>Notes:</b> 1. The PCIe functions associated with the port are not affected by the link loss. 2. Deactivating the link using this configuration is ignored when the interface is used for manageability.

### 6.3.58.29 Data High of PRTGEN\_CNF2, for PRT[0] (0x03A2)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 6.3.58.30 Data Low of PRTGEN\_CNF2, for PRT[1] (0x03A3)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:1	Reserved	0x0	Reserved.
0	ACTIVATE_PORT_LINK	1b	When this field is set to 0b, the port's link is powered down. This field can be used by an application to disable the link until the software device driver is loaded and enables the link. <b>Notes:</b> 1. The PCIe functions associated with the port are not affected by the link loss. 2. Deactivating the link using this configuration is ignored when the interface is used for manageability.

### 6.3.58.31 Data High of PRTGEN\_CNF2, for PRT[1] (0x03A4)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 6.3.58.32 Data Low of PRTGEN\_CNF2, for PRT[2] (0x03A5)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:1	Reserved	0x0	Reserved.
0	ACTIVATE_PORT_LINK	1b	When this field is set to 0b, the port's link is powered down. This field can be used by an application to disable the link until the software device driver is loaded and enables the link. <b>Notes:</b> 1. The PCIe functions associated with the port are not affected by the link loss. 2. Deactivating the link using this configuration is ignored when the interface is used for manageability.

### 6.3.58.33 Data High of PRTGEN\_CNF2, for PRT[2] (0x03A6)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 6.3.58.34 Data Low of PRTGEN\_CNF2, for PRT[3] (0x03A7)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:1	Reserved	0x0	Reserved.
0	ACTIVATE_PORT_LINK	1b	When this field is set to 0b, the port's link is powered down. This field can be used by an application to disable the link until the software device driver is loaded and enables the link. <b>Notes:</b> 1. The PCIe functions associated with the port are not affected by the link loss. 2. Deactivating the link using this configuration is ignored when the interface is used for manageability.

### 6.3.58.35 Data High of PRTGEN\_CNF2, for PRT[3] (0x03A8)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 6.3.58.36 Data Low of PRTGEN\_CNF2, for PRT[4] (0x03A9)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:1	Reserved	0x0	Reserved.
0	ACTIVATE_PORT_LINK	1b	When this field is set to 0b, the port's link is powered down. This field can be used by an application to disable the link until the software device driver is loaded and enables the link. <b>Notes:</b> 1. The PCIe functions associated with the port are not affected by the link loss. 2. Deactivating the link using this configuration is ignored when the interface is used for manageability.

### 6.3.58.37 Data High of PRTGEN\_CNF2, for PRT[4] (0x03AA)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 6.3.58.38 Data Low of PRTGEN\_CNF2, for PRT[5] (0x03AB)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:1	Reserved	0x0	Reserved.
0	ACTIVATE_PORT_LINK	1b	When this field is set to 0b, the port's link is powered down. This field can be used by an application to disable the link until the software device driver is loaded and enables the link. <b>Notes:</b> 1. The PCIe functions associated with the port are not affected by the link loss. 2. Deactivating the link using this configuration is ignored when the interface is used for manageability.

### 6.3.58.39 Data High of PRTGEN\_CNF2, for PRT[5] (0x03AC)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 6.3.58.40 Data Low of PRTGEN\_CNF2, for PRT[6] (0x03AD)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:1	Reserved	0x0	Reserved.
0	ACTIVATE_PORT_LINK	1b	When this field is set to 0b, the port's link is powered down. This field can be used by an application to disable the link until the software device driver is loaded and enables the link. <b>Notes:</b> 1. The PCIe functions associated with the port are not affected by the link loss. 2. Deactivating the link using this configuration is ignored when the interface is used for manageability.

### 6.3.58.41 Data High of PRTGEN\_CNF2, for PRT[6] (0x03AE)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

### 6.3.58.42 Data Low of PRTGEN\_CNF2, for PRT[7] (0x03AF)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:1	Reserved	0x0	Reserved.
0	ACTIVATE_PORT_LINK	1b	When this field is set to 0b, the port's link is powered down. This field can be used by an application to disable the link until the software device driver is loaded and enables the link. <b>Notes:</b> 1. The PCIe functions associated with the port are not affected by the link loss. 2. Deactivating the link using this configuration is ignored when the interface is used for manageability.

### 6.3.58.43 Data High of PRTGEN\_CNF2, for PRT[7] (0x03B0)

This register contains configuration per Ethernet port loaded from NVM.

Bits	Field Name	Default NVM Value	Description
15:0	Reserved		Reserved.

## 6.3.59 PE CORER Registers Section

Default setup to registers and internal memories that load on CORER events for PE.

**Table 6-65. PE CORER Registers Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Module Length	6.3.59.1
0x0001 - 0x0017	Reserved	6.3.59.2

### 6.3.59.1 Module Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1 First Section -> Word: PE CORER Registers -> Module Length Last Section -> Word: PE CORER Registers -> Reserved

### 6.3.59.2 Reserved (0x0001 - 0x0017)

## 6.3.60 Sideband Bus Auto-Load Section

**Table 6-66. Sideband Bus Auto-Load Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Module Length	6.3.60.1
0x0001	CDF CFIO West - Type F Word 0	6.3.60.2
0x0002	CDF CFIO West - Type F Word 1	6.3.60.3
0x0003	CDF CFIO West - Type F Word 2	6.3.60.4

### 6.3.60.1 Module Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1 First Section -> Word: Sideband Bus Auto-Load -> Module Length Last Section -> Word: Sideband Bus Auto-Load -> Manual Additions

### 6.3.60.2 CDF CFIO West - Type F Word 0 (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Subtype	0x0	
3:0	Type	0xF	

### 6.3.60.3 CDF CFIO West - Type F Word 1 (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15	R	0b	
14:12	TAG	000b	
11	AL	0b	
10:8	BAR	000b	
7:4	Select ID	0x7	
3:0	Opcode	0x7	

### 6.3.60.4 CDF CFIO West - Type F Word 2 (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Second Byte En	0x0	
11:8	First Byte En	0x2	
7:0	Function ID	0x0	

### 6.3.60.5 GBE\_SDP\_TIMESYNC0 Address Low (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x800	
3:0	Type	0x1	

### 6.3.60.6 GBE\_SDP\_TIMESYNC0 Address High (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.7 GBE\_SDP\_TIMESYNC0 Data Low (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.8 GBE\_SDP\_TIMESYNC0 Data High (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.9 GBE\_SDP\_TIMESYNC1 Address Low (0x0008)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x810	
3:0	Type	0x1	

### 6.3.60.10 GBE\_SDP\_TIMESYNC1 Address High (0x0009)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.11 GBE\_SDP\_TIMESYNC1 Data Low (0x000A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.12 GBE\_SDP\_TIMESYNC1 Data High (0x000B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.13 GBE\_SDP\_TIMESYNC2 Address Low (0x000C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x820	
3:0	Type	0x1	

### 6.3.60.14 GBE\_SDP\_TIMESYNC2 Address High (0x000D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.15 GBE\_SDP\_TIMESYNC2 Data Low (0x000E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.16 GBE\_SDP\_TIMESYNC2 Data High (0x000F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.17 GBE\_SDP\_TIMESYNC3 Address Low (0x0010)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x830	
3:0	Type	0x1	

### 6.3.60.18 GBE\_SDP\_TIMESYNC3 Address High (0x0011)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.19 GBE\_SDP\_TIMESYNC3 Data Low (0x0012)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.20 GBE\_SDP\_TIMESYNC3 Data High (0x0013)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.21 GBE0\_I2C\_CLK Address Low (0x0014)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x840	
3:0	Type	0x1	

### 6.3.60.22 GBE0\_I2C\_CLK Address High (0x0015)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.23 GBE0\_I2C\_CLK Data Low (0x0016)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.24 GBE0\_I2C\_CLK Data High (0x0017)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.25 GBE0\_I2C\_DATA Address Low (0x0018)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x850	
3:0	Type	0x1	

### 6.3.60.26 GBE0\_I2C\_DATA Address High (0x0019)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.27 GBE0\_I2C\_DATA Data Low (0x001A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.28 GBE0\_I2C\_DATA Data High (0x001B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.29 GBE1\_I2C\_CLK Address Low (0x001C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x860	
3:0	Type	0x1	

### 6.3.60.30 GBE1\_I2C\_CLK Address High (0x001D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.31 GBE1\_I2C\_CLK Data Low (0x001E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.32 GBE1\_I2C\_CLK Data High (0x001F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.33 GBE1\_I2C\_DATA Address Low (0x0020)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x870	
3:0	Type	0x1	

### 6.3.60.34 GBE1\_I2C\_DATA Address High (0x0021)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.35 GBE1\_I2C\_DATA Data Low (0x0022)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.36 GBE1\_I2C\_DATA Data High (0x0023)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.37 GBE2\_I2C\_CLK Address Low (0x0024)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x880	
3:0	Type	0x1	

### 6.3.60.38 GBE2\_I2C\_CLK Address High (0x0025)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.39 GBE2\_I2C\_CLK Data Low (0x0026)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.40 GBE2\_I2C\_CLK Data High (0x0027)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.41 GBE2\_I2C\_DATA Address Low (0x0028)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x890	
3:0	Type	0x1	

### 6.3.60.42 GBE2\_I2C\_DATA Address High (0x0029)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.43 GBE2\_I2C\_DATA Data Low (0x002A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.44 GBE2\_I2C\_DATA Data High (0x002B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.45 GBE3\_I2C\_CLK Address Low (0x002C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x8A0	
3:0	Type	0x1	

### 6.3.60.46 GBE3\_I2C\_CLK Address High (0x002D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.47 GBE3\_I2C\_CLK Data Low (0x002E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.48 GBE3\_I2C\_CLK Data High (0x002F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.49 GBE3\_I2C\_DATA Address Low (0x0030)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x8B0	
3:0	Type	0x1	

### 6.3.60.50 GBE3\_I2C\_DATA Address High (0x0031)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.51 GBE3\_I2C\_DATA Data Low (0x0032)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.52 GBE3\_I2C\_DATA Data High (0x0033)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.53 GBE0\_LED0 Address Low (0x0034)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x0C8	
3:0	Type	0x1	

### 6.3.60.54 GBE0\_LED0 Address High (0x0035)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.55 GBE0\_LED0 Data Low (0x0036)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.56 GBE0\_LED0 Data High (0x0037)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.57 GBE0\_LED1 Address Low (0x0038)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x8D0	
3:0	Type	0x1	

### 6.3.60.58 GBE0\_LED1 Address High (0x0039)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.59 GBE0\_LED1 Data Low (0x003A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.60 GBE0\_LED1 Data High (0x003B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.61 GBE0\_LED2 Address Low (0x003C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x8E0	
3:0	Type	0x1	

### 6.3.60.62 GBE0\_LED2 Address High (0x003D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.63 GBE0\_LED2 Data Low (0x003E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.64 GBE0\_LED2 Data High (0x003F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.65 GBE1\_LED0 Address Low (0x0040)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x8F0	
3:0	Type	0x1	

### 6.3.60.66 GBE1\_LED0 Address High (0x0041)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.67 GBE1\_LED0 Data Low (0x0042)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.68 GBE1\_LED0 Data High (0x0043)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.69 GBE1\_LED1 Address Low (0x0044)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x900	
3:0	Type	0x1	

### 6.3.60.70 GBE1\_LED1 Address High (0x0045)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.71 GBE1\_LED1 Data Low (0x0046)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.72 GBE1\_LED1 Data High (0x0047)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.73 GBE1\_LED2 Address Low (0x0048)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x910	
3:0	Type	0x1	

### 6.3.60.74 GBE1\_LED2 Address High (0x0049)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.75 GBE1\_LED2 Data Low (0x004A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.76 GBE1\_LED2 Data High (0x004B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.77 GBE2\_LED0 Address Low (0x004C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x920	
3:0	Type	0x1	

### 6.3.60.78 GBE2\_LED0 Address High (0x004D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.79 GBE2\_LED0 Data Low (0x004E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.80 GBE2\_LED0 Data High (0x004F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.81 GBE2\_LED1 Address Low (0x0050)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x930	
3:0	Type	0x1	

### 6.3.60.82 GBE2\_LED1 Address High (0x0051)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.83 GBE2\_LED1 Data Low (0x0052)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.84 GBE2\_LED1 Data High (0x0053)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.85 GBE2\_LED2 Address Low (0x0054)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x940	
3:0	Type	0x1	

### 6.3.60.86 GBE2\_LED2 Address High (0x0055)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.87 GBE2\_LED2 Data Low (0x0056)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.88 GBE2\_LED2 Data High (0x0057)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.89 GBE3\_LED0 Address Low (0x0058)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x950	
3:0	Type	0x1	

### 6.3.60.90 GBE3\_LED0 Address High (0x0059)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.91 GBE3\_LED0 Data Low (0x005A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.92 GBE3\_LED0 Data High (0x005B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.93 GBE3\_LED1 Address Low (0x005C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x960	
3:0	Type	0x1	

### 6.3.60.94 GBE3\_LED1 Address High (0x005D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.95 GBE3\_LED1 Data Low (0x005E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.96 GBE3\_LED1 Data High (0x005F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.97 GBE3\_LED2 Address Low (0x0060)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x970	
3:0	Type	0x1	

### 6.3.60.98 GBE3\_LED2 Address High (0x0061)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.99 GBE3\_LED2 Data Low (0x0062)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.100 GBE3\_LED2 Data High (0x0063)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.101 GBE\_SMB\_CLK Address Low (0x0064)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0xA10	
3:0	Type	0x1	

### 6.3.60.102 GBE\_SMB\_CLK Address High (0x0065)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.103 GBE\_SMB\_CLK Data Low (0x0066)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.104 GBE\_SMB\_CLK Data High (0x0067)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.105 GBE\_SMB\_DATA Address Low (0x0068)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0xA20	
3:0	Type	0x1	

### 6.3.60.106 GBE\_SMB\_DATA Address High (0x0069)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.107 GBE\_SMB\_DATA Data Low (0x006A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.108 GBE\_SMB\_DATA Data High (0x006B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.109 GBE\_SMB\_ALERT\_N Address Low (0x006C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0xA30	
3:0	Type	0x1	

### 6.3.60.110 GBE\_SMB\_ALERT\_N Address High (0x006D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.111 GBE\_SMB\_ALERT\_N Data Low (0x006E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.112 GBE\_SMB\_ALERT\_N Data High (0x006F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.113 UART1\_RXD Address Low (0x0070)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0xAE0	
3:0	Type	0x1	

### 6.3.60.114 UART1\_RXD Address High (0x0071)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.115 UART1\_RXD Data Low (0x0072)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.116 UART1\_RXD Data High (0x0073)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.117 UART1\_TXD Address Low (0x0074)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0xAF0	
3:0	Type	0x1	

### 6.3.60.118 UART1\_TXD Address High (0x0075)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.119 UART1\_TXD Data Low (0x0076)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.120 UART1\_TXD Data High (0x0077)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.121 CPU\_GP\_0 Address Low (0x0078)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0xB00	
3:0	Type	0x1	

### 6.3.60.122 CPU\_GP\_0 Address High (0x0079)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.123 CPU\_GP\_0 Data Low (0x007A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.124 CPU\_GP\_0 Data High (0x007B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.125 GBE\_MNG\_I2C\_CLK Address Low (0x007C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0xC50	
3:0	Type	0x1	

### 6.3.60.126 GBE\_MNG\_I2C\_CLK Address High (0x007D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.127 GBE\_MNG\_I2C\_CLK Data Low (0x007E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.128 GBE\_MNG\_I2C\_CLK Data High (0x007F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.129 GBE\_MNG\_I2C\_DATA Address Low (0x0080)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0xC60	
3:0	Type	0x1	

### 6.3.60.130 GBE\_MNG\_I2C\_DATA Address High (0x0081)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.131 GBE\_MNG\_I2C\_DATA Data Low (0x0082)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.132 GBE\_MNG\_I2C\_DATA Data High (0x0083)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.133 NCSI\_RXD0 Address Low (0x0084)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x980	
3:0	Type	0x1	

### 6.3.60.134 NCSI\_RXD0 Address High (0x0085)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.135 NCSI\_RXD0 Data Low (0x0086)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.136 NCSI\_RXD0 Data High (0x0087)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.137 NCSI\_RXD1 Address Low (0x0088)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x9A0	
3:0	Type	0x1	

### 6.3.60.138 NCSI\_RXD1 Address High (0x0089)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.139 NCSI\_RXD1 Data Low (0x008A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.140 NCSI\_RXD1 Data High (0x008B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.141 NCSI\_CRD\_DV Address Low (0x008C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x9B0	
3:0	Type	0x1	

### 6.3.60.142 NCSI\_CRD\_DV Address High (0x008D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.143 NCSI\_CRD\_DV Data Low (0x008E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.144 NCSI\_CRD\_DV Data High (0x008F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.145 NCSI\_ARB\_IN Address Low (0x0090)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x9C0	
3:0	Type	0x1	

### 6.3.60.146 NCSI\_ARB\_IN Address High (0x0091)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.147 NCSI\_ARB\_IN Data Low (0x0092)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.148 NCSI\_ARB\_IN Data High (0x0093)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.149 NCSI\_TX\_EN Address Low (0x0094)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x9D0	
3:0	Type	0x1	

### 6.3.60.150 NCSI\_TX\_EN Address High (0x0095)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.151 NCSI\_TX\_EN Data Low (0x0096)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.152 NCSI\_TX\_EN Data High (0x0097)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.153 NCSI\_TXD0 Address Low (0x0098)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x9E0	
3:0	Type	0x1	

### 6.3.60.154 NCSI\_TXD0 Address High (0x0099)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.155 NCSI\_TXD0 Data Low (0x009A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.156 NCSI\_TXD0 Data High (0x009B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.157 NCSI\_TXD1 Address Low (0x009C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x9F0	
3:0	Type	0x1	

### 6.3.60.158 NCSI\_TXD1 Address High (0x009D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.159 NCSI\_TXD1 Data Low (0x009E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.160 NCSI\_TXD1 Data High (0x009F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.161 NCSI\_ARB\_OUT Address Low (0x00A0)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0xA00	
3:0	Type	0x1	

### 6.3.60.162 NCSI\_ARB\_OUT Address High (0x00A1)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.163 NCSI\_ARB\_OUT Data Low (0x00A2)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.164 NCSI\_ARB\_OUT Data High (0x00A3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.165 CPU\_GP\_1 Address Low (0x00A4)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0xB10	
3:0	Type	0x1	

### 6.3.60.166 CPU\_GP\_1 Address High (0x00A5)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.167 CPU\_GP\_1 Data Low (0x00A6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.168 CPU\_GP\_1 Data High (0x00A7)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.169 NAC\_GBE\_GPIO0 Address Low (0x00A8)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x170	
3:0	Type	0x1	

### 6.3.60.170 NAC\_GBE\_GPIO0 Address High (0x00A9)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0001	

### 6.3.60.171 NAC\_GBE\_GPIO0 Data Low (0x00AA)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.172 NAC\_GBE\_GPIO0 Data High (0x00AB)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.173 NAC\_GBE\_GPIO1 Address Low (0x00AC)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x180	
3:0	Type	0x1	

### 6.3.60.174 NAC\_GBE\_GPIO1 Address High (0x00AD)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0001	

### 6.3.60.175 NAC\_GBE\_GPIO1 Data Low (0x00AE)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.176 NAC\_GBE\_GPIO1 Data High (0x00AF)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.177 NAC\_GBE\_GPIO2 Address Low (0x00B0)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x190	
3:0	Type	0x1	

### 6.3.60.178 NAC\_GBE\_GPIO2 Address High (0x00B1)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0001	

### 6.3.60.179 NAC\_GBE\_GPIO2 Data Low (0x00B2)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.180 NAC\_GBE\_GPIO2 Data High (0x00B3)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.181 NAC\_GBE\_GPIO3 Address Low (0x00B4)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x1A0	
3:0	Type	0x1	

### 6.3.60.182 NAC\_GBE\_GPIO3 Address High (0x00B5)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0001	

### 6.3.60.183 NAC\_GBE\_GPIO3 Data Low (0x00B6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.184 NAC\_GBE\_GPIO3 Data High (0x00B7)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.185 CDF CFIO East - Type F Word 0 - 0x00B8

Bit(s)	Field Name	Default NVM Value	Description
15:4	Subtype	0x0	
3:0	Type	0xF	

### 6.3.60.186 CDF CFIO East - Type F Word 1 - 0x00B9

Bit(s)	Field Name	Default NVM Value	Description
15	R	0b	
14:12	TAG	000b	
11	AL	0b	
10:8	BAR	000b	
7:4	Select ID	0x8	
3:0	Opcode	0x7	

### 6.3.60.187 CDF CFIO East - Type F Word 2 - 0x00BA

Bit(s)	Field Name	Default NVM Value	Description
15:12	Second Byte En	0x0	
11:8	First Byte En	0x2	
7:0	Function ID	0x0	

### 6.3.60.188 GPIO0 Address Low (0x00BB)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x810	
3:0	Type	0x1	

### 6.3.60.189 GPIO0 Address High (0x00BC)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.190 GPIO0 Data Low (0x00BD)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.191 GPIO0 Data High (0x00BE)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.192 GPIO1 Address Low (0x00BF)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x820	
3:0	Type	0x1	

### 6.3.60.193 GPIO1 Address High (0x00C0)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.194 GPIO1 Data Low (0x00C1)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.195 GPIO1 Data High (0x00C2)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.196 GPIO2 Address Low (0x00C3)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x830	
3:0	Type	0x1	

### 6.3.60.197 GPIO2 Address High (0x00C4)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.198 GPIO2 Data Low (0x00C5)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.199 GPIO2 Data High (0x00C6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.200 GPIO3 Address Low (0x00C7)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x840	
3:0	Type	0x1	

### 6.3.60.201 GPIO3 Address High (0x00C8)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.202 GPIO3 Data Low (0x00C9)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.203 GPIO3 Data High (0x00CA)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.204 GPIO4 Address Low (0x00CB)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x850	
3:0	Type	0x1	

### 6.3.60.205 GPIO4 Address High (0x00CC)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.206 GPIO4 Data Low (0x00CD)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.207 GPIO4 Data High (0x00CE)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.208 GPIO5 Address Low (0x00CF)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x860	
3:0	Type	0x1	

### 6.3.60.209 GPIO5 Address High (0x00D0)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.210 GPIO5 Data Low (0x00D1)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.211 GPIO5 Data High (0x00D2)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.212 GPIO6 Address Low (0x00D3)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x870	
3:0	Type	0x1	

### 6.3.60.213 GPIO6 Address High (0x00D4)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.214 GPIO6 Data Low (0x00D5)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.215 GPIO6 Data High (0x00D6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.216 GPIO7 Address Low (0x00D7)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x880	
3:0	Type	0x1	

### 6.3.60.217 GPIO7 Address High (0x00D8)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.218 GPIO7 Data Low (0x00D9)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.219 GPIO7 Data High (0x00DA)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.220 GPIO8 Address Low (0x00DB)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x890	
3:0	Type	0x1	

### 6.3.60.221 GPIO8 Address High (0x00DC)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.222 GPIO8 Data Low (0x00DD)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.223 GPIO8 Data High (0x00DE)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.224 GPIO9 Address Low (0x00DF)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x8A0	
3:0	Type	0x1	

### 6.3.60.225 GPIO9 Address High (0x00E0)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.226 GPIO9 Data Low (0x00E1)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.227 GPIO9 Data High (0x00E2)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.228 GPIO10 Address Low (0x00E3)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x8B0	
3:0	Type	0x1	

### 6.3.60.229 GPIO10 Address High (0x00E4)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.230 GPIO10 Data Low (0x00E5)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.231 GPIO10 Data High (0x00E6)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.232 GPIO11 Address Low (0x00E7)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x8C0	
3:0	Type	0x1	

### 6.3.60.233 GPIO11 Address High (0x00E8)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.234 GPIO11 Data Low (0x00E9)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.235 GPIO11 Data High (0x00EA)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.236 GPIO12 Address Low (0x00EB)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Address Low	0x8D0	
3:0	Type	0x1	

### 6.3.60.237 GPIO12 Address High (0x00EC)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Address High	0x0	

### 6.3.60.238 GPIO12 Data Low (0x00ED)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data Low	0x0700	Valid values are: 0x0700 = Function 1 0x0B00 = Function 2 0x0F00 = Function 3 0x1300 = Function 4

### 6.3.60.239 GPIO12 Data High (0x00EE)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Data High	0x0	

### 6.3.60.240 Manual Additions (0x00EF)

Raw data module length: variable

### 6.3.61 EMP SR Settings Module Header Section

This section contains the modes of operation of the EMP which are be stored in the Shadow RAM.

**Table 6-67. EMP SR Settings Module Header Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Section Header	6.3.61.1
0x0001	SMBus Secondary Addresses	6.3.61.2
0x0002	SMBus Secondary Addresses 2	6.3.61.3
0x0003	SMBus Secondary Addresses 3	6.3.61.4
0x0004	SMBus Secondary Addresses 4	6.3.61.5
0x0005	OEM Capabilities	6.3.61.6
0x0006	OEM Technologies Enabled	6.3.61.7
0x0007	SR PF Allocations Pointer	6.3.61.8
0x0008	Max PF and VF per Port	6.3.61.9
0x0009	PF LAN Device ID	6.3.61.10
0x000A	PF SAN Device ID	6.3.61.11
0x000B	PF iSCSI Device ID	6.3.61.12
0x000C	PF RDMA Device ID	6.3.61.13
0x000D	VF LAN Device ID	6.3.61.14
0x000E	VF SAN Device ID	6.3.61.15
0x000F	VF iSCSI Device ID	6.3.61.16
0x0010	VF RDMA Device ID	6.3.61.17
0x0011	PF LAN Subsystem ID	6.3.61.18
0x0012	PF SAN Subsystem ID	6.3.61.19
0x0013	PF iSCSI Subsystem ID	6.3.61.20
0x0014	PF RDMA Subsystem ID	6.3.61.21
0x0015	VF LAN Subsystem ID	6.3.61.22
0x0016	VF SAN Subsystem ID	6.3.61.23
0x0017	VF iSCSI Subsystem ID	6.3.61.24
0x0018	VF RDMA Subsystem ID	6.3.61.25
0x0019 + 1*n, n=0...7	PFGEN_STATE	6.3.61.26
0x0021	Reserved - OEM Current Settings Pointer	6.3.61.27
0x0022	Features Enable	6.3.61.28
0x0023	LLDP Configuration Pointer	6.3.61.29
0x0024	Allowed SB Targets	6.3.61.30
0x0025	Allow 64 Bits Transactions	6.3.61.31
0x0026	Allowed Opcodes	6.3.61.32
0x0027	RX Hang Workaround Control 0	6.3.61.33
0x0028	RX Hang Workaround Control 1	6.3.61.34

### 6.3.61.1 Section Header (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 1 First Section -> Word: EMP SR Settings Module Header -> Section Header Last Section -> Word: EMP SR Settings Module Header -> RX Hang Workaround Control 1 Section length in words.

### 6.3.61.2 SMBus Secondary Addresses (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:9	SMBus 1 Secondary Address	0x4A	Dual address mode only.
8	Reserved	0b	Reserved.
7:1	SMBus 0 Secondary Address	0x49	
0	Reserved	0b	Reserved.

### 6.3.61.3 SMBus Secondary Addresses 2 (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:9	SMBus 3 Secondary Address	0x4C	
8	Reserved	0b	Reserved.
7:1	SMBus 2 Secondary Address	0x4B	
0	Reserved	0b	Reserved.

### 6.3.61.4 SMBus Secondary Addresses 3 (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:9	SMBus 5 Secondary Address	0x4E	Dual address mode only.
8	Reserved	0b	Reserved.
7:1	SMBus 4 Secondary Address	0x4D	
0	Reserved	0b	Reserved.

### 6.3.61.5 SMBus Secondary Addresses 4 (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:9	SMBus 7 Secondary Address	0x50	
8	Reserved	0b	Reserved.
7:1	SMBus 6 Secondary Address	0x4F	
0	Reserved	0b	Reserved.

### 6.3.61.6 OEM Capabilities (0x0005)

Defines the OEM technologies supported in this device.

Bit(s)	Field Name	Default NVM Value	Description
15	Skip Jack Island Support	0b	Skip Jack Island Support enable 0b = Disabled 1b = Enabled
14:8	Reserved	0x0	Reserved.
7	Allow HII Port Disable	0b	Determines whether the present HII configuration feature is present in the configuration menu. If this bit is set (1), the HII configuration feature is available. If the bit is clear (0), the HII configuration is not available. 0b = Disabled 1b = Enabled
6	OCBB over MCTP Capable	0b	HP OCBB over MCTP Capable enable. 0b = Disabled 1b = Capable
5	HP PLDM support Capable	0b	HP PLDM support Capable. 0b = Disabled 1b = Capable
4:0	Reserved	0x0	Reserved.

### 6.3.61.7 OEM Technologies Enabled (0x0006)

Defines the OEM technologies enabled in this device.

Bit(s)	Field Name	Default NVM Value	Description
15:14	Reserved	00b	Reserved.
13	Anti Rollback Feature Enable	0b	Anti Rollback feature enable. 0b = Disabled 1b = Enabled
12	OCBB over MCTP	0b	HP OCBB enable. 0b = Disabled 1b = Enabled
11	HP PLDM Support	0b	Enable PLDM support. 0b = Disabled 1b = Enabled
10:0	Reserved	0x0	Reserved.

### 6.3.61.8 SR PF Allocations Pointer (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PF Allocations Pointer	0xFFFF	Points to SR PF Allocations Section. For SR PF Allocations inner structure, see <a href="#">Section 6.3.62</a> .

### 6.3.61.9 Max PF and VF per Port (0x0008)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Max VF per PF	0x80	Max number of VFs allocated to a PF.
7:3	Reserved	0x0	Reserved.
2:0	Max PF per Port	010b	Valid values are: 000b = 1 PF per Port 001b = 2 PFs per Port 010b = 4 PFs per Port 011b = 8 PFs per Port 100b = 16 PFs per Port

### 6.3.61.10 PF LAN Device ID (0x0009)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PF LAN Device ID	0x1888	

### 6.3.61.11 PF SAN Device ID (0x000A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PF SAN Device ID	0x1888	

### 6.3.61.12 PF iSCSI Device ID (0x000B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PF iSCSI Device ID	0x1888	

### 6.3.61.13 PF RDMA Device ID (0x000C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PF RDMA Device ID	0x1888	

### 6.3.61.14 VF LAN Device ID (0x000D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	VF LAN Device ID	0x1889	

### 6.3.61.15 VF SAN Device ID (0x000E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	VF SAN Device ID	0x1889	

### 6.3.61.16 VF iSCSI Device ID (0x000F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	VF iSCSI Device ID	0x1889	

### 6.3.61.17 VF RDMA Device ID (0x0010)

Bit(s)	Field Name	Default NVM Value	Description
15:0	VF RDMA Device ID	0x1889	

### 6.3.61.18 PF LAN Subsystem ID (0x0011)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PF LAN Subsystem ID	0x0	

### 6.3.61.19 PF SAN Subsystem ID (0x0012)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PF SAN Subsystem ID	0x0	

### 6.3.61.20 PF iSCSI Subsystem ID (0x0013)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PF iSCSI Subsystem ID	0x0	

### 6.3.61.21 PF RDMA Subsystem ID (0x0014)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PF RDMA Subsystem ID	0x0	

### 6.3.61.22 VF LAN Subsystem ID (0x0015)

Bit(s)	Field Name	Default NVM Value	Description
15:0	VF LAN Subsystem ID	0x0	

### 6.3.61.23 VF SAN Subsystem ID (0x0016)

Bit(s)	Field Name	Default NVM Value	Description
15:0	VF SAN Subsystem ID	0x0	

### 6.3.61.24 VF iSCSI Subsystem ID (0x0017)

Bit(s)	Field Name	Default NVM Value	Description
15:0	VF iSCSI Subsystem ID	0x0	

### 6.3.61.25 VF RDMA Subsystem ID (0x0018)

Bit(s)	Field Name	Default NVM Value	Description
15:0	VF RDMA Subsystem ID	0x0	

### 6.3.61.26 PFGEN\_STATE[n] (0x0019 + 1\*n, n=0...7)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11	PFGEN_STATE[1 + 2*n].PFSCEN	0b	
10	PFGEN_STATE[1 + 2*n].PFLINKEN	1b	
9	PFGEN_STATE[1 + 2*n].PFFCEN	1b	
8	PFGEN_STATE[1 + 2*n].PFPEEN	0b	
7:4	Reserved	0x0	Reserved.
3	PFGEN_STATE[0 + 2*n].PFSCEN	0b	
2	PFGEN_STATE[0 + 2*n].PFLINKEN	1b	
1	PFGEN_STATE[0 + 2*n].PFFCEN	1b	
0	PFGEN_STATE[0 + 2*n].PFPEEN	0b	

### 6.3.61.27 Reserved - OEM Current Settings Pointer (0x0021)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.61.28 Features Enable (0x0022)

Describes support for various features.

Bit(s)	Field Name	Default NVM Value	Description
15	PHY 2 Autoload Enable	1b	PHY Auto-load Enable.
14	PHY 1 Autoload Enable	1b	PHY Auto-load Enable.
13	PHY 0 Autoload Enable	1b	PHY Auto-load Enable.
12	PXE Mode No-Drop Policy Supported	0b	The value indicates if the PXE Mode No-Drop policy is supported. 0b = No support. 1b = PXE Mode No-Drop is supported. This mode can be enabled by the Configure No-Drop Policy AQ command. <b>Note:</b> This field is preserved by Intel NVM Update Tool.
11:9	Switching mode	0x0	Reserved.
8	HII Version Check For Seamless Update Enable	0b	New bit to enable the feature. It is unset for all OEMGEN images. 0b = Disabled 1b = Enabled <b>Note:</b> This field is preserved by Intel NVM Update Tool.
7:5	Reserved	000b	Reserved <b>Note:</b> This field is preserved by Intel NVM Update Tool.
4	LCB Autoload Workaround 2	1b	If set, enables a firmware workaround that aborts an LCB auto-load if a PCIe reset assertion is detected.
3	LCB Autoload Workaround 1	0b	If set, enables a firmware workaround that delays the start of an LCB auto-load after a PCIe Hot Reset.
2:1	Reserved	00b	Reserved <b>Note:</b> This field is preserved by Intel NVM Update Tool.
0	Non-BTS Switch mode	0b	non-BTS mode. <b>Note:</b> This field is preserved by Intel NVM Update Tool.

### 6.3.61.29 LLDP Configuration Pointer (0x0023)

Bit(s)	Field Name	Default NVM Value	Description
15:0	LLDP Configuration Pointer	0xFFFF	Points to LLDP Configuration Section. For LLDP Configuration inner structure, see <a href="#">Section 6.3.63</a> .

### 6.3.61.30 Allowed SB Targets (0x0024)

The list of allowed sideband targets.

Bits	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11	SPI	0b	
10	FC	0b	
9	DSA	0b	
8	LCB	1b	
7	PCIW	1b	
6	CAR	1b	

Bits	Field Name	Default NVM Value	Description
5	IO Widget	1b	
4:3	Reserved	00b	Reserved.
2	ETHW	1b	
1:0	Reserved	0b	Reserved.

### 6.3.61.31 Allow 64 Bits Transactions (0x0025)

Block/Allow 64 bits transactions.

Bits	Field Name	Default NVM Value	Description
15:1	Reserved		Reserved.
0	Allow 64 Bits Transactions	0b	

### 6.3.61.32 Allowed Opcodes (0x0026)

The list of allowed sideband opcodes.

Bits	Field Name	Default NVM Value	Description
15	Reserved	0b	Reserved.
14	IOWr - IO Register Write (Non Posted)	0b	
13	IOWr - IO Register Write (Posted)	0b	
12	IORd - IO Register Read (Non Posted)	0b	
11	CfgWr - Config Register Write (Non Posted)	1b	
10	CfgWr - Config Register Write (Posted)	0b	
9	CfgRd - Config Register Read (Non Posted)	1b	
8	CRRd - Read Private Control Register (Non Posted)	0b	
7	CRWr - Write Private Control Register (Non Posted)	0b	
6	CRWr - Write Private Control Register (Posted)	0b	
5	MBWr - Multiple Block Write (Non Posted)	0b	
4	MBWr - Multiple Block Write (Posted)	0b	
3	MBRd - Multiple Block Read (Non Posted)	0b	
2	MWr - Register Write (Non Posted)	0b	
1	MWr - Register Write (Posted)	1b	
0	Mrd - Register Read (Non Posted)	1b	

### 6.3.61.33 RX Hang Workaround Control 0 (0x0027)

Bits	Field Name	Default NVM Value	Description
15:14	Reserved	00b	Reserved.
13:8	PE_ACK_REQ_PM_TH	0x3	
7:5	Reserved	000b	Reserved.
4:0	REQ_WB_PM_TH	0x2	

### 6.3.61.34 RX Hang Workaround Control 1 (0x0028)

Bits	Field Name	Default NVM Value	Description
15	RX Hang W/A Disable	0x0	
14:6	Reserved	0x0	Reserved.
5:0	RLAN_ACK_REQ_PM_TH	0x3	

## 6.3.62 SR PF Allocations Section

This section contains the modes of operation of the EMP which are be stored in the Shadow RAM.

**Table 6-68. SR PF Allocations Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Header	6.3.62.1
0x0001 + 2*n, n=0...7	PF Flags	6.3.62.2
0x0002 + 2*n, n=0...7	PF BW	6.3.62.3
0x0011 + 2*n, n=0...23	PF Allocations - Type	6.3.62.4
0x0012 + 2*n, n=0...23	PF Allocations - Value	6.3.62.5

### 6.3.62.1 Header (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Block Length		Length in: 2 Bytes unit - 1 First Section -> Word: SR PF Allocations -> Header Last Section -> Word: SR PF Allocations -> PF Allocations - Value Size of section.

### 6.3.62.2 PF Flags[n] (0x0001 + 2\*n, n=0...7)

Bit(s)	Field Name	Default NVM Value	Description
15:1	Reserved	0x0	Reserved.
0	Load PF MAC Address	1b	Defines if the LAN MAC Address of the PF should be added to the filtering table. If this bit is set, only packets that passes the MAC and if needed, the STag are forwarded to the PF.

### 6.3.62.3 PF BW[n] (0x0002 + 2\*n, n=0...7)

Bit(s)	Field Name	Default NVM Value	Description
15:8	PF Max BW	0x64	This field contains the Maximum Tx bandwidth allocation of the specified partition expressed in % of the Maximum physical port link speed. The % value ranges from 0 to 100.
7:0	PF Min BW	0x0	This field contains the Minimum Tx bandwidth allocation of the specified partition expressed in % of the Maximum physical port link speed. The % value ranges from 0 to 100.

### 6.3.62.4 PF Allocations - Type[n] (0x0011 + 2\*n, n=0...23)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Type	0xFFFF	Type array.

### 6.3.62.5 PF Allocations - Value[n] (0x0012 + 2\*n, n=0...23)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Value	0x0	Value array.

### 6.3.63 LLDP Configuration Section

Default settings to the embedded LLDP agent.

**Table 6-69. LLDP Configuration Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Section Length	6.3.63.1
0x0001	LLDP Admin Status 0	6.3.63.2
0x0002	LLDP Admin Status 1	6.3.63.3
0x0003	msgFastTx	6.3.63.4
0x0004	msgTxInterval	6.3.63.5
0x0005	LLDP Tx Parameters	6.3.63.6
0x0006	LLDP Initialization Timers	6.3.63.7
0x0007	ENDLESS_XOFF_THRESH	6.3.63.8
0x0008	DCBx Mode 0	6.3.63.9
0x0009	DCBx Mode 1	6.3.63.10

#### 6.3.63.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1 First Section -> Word: LLDP Configuration -> Section Length Last Section -> Word: LLDP Configuration -> DCBx Mode 1

#### 6.3.63.2 LLDP Admin Status 0 (0x0001)

Defines status of LLDP agent. Each LAN port has independent status.

- 0: LLDP agent is disabled.
- 1: LLDP is configured for receives only.
- 2: LLDP is configured for transmits only.
- 3: Both receive and transmit enabled (default).

Bit(s)	Field Name	Default NVM Value	Description
15:12	Port 3	0x0	Defines status of LLDP agent. Applies to LAN Port 3.
11:8	Port 2	0x0	Defines status of LLDP agent. Applies to LAN Port 2.
7:4	Port 1	0x0	Defines status of LLDP agent. Applies to LAN Port 1.
3:0	Port 0	0x0	Defines status of LLDP agent. Applies to LAN Port 0.

### 6.3.63.3 LLDP Admin Status 1 (0x0002)

Defines status of LLDP agent. Each LAN port has independent status.

- 0: LLDP agent is disabled.
- 1: LLDP is configured for receives only.
- 2: LLDP is configured for transmits only.
- 3: Both receive and transmit enabled (default).

Bit(s)	Field Name	Default NVM Value	Description
15:12	Port 7	0x0	Defines status of LLDP agent. Applies to LAN Port 7.
11:8	Port 6	0x0	Defines status of LLDP agent. Applies to LAN Port 6.
7:4	Port 5	0x0	Defines status of LLDP agent. Applies to LAN Port 5.
3:0	Port 4	0x0	Defines status of LLDP agent. Applies to LAN Port 4.

### 6.3.63.4 msgFastTx (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	msgFastTx	0x1	Time interval in timer ticks (Seconds) between PDU transmits during fast transmits period.

### 6.3.63.5 msgTxInterval (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	msgTxInterval	0x1E	Is the time in timer ticks (Seconds) between transmissions during normal transmission.

### 6.3.63.6 LLDP Tx Parameters (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:8	txCreditMax	0x5	Determines maximum number of LLDPDUs that can be sent per second.
7:0	msgTxHold	0x4	Is used as a multiplier of <i>msgTxInterval</i> to determine the txTTL that is carried in the LLDP frames.

### 6.3.63.7 LLDP Initialization Timers (0x0006)

Timers used by LLDP agent during initialization and when to reinitialize. All times are in seconds.

Bit(s)	Field Name	Default NVM Value	Description
15:8	reinitDelay	0x2	This parameter indicates the amount of delay, in seconds, from when adminStatus becomes disabled until re-initialization is attempted.
7:0	txFastInit	0x4	This variable is used as the initial value for the txFast variable. This value determines the number of LLDPDUs that are transmitted during a fast transmission period.

### 6.3.63.8 ENDLESS\_XOFF\_THRESH (0x0007)

Define a time limit the firmware waits for XOFF condition during PFR flow. The time is defined in 1msec units. A possible default setting is 10msec (DCR175 - PFR XOFF deadlock prevention).

Bit(s)	Field Name	Default NVM Value	Description
15:0	ENDLESS_XOFF_THRESH	0xA	Define a time limit the firmware waits for XOFF condition during PFR flow. The time is defined in 1 ms units. A possible default setting is 10 ms.

### 6.3.63.9 DCBx Mode 0 (0x0008)

Defines per-PORT DCBx mode. Please note that each port could be configured independently regardless of the other ports configurations.

- 0: No DCBx is supported.
- 1: IEEE DCBx only.
- 2: CEE DCBx only.
- 3: Auto-Select, starting in IEEE (default).

Bit(s)	Field Name	Default NVM Value	Description
15:12	DCBx Port[3]	0x3	Port[3] DCBx mode.
11:8	DCBx Port[2]	0x3	Port[2] DCBx mode.
7:4	DCBx Port[1]	0x3	Port[1] DCBx mode.
3:0	DCBx Port[0]	0x3	Port[0] DCBx mode.

### 6.3.63.10 DCBx Mode 1 (0x0009)

Defines per-PORT DCBx mode. Please note that each port could be configured independently regardless of the other ports configurations.

- 0: No DCBx is supported.
- 1: IEEE DCBx only.
- 2: CEE DCBx only.
- 3: Auto-Select, starting in IEEE (default).

Bit(s)	Field Name	Default NVM Value	Description
15:12	DCBx Port[7]	0x3	Port[7] DCBx mode.
11:8	DCBx Port[6]	0x3	Port[6] DCBx mode.
7:4	DCBx Port[5]	0x3	Port[5] DCBx mode.
3:0	DCBx Port[4]	0x3	Port[4] DCBx mode.

## 6.3.64 GFID Module Section

**Table 6-70. GFID Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Length	6.3.64.1
0x0001	GFID	6.3.64.2
0x0002	GFID0	6.3.64.3
0x0003	GFID1	6.3.64.4
0x0004	GFID.SOFTFUSE	6.3.64.5
0x0005	GFID3	6.3.64.6
0x0006	GFID4	6.3.64.7
0x0007	GFID5	6.3.64.8

0x001C	Original GFID8	6.3.64.29
0x001D	Original GFID9	6.3.64.30
0x001E	Original GFID10	6.3.64.31
0x001F	Original GFID11	6.3.64.32
0x0020	Original GFID12	6.3.64.33
0x0021	Original GFID13	6.3.64.34
0x0022	Original GFID14	6.3.64.35

**Table 6-70. GFID Module Section Summary Table**

Word Offset	Description	Section Reference
0x0023	Original GFID15	6.3.64.36
0x0024	Original GFID16	6.3.64.37

### 6.3.64.1 Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 2 First Section -> Word: GFID Module -> Length Last Section -> Word: GFID Module -> Original GFID16

### 6.3.64.2 GFID (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.3 GFID0 (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.4 GFID1 (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.5 GFID.SOFTFUSE (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Reserved	0x0	Reserved for future use.
4:3	MaxBW	00b	Restrict to 50G. Relevant only if soft fuse is applied. Valid values are: 00b = 200 Gb/s 01b = 100 Gb/s 10b = 50 Gb/s 11b = 25 Gb/s

Bit(s)	Field Name	Default NVM Value	Description
2:1	NumOfPorts	00b	For future use and compatibility. Relevant only if soft fuse is applied. Valid values are: 00b = 8 ports 01b = 4 ports 10b = 2 ports 11b = 1 ports
0	ApplyFuses	0b	Enable "Soft" FW Fuse. Valid values are: 0b = Fuses not applied. 1b = Fuses applied.

### 6.3.64.6 GFID3 (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.7 GFID4 (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.8 GFID5 (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.9 GFID6 (0x0008)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.10 GFID7 (0x0009)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.11 GFID8 (0x000A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.12 GFID9 (0x000B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.13 GFID10 (0x000C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.14 GFID11 (0x000D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.15 GFID12 (0x000E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.16 GFID13 (0x000F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.17 GFID14 (0x0010)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.18 GFID15 (0x0011)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.19 GFID16 (0x0012)

Bit(s)	Field Name	Default NVM Value	Description
15:0	GFID	0x0	

### 6.3.64.20 Original GFID (0x0013)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.21 Original GFID0 (0x0014)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.22 Original GFID1 (0x0015)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.23 Original GFID.SOFTFUSE (0x0016)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Reserved	0x0	Reserved for future use.
4:3	MaxBW	00b	Restrict to 50G. Relevant only if soft fuse is applied. Valid values are: 00b = 200 Gb/s 01b = 100 Gb/s 10b = 50 Gb/s 11b = 25 Gb/s

Bit(s)	Field Name	Default NVM Value	Description
2:1	NumOfPorts	00b	For future use and compatibility. Relevant only if soft fuse is applied. Valid values are: 00b = 8 ports 01b = 4 ports 10b = 2 ports 11b = 1 ports
0	ApplyFuses	0b	Enable "Soft" FW Fuse. Valid values are: 0b = Fuses not applied. 1b = Fuses applied.

### 6.3.64.24 Original GFID3 (0x0017)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.25 Original GFID4 (0x0018)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.26 Original GFID5 (0x0019)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.27 Original GFID6 (0x001A)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.28 Original GFID7 (0x001B)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.29 Original GFID8 (0x001C)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.30 Original GFID9 (0x001D)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.31 Original GFID10 (0x001E)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.32 Original GFID11 (0x001F)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.33 Original GFID12 (0x0020)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.34 Original GFID13 (0x0021)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.35 Original GFID14 (0x0022)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.36 Original GFID15 (0x0023)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

### 6.3.64.37 Original GFID16 (0x0024)

Bits	Field Name	Default NVM Value	Description
15:0	Original GFID	0x0	

## 6.3.65 Manageability Module Header Section

This section contains parameters related to the manageability functionality, such as connection type and others, It also points to subsections configuring the filters and the sideband interfaces.

**Table 6-71. Manageability Module Header Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Section Length	6.3.65.1
0x0001	Common Manageability Parameters	6.3.65.2
0x0002	Common Manageability Parameters 2	6.3.65.3
0x0003	PLDM Control Word	6.3.65.4
0x0004	RDE Control Word	6.3.65.5
0x0005	OCP NIC Parameters Obsolete	6.3.65.6
0x0006	OCP NIC Parameters 2	6.3.65.7
0x0007	Sideband Configuration Pointer	6.3.65.8
0x0008	Reserved	6.3.65.9
0x0009	Traffic Types Parameters	6.3.65.10
0x000A	OEM Section Pointer	6.3.65.11

### 6.3.65.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1 First Section -> Word: Manageability Module Header -> Section Length Last Section -> Word: Manageability Module Header -> OEM Section Pointer

### 6.3.65.2 Common Manageability Parameters (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:11	Reserved	0x0	Reserved.
10:8	Manageability Pass-Through Mode	010b	Valid values are: 000b = None 010b = Pass-through (PT) mode
7:5	Reserved	000b	Reserved.
4	Force TCO Reset Disable	1b	If cleared, allows the BMC to do a Global reset of the device using the Force TCO SMBus or NC-SI commands. 0b = Enable Force TCO reset. 1b = Disable Force TCO reset.
3	Reserved	0b	Reserved.
2	OS2BMC Capable	1b	0b = Disable 1b = Enable.

Bit(s)	Field Name	Default NVM Value	Description
1:0	Reserved	0b	Reserved.

### 6.3.65.3 Common Manageability Parameters 2 (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15	LAN7_FTCO_ISOL_DIS	1b	Allow isolation of port 7 per BMC request. 0b = Enabled 1b = Disabled
14	LAN6_FTCO_ISOL_DIS	1b	Allow isolation of port 6 per BMC request. 0b = Enabled 1b = Disabled
13	LAN5_FTCO_ISOL_DIS	1b	Allow isolation of port 5 per BMC request. 0b = Enabled 1b = Disabled
12	LAN4_FTCO_ISOL_DIS	1b	Allow isolation of port 4 per BMC request. 0b = Enabled 1b = Disabled
11	Multi-Drop NC-SI	1b	0b = Point-to-point 1b = Multi-drop
10	Reserved	0b	Reserved.
9	EMP_LINK_ON	0b	Copy of the PRTPM_GC.EMP_LINK_ON bit for EMP use. 0b = Disabled 1b = Enabled
8	Redfish Support for PLDM (Type 6)	1b	0b = Disabled 1b = Enabled
7	FW Update over PLDM Support	0b	Support for PLDM base is defined as bit 7   bit 6 (FW update or monitoring and control support). 0b = Disabled 1b = Enabled
6	PLDM Monitoring and Control	0b	Support for PLDM base is defined as bit 7   bit 6 (FW update or monitoring and control support). 0b = Disabled 1b = Enabled
5	OEM over MCTP Support	0b	0b = Disabled 1b = Enabled
4	NC-SI over MCTP Support	0b	0b = Disabled 1b = Enabled
3	LAN3_FTCO_ISOL_DIS	1b	Allow isolation of port 3 per BMC request. 0b = Enabled 1b = Disabled
2	LAN2_FTCO_ISOL_DIS	1b	Allow isolation of port 2 per BMC request. 0b = Enabled 1b = Disabled
1	LAN1_FTCO_ISOL_DIS	1b	Allow isolation of port 1 per BMC request. 0b = Enabled 1b = Disabled
0	LAN0_FTCO_ISOL_DIS	1b	Allow isolation of port 0 per BMC request. 0b = Enabled 1b = Disabled

### 6.3.65.4 PLDM Control Word (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:9	Reserved	0x0	Reserved.
8	Expose NIC Composite State sensors	1b	
7	Expose Power Sensors	1b	
6	Expose Thermal Trip State Sensors	1b	
5	Expose Configuration and Configuration Change	1b	
4	Expose Presence State	1b	
3	Expose Health State	1b	
2	Expose Thermal Sensors	1b	
1	Expose Link Speed	1b	
0	Expose Link Status	1b	

### 6.3.65.5 RDE Control Word (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Reserved	0x0	Reserved for other schemas including OEM schema extensions.
3	EthernetInterface v1.4.0	1b	Ethernet Interface schema.
2:1	Reserved	00b	Reserved.
0	ACD	1b	ACD collection.

### 6.3.65.6 OCP NIC Parameters Obsolete (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:7	Reserved	0x0	Reserved.
6	FAN_ON_AUX Valid Obsolete	0b	
5	FAN_ON_AUX Value Obsolete	0b	
4:0	FAN_ON_AUX SDP Obsolete	0x0	Valid only if FAN_ON_AUX valid = 1.

### 6.3.65.7 OCP NIC Parameters 2 (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:10	Reserved	0x0	Reserved.
9	OCP Compliance Indicator	0b	OCP Compliance Indicator 0b = Stand-up card 1b = OCP compliant card
8:4	Instance ID SDP	0x0	This field determines the SDP that is used for the Instance ID on a dual-device NIC. This field is only valid if the <i>Instance ID from SDP</i> field is 1b.

Bit(s)	Field Name	Default NVM Value	Description
3	Instance ID from SDP	0b	This bit determines whether the instance ID should be taken from an SDP. 0b = There is only one device on the NIC. 1b = There are two devices on the NIC. The instance ID of this device is taken from the SDP defined by the <i>Instance ID SDP</i> field.
2	FAN_ON_AUX Present	0b	
1	TEMP_CRIT_N Present	0b	
0	TEMP_WARN_N Present	0b	

### 6.3.65.8 Sideband Configuration Pointer (0x0007)

This module is 128 bytes and must be mapped in the first valid 4 KB sector of the Flash.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Sideband Configuration Pointer	0xFFFF	Points to Sideband Configuration Structure Section. For Sideband Configuration Structure inner structure, see <a href="#">Section 6.3.66</a> .

### 6.3.65.9 Reserved (0x0008)

### 6.3.65.10 Traffic Types Parameters (0x0009)

Bit(s)	Field Name	Default NVM Value	Description
15:14	Port 7 Traffic Types	01b	Defines which type of traffic can flow to and from primary BMC connection on port 3. The traffic types defined by this field are enabled by the Manageability Mode field and the OS2BMC Capable bit in the Common Manageability Parameters 1 NVM word. 00b = Reserved 01b = Network to BMC traffic only 10b = OS2BMC traffic only 11b = Both Network to BMC traffic and OS2BMC traffic
13:12	Port 6 Traffic Types	01b	Defines which type of traffic can flow to and from primary BMC connection on port 3. The traffic types defined by this field are enabled by the Manageability Mode field and the OS2BMC Capable bit in the Common Manageability Parameters 1 NVM word. 00b = Reserved 01b = Network to BMC traffic only 10b = OS2BMC traffic only 11b = Both Network to BMC traffic and OS2BMC traffic
11:10	Port 5 Traffic Types	01b	Defines which type of traffic can flow to and from primary BMC connection on port 2. The traffic types defined by this field are enabled by the Manageability Mode field and the OS2BMC Capable bit in the Common Manageability Parameters 1 NVM word. 00b = Reserved 01b = Network to BMC traffic only 10b = OS2BMC traffic only 11b = Both Network to BMC traffic and OS2BMC traffic
9:8	Port 4 Traffic Types	01b	Defines which type of traffic can flow to and from primary BMC connection on port 2. The traffic types defined by this field are enabled by the Manageability Mode field and the OS2BMC Capable bit in the Common Manageability Parameters 1 NVM word. 00b = Reserved 01b = Network to BMC traffic only 10b = OS2BMC traffic only 11b = Both Network to BMC traffic and OS2BMC traffic

Bit(s)	Field Name	Default NVM Value	Description
7:6	Port 3 Traffic Types	01b	Defines which type of traffic can flow to and from primary BMC connection on port 1. The traffic types defined by this field are enabled by the Manageability Mode field and the OS2BMC Capable bit in the Common Manageability Parameters 1 NVM word. 00b = Reserved 01b = Network to BMC traffic only 10b = OS2BMC traffic only 11b = Both Network to BMC traffic and OS2BMC traffic
5:4	Port 2 Traffic Types	01b	Defines which type of traffic can flow to and from primary BMC connection on port 1. The traffic types defined by this field are enabled by the Manageability Mode field and the OS2BMC Capable bit in the Common Manageability Parameters 1 NVM word. 00b = Reserved 01b = Network to BMC traffic only 10b = OS2BMC traffic only 11b = Both Network to BMC traffic and OS2BMC traffic
3:2	Port 1 Traffic Types	01b	Defines which type of traffic can flow to and from primary BMC connection on port 0. The traffic types defined by this field are enabled by the Manageability Mode field and the OS2BMC Capable bit in the Common Manageability Parameters 1 NVM word. 00b = Reserved 01b = Network to BMC traffic only 10b = OS2BMC traffic only 11b = Both Network to BMC traffic and OS2BMC traffic
1:0	Port 0 Traffic Types	01b	Defines which type of traffic can flow to and from primary BMC connection on port 0. The traffic types defined by this field are enabled by the Manageability Mode field and the OS2BMC Capable bit in the Common Manageability Parameters 1 NVM word. 00b = Reserved 01b = Network to BMC traffic only 10b = OS2BMC traffic only 11b = Both Network to BMC traffic and OS2BMC traffic

### 6.3.65.11 OEM Section Pointer (0x000A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	OEM Section Pointer	0xFFFF	Points to OEM Section. For OEM Section inner structure, see <a href="#">Section 6.3.67</a> .

## 6.3.66 Sideband Configuration Structure Section

This section describes the setting of the different pass-through interfaces (SMBus, NC-SI, and MCTP).

**Table 6-72. Sideband Configuration Structure Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Section Length	6.3.66.1
0x0001	SMBus Maximum Fragment Size	6.3.66.2
0x0002	SMBus Notification Timeout and Flags	6.3.66.3
0x0003	NC-SI Configuration 1	6.3.66.4
0x0004	NC-SI Configuration 2	6.3.66.5
0x0005	NC-SI Flow Control XOFF	6.3.66.6
0x0006	NC-SI Flow Control XON	6.3.66.7
0x0007	NC-SI HW Arbitration Configuration	6.3.66.8
0x0008 - 0x000C	Reserved	6.3.66.9
0x000D	OEM IANA	6.3.66.10
0x000E	NC-SI over MCTP Message Types	6.3.66.11
0x000F	NC-SI over MCTP Configuration	6.3.66.12
0x0010	MCTP Rate Limiter Config 1	6.3.66.13
0x0011	MCTP Rate Limiter Config 2	6.3.66.14
0x0012	Port to MDEF Mapping 0	6.3.66.15
0x0013	Port to MDEF Mapping 1	6.3.66.16
0x0014	Port to MDEF Mapping 2	6.3.66.17

### 6.3.66.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1 First Section -> Word: Sideband Configuration Structure -> Section Length Last Section -> Word: Sideband Configuration Structure -> Port to MDEF Mapping 2

### 6.3.66.2 SMBus Maximum Fragment Size (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Fragment Size	0x0020	SMBus Maximum Fragment Size (bytes). Supported range is between 32 and 240 bytes. <b>Note:</b> In MCTP mode, this value should be set to 0x45 (64 bytes payload + 5 bytes of MCTP header).

### 6.3.66.3 SMBus Notification Timeout and Flags (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:8	SMBus Notification Timeout (ms)	0xFF	
7:6	SMBus Connection Speed	00b	SMBus Connection Speed 00b = Standard SMBus connection. 01b = 400 Kb/s fast I <sup>2</sup> C. 10b = 1 Mb/s fast+ I <sup>2</sup> C. 11b = Reserved.
5	SMBus Block Read Command	0b	SMBus Block Read Command 0b = Block read command is 0xC0. 1b = Block read command is 0xD0.
4	Reserved	0b	Reserved.
3	Enable Fairness Arbitration	1b	MCTP over SMBus feature 0b = Disable fairness arbitration. 1b = Enable fairness arbitration.
2	Disable SMBus ARP Functionality	0b	Disable SMBus ARP Functionality 0b = SMBus ARP Enabled. 1b = SMBus ARP Disabled.
1	SMBus ARP PEC	1b	SMBus ARP PEC 0b = Disable PEC Disable SMBus ARP PEC. 1b = Enable PEC Enable SMBus ARP PEC. Should be set in MCTP modes.
0	SMBus Transaction PEC	0b	SMBus Transactions PEC 0b = Disable PEC. If this bit is cleared, PEC is not added to primary write or secondary read transactions, a secondary write transaction with PEC is dropped. 1b = Enable PEC. If this bit is set, PEC is added for primary SMBus write transactions. a PEC is added to secondary read transactions and can be received in secondary write transaction. Should be set in MCTP modes.

### 6.3.66.4 NC-SI Configuration 1 (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15	NC-SI Channel to Port Mapping Table Valid	0b	0b = Table Invalid Use default algorithm described in Channel ID mapping section. 1b = Table Valid Use the mapping defined in this word.
14	Flow Control	0b	0b = NC-SI flow control disable. 1b = NC-SI flow control enable.
13:10	NC-SI Version	0x1	Supported NC-SI version. Valid values are: 0x0 = NC-SI 1.0.1 0x1 = NC-SI 1.1
9	NC-SI HW Arbitration Enable	0b	0b = Not supported 1b = Supported
8	Reserved		Reserved.
7:5	Package ID	000b	Meaningful only when bit 15 of NC-SI Configuration 2 word (offset 0x07) is cleared.
4:0	Reserved	0x0	Reserved. Must be zero.

### 6.3.66.5 NC-SI Configuration 2 (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:14	Read NC-SI Package ID from SDP	00b	Read NC-SI Package ID. 00b = PackageID from NVM Package ID is read from <i>NVM Package ID</i> field in the NC-SI Configuration 01b = PackageID from NVM and SDPs #0 and #1. The package ID is (NVM Package ID[2], SDP#1 value, SDP#0 value). 10b = PackageID from NVM and SDP#1. The package ID is (NVM Package ID[2], SDP#1 value, NVM Package ID[0]). 11b = Reserved
13:9	PackageID SDP 0 <sup>1</sup>	0x0	Defines the SDP#1 from which the NC-SI package ID[1] is taken.
8:4	PackageID SDP 1 <sup>1</sup>	0x0	Defines the SDP#0 from which the NC-SI package ID[0] is taken
3:0	Max XOFF Renewal	0x3	NC-SI Flow Control MAX XOFF Renewal (# of XOFF renewals allowed): 0x0 = Disabled. Unlimited number of XOFF frames can be sent. 0x1 = Up to 2 consecutive XOFFs frames can be sent by the device. 0x2 = Up to 3 consecutive XOFFs frames can be sent by the device. ... 0xF = Up to 16 consecutive XOFFs frames can be sent by the device.

1. *PackageID SPD 0* and *PackageID SPD 1* must each be connected directly to an SDP on the E810.

### 6.3.66.6 NC-SI Flow Control XOFF (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	XOFF Threshold	0x12C0	Tx buffer watermark for sending a XOFF NC-SI flow control packet in bytes. The XOFF Threshold value refers to the occupied space in the buffer. The value should be 16 bytes aligned. <b>Notes:</b> <ul style="list-style-type: none"> <li>Field relevant for NC-SI operation mode only.</li> <li>To support a maximum packet size of 1.5 KB, the value programmed assuming a Tx buffer size of 8 KB value of field should be 0x12C0 (4,800 bytes).</li> </ul>

### 6.3.66.7 NC-SI Flow Control XON (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:0	XON Threshold	0x1340	Tx buffer watermark for sending a XON NC-SI flow control packet in bytes. The XON Threshold value refers to the available space in the Tx buffer. The value should be 16 bytes aligned. <b>Notes:</b> <ul style="list-style-type: none"> <li>Field relevant for NC-SI operation mode only.</li> <li>To support maximum packet size of 1.5 KB, the value programmed should be a positive value that equals: Buffer size - XOFF Threshold + 1536 bytes. Assuming a Tx Buffer size is 8 KB and the XOFF Threshold is 4800 bytes value of field should be 0x1340 (4,928 bytes).</li> </ul>

### 6.3.66.8 NC-SI HW Arbitration Configuration (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	TOKEN Timeout	0xA000	NC-SI Hardware Arbitration TOKEN Timeout (in NC-SI REF_CLK cycles - 20 ns). Setting value to 0 disables the timeout mechanism.

### 6.3.66.9 Reserved (0x0008 - 0x000C)

### 6.3.66.10 OEM IANA (0x000D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	OEM IANA	0x0	Identifies the OEM targeted by this image. The set of commands accepted depends on the IANA value in this field. The regular Intel OEM commands are accepted only with IANA 0x157.

### 6.3.66.11 NC-SI over MCTP Message Types (0x000E)

Bit(s)	Field Name	Default NVM Value	Description
15:8	NC-SI Control Message Type	0x2	Defines the MCTP message type used to identify NC-SI Control packets.
7:0	NC-SI Pass-Through Message Type	0x3	Defines the MCTP message type used to identify NC-SI pass-through packets.

### 6.3.66.12 NC-SI over MCTP Configuration (0x000F)

Bit(s)	Field Name	Default NVM Value	Description
15:7	Reserved	0x0	Reserved.
6	Simplified MCTP	0b	If set, only SOM and EOM bits are used for the reassembly process. Relevant only in SMBus mode.
5	Disable ACLs	0b	If set, the ACLs on the PCIe VDMs are disabled.
4:3	Reserved	00b	Reserved.
2	MCTP Over PCIe Segmentation Enable	1b	This bit enables a modification to the MCTP over PCIe VDM discovery/enumeration flow to support PCIe bus segmentation with a single MCTP Bus Owner. 0b = 0x0 = MCTP discovery/enumeration follows DSP0238 v1.2.0. 1b = Enable modification for PCIe bus segmentation.
1	Reserved	0b	Reserved.

### 6.3.66.13 MCTP Rate Limiter Config 1 (0x0010)

MCTP rate limiter configuration for first channel.

Bit(s)	Field Name	Default NVM Value	Description
15:0	MCTP Rate	0x9C40	Defines the number of cycles between accesses of the MCTP send client to the memory arbiter. Current value assumes a clock of 312.5 MHz and a bus width of 128 bits. This value provides a bit rate of 1 Mb/s.

### 6.3.66.14 MCTP Rate Limiter Config 2 (0x0011)

MCTP rate limiter configuration for first channel.

Bit(s)	Field Name	Default NVM Value	Description
15	Decision Point	0b	Defines if, when credits are available, a full MCTP message is sent or a single VDM is sent. 0b = Per VDM 1b = Per Packet
14:0	MCTP Max Credits	0x5	Defines the maximum number of 16 bytes credit that can be accumulated. These credits include the VDM header line (one line for each 64 byte VDM).

### 6.3.66.15 Port to MDEF Mapping 0 (0x0012)

Defines the ports mapping to MDEF sets for sets 0-2.

Bit(s)	Field Name	Default NVM Value	Description
15	Reserved	0b	Reserved.
14:10	MDEF Set 2 Port	0x1F	If 0x1F the MDEF is not assigned to any port.
9:5	MDEF Set 1 Port	0x1F	If 0x1F the MDEF is not assigned to any port.
4:0	MDEF Set 0 Port	0x1F	If 0x1F the MDEF is not assigned to any port.

### 6.3.66.16 Port to MDEF Mapping 1 (0x0013)

Defines the ports mapping to MDEF sets for sets 3-5.

Bit(s)	Field Name	Default NVM Value	Description
15	Reserved	0b	Reserved.
14:10	MDEF Set 5 Port	0x1F	If 0x1F the MDEF is not assigned to any port.
9:5	MDEF Set 4 Port	0x1F	If 0x1F the MDEF is not assigned to any port.
4:0	MDEF Set 3 Port	0x1F	If 0x1F the MDEF is not assigned to any port.

### 6.3.66.17 Port to MDEF Mapping 2 (0x0014)

Defines the ports mapping to MDEF sets for sets 6-7.

Bit(s)	Field Name	Default NVM Value	Description
15:10	Reserved	0x0	Reserved.
9:5	MDEF Set 7 Port	0x1F	If 0x1F the MDEF is not assigned to any port.
4:0	MDEF Set 6 Port	0x1F	If 0x1F the MDEF is not assigned to any port.

### 6.3.67 OEM Section

This section is the header of the OEM-specific data identifying the OEM for which this data is defined.

**Table 6-73. OEM Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Section Length	6.3.67.1
0x0001	OEM Header	6.3.67.2
0x0002	Reserved	6.3.67.3

#### 6.3.67.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1 First Section -> Word: OEM Section -> Section Length Last Section -> Word: OEM Section -> Reserved

#### 6.3.67.2 OEM Header (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	OEM Identifier	0x02A2	Identify the OEM for which this section is defined. Should be equal to the OEM IANA value.

#### 6.3.67.3 Reserved (0x0002)

## 6.3.68 Auto-Generated Pointers Module Section

Pointers to Type 1/2 words used by EMP and Software.

**Table 6-74. Auto-Generated Pointers Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Module Length	6.3.68.1
0x0001	Pointer to PFPM_APM Section	6.3.68.2
0x0002	Pointer to PFPM_APM Offset	6.3.68.3
0x0003	Pointer to PRTPM_GC Section	6.3.68.4
0x0004	Pointer to PRTPM_GC Offset	6.3.68.5
0x0005	Pointer to GLPCI_CAPSUP Section	6.3.68.6
0x0006	Pointer to GLPCI_CAPSUP Offset	6.3.68.7
0x0007	Pointer to PRTDCB_FCCFG Section	6.3.68.8
0x0008	Pointer to PRTDCB_FCCFG Offset	6.3.68.9
0x0009	Pointer to PFGEN_PORTNUM Section	6.3.68.10
0x000A	Pointer to PFGEN_PORTNUM Offset	6.3.68.11
0x000B	Pointer to PFPCI_FUNC2 Section	6.3.68.12
0x000C	Pointer to PFPCI_FUNC2 Offset	6.3.68.13
0x000D	Pointer to PF_VT_PFALLOC_PCIE Section	6.3.68.14
0x000E	Pointer to PF_VT_PFALLOC_PCIE Offset	6.3.68.15
0x000F	Pointer to PF_VT_PFALLOC Section	6.3.68.16
0x0010	Pointer to PF_VT_PFALLOC Offset	6.3.68.17
0x0011	Pointer to GLPCI_REVID Section	6.3.68.18
0x0012	Pointer to GLPCI_REVID Offset	6.3.68.19
0x0013	Pointer to PFPCI_DEVID Section	6.3.68.20
0x0014	Pointer to PFPCI_DEVID Offset	6.3.68.21
0x0015	Pointer to GLPCI_SUBVENID Section	6.3.68.22
0x0016	Pointer to GLPCI_SUBVENID Offset	6.3.68.23
0x0017	Pointer to PFPCI_SUBSYSID Section	6.3.68.24
0x0018	Pointer to PFPCI_SUBSYSID Offset	6.3.68.25
0x0019	Pointer to GLPCI_VENDORID Section	6.3.68.26
0x001A	Pointer to GLPCI_VENDORID Offset	6.3.68.27
0x001B	Pointer to PFPCI_FUNC Section	6.3.68.28
0x001C	Pointer to PFPCI_FUNC Offset	6.3.68.29
0x001D	Pointer to PFPCI_CNF Section	6.3.68.30
0x001E	Pointer to PFPCI_CNF Offset	6.3.68.31
0x001F	Pointer to GLPCI_CAPCTRL Section	6.3.68.32
0x0020	Pointer to GLPCI_CAPCTRL Offset	6.3.68.33
0x0021	Pointer to PFGEN_PORTNUM_CAR Section	6.3.68.34

**Table 6-74. Auto-Generated Pointers Module Section Summary Table [continued]**

Word Offset	Description	Section Reference
0x0022	Pointer to PFGEN_PORTNUM_CAR Offset	6.3.68.35
0x0023	Pointer to GLFOC_CACHE_CTL Section	6.3.68.36
0x0024	Pointer to GLFOC_CACHE_CTL Offset	6.3.68.37
0x0025	Pointer to PRTGEN_CNF Section	6.3.68.38
0x0026	Pointer to PRTGEN_CNF Offset	6.3.68.39
0x0027	Pointer to PF_VT_PFALLOC_HIF Section	6.3.68.40
0x0028	Pointer to PF_VT_PFALLOC_HIF Offset	6.3.68.41
0x0029	Pointer to PRTMAC_HSECTL1 Section	6.3.68.42
0x002A	Pointer to PRTMAC_HSECTL1 Offset	6.3.68.43
0x002B	Pointer to PRT_TDPUL2TAGSEN Section	6.3.68.44
0x002C	Pointer to PRT_TDPUL2TAGSEN Offset	6.3.68.45
0x002D	Pointer to GLGEN_MAC_LINK_TOPO Section	6.3.68.46
0x002E	Pointer to GLGEN_MAC_LINK_TOPO Offset	6.3.68.47

### 6.3.68.1 Module Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1 First Section -> Word: Auto Generated Pointers Module -> Module Length Last Section -> Word: Auto Generated Pointers Module -> Pointer to GLGEN_MAC_LINK_TOPO Offset

### 6.3.68.2 Pointer to PFPM\_APM Section (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PFPM_APM Section	0x0	

### 6.3.68.3 Pointer to Pfpm\_apm Offset (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PFPM_APM Offset	0x59	

### 6.3.68.4 Pointer to PRTPM\_GC Section (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to PRTPM_GC Section		

### 6.3.68.5 Pointer to PRTPM\_GC Offset (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PRTPM_GC Offset	0x7C	

### 6.3.68.6 Pointer to GLPCI\_CAPSUP Section (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to GLPCI_CAPSUP Section	0x0	

### 6.3.68.7 Pointer to GLPCI\_CAPSUP Offset (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to GLPCI_CAPSUP Offset	0x51	

### 6.3.68.8 Pointer to PRTDCB\_FCCFG Section (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PRTDCB_FCCFG Section	0x0	

### 6.3.68.9 Pointer to PRTDCB\_FCCFG Offset (0x0008)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PRTDCB_FCCFG Offset	0x35F	

### 6.3.68.10 Pointer to PFGEN\_PORTNUM Section (0x0009)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PFGEN_PORTNUM Section	0x0	

### 6.3.68.11 Pointer to PFGEN\_PORTNUM Offset (0x000A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PFGEN_PORTNUM Offset	0x40B	

### 6.3.68.12 Pointer to PFPCI\_FUNC2 Section (0x000B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to PFINT_ALLOC_PCI Section		

### 6.3.68.13 Pointer to PFPCI\_FUNC2 Offset (0x000C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PFINT_ALLOC_PCI Offset	0x3	

### 6.3.68.14 Pointer to PF\_VT\_PFALLOC\_PCIE Section (0x000D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to PF_VT_PFALLOC_PCIE Section		

### 6.3.68.15 Pointer to PF\_VT\_PFALLOC\_PCIE Offset (0x000E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PF_VT_PFALLOC_PCIE Offset	0x77	

### 6.3.68.16 Pointer to PF\_VT\_PFALLOC Section (0x000F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to PF_VT_PFALLOC Section		

### 6.3.68.17 Pointer to PF\_VT\_PFALLOC Offset (0x0010)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PF_VT_PFALLOC Offset	0x41E	

### 6.3.68.18 Pointer to GLPCI\_REVID Section (0x0011)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to GLPCI_REVID Section	0x0	Points to PCIR Type 1/2 Section. For PCIR Type 1/2 inner structure, see <a href="#">Section 6.3.54</a> .

### 6.3.68.19 Pointer to GLPCI\_REVID Offset (0x0012)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to GLPCI_REVID Offset	0x9	

### 6.3.68.20 Pointer to PFPCI\_DEVID Section (0x0013)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to PFPCI_DEVID Section		

### 6.3.68.21 Pointer to PFPCI\_DEVID Offset (0x0014)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PFPCI_DEVID Offset	0x3C	

### 6.3.68.22 Pointer to GLPCI\_SUBVENID Section (0x0015)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to GLPCI_SUBVENID Section		

### 6.3.68.23 Pointer to GLPCI\_SUBVENID Offset (0x0016)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to GLPCI_SUBVENID Offset	0x5B	

### 6.3.68.24 Pointer to PFPCI\_SUBSYSID Section (0x017)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to PFPCI_SUBSYSID Section		

### 6.3.68.25 Pointer to PFPCI\_SUBSYSID Offset (0x0018)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PFPCI_SUBSYSID Offset	0x16	

### 6.3.68.26 Pointer to GLPCI\_VENDORID Section (0x0019)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to GLPCI_VENDORID Section		

### 6.3.68.27 Pointer to GLPCI\_VENDORID Offset (0x001A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to GLPCI_VENDORID Offset	0x57	

### 6.3.68.28 Pointer to PFPCI\_FUNC Section (0x001B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to PFPCI_FUNC Section		

### 6.3.68.29 Pointer to PFPCI\_FUNC Offset (0x001C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PFPCI_FUNC Offset	0x14	

### 6.3.68.30 Pointer to PFPCI\_CNF Section (0x001D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to PFPCI_CNF Section		

### 6.3.68.31 Pointer to PFPCI\_CNF Offset (0x001E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PFPCI_CNF Offset	0x60	

### 6.3.68.32 Pointer to GLPCI\_CAPCTRL Section (0x001F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to GLPCI_CAPCTRL Section		

### 6.3.68.33 Pointer to GLPCI\_CAPCTRL Offset (0x0020)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to GLPCI_CAPCTRL Offset	0x4F	

### 6.3.68.34 Pointer to PFGEN\_PORTNUM\_CAR Section (0x0021)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to PFGEN_PORTNUM_CAR Section		

### 6.3.68.35 Pointer to PFGEN\_PORTNUM\_CAR Offset (0x0022)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PFGEN_PORTNUM_CAR Offset	0x46	

### 6.3.68.36 Pointer to GLFOC\_CACHE\_CTL Section (0x0023)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to GLFOC_CACHE_CTL Section		

### 6.3.68.37 Pointer to GLFOC\_CACHE\_CTL Offset (0x0024)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to GLFOC_CACHE_CTL Offset	0x1A5	

### 6.3.68.38 Pointer to PRTGEN\_CNF Section (0x0025)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to PRTGEN_CNF Section		

### 6.3.68.39 Pointer to PRTGEN\_CNF Offset (0x0026)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PRTGEN_CNF Offset	0x6C	

### 6.3.68.40 Pointer to PF\_VT\_PFALLOC\_HIF Section (0x0027)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to PF_VT_PFALLOC_HIF Section		

### 6.3.68.41 Pointer to PF\_VT\_PFALLOC\_HIF Offset (0x0028)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PF_VT_PFALLOC_HIF Offset	0x29	

### 6.3.68.42 Pointer to PRTMAC\_HSECTL1 Section (0x0029)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to PRTMAC_HSECTL1 Section		

### 6.3.68.43 Pointer to PRTMAC\_HSECTL1 Offset (0x002A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PRTMAC_HSECTL1 Offset	0x2B2	

### 6.3.68.44 Pointer to PRT\_TDPUL2TAGSEN Section (0x002B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to PRT_TDPUL2TAGSEN Section		

### 6.3.68.45 Pointer to PRT\_TDPUL2TAGSEN Offset (0x002C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to PRT_TDPUL2TAGSEN Offset	0x3	

### 6.3.68.46 Pointer to GLGEN\_MAC\_LINK\_TOPO Section (0x002D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Cloned Pointer to GLGEN_MAC_LINK_TOPO Section		

### 6.3.68.47 Pointer to GLGEN\_MAC\_LINK\_TOPO Offset (0x002E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Pointer to GLGEN_MAC_LINK_TOPO Offset	0x2	

## 6.3.69 NVM Image CSS Header Section

**Table 6-75. NVM Image CSS Header Section Summary Table**

Word Offset	Description	Section Reference
0x0000	moduleTypeL	6.3.69.1
0x0001	moduleTypeH	6.3.69.2
0x0002	headerLenL	6.3.69.3

Bits	Field Name	Default NVM Value	Description
15	Reserved	0b	Reserved.
14:1	lad_module_idH		

### 6.3.69.31 Reserved (0x0020)

## 6.3.70 NVM Key and Signature Section

Table 6-76. NVM Key and Signature Section Summary Table

Word Offset	Description	Section Reference
0x0000 + 1*n, n=0...127	RSA Public Key	6.3.70.1
0x0080	RSA ExponentL	6.3.70.2
0x0081	RSA ExponentH	6.3.70.3
0x0082 + 1*n, n=0...127	Encrypted SHA256 Hash	6.3.70.4

### 6.3.70.1 RSA Public Key[n] (0x0000 + 1\*n, n=0...127)

Bit(s)	Field Name	Default NVM Value	Description
15:0	RSA Public Key	0x0	

### 6.3.70.2 RSA ExponentL (0x0080)

Bit(s)	Field Name	Default NVM Value	Description
15:0	RSA ExponentL	0x0	

### 6.3.70.3 RSA ExponentH (0x0081)

Bit(s)	Field Name	Default NVM Value	Description
15:0	RSA ExponentH	0x0	

### 6.3.70.4 Encrypted SHA256 Hash[n] (0x0082 + 1\*n, n=0...127)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Encrypted SHA256 Hash	0x0	

## 6.3.71 NVM Image Auth Header Section

Table 6-77. NVM Image Auth Header Section Summary Table

Word Offset	Description	Section Reference
0x0000	Device Blank NVM Device ID	6.3.71.1
0x0001	Max Module AreaL	6.3.71.2
0x0002	Max Module AreaH	6.3.71.3
0x0003	Current Module AreaL	6.3.71.4
0x0004	Current Module AreaH	6.3.71.5
0x0005	Reserved	6.3.71.6
0x0006	Code Revision	6.3.71.7
0x0007	Reserved Spare Word	6.3.71.8

### 6.3.71.1 Device Blank NVM Device ID (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Device Blank NVM Device ID	0x374C	

### 6.3.71.2 Max Module AreaL (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Max Module AreaL	0x1000	

### 6.3.71.3 Max Module AreaH (0x0002)

Bits	Field Name	Default NVM Value	Description
15:0	Max Module AreaH	0x0009	

### 6.3.71.4 Current Module AreaL (0x0003)

Bits	Field Name	Default NVM Value	Description
15:0	Current Module AreaL	0xE000	

### 6.3.71.5 Current Module AreaH (0x0004)

Bits	Field Name	Default NVM Value	Description
15:0	Current Module AreaH	0x0006	

### 6.3.71.6 Reserved (0x0005)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.71.7 Code Revision (0x0006)

Bits	Field Name	Default NVM Value	Description
15:8	Major Revision	0x0	
7:0	Minor Revision	0x0	

### 6.3.71.8 Reserved Spare Word (0x0007)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved Spare Word	0x0	

## 6.3.72 SR1 - Should Be Copy of Shadow RAM: Section Clone

SR1 - should be copy of Shadow RAM is a clone of data starting at section Init Module word NVM Control Word 1 and ending at section Last Word of Shadow RAM word Last Word of Shadow RAM.

Bits	Field Name	Default NVM Value	Description
15:0	Max Module AreaH	0x0009	

### 6.3.75.4 Current Module AreaL (0x0003)

Bits	Field Name	Default NVM Value	Description
15:0	Current Module AreaL	0xE000	

### 6.3.75.5 Current Module AreaH (0x0004)

Bits	Field Name	Default NVM Value	Description
15:0	Current Module AreaH	0x0006	

### 6.3.75.6 Reserved (0x0005)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.75.7 Code Revision (0x0006)

Bits	Field Name	Default NVM Value	Description
15:8	Major Revision	0x0	
7:0	Minor Revision	0x0	

### 6.3.75.8 Reserved Spare Word (0x0007)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved Spare Word	0x0	

## 6.3.76 Extended ML Header Section

**Table 6-81. Extended ML Header Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Reserved	6.3.76.1
0x0001	Analog PHY pre PLL Configuration Pointer	6.3.76.2
0x0002	CSR Protected List Pointer	6.3.76.3
0x0003	PCIe Analog Pointer	6.3.76.4
0x0004	PCIR Fixed Auto-Load Pointer	6.3.76.5
0x0005	POR Fixed Auto-Load Pointer	6.3.76.6
0x0006	PCIR PFA Auto-Load Allowlist Pointer	6.3.76.7
0x0007	POR PFA Auto-Load Allowlist Pointer	6.3.76.8
0x0008	Reserved	6.3.76.9
0x0009	1st NVM Bank Pointer	6.3.76.10
0x000A	NVM Bank Area Size	6.3.76.11
0x000B	1st OROM Bank Pointer	6.3.76.12
0x000C	OROM Bank Area Size	6.3.76.13
0x000D	1st TLV Extension Bank Pointer	6.3.76.14
0x000E	TLV Extension Bank Area Size	6.3.76.15
0x000F	Preserved Field Area Pointer	6.3.76.16
0x0010	Recovery Firmware Pointer	6.3.76.17
0x0011	Reserved	6.3.76.18
0x0012	Factory Settings Size	6.3.76.19
0x0013	Last PFA Word Pointer	6.3.76.20
0x0014	LVK Hashes Pointer	6.3.76.21
0x0015	Reserved	6.3.76.22
0x0016	PCIe Config Group 1 Hash Low	6.3.76.23
0x0017	PCIe Config Group 1 Hash High	6.3.76.24
0x0018	CPK PCIe Config Group 1 Hash Low	6.3.76.25
0x0019	CPK PCIe Config Group 1 Hash High	6.3.76.26

### 6.3.76.1 Reserved (0x0000)

### 6.3.76.2 Analog PHY pre PLL Configuration Pointer (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Analog PLL Configuration Pointer	0x0	Points to Analog PHY pre PLL Configuration Section. For Analog PHY pre PLL Configuration inner structure, see <a href="#">Section 6.3.78</a> .

### 6.3.76.3 CSR Protected List Pointer (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	CSR Protected List Pointer	0x0	Points to CSR Protected List Section. For CSR Protected List inner structure, see <a href="#">Section 6.3.79</a> .

### 6.3.76.4 PCIe Analog Pointer (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PCIe Analog Pointer	0xFFF	Points to PCIe Analog Module Section. For PCIe Analog Module inner structure, see <a href="#">Section 6.3.80</a> .

### 6.3.76.5 PCIR Fixed Auto-Load Pointer (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PCIR Fixed Autoload Pointer	0x0	Points to PCIR Registers Auto-Load Module Section. For PCIR Registers Auto-Load Module inner structure, see <a href="#">Section 6.3.81</a> .

### 6.3.76.6 POR Fixed Auto-Load Pointer (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	POR Fixed Autoload Pointer	0x0	Points to POR Registers Auto-Load Module Section. For POR Registers Auto-Load Module inner structure, see <a href="#">Section 6.3.82</a> .

### 6.3.76.7 PCIR PFA Auto-Load Allowlist Pointer (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PCIR PFA Autoload Allowlist Pointer	0x0	Points to POR PCIR_PFA Auto-Load Allowlist Module Section. For PCIR_PFA Auto-Load Allowlist Module inner structure, see <a href="#">Section 6.3.83</a> .

### 6.3.76.8 POR PFA Auto-Load Allowlist Pointer (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	POR PFA Autoload Allowlist Pointer	0x0	Points to POR POR_PFA Auto-Load Allowlist Module Section. For POR_PFA Auto-Load Allowlist Module inner structure, see <a href="#">Section 6.3.84</a> .

### 6.3.76.9 Reserved (0x0008)

### 6.3.76.10 1st NVM Bank Pointer (0x0009)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	1st NVM Bank Pointer	0x020	Pointer to first NVM section (not swapped when section changes).

### 6.3.76.11 NVM Bank Area Size (0x000A)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11:0	NVM Bank Area Size	0x41A	Size expressed in 4 KB sector units.

### 6.3.76.12 1st OROM Bank Pointer (0x000B)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	1st OROM Bank Pointer	0x0854	Pointer to first OROM section (not swapped when section changes). <b>Note:</b> This value is fixed to 4224 KB - needs to be manually changed if location of section changes.

### 6.3.76.13 OROM Bank Area Size (0x000C)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11:0	OROM Bank Area Size	0x7D	Size expressed in 4 KB sector units.

### 6.3.76.14 1st TLV Extension Bank Pointer (0x000D)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	1st TLV Extension Bank Pointer	0x094E	Pointer to first OROM section (not swapped when section changes). <b>Note:</b> This value is fixed to 4224 KB - needs to be manually changed if location of section changes.

### 6.3.76.15 TLV Extension Bank Area Size (0x000E)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11:0	TLV Extension Bank Area Size	0x07	Size expressed in 4 KB sector units.

### 6.3.76.16 Preserved Field Area Pointer (0x000F)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	PFA Pointer	0x100	Pointer to PFA in first NVM section (not swapped when section changes).

### 6.3.76.17 Recovery Firmware Pointer (0x0010)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	1b	Pointer Type: 0b = Word units. 1b = 4 KB sector units.
14:0	Recovery Firmware Pointer	0x043	Absolute pointer to Recovery Firmware section.

### 6.3.76.18 Reserved (0x0011)

### 6.3.76.19 Factory Settings Size (0x0012)

Bit(s)	Field Name	Default NVM Value	Description
15:12	Reserved	0x0	Reserved.
11:0	Factory Settings Size	0xD	Size expressed in 4 KB sector units.

### 6.3.76.20 Last PFA Word Pointer (0x0013)

Bit(s)	Field Name	Default NVM Value	Description
15	Pointer Type	0b	Pointer Type: 0b = Word units. 1b = 4 KB sector units. Only the 4 KB sector unit is supported for this pointer.
14:0	Last PFA Word Pointer	0x2FFF	Pointer to the last word of the PFA in first NVM section (not swapped when section changes).

### 6.3.76.21 LVK Hashes Pointer (0x0014)

Bit(s)	Field Name	Default NVM Value	Description
15:0	LVK Hashes Pointer	0x0	Relative pointer to Low Value Keys Hashes. Points to LVK Hashes Section. For LVK Hashes inner structure See <a href="#">Section 6.3.85</a> .

### 6.3.76.22 Reserved (0x0015)

### 6.3.76.23 PCIe Config Group 1 Hash Low (0x0016)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PCIe Config Group 1 Hash Low		CRC-32: Start Section -> Word: PCIe Analog Module -> Module Length End Section -> Word: LCB Configuration -> Reg Write Indirect List

### 6.3.76.24 PCIe Config Group 1 Hash High (0x0017)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PCIe Config Group 1 Hash High		

### 6.3.76.25 CPK PCIe Config Group 1 Hash Low (0x0018)

Bit(s)	Field Name	Default NVM Value	Description
15:0	CPK PCIe Config Group 1 Hash Low		

### 6.3.76.26 CPK PCIe Config Group 1 Hash High (0x0019)

Bit(s)	Field Name	Default NVM Value	Description
15:0	CPK PCIe Config Group 1 Hash High	0x0	

## 6.3.77 ML Image Section

This module is the whole module that has been signed by CSS.

It is in the NVM map for EM tool needs only.

## 6.3.78 Analog PHY pre PLL Configuration Section

Includes static configurations of PHY Core registers for PLL lock.

**Table 6-82. Analog PHY pre PLL Configuration Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Section Length	6.3.78.1
0x0001	Reg Write Indirect List	6.3.78.2

### 6.3.78.1 Section Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1 First Section -> Word: Analog PHY pre PLL Configuration -> Section Length Last Section -> Word: Analog PHY pre PLL Configuration -> Reg Write Indirect List

### 6.3.78.2 Reg Write Indirect List (0x0001)

Raw data module length: variable

## 6.3.79 CSR Protected List Section

Defines the list of the protected CSRs and their default settings. These registers are made RO to the host as they contain settings that are critical for the host to Flash access when in blank Flash programming mode.

**Table 6-83. CSR Protected List Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Module Length	6.3.79.1
0x0001 - 0x000C	Reserved	6.3.79.2
0x000D - 0x0010	NVM contents for GLGEN_STAT	6.3.79.3
0x0011 - 0x0014	NVM contents for GLNVM_ALTIMERS	6.3.79.4
0x0015 - 0x0018	Reserved	6.3.79.5
0x0019 - 0x0093	NVM contents for GLNVM_PROTCSR	6.3.79.6

### 6.3.79.1 Module Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1 First Section -> Word: CSR Protected List -> Module Length Last Section -> Word: CSR Protected List -> Starting Address Low at GLNVM_PROTCSR[0]

### 6.3.79.2 Reserved (0x0001 - 0x000C)

### 6.3.79.3 GLGEN\_STAT (0x000D - 0x0010)

#### 6.3.79.3.1 Address Low at GLGEN\_STAT (0x000D)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLGEN_STAT	0xB612C	
3:0	Type	0x1	

#### 6.3.79.3.2 Address High at GLGEN\_STAT (0x000E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLGEN_STAT		

### 6.3.79.3.3 Data Low of GLGEN\_STAT (0x000F)

### 6.3.79.3.4 Data High of GLGEN\_STAT (0x0010)

## 6.3.79.4 GLNVM\_ALTIMERS (0x0011 - 0x0014)

### 6.3.79.4.1 Address Low at GLNVM\_ALTIMERS (0x0011)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLNVM_ALTIMERS	0xB6140	
3:0	Type	0x1	

### 6.3.79.4.2 Address High at GLNVM\_ALTIMERS (0x0012)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLNVM_ALTIMERS		

### 6.3.79.4.3 Data Low of GLNVM\_ALTIMERS (0x0013)

### 6.3.79.4.4 Data High of GLNVM\_ALTIMERS (0x0014)

## 6.3.79.5 Reserved (0x0015 - 0x0018)

## 6.3.79.6 GLNVM\_PROTCSR (0x0019 - 0x0093)

### 6.3.79.6.1 Starting Address Low at GLNVM\_PROTCSR (0x0019)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLNVM_PROTCSR	0xB6010	
3:0	Type	0x2	

### 6.3.79.6.2 Starting Address High at GLNVM\_PROTCSR (0x001A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLNVM_PROTCSR		

### 6.3.79.6.3 Attributes at GLNVM\_PROTCSR (0x001B)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x3C	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.79.6.4 Data Low of GLNVM\_PROTCSR[n] (0x001C + 2\*n, n=0...59)

### 6.3.79.6.5 Data High of GLNVM\_PROTCSR[n] (0x001D + 2\*n, n=0...59)

## 6.3.80 PCIe Analog Module Section

Contains read-only parameters that configure the PCIe Transaction layer.

**Table 6-84. PCIe Analog Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Module Length	6.3.80.1
0x0001	PCIe Analog Data	6.3.80.2

### 6.3.80.1 Module Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		

### 6.3.80.2 PCIe Analog Data (0x0001)

Raw data module length: variable

This word must be disabled at the image level.

## 6.3.81 PCIR Registers Auto-Load Module Section

Default setup to registers and internal memories that load on PCIR events.

**Table 6-85. PCIR Registers Auto-Load Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Module Length	6.3.81.1
0x0001 - 0x0004	NVM contents for GLPCI_PWRDATA	6.3.81.2
0x0005 - 0x0009	NVM contents for GLPCI_PMSUP	6.3.81.3
0x000A - 0x000B	NVM contents for GLPCI_REVID	6.3.81.4
0x000C - 0x0013	Reserved	6.3.81.5

### 6.3.81.1 Module Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1 First Section -> Word: PCIR Registers Auto-Load Module -> Module Length Last Section -> Word: POR Registers Auto-Load Module -> PCI Link Block Data

### 6.3.81.2 GLPCI\_PWRDATA (0x0001 - 0x0004)

#### 6.3.81.2.1 Address Low at GLPCI\_PWRDATA (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_PWRDATA	0x9DE7C	
3:0	Type	0x1	

#### 6.3.81.2.2 Address High at GLPCI\_PWRDATA (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLPCI_PWRDATA		

#### 6.3.81.2.3 Data Low of GLPCI\_PWRDATA (0x0003)

#### 6.3.81.2.4 Data High of GLPCI\_PWRDATA (0x0004)

### 6.3.81.3 GLPCI\_PMSUP (0x0005 - 0x0009)

#### 6.3.81.3.1 Starting Address Low at GLPCI\_PMSUP (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_PMSUP	0x9DE94	
3:0	Type	0x2	

#### 6.3.81.3.2 Starting Address High at GLPCI\_PMSUP (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLPCI_PMSUP		

#### 6.3.81.3.3 Attributes at GLPCI\_PMSUP (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x2	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.81.3.4 Data Low of GLPCI\_PMSUP (0x0008)

#### 6.3.81.3.5 Data High of GLPCI\_PMSUP (0x0009)

### 6.3.81.4 GLPCI\_REVID (0x000A - 0x000B)

#### 6.3.81.4.1 Data Low of GLPCI\_REVID (0x000A)

#### 6.3.81.4.2 Data High of GLPCI\_REVID (0x000B)

### 6.3.81.5 Reserved (0x000C - 0x0013)

## 6.3.82 POR Registers Auto-Load Module Section

Default setup to registers that load on POR events.

**Table 6-86. POR Registers Auto-Load Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Module Length	6.3.82.1

### 6.3.82.1 Module Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1 First Section -> Word: POR Registers Auto-Load Module -> Module Length Last Section -> Word: POR Registers Auto-Load Module -> Address Low at GLMNG_WD_ENA

## 6.3.83 PCIR\_PFA Auto-Load Allowlist Module Section

Default setup to registers and internal memories that load on PCIR events.

**Table 6-87. PCIR\_PFA Auto-Load Allowlist Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Module Length	6.3.83.1
0x0001 - 0x0013	NVM contents for PFINT_ALLOC_PCI	6.3.83.2
0x0014 - 0x0026	NVM contents for PFPCI_SUBSYSID	6.3.83.3
0x0027 - 0x0039	NVM contents for PF_VT_PFALLOC_HIF	6.3.83.4
0x003A - 0x004C	NVM contents for PFPCI_DEVID	6.3.83.5
0x004D - 0x0051	NVM contents for GLPCI_CAPCTRL	6.3.83.6
0x0052 - 0x0053	NVM contents for GLPCI_CAPSUP	6.3.83.7
0x0054 - 0x0055	NVM contents for GLPCI_LINKCAP	6.3.83.8
0x0056 - 0x0059	NVM contents for GLPCI_VENDORID	6.3.83.9
0x005A - 0x005D	NVM contents for GLPCI_SUBVENID	6.3.83.10
0x005E - 0x0070	NVM contents for PFPCI_CNF	6.3.83.11
0x0071 - 0x0074	Reserved	6.3.83.12
0x0075 - 0x0087	NVM contents for PF_VT_PFALLOC_PCIE	6.3.83.13

### 6.3.83.1 Module Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1 First Section -> Word: PCIR_PFA Auto-load Allowlist Module -> Module Length Last Section -> Word: PCIR_PFA Auto-load Allowlist Module -> Starting Address Low at PF_VT_PFALLOC_PCIE, for PF[0]

### 6.3.83.2 PFINT\_ALLOC\_PCI (0x0001 - 0x0013)

#### 6.3.83.2.1 Starting Address Low at PFINT\_ALLOC\_PCI (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFINT_ALLOC_PCI, for PF[0]	0x9D800	
3:0	Type	0x2	

### 6.3.83.2.2 Starting Address High at PFINT\_ALLOC\_PCI (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFINT_ALLOC_PCI, for PF[0]		

### 6.3.83.2.3 Attributes at PFINT\_ALLOC\_PCI (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.83.2.4 Data Low of PFINT\_ALLOC\_PCI[PF] (0x0004 + 2\*PF, PF=0...7)

### 6.3.83.2.5 Data High of PFINT\_ALLOC\_PCI[PF] (0x0005 + 2\*PF, PF=0...7)

## 6.3.83.3 PFPCI\_SUBSYSID (0x0014 - 0x0026)

### 6.3.83.3.1 Starting Address Low at PFPCI\_SUBSYSID (0x0014)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFPCI_SUBSYSID, for PF[0]	0x9D880	
3:0	Type	0x2	

### 6.3.83.3.2 Starting Address High at PFPCI\_SUBSYSID (0x0015)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFPCI_SUBSYSID, for PF[0]		

### 6.3.83.3.3 Attributes at PFPCI\_SUBSYSID (0x0016)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.83.3.4 Data Low of PFPCI\_SUBSYSID[PF] (0x0017 + 2\*PF, PF=0...7)**

**6.3.83.3.5 Data High of PFPCI\_SUBSYSID[PF] (0x0018 + 2\*PF, PF=0...7)**

**6.3.83.4 PF\_VT\_PFALLOC\_HIF (0x0027 - 0x0039)**

**6.3.83.4.1 Starting Address Low at PF\_VT\_PFALLOC\_HIF (0x0027)**

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PF_VT_PFALLOC_HIF, for PF[0]	0x9DD80	
3:0	Type	0x2	

**6.3.83.4.2 Starting Address High at PF\_VT\_PFALLOC\_HIF (0x0028)**

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PF_VT_PFALLOC_HIF, for PF[0]		

**6.3.83.4.3 Attributes at PF\_VT\_PFALLOC\_HIF (0x0029)**

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.83.4.4 Data Low of PF\_VT\_PFALLOC\_HIF[PF] (0x002A + 2\*PF, PF=0...7)**

**6.3.83.4.5 Data High of PF\_VT\_PFALLOC\_HIF[PF] (0x002B + 2\*PF, PF=0...7)**

### 6.3.83.5 PFPCI\_DEVID (0x003A - 0x004C)

#### 6.3.83.5.1 Starting Address Low at PFPCI\_DEVID (0x003A)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFPCI_DEVID, for PF[0]	0x9DE00	
3:0	Type	0x2	

#### 6.3.83.5.2 Starting Address High at PFPCI\_DEVID (0x003B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFPCI_DEVID, for PF[0]		

#### 6.3.83.5.3 Attributes at PFPCI\_DEVID (0x003C)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.83.5.4 Data Low of PFPCI\_DEVID[PF] (0x003D + 2\*PF, PF=0...7)

#### 6.3.83.5.5 Data High of PFPCI\_DEVID[PF] (0x003E + 2\*PF, PF=0...7)

### 6.3.83.6 GLPCI\_CAPCTRL (0x004D - 0x0051)

#### 6.3.83.6.1 Starting Address Low at GLPCI\_CAPCTRL (0x004D)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_CAPCTRL	0x9DE88	
3:0	Type	0x2	

#### 6.3.83.6.2 Starting Address High at GLPCI\_CAPCTRL (0x004E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLPCI_CAPCTRL		

### 6.3.83.6.3 Attributes at GLPCI\_CAPCTRL (0x004F)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x3	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.83.6.4 Data Low of GLPCI\_CAPCTRL (0x0050)

### 6.3.83.6.5 Data High of GLPCI\_CAPCTRL (0x0051)

### 6.3.83.7 GLPCI\_CAPSUP (0x0052 - 0x0053)

#### 6.3.83.7.1 Data Low of GLPCI\_CAPSUP (0x0052)

#### 6.3.83.7.2 Data High of GLPCI\_CAPSUP (0x0053)

### 6.3.83.8 GLPCI\_LINKCAP (0x0054 - 0x0055)

#### 6.3.83.8.1 Data Low of GLPCI\_LINKCAP (0x0054)

#### 6.3.83.8.2 Data High of GLPCI\_LINKCAP (0x0055)

### 6.3.83.9 GLPCI\_VENDORID (0x0056 - 0x0059)

#### 6.3.83.9.1 Address Low at GLPCI\_VENDORID (0x0056)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_VENDORID	0x9DEC8	
3:0	Type	0x1	

#### 6.3.83.9.2 Address High at GLPCI\_VENDORID (0x0057)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLPCI_VENDORID		

#### 6.3.83.9.3 Data Low of GLPCI\_VENDORID (0x0058)

#### 6.3.83.9.4 Data High of GLPCI\_VENDORID (0x0059)

### 6.3.83.10 GLPCI\_SUBVENID (0x005A - 0x005D)

#### 6.3.83.10.1 Address Low at GLPCI\_SUBVENID (0x005A)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_SUBVENID	0x9DEE8	
3:0	Type	0x1	

#### 6.3.83.10.2 Address High at GLPCI\_SUBVENID (0x005B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLPCI_SUBVENID		

#### 6.3.83.10.3 Data Low of GLPCI\_SUBVENID (0x005C)

#### 6.3.83.10.4 Data High of GLPCI\_SUBVENID (0x005D)

### 6.3.83.11 PFPCI\_CNF (0x005E - 0x0070)

#### 6.3.83.11.1 Starting Address Low at PFPCI\_CNF (0x005E)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFPCI_CNF, for PF[0]	0x9DF00	
3:0	Type	0x2	

#### 6.3.83.11.2 Starting Address High at PFPCI\_CNF (0x005F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFPCI_CNF, for PF[0]		

#### 6.3.83.11.3 Attributes at PFPCI\_CNF (0x0060)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.83.11.4 Data Low of PFPCI\_CNF[PF] (0x0061 + 2\*PF, PF=0...7)**

**6.3.83.11.5 Data High of PFPCI\_CNF[PF] (0x0062 + 2\*PF, PF=0...7)**

**6.3.83.12 Reserved (0x0071 - 0x0074)**

**6.3.83.13 PF\_VT\_PFALLOC\_PCIE (0x0075 - 0x0087)**

**6.3.83.13.1 Starting Address Low at PF\_VT\_PFALLOC\_PCIE (0x0075)**

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PF_VT_PFALLOC_PCIE, for PF[0]	0xBE080	
3:0	Type	0x2	

**6.3.83.13.2 Starting Address High at PF\_VT\_PFALLOC\_PCIE (0x0076)**

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PF_VT_PFALLOC_PCIE, for PF[0]		

**6.3.83.13.3 Attributes at PF\_VT\_PFALLOC\_PCIE (0x0077)**

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

**6.3.83.13.4 Data Low of PF\_VT\_PFALLOC\_PCIE[PF] (0x0078 + 2\*PF, PF=0...7)**

**6.3.83.13.5 Data High of PF\_VT\_PFALLOC\_PCIE[PF] (0x0079 + 2\*PF, PF=0...7)**

## 6.3.84 POR\_PFA Auto-Load Allowlist Module Section

Default setup to registers and internal memories that load on POR events.

**Table 6-88. POR\_PFA Auto-Load Allowlist Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Module Length	6.3.84.1
0x0001 - 0x0011	NVM contents for GLGEN_GPIO_CTL	6.3.84.2
0x0012 - 0x0024	NVM contents for PFPCI_FUNC	6.3.84.3
0x0025 - 0x0037	NVM contents for PFPM_WUC	6.3.84.4
0x0038 - 0x003B	NVM contents for GLPCI_LBARCTRL	6.3.84.5
0x003C - 0x003F	NVM contents for GLPCI_CNF	6.3.84.6
0x0040 - 0x0043	NVM contents for GL_MNG_HWARB_CTRL	6.3.84.7
0x0044 - 0x0056	Reserved	6.3.84.8
0x0057 - 0x0069	NVM contents for PFPM_APM	6.3.84.9
0x006A - 0x007C	NVM contents for PRTGEN_CNF	6.3.84.10
0x007D - 0x008C	Reserved	6.3.84.11
0x008D - 0x009C	NVM contents for PRTGEN_CNF2	6.3.84.12
0x009D - 0x00A7	Reserved	6.3.84.13
0x00A8 - 0x00AB	NVM contents for GL_PWR_MODE_CTL	6.3.84.14

### 6.3.84.1 Module Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Module Length		Length in: 2 Bytes unit - 1 First Section -> Word: POR_PFA Auto-load Allowlist Module -> Module Length Last Section -> Word: POR_PFA Auto-load Allowlist Module -> Address Low at GL_PWR_MODE_CTL

### 6.3.84.2 GLGEN\_GPIO\_CTL (0x0001 - 0x0011)

#### 6.3.84.2.1 Starting Address Low at GLGEN\_GPIO\_CTL (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLGEN_GPIO_CTL	0x880C8	
3:0	Type	0x2	

### 6.3.84.2.2 Starting Address High at GLGEN\_GPIO\_CTL (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLGEN_GPIO_CTL		

### 6.3.84.2.3 Attributes at GLGEN\_GPIO\_CTL (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x7	
4:3	Skip	00b	
2:0	Width	000b	

### 6.3.84.2.4 Data Low of GLGEN\_GPIO\_CTL[n] (0x0004 + 2\*n, n=0...6)

### 6.3.84.2.5 Data High of GLGEN\_GPIO\_CTL[n] (0x0005 + 2\*n, n=0...6)

## 6.3.84.3 PFPCI\_FUNC (0x0012 - 0x0024)

### 6.3.84.3.1 Starting Address Low at PFPCI\_FUNC (0x0012)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFPCI_FUNC, for PF[0]	0x9D980	
3:0	Type	0x2	

### 6.3.84.3.2 Starting Address High at PFPCI\_FUNC (0x0013)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFPCI_FUNC, for PF[0]		

### 6.3.84.3.3 Attributes at PFPCI\_FUNC (0x0014)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.84.3.4 Data Low of PFPCI\_FUNC[PF] (0x0015 + 2\*PF, PF=0...7)

#### 6.3.84.3.5 Data High of PFPCI\_FUNC[PF] (0x0016 + 2\*PF, PF=0...7)

### 6.3.84.4 PFPM\_WUC (0x0025 - 0x0037)

#### 6.3.84.4.1 Starting Address Low at PFPM\_WUC (0x0025)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFPM_WUC, for PF[0]	0x9DC80	
3:0	Type	0x2	

#### 6.3.84.4.2 Starting Address High at PFPM\_WUC (0x0026)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFPM_WUC, for PF[0]		

#### 6.3.84.4.3 Attributes at PFPM\_WUC (0x0027)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.84.4.4 Data Low of PFPM\_WUC[PF] (0x0028 + 2\*PF, PF=0...7)

#### 6.3.84.4.5 Data High of PFPM\_WUC[PF] (0x0029 + 2\*PF, PF=0...7)

### 6.3.84.5 GLPCI\_LBARCTRL (0x0038 - 0x003B)

#### 6.3.84.5.1 Address Low at GLPCI\_LBARCTRL (0x0038)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_LBARCTRL	0x9DE74	
3:0	Type	0x1	

### 6.3.84.5.2 Address High at GLPCI\_LBARCTRL (0x0039)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GLPCI_LBARCTRL		

### 6.3.84.5.3 Data Low of GLPCI\_LBARCTRL (0x003A)

### 6.3.84.5.4 Data High of GLPCI\_LBARCTRL (0x003B)

## 6.3.84.6 GLPCI\_CNF (0x003C - 0x003F)

### 6.3.84.6.1 Address Low at GLPCI\_CNF (0x003C)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GLPCI_CNF	0x9DEA0	
3:0	Type	0x1	

### 6.3.84.6.2 Address High at GLPCI\_CNF (0x003D)

Bit(s)	Field Name	Default NVM Value	Description
15:0			

### 6.3.84.6.3 Data Low of GLPCI\_CNF (0x003E)

### 6.3.84.6.4 Data High of GLPCI\_CNF (0x003F)

## 6.3.84.7 GL\_MNG\_HWARB\_CTRL (0x0040 - 0x0043)

### 6.3.84.7.1 Address Low at GL\_MNG\_HWARB\_CTRL (0x0040)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_MNG_HWARB_CTRL	0xB6130	
3:0	Type	0x1	

### 6.3.84.7.2 Address High at GL\_MNG\_HWARB\_CTRL (0x0041)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_MNG_HWARB_CTRL		

### 6.3.84.7.3 Data Low of GL\_MNG\_HWARB\_CTRL (0x0042)

### 6.3.84.7.4 Data High of GL\_MNG\_HWARB\_CTRL (0x0043)

### 6.3.84.8 Reserved (0x0044 - 0x0056)

### 6.3.84.9 PFPM\_APM (0x0057 - 0x0069)

#### 6.3.84.9.1 Starting Address Low at PFPM\_APM (0x0057)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PFPM_APM, for PF[0]	0xB8080	
3:0	Type	0x2	

#### 6.3.84.9.2 Starting Address High at PFPM\_APM (0x0058)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PFPM_APM, for PF[0]		

#### 6.3.84.9.3 Attributes at PFPM\_APM (0x0059)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x8	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.84.9.4 Data Low of PFPM\_APM[PF] (0x005A + 2\*PF, PF=0...7)

#### 6.3.84.9.5 Data High of PFPM\_APM[PF] (0x005B + 2\*PF, PF=0...7)

### 6.3.84.10 PRTGEN\_CNF (0x006A - 0x007C)

#### 6.3.84.10.1 Starting Address Low at PRTGEN\_CNF (0x006A)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of PRTGEN_CNF, for PRT[0]	0xB8120	
3:0	Type	0x2	

#### 6.3.84.10.2 Starting Address High at PRTGEN\_CNF (0x006B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of PRTGEN_CNF, for PRT[0]		

#### 6.3.84.10.3 Attributes at PRTGEN\_CNF (0x006C)

Bit(s)	Field Name	Default NVM Value	Description
15:5	Length	0x18	
4:3	Skip	00b	
2:0	Width	000b	

#### 6.3.84.10.4 Data Low of PRTGEN\_CNF[PRT] (0x006D + 2\*PRT, PRT=0...7)

#### 6.3.84.10.5 Data High of PRTGEN\_CNF[PRT] (0x006E + 2\*PRT, PRT=0...7)

### 6.3.84.11 Reserved (0x007D - 0x008C)

### 6.3.84.12 PRTGEN\_CNF2 (0x008D - 0x009C)

#### 6.3.84.12.1 Data Low of PRTGEN\_CNF2[PRT] (0x008D + 2\*PRT, PRT=0...7)

#### 6.3.84.12.2 Data High of PRTGEN\_CNF2[PRT] (0x008E + 2\*PRT, PRT=0...7)

### 6.3.84.13 Reserved (0x009D - 0x00A7)

## 6.3.84.14 GL\_PWR\_MODE\_CTL (0x00A8 - 0x00AB)

### 6.3.84.14.1 Address Low at GL\_PWR\_MODE\_CTL (0x00A8)

Bit(s)	Field Name	Default NVM Value	Description
15:4	Low Address Bits of GL_PWR_MODE_CTL	0xB820C	
3:0	Type	0x1	

### 6.3.84.14.2 Address High at GL\_PWR\_MODE\_CTL (0x00A9)

Bit(s)	Field Name	Default NVM Value	Description
15:0	High Address Bits of GL_PWR_MODE_CTL		

### 6.3.84.14.3 Data Low of GL\_PWR\_MODE\_CTL (0x00AA)

### 6.3.84.14.4 Data High of GL\_PWR\_MODE\_CTL (0x00AB)

## 6.3.85 LVK Hashes Section

Hashes for Low Value Keys.

**Table 6-89. LVK Hashes Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Length	6.3.85.1
0x0001 + 1*n, n=0...15	NVM Bank Key Hash	6.3.85.2
0x0011 + 1*n, n=0...15	OS Package Key Hash	6.3.85.3
0x0021 + 1*n, n=0...15	OROM Key Hash	6.3.85.4
0x0031 + 1*n, n=0...15	Netlist Key Hash	6.3.85.5

### 6.3.85.1 Length (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Length		Length in: 2 Bytes unit - 1 First Section -> Word: LVK Hashes -> Length Last Section -> Word: LVK Hashes -> Netlist Key Hash

### 6.3.85.2 NVM Bank Key Hash[n] (0x0001 + 1\*n, n=0...15)

Bit(s)	Field Name	Default NVM Value	Description
15:0	NVM Bank Key Hash	0x0	Hash for NVM Bank and Recovery section key.

### 6.3.85.3 OS Package Key Hash[n] (0x0011 + 1\*n, n=0...15)

Bit(s)	Field Name	Default NVM Value	Description
15:0	OS Package Key Hash	0x0	Hash for OS Package keys.

### 6.3.85.4 OROM Key Hash[n] (0x0021 + 1\*n, n=0...15)

Bit(s)	Field Name	Default NVM Value	Description
15:0	OROM Key Hash	0x0	Hash for OROM key.

### 6.3.85.5 Netlist Key Hash[n] (0x0031 + 1\*n, n=0...15)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Netlist Key Hash	0x0	Hash for Netlist key.

## 6.3.86 Recovery FW CSS Header Section

**Table 6-90. Recovery FW CSS Header Section Summary Table**

Word Offset	Description	Section Reference
0x0000	moduleTypeL	6.3.86.1
0x0001	moduleTypeH	6.3.86.2
0x0002	headerLenL	6.3.86.3

0x0004	Current Module AreaH	6.3.88.5
0x0005	Reserved	6.3.88.6
0x0006	Code Revision	6.3.88.7
0x0007	Reserved Spare Word	6.3.88.8

### 6.3.88.1 Device Blank NVM Device ID (0x0000)

Bits	Field Name	Default NVM Value	Description
15:0	Device Blank NVM Device ID	0x1590	

### 6.3.88.2 Max Module AreaL (0x0001)

Bits	Field Name	Default NVM Value	Description
15:0	Max Module AreaL	0x1000	

### 6.3.88.3 Max Module AreaH (0x0002)

Bits	Field Name	Default NVM Value	Description
15:0	Max Module AreaH	0x0009	

### 6.3.88.4 Current Module AreaL (0x0003)

Bits	Field Name	Default NVM Value	Description
15:0	Current Module AreaL	0xE000	

### 6.3.88.5 Current Module AreaH (0x0004)

Bits	Field Name	Default NVM Value	Description
15:0	Current Module AreaH	0x0006	

### 6.3.88.6 Reserved (0x0005)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved	0xFFFF	Reserved.

### 6.3.88.7 Code Revision (0x0006)

Bits	Field Name	Default NVM Value	Description
15:8	Major Revision	0x0	
7:0	Minor Revision	0x0	

### 6.3.88.8 Reserved Spare Word (0x0007)

Bits	Field Name	Default NVM Value	Description
15:0	Reserved Spare Word	0x0	

### 6.3.89 DCB Rx Module Section

### 6.3.90 DCB Tx Module Section

### 6.3.91 QoS DCB Auto-Load Section

### 6.3.92 QoS no-DCB Auto-Load Section

### 6.3.93 Ext. CORER Registers Auto-Load Module Section

Default setup to registers and internal memories that load on CORER events.

**Table 6-93. Ext. CORER Registers Auto-Load Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	ModuleLenL	6.3.93.1
0x0001	ModuleLenH	6.3.93.2

#### 6.3.93.1 ModuleLenL (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ModuleLenL	0x00000000	Length in: 2 Bytes unit - 2 First Section -> Word: Ext. CORER Registers Auto-load Module -> ModuleLenL Last Section -> Word: Ext. CORER Registers Auto-load Module -> ModuleLenH

#### 6.3.93.2 ModuleLenH (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ModuleLenH		

## 6.3.94 EMP Global Module Section

This section contains two sub-sections:

1. **Vendor-Specific Settings:** Settings for external PHY or Modules. This part has a proprietary format to enable advanced, vendor-specific, PHY setting. These settings are loaded into the external devices via the MDIO/I<sup>2</sup>C interface.
2. **List of Qualified Modules:** Parameter list of up to 16 modules. Per module list holds OUI, Revision, and Version numbers.

**Table 6-94. EMP Global Module Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Section Length	6.3.94.1
0x0001	Number of Qualified Modules	6.3.94.2
0x0002 + 12*n, n=0...15	Module OUI Bytes 0-1	6.3.94.3
0x0003 + 12*n, n=0...15	Module OUI Byte 2	6.3.94.4
0x0004 + 12*n, n=0...15	Vendor Part Number Bytes 0-1	6.3.94.5
0x0005 + 12*n, n=0...15	Vendor Part Number Bytes 2-3	6.3.94.6
0x0006 + 12*n, n=0...15	Vendor Part Number Bytes 4-5	6.3.94.7
0x0007 + 12*n, n=0...15	Vendor Part Number Bytes 6-7	6.3.94.8
0x0008 + 12*n, n=0...15	Vendor Part Number Bytes 8-9	6.3.94.9
0x0009 + 12*n, n=0...15	Vendor Part Number Bytes 10-11	6.3.94.10
0x000A + 12*n, n=0...15	Vendor Part Number Bytes 12-13	6.3.94.11
0x000B + 12*n, n=0...15	Vendor Part Number Bytes 14-15	6.3.94.12
0x000C + 12*n, n=0...15	Module Revision Number Bytes 0-1	6.3.94.13
0x000D + 12*n, n=0...15	Module Revision Number Bytes 2-3	6.3.94.14

### 6.3.94.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1 First Section -> Word: EMP Global Module -> Section Length Last Section -> Word: EMP Global Module -> Module Revision Number Bytes 2-3

### 6.3.94.2 Number of Qualified Modules (0x0001)

Number of valid entries, 0 through 15, in the qualified modules' list.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Number of Qualified Modules	0x10	

### 6.3.94.3 Module OUI Bytes 0-1[n] (0x0002 + 12\*n, n=0...15)

OUI of qualified external modules.

- SFP Vendor OUI is located at offsets [39:37].
- QSFP Vendor OUI is located at offsets [167:165].

Bit(s)	Field Name	Default NVM Value	Description
15:8	Byte 1	0x0	
7:0	Byte 0	0x0	

### 6.3.94.4 Module OUI Byte 2[n] (0x0003 + 12\*n, n=0...15)

OUI of qualified external modules.

- SFP Vendor OUI is located at offsets [39:37].
- QSFP Vendor OUI is located at offsets [167:165].

Bit(s)	Field Name	Default NVM Value	Description
15:8	Reserved	0x0	Reserved.
7:0	Byte 2	0x0	

### 6.3.94.5 Vendor Part Number Bytes 0-1[n] (0x0004 + 12\*n, n=0...15)

Vendor Part Number of qualified external modules.

- SFP+: Addr A0h Bytes 55:40
- QSFP+: Addr 183:168 page 0

Bit(s)	Field Name	Default NVM Value	Description
15:8	Byte 1	0x0	
7:0	Byte 0	0x0	

### 6.3.94.6 Vendor Part Number Bytes 2-3[n] (0x0005 + 12\*n, n=0...15)

Vendor Part Number of qualified external modules.

- SFP+: Addr A0h Bytes 55:40
- QSFP+: Addr 183:168 page 0

Bit(s)	Field Name	Default NVM Value	Description
15:8	Byte 1	0x0	
7:0	Byte 0	0x0	

### 6.3.94.7 Vendor Part Number Bytes 4-5[n] (0x0006 + 12\*n, n=0...15)

Vendor Part Number of qualified external modules.

- SFP+: Addr A0h Bytes 55:40
- QSFP+: Addr 183:168 page 0

Bit(s)	Field Name	Default NVM Value	Description
15:8	Byte 1	0x0	
7:0	Byte 0	0x0	

### 6.3.94.8 Vendor Part Number Bytes 6-7[n] (0x0007 + 12\*n, n=0...15)

Vendor Part Number of qualified external modules.

- SFP+: Addr A0h Bytes 55:40
- QSFP+: Addr 183:168 page 0

Bit(s)	Field Name	Default NVM Value	Description
15:8	Byte 1	0x0	
7:0	Byte 0	0x0	

### 6.3.94.9 Vendor Part Number Bytes 8-9[n] (0x0008 + 12\*n, n=0...15)

Vendor Part Number of qualified external modules.

- SFP+: Addr A0h Bytes 55:40
- QSFP+: Addr 183:168 page 0

Bit(s)	Field Name	Default NVM Value	Description
15:8	Byte 1	0x0	
7:0	Byte 0	0x0	

### 6.3.94.10 Vendor Part Number Bytes 10-11[n] (0x0009 + 12\*n, n=0...15)

Vendor Part Number of qualified external modules.

- SFP+: Addr A0h Bytes 55:40
- QSFP+: Addr 183:168 page 0

Bit(s)	Field Name	Default NVM Value	Description
15:8	Byte 1	0x0	
7:0	Byte 0	0x0	

### 6.3.94.11 Vendor Part Number Bytes 12-13[n] (0x000A + 12\*n, n=0...15)

Vendor Part Number of qualified external modules.

- SFP+: Addr A0h Bytes 55:40
- QSFP+: Addr 183:168 page 0

Bit(s)	Field Name	Default NVM Value	Description
15:8	Byte 1	0x0	
7:0	Byte 0	0x0	

### 6.3.94.12 Vendor Part Number Bytes 14-15[n] (0x000B + 12\*n, n=0...15)

Vendor Part Number of qualified external modules.

- SFP+: Addr A0h Bytes 55:40
- QSFP+: Addr 183:168 page 0

Bit(s)	Field Name	Default NVM Value	Description
15:8	Byte 1	0x0	
7:0	Byte 0	0x0	

### 6.3.94.13 Module Revision Number Bytes 0-1[n] (0x000C + 12\*n, n=0...15)

Revision Number of qualified external modules.

- SFP+: Addr A0h Bytes 59:56
- QSFP+: Addr 185:184 page 0

Bit(s)	Field Name	Default NVM Value	Description
15:8	Byte 1	0x0	
7:0	Byte 0	0x0	

### 6.3.94.14 Module Revision Number Bytes 2-3[n] (0x000D + 12\*n, n=0...15)

Revision Number of qualified external modules.

- SFP+: Addr A0h Bytes 59:56
- QSFP+: Addr 185:184 page 0

Bit(s)	Field Name	Default NVM Value	Description
15:8	Byte 1	0x0	
7:0	Byte 0	0x0	

## 6.3.95 EMP Settings Module Header Section

This section contains the modes of operation of the EMP.

**Table 6-95. EMP Settings Module Header Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Section Length	6.3.95.1
0x0001	Common Firmware Parameters	6.3.95.2
0x0002	FW Misc	6.3.95.3
0x0003	EEE Variables	6.3.95.4
0x0004	Maximal Wear-Out Value	6.3.95.5
0x0005	Initial Wear-Out Value	6.3.95.6
0x0006	Staggering Delay	6.3.95.7
0x0007	PXE PFC Timer Value	6.3.95.8
0x0008	PXE GPC High Threshold Value	6.3.95.9
0x0009	PXE GPC Low Threshold Value	6.3.95.10
0x000A	Internal Thermal Sensor Maximum Secured Value	6.3.95.11
0x000B	Internal Thermal Sensor Minimum Secured Value	6.3.95.12
0x000C	MAX_LL_AQ_CREDITS	6.3.95.13
0x000D	MAX_PWR_LMT	6.3.95.14

### 6.3.95.1 Section Length (0x0000)

The length of the section in words. Note that section length does not include a count for the section length word.

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length		Length in: 2 Bytes unit - 1 First Section -> Word: EMP Settings Module Header -> Section Length Last Section -> Word: EMP Settings Module Header -> MAX_PWR_LMT

### 6.3.95.2 Common Firmware Parameters (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:10	Reserved	0x5	Reserved.
9	PF Reset on Queue Overflow	0b	0b = Disabled (default) 1b = Enabled
8:0	Reserved	0x3	Reserved.

### 6.3.95.3 FW Misc (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:1	FW Reserved	0x0	Reserved.
0	VEB Statistics Disable	0x0	0b = VEB Statistics are enable (default). 1b = VEB Statistics are disabled.

### 6.3.95.4 EEE Variables (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:8	receiveTW	0xE	Value determines the time (expressed in microseconds) that the receiving link partner is requesting the transmitting link partner to wait before starting the transmission data following the LPI. This value is platform dependent and depends on the OEM platform.
7:0	transmitTW	0xE	Value determines the time (expressed in microseconds) that the transmitting link partner waits before it starts transmitting data after leaving the Low Power Idle (LPI) mode. This value is platform dependent and depends on the OEM platform.

### 6.3.95.5 Maximal Wear-Out Value (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	MAX	0x1400	Maximal wear out credit value.

### 6.3.95.6 Initial Wear-Out Value (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	INITIAL	0x800	Initial wear out credit value.

### 6.3.95.7 Staggering Delay (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Delay	0x0	Port staggering delay in $\mu$ s.

### 6.3.95.8 PXE PFC Timer Value (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:14	Reserved	0x0	Reserved.
13:0	PXE PFC Timer	0x4	The value [in ms] to be set as the PFC timer in PCE mode.

### 6.3.95.9 PXE GPC High Threshold Value (0x0008)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PXE GPC High Threshold	0x0080	High threshold [in quanta of 32B] of GPC to be used in the RPB monitoring flow.

### 6.3.95.10 PXE GPC Low Threshold Value (0x0009)

Bit(s)	Field Name	Default NVM Value	Description
15:0	PXE GPC Low Threshold Value	0x0010	Low threshold [in quanta of 32B] of GPC to be used in the RPB monitoring flow.

### 6.3.95.11 Internal Thermal Sensor Maximum Secured Value (0x000A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Internal Thermal Sensor Maximum Secured Value	0x73	0-255 Recommended 0-115 degrees.

### 6.3.95.12 Internal Thermal Sensor Minimum Secured Value (0x000B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Internal Thermal Sensor Minimum Secured Value	0c60	0-255 Recommended 90-100 degrees.

### 6.3.95.13 MAX\_LL\_AQ\_CREDITS (0x000C)

Bits	Field Name	Default NVM Value	Description
15:0	MAX_LL_AQ_CREDITS	0x8	

### 6.3.95.14 MAX\_PWR\_LMT (0x000D)

Bits	Field Name	Default NVM Value	Description
15:8	Board Max Power Limit	0xE	Maximum allowed power for board. 0.5 W resolution
7:0	Cage Max Power Limit	0x7	Maximum allowed power for any cage. 0.5 W resolution

## 6.3.96 DL Scripts Section

## 6.3.97 Allowlist Section

## 6.3.98 Analog PHY Configuration Section

Includes static configurations of SerDes PHY registers for link establishment.

**Table 6-96. Analog PHY Configuration Section Summary Table**

Word Offset	Description	Section Reference
0x0000	Section Length Low	6.3.98.1
0x0001	Section Length High	6.3.98.2
0x0002	Reg Write Indirect List	6.3.98.3
0x0003	Reg Write Indirect List 2	6.3.98.4

### 6.3.98.1 Section Length Low (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length Low	0x0	Length in: 2 Bytes unit - 2 First Section -> Word: Analog PHY Configuration -> Section Length Low Last Section -> Word: Analog PHY Configuration -> Reg Write Indirect List 2

### 6.3.98.2 Section Length High (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length High		

### 6.3.98.3 Reg Write Indirect List (0x0002)

Raw data module length: variable

### 6.3.98.4 Reg Write Indirect List 2 (0x0003)

Raw data module length: variable

## 6.3.99 Configuration Metadata Section

NVM adaptive configuration metadata.

**Table 6-97. Configuration Metadata Section Summary Table**

Word Offset	Description	Section Reference

## 6.3.100 Control Pipe Package Section

This module contains the package used to configure the control pipe. This package is encoded as a set of Download Package Command (Opcode: 0x0C40) buffers.

**Table 6-98. Control Pipe Package Section Summary Table**

Word Offset	Description	Section Reference
0x0000	ModuleLenL	6.3.100.1
0x0001	ModuleLenH	6.3.100.2
0x0002	Package Raw	6.3.100.3

### 6.3.100.1 ModuleLenL (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ModuleLenL		Length in: 2 Bytes unit - 2 First Section -> Word: Control Pipe Package -> ModuleLenL Last Section -> Word: Control Pipe Package -> Package Raw

### 6.3.100.2 ModuleLenH (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	ModuleLenH	0x0	

### 6.3.100.3 Package Raw (0x0002)

Raw data module length: variable

## 6.3.101 EMP Image Section

This module contains the EMP processor code.

**Table 6-99. EMP Image Section Summary Table**

Word Offset	Description	Section Reference
0x0000	EMP Image Raw Data	6.3.101.1

### 6.3.101.1 EMP Image Raw Data (0x0000)

Raw data module length: variable

## 6.3.102 RDE Dictionaries Section

**Table 6-100. RDE Dictionaries Section Summary Table**

Word Offset	Description	Section Reference
0x0002	Dictionaries	6.3.102.1

### 6.3.102.1 Dictionaries (0x0000)

Raw data module length: variable

### 6.3.103 External Topology Device Image 0 Section

Table 6-101. External Topology Device Image 0 Section Summary Table

Word Offset	Description	Section Reference
0x0000	Section Length Low	6.3.103.1
0x0001	Section Length High	6.3.103.2
0x0002	Topology Device Image Version Number High 0	6.3.103.3
0x0003	Topology Device Image Version Number High 1	6.3.103.4
0x0004	Topology Device Image Version Number Low 0	6.3.103.5
0x0005	Topology Device Image Version Number Low 1	6.3.103.6
0x0006	Flags and Device Part Number	6.3.103.7
0x0007	Number of Sub-Sections	6.3.103.8
0x0008	External Topology Device Image	6.3.103.9

#### 6.3.103.1 Section Length Low (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length Low		Length in: 2 Bytes unit - 2 First Section -> Word: External Topology Device Image 0 -> Section Length Low Last Section -> Word: External Topology Device Image 0 -> External Topology Device Image

#### 6.3.103.2 Section Length High (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length High	0x0	

#### 6.3.103.3 Topology Device Image Version Number High 0 (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number High 0	0x0	

### 6.3.103.4 Topology Device Image Version Number High 1 (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number High 1	0x0	

### 6.3.103.5 Topology Device Image Version Number Low 0 (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number Low 0	0x0	

### 6.3.103.6 Topology Device Image Version Number Low 1 (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number Low 1	0x0	

### 6.3.103.7 Flags and Device Part Number (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Device Part Number	0x0	0x31 = C827 0x32 = X557 - 4 ports (X557-AT4) 0x37 = X557 - 2 ports (X557-AT2)
7:2	Reserved	0x0	Reserved.
1	ProgEn	0b	
0	LoadEn	0b	

### 6.3.103.8 Number of Sub-Sections (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Number of Sub-Sections	0x0	

### 6.3.103.9 External Topology Device Image (0x0008)

Raw data module length: variable

## 6.3.104 External Topology Device Image 1 Section

Table 6-102. External Topology Device Image 1 Section Summary Table

Word Offset	Description	Section Reference
0x0000	Section Length Low	6.3.104.1
0x0001	Section Length High	6.3.104.2
0x0002	Topology Device Image Version Number High 0	6.3.104.3
0x0003	Topology Device Image Version Number High 1	6.3.104.4
0x0004	Topology Device Image Version Number Low 0	6.3.104.5
0x0005	Topology Device Image Version Number Low 1	6.3.104.6
0x0006	Flags and Device Part Number	6.3.104.7
0x0007	Number of Sub-Sections	6.3.104.8
0x0008	External Topology Device Image	6.3.104.9

### 6.3.104.1 Section Length Low (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length Low		Length in: 2 Bytes unit - 2 First Section -> Word: External Topology Device Image 0 -> Section Length Low Last Section -> Word: External Topology Device Image 0 -> External Topology Device Image

### 6.3.104.2 Section Length High (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length High	0x0	

### 6.3.104.3 Topology Device Image Version Number High 0 (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number High 0	0x0	

### 6.3.104.4 Topology Device Image Version Number High 1 (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number High 1	0x0	

### 6.3.104.5 Topology Device Image Version Number Low 0 (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number Low 0	0x0	

### 6.3.104.6 Topology Device Image Version Number Low 1 (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number Low 1	0x0	

### 6.3.104.7 Flags and Device Part Number (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Device Part Number	0x0	0x31 = C827 0x32 = X557 - 4 ports (X557-AT4) 0x37 = X557 - 2 ports (X557-AT2)
7:2	Reserved	0x0	Reserved.
1	ProgEn	0b	
0	LoadEn	0b	

### 6.3.104.8 Number of Sub-Sections (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Number of Sub-Sections	0x0	

### 6.3.104.9 External Topology Device Image (0x0008)

Raw data module length: variable

## 6.3.105 External Topology Device Image 2 Section

Table 6-103. External Topology Device Image 2 Section Summary Table

Word Offset	Description	Section Reference
0x0000	Section Length Low	6.3.105.1
0x0001	Section Length High	6.3.105.2
0x0002	Topology Device Image Version Number High 0	6.3.105.3
0x0003	Topology Device Image Version Number High 1	6.3.105.4
0x0004	Topology Device Image Version Number Low 0	6.3.105.5
0x0005	Topology Device Image Version Number Low 1	6.3.105.6
0x0006	Flags and Device Part Number	6.3.105.7
0x0007	Number of Sub-Sections	6.3.105.8
0x0008	External Topology Device Image	6.3.105.9

### 6.3.105.1 Section Length Low (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length Low		Length in: 2 Bytes unit - 2 First Section -> Word: External Topology Device Image 0 -> Section Length Low Last Section -> Word: External Topology Device Image 0 -> External Topology Device Image

### 6.3.105.2 Section Length High (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length High	0x0	

### 6.3.105.3 Topology Device Image Version Number High 0 (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number High 0	0x0	

### 6.3.105.4 Topology Device Image Version Number High 1 (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number High 1	0x0	

### 6.3.105.5 Topology Device Image Version Number Low 0 (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number Low 0	0x0	

### 6.3.105.6 Topology Device Image Version Number Low 1 (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number Low 1	0x0	

### 6.3.105.7 Flags and Device Part Number (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Device Part Number	0x0	0x31 = C827 0x32 = X557 - 4 ports (X557-AT4) 0x37 = X557 - 2 ports (X557-AT2)
7:2	Reserved	0x0	Reserved.
1	ProgEn	0b	
0	LoadEn	0b	

### 6.3.105.8 Number of Sub-Sections (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Number of Sub-Sections	0x0	

### 6.3.105.9 External Topology Device Image (0x0008)

Raw data module length: variable

## 6.3.106 External Topology Device Image 3 Section

Table 6-104. External Topology Device Image 3 Section Summary Table

Word Offset	Description	Section Reference
0x0000	Section Length Low	6.3.106.1
0x0001	Section Length High	6.3.106.2
0x0002	Topology Device Image Version Number High 0	6.3.106.1
0x0003	Topology Device Image Version Number High 1	6.3.106.4
0x0004	Topology Device Image Version Number Low 0	6.3.106.5
0x0005	Topology Device Image Version Number Low 1	6.3.106.6
0x0006	Flags and Device Part Number	6.3.106.7
0x0007	Number of Sub-Sections	6.3.106.8
0x0008	External Topology Device Image	6.3.106.9

### 6.3.106.1 Section Length Low (0x0000)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length Low		Length in: 2 Bytes unit - 2 First Section -> Word: External Topology Device Image 0 -> Section Length Low Last Section -> Word: External Topology Device Image 0 -> External Topology Device Image

### 6.3.106.2 Section Length High (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Section Length High	0x0	

### 6.3.106.3 Topology Device Image Version Number High 0 (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number High 0	0x0	

### 6.3.106.4 Topology Device Image Version Number High 1 (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number High 1	0x0	

### 6.3.106.5 Topology Device Image Version Number Low 0 (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number Low 0	0x0	

### 6.3.106.6 Topology Device Image Version Number Low 1 (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Topology Device Image Version Number Low 1	0x0	

### 6.3.106.7 Flags and Device Part Number (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:8	Device Part Number	0x0	0x31 = C827 0x32 = X557 - 4 ports (X557-AT4) 0x37 = X557 - 2 ports (X557-AT2)
7:2	Reserved	0x0	Reserved.
1	ProgEn	0b	
0	LoadEn	0b	

### 6.3.106.8 Number of Sub-Sections (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Number of Sub-Sections	0x0	

### 6.3.106.9 External Topology Device Image (0x0008)

Raw data module length: variable

## 6.3.107 NVM Provisioning Area Section

Free area used as the new bank when updating 4 MB long modules.

**Table 6-105. NVM Provisioning Area Section Summary Table**

Word Offset	Description	Section Reference
0x21D000	Raw Data	6.3.107.1

### 6.3.107.1 Raw Data (0x21D000)

Raw data module length: variable

## 6.3.108 OROM Section

Option ROM module. It contains pre-boot code and settings read by BIOS.

**Table 6-106. OROM Section Summary Table**

Word Offset	Description	Section Reference
0x0000	OROM Data	6.3.108.1
0x0001	moduleTypeL	6.3.108.2
0x0002	moduleTypeH	6.3.108.3
0x0003	headerLenL	6.3.108.4
0x0004	headerLenH	6.3.108.5
0x0005	headerVersionL	6.3.108.6
0x0006	headerVersionH	6.3.108.7
0x0007	moduleIDL	6.3.108.8
0x0008	moduleIDH	6.3.108.9
0x0009	moduleVendorL	6.3.108.10
0x000A	moduleVendorH	6.3.108.11
0x000B	dateL	6.3.108.12
0x000C	dateH	6.3.108.13
0x000D	sizeL	6.3.108.14
0x000E	sizeH	6.3.108.15
0x000F	keySizeL	6.3.108.16
0x0010	keySizeH	6.3.108.17
0x0011	modulusSizeL	6.3.108.18
0x0012	modulusSizeH	6.3.108.19
0x0013	exponentSizeL	6.3.108.20
0x0014	exponentSizeH	6.3.108.21
0x0015	lad_srevL	6.3.108.22
0x0016	lad_srevH	6.3.108.23
0x0017 - 0x0018	Reserved	6.3.108.24
0x0019	lad_fw_entry_offsetL	6.3.108.25
0x001A	lad_fw_entry_offsetH	6.3.108.26
0x001B - 0x001C	Reserved	6.3.108.27
0x001D	lad_image_unique_idL	6.3.108.28
0x001E	lad_image_unique_idH	6.3.108.29

0x0021	Reserved	6.3.108.32
0x0022	RSA Public Key	6.3.108.33
0x0023	RSA ExponentL	6.3.108.34

**Table 6-106. OROM Section Summary Table [continued]**

Word Offset	Description	Section Reference
0x0024	RSA ExponentH	6.3.108.35
0x0025	Encrypted SHA256 Hash	6.3.108.36
0x0026	Device Blank NVM Device ID	6.3.108.37
0x0027	Max Module AreaL	6.3.108.38
0x0028	Max Module AreaH	6.3.108.39
0x0029	Current Module AreaL	6.3.108.40
0x002A	Current Module AreaH	6.3.108.41
0x002B	Reserved	6.3.108.42
0x002C	Code Revision	6.3.108.43
0x002D	Reserved Spare Word	6.3.108.44

### 6.3.108.1 OROM Data (0x0000)

Raw data module length: variable

### 6.3.108.2 moduleTypeL (0x0001)

Bit(s)	Field Name	Default NVM Value	Description
15:0	moduleTypeL	0x6	

### 6.3.108.3 moduleTypeH (0x0002)

Bit(s)	Field Name	Default NVM Value	Description
15:0	moduleTypeH		

### 6.3.108.4 headerLenL (0x0003)

Bit(s)	Field Name	Default NVM Value	Description
15:0	headerLenL	0xA1	

### 6.3.108.5 headerLenH (0x0004)

Bit(s)	Field Name	Default NVM Value	Description
15:0	headerLenH		

### 6.3.108.6 headerVersionL (0x0005)

Bit(s)	Field Name	Default NVM Value	Description
15:0	headerVersionL	0x00010000	

### 6.3.108.7 headerVersionH (0x0006)

Bit(s)	Field Name	Default NVM Value	Description
15:0	headerVersionH		

### 6.3.108.8 moduleIDL (0x0007)

Bit(s)	Field Name	Default NVM Value	Description
15:0	moduleIDL	0x0	

### 6.3.108.9 moduleIDH (0x0008)

Bit(s)	Field Name	Default NVM Value	Description
15	signMode	0x1	
14:0	moduleIDH		

### 6.3.108.10 moduleVendorL (0x0009)

Bit(s)	Field Name	Default NVM Value	Description
15:0	moduleVendorL	0x00008086	

### 6.3.108.11 moduleVendorH (0x000A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	moduleVendorH		

### 6.3.108.12 dateL (0x000B)

Bit(s)	Field Name	Default NVM Value	Description
15:0	DateL	0x20130530	0xMMDD

### 6.3.108.13 dateH (0x000C)

Bit(s)	Field Name	Default NVM Value	Description
15:0	DateH		0xYYYY

### 6.3.108.14 sizeL (0x000D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	sizeL	0x00025800	Size is in DWords.

### 6.3.108.15 sizeH (0x000E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	sizeH		Size is in DWords.

### 6.3.108.16 keySizeL (0x000F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	keySizeL	0x40	

### 6.3.108.17 keySizeH (0x0010)

Bit(s)	Field Name	Default NVM Value	Description
15:0	keySizeH		

### 6.3.108.18 modulusSizeL (0x0011)

Bit(s)	Field Name	Default NVM Value	Description
15:0	modulusSizeL	0x40	

### 6.3.108.19 modulusSizeH (0x0012)

Bit(s)	Field Name	Default NVM Value	Description
15:0	modulusSizeH		

### 6.3.108.20 exponentSizeL (0x0013)

Bit(s)	Field Name	Default NVM Value	Description
15:0	exponentSizeL	0x1	

### 6.3.108.21 exponentSizeH (0x0014)

Bit(s)	Field Name	Default NVM Value	Description
15:0	exponentSizeH		

### 6.3.108.22 lad\_srevL (0x0015)

Bit(s)	Field Name	Default NVM Value	Description
15:0	lad_srevL	0x0	

### 6.3.108.23 lad\_srevH (0x0016)

Bit(s)	Field Name	Default NVM Value	Description
15:0	lad_srevH		

### 6.3.108.24 Reserved (0x0017 - 0x0018)

### 6.3.108.25 lad\_fw\_entry\_offsetL (0x0019)

Bit(s)	Field Name	Default NVM Value	Description
15:0	lad_fw_entry_offsetL	0x14C	Offset of OROM image from the beginning of OROM CSS module.

### 6.3.108.26 lad\_fw\_entry\_offsetH (0x001A)

Bit(s)	Field Name	Default NVM Value	Description
15:0	lad_fw_entry_offsetH		

### 6.3.108.27 Reserved (0x001B - 0x001C)

### 6.3.108.28 lad\_image\_unique\_idL (0x001D)

Bit(s)	Field Name	Default NVM Value	Description
15:0	lad_image_unique_idL	0x0	

### 6.3.108.29 lad\_image\_unique\_idH (0x001E)

Bit(s)	Field Name	Default NVM Value	Description
15:0	lad_image_unique_idH		

### 6.3.108.30 lad\_module\_idL (0x001F)

Bit(s)	Field Name	Default NVM Value	Description
15:0	lad_module_idL	0x5	Valid values are: 0x1 = EMP Image 0x2 = PE Image 0x3 = PCIe Analog 0x4 = PHY Analog 0x5 = Option ROM

### 6.3.108.31 lad\_module\_idH (0x0020)

Bit(s)	Field Name	Default NVM Value	Description
15	Reserved	0b	Reserved.
14:0	lad_module_idH		

### 6.3.108.32 Reserved (0x0021)

### 6.3.108.33 RSA Public Key (0x0022)

Raw data module length: variable

### 6.3.108.34 RSA ExponentL (0x0023)

Bit(s)	Field Name	Default NVM Value	Description
15:0	RSA ExponentL	0x0	

### 6.3.108.35 RSA ExponentH (0x0024)

Bit(s)	Field Name	Default NVM Value	Description
15:0	RSA ExponentH	0x0	

### 6.3.108.36 Encrypted SHA256 Hash (0x0025)

Raw data module length: variable

### 6.3.108.37 Device Blank NVM Device ID (0x0026)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Device Blank NVM Device ID	0x1590	

### 6.3.108.38 Max Module AreaL (0x0027)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Max Module AreaL	0x1000	

### 6.3.108.39 Max Module AreaH (0x0028)

Bit(s)	Field Name	Default NVM Value	Description
15:0	Max Module AreaH	0x0009

## Chapter 7 Packet Processing

---

### 7.1 Introduction

The E810 provides a programmable packet processing engine with extensive support for advanced applications ranging from Enterprise LAN to SDN/NFV, Cloud, Comms, and Wireless.

Key features include:

- FlexiPipe virtualized pipeline with profile-based processing stages.
- OpenFlow-enabled Flow-Tables structure with metadata propagation between pipeline stages.
- P4-ready parsing and classification flows.
- Programmable packet modification (for example, tunnel encap/decap, NAT)
- Multiple binary and ternary (like ACL) classification stages.
- RDMA Flow Table expansions to host DRAM.
- SDN-enabled architecture.
  - Generic L1 to L5+ protocol handling.
  - Protocol-agnostic SDN parsing, classification, and packet forwarding and modification, including standard L2 and/or L3+ packet switching.
  - N-Tuple lookup key pre- and post-modification classification.
  - M-Tuple action execution.
- Deep header processing up to 504 bytes.
  - Supports tunneled overlay encapsulations and large IPv6 extension headers.
- Fully software-programmable FlexiParser.
  - Supports user-defined proprietary packet formats.
  - Programmable parse graph, enforcing user-defined parsing policy.
  - Programmable PTYPEs (Packet Types).
- Cloud-enabled generic overlays including GRE, NVGRE, VXLAN, VXLAN-GPE, Geneve.
- MPLS-enabled processing.
  - Outer MPLS and inner-MPLS (e.g., MPLSoGRE, MPLSoUDP).
- Service chaining forwarding including NSH (Network Service Header) processing.

The advanced packet processing engine enables high-performance acceleration by hardware-offloading of software functions, especially in a VMM/Hypervisor environments with SR-IOV paths.

## 7.2 FlexiPipe Processing Pipeline

The E810 FlexiPipe pipeline serves as the backbone of the packet processing engine. The OpenFlow-enabled pipeline is fully SDN/NFV-enabled, providing multiple programmable lookup stages (Flow Tables) augmented with programmable FlexiParser and packet modifier.

The generic FlexiPipe pipeline architecture enables support for diverse processing requirements. The pipeline provides multiple protocol-agnostic processing stages that can be re-purposed according to the target application. For example, a generic classification stage in the pipe can set a Destination VSI/ Destination Q in one application, whereas in another application the same generic classification stage can set an opaque metadata associated with the packet. Each of these classifications can be performed using different lookup keys over different protocols.

### 7.2.1 Rx and Tx Pipeline Structure

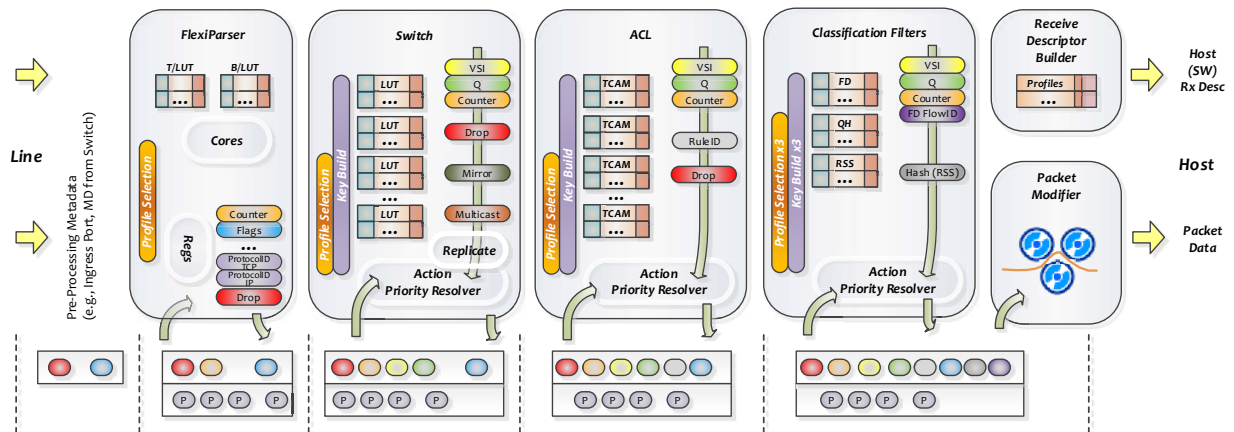

The E810 pipeline shares sections of the pipe between Rx and Tx flows. Shared components are designed to process packets at the combined rates of Rx and Tx.

The pipeline provides a loopback forwarding path between Tx and Rx for packets that are destined to functions residing on the same host. Such packets are first processed in the Tx section of the pipeline, stored in the Tx Packet Buffer, copied to Rx Packet Buffer, and then processed in the Rx section of the pipeline.

The Rx processing pipeline contains the following stages for LAN traffic:

1. Rx Packet Buffer
2. Rx FlexiParser ([Section 7.7](#))
3. Switch (Phase 1 Classifier - Binary) — Default function: Node level VEB switch, multi-cast and mirror replicate ([Section 7.8](#))
4. ACL (Phase 2 Classifier - Ternary) — Default function: ACL ([Section 7.9](#))
5. POSTPRS - Post Modification Parser
6. Classifications filters ([Section 7.10](#))
  - FD (Binary Classifier) — Default function: Flow Director (Q steering)
  - QH (Binary Classifier) — Default function: RDMA flow steering
  - Hash — Default function: RSS
7. Flex Descriptor Builder ([Section 7.6](#))
8. Packet Modifier

A detailed view of the FlexiPipe Rx processing pipeline is illustrated in [Figure 7-1](#).

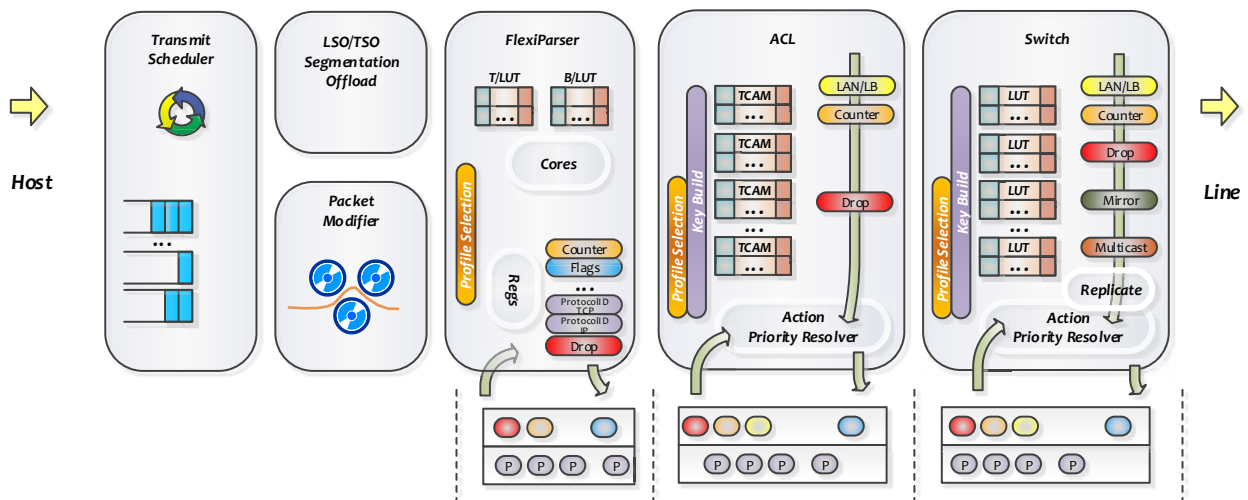

**Figure 7-1. Rx Processing Pipeline (Showing Post-Receive Packet Buffer Section)**

The FlexiPipe Tx processing pipeline contains the following stages:

1. Tx WFQ Scheduler (Section 8.3)
2. LSO/TSO Segmentation Offload (Section 10.5.8.4)
3. Packet Modifier
4. Tx FlexiParser (Section 7.7)
5. Switch (Phase 1 Classifier - Binary) - Default function: Node level packet steering to LAN (Line) / LB (Loopback to host) (Section 7.8)
6. ACL (Phase 2 Classifier - Ternary) - Default function: ACL (Section 7.9)
7. Tx Packet Buffer

A detailed view of the FlexiPipe Tx processing pipeline is illustrated in Figure 7-2.

**Figure 7-2. Tx Processing Pipeline**

Further descriptions of the pipeline stages appear in subsequent sections of this document.

## 7.2.2 Pipeline Virtualization

The E810 FlexiPipe provides a unique feature of Pipeline Virtualization that logically partitions the single physical pipeline instance into functionally-independent logical pipeline instances. Each behaves like a standalone pipeline available for programming, as illustrated in [Figure 7-3](#).

In [Figure 7-3](#), the physical pipeline is virtualized and partitioned into two logical pipeline instances: orange and green. Each of the logical pipeline instances can be programmed independently and provide different functionality.

**Figure 7-3. Pipeline Virtualization**

## 7.3 Priority Resolver

The E810 pipeline provides a generic action-agnostic metadata generation at each pipeline stage. Consequently, multiple pipeline stages are allowed to generate the same MDID types, possibly creating conflicts.

For example, multiple pipeline stages might attempt to set the <Destination Q> of the packet: the switch, the ACL, and the FD (Flow Director). Similarly, multiple pipeline stages might attempt to set the <DestinationVSI>.

To guarantee consistent behavior, the pipeline provides a metadata Priority Resolver at each pipeline stage, resolving possible conflicts per each MDID type. The Priority Resolver selects the highest priority metadata value per each MDID metadata type, based on the input metadata to the pipeline stage and the metadata generated by the pipeline stage itself (the core). When priorities are equal, the later pipeline stage wins (for example, if switch selects <DestinationVSI>=A Priority=3, and ACL selects <DestinationVSI>=B Priority=3, the ACL wins because it is a later stage in the pipe).

The metadata Priority Resolver is illustrated in [Figure 7-4](#).

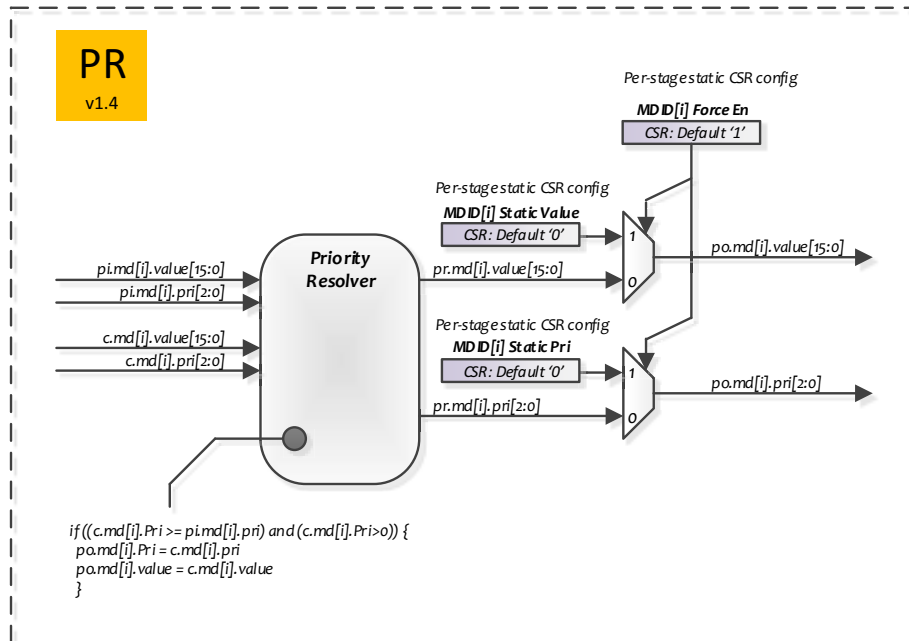

Figure 7-4. Metadata Priority Resolver

MDID metadata types that have priority association are carried in the pipeline alongside with their priority association and provided to the next pipeline stage for further processing.

### 7.3.1 MDID Override

The Priority Resolver in each pipeline stage provides an MDID Override feature for setting the MDID outputs of the pipe stage from CSRs. For each RW MDID metadata, the following CSRs are provided:

- <MDID[i] Force Enable> — When set, MDID override is enabled for MDID type i.
- <MDID[i] Static Value> — When MDID override is enabled for MDID type i, the metadata value is taken from CSR.
- <MDID[i] Static Priority> — When MDID override is enabled for MDID type i, the metadata priority is taken from CSR.

The metadata override feature enables functional bypassing of pipeline stages, complete or partial bypass, depending on the target use case. It also facilitates the silicon bring-up process by placing the pipeline into a simple static configuration where all traffic is directed to known destinations (VSI, Q, and so on) determined by CSRs.

### 7.3.2 Programming the Priority Resolver

As detailed in earlier sections, the E810 FlexiPipe implements priority resolution mechanisms for several of its actions.

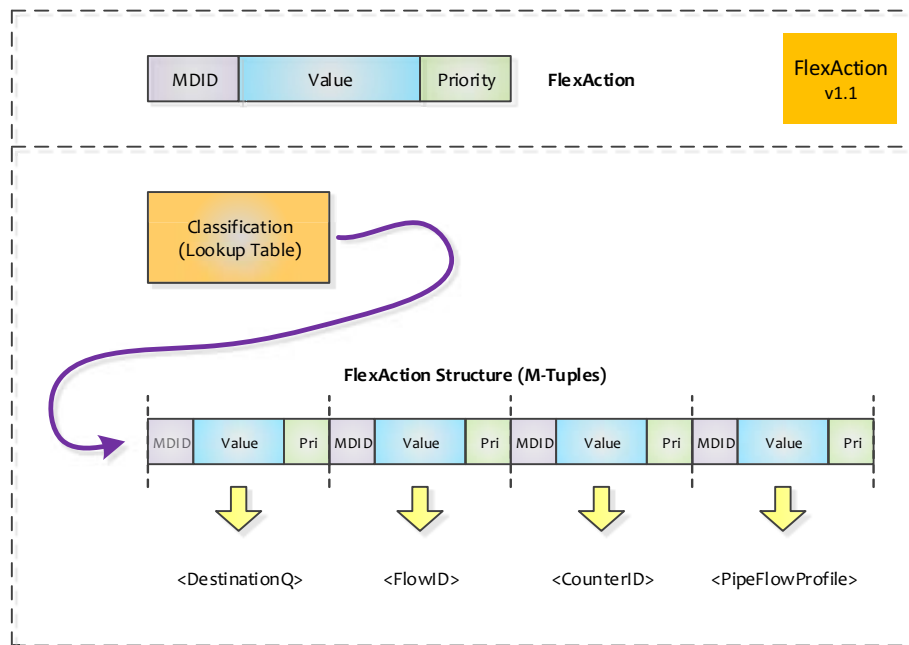

These mechanisms are placed in each of the four stages of the Routing Control Unit (RCU): the parser, the switch, the ACL, and the Rx filters.

## 7.4 FlexActions

When a pipe stage generates FlexActions, they are mapped into the MDID metadata infrastructure of the pipeline. A generic FlexAction structure is made of  $xM^1$  FlexAction Tuples that define the actions generated and the mapping of these actions into the pipeline metadata.

**Note:** Some legacy blocks in the E810 pipeline provide a hybrid FlexAction implementation, where some actions are statically mapped (for example, VSI selection in the legacy portion of the E810 switch), while the block also provides a FlexAction structure for generating all the other actions and metadata supported by the pipeline (like the flex portion of the E810 switch). More details are provided in further sections of this document that refer to the corresponding pipeline stages.

An example for the generic structure of a FlexAction is illustrated in [Figure 7-5](#).

**Figure 7-5. FlexAction Structure**

The FlexAction structure is made of  $xN$  FlexAction Tuples, each carrying the following fields:

- <MDID> — The MDID type to be assigned, such as <DestinationQ>.
- <Value> — The value to associate with the MDID, such as the <DestinationQ> number.
- <Priority> — The priority to associate with the Action Tuple, for resolving conflicts with other sources in the pipe that can generate the same MDID type.

**Note:** <Priority>=0 indicates that the MDID is invalid and its <Value> should be disregarded.

1.  $xM$  is an implementation parameter selected independently per each pipeline function that generates actions. It denotes the number of FlexActions generated simultaneously, e.g., as a result of a classification lookup hit. In the example in [Figure 7-5](#),  $M=4$  and the FlexActions generated are <DestinationQ>, <FlowID>, <CounterID>, and a user-defined <PipeFlowProfile>.

## 7.5 Extractor

The E810 pipeline provides a generic extraction logic instantiated at pipeline stages that require extraction from the packet header, namely:

- Switch
- ACL
- Rx filters: FD (Flow Director), HASH, RDMA/QH (Quad Hash)

The Extractor's logic uses the Profile ID, generated by the Profile Builder, and the metadata supplied by previous stages in the pipeline to extract fields to be used in each stage.

Each extractor contains a configuration per Profile ID, which determines which fields from the packet header or its metadata are used for packets that hit that Profile ID. The extractor output, which contains the set of fields selected for the packet, is referred to as the *Fields Vector*.

The extractor offsets are expressed in byte resolution while the extraction itself is done in word resolution. For each word in the Fields Vector, the configuration must specify a source word that can be from either the packet's header (up to 504B first bytes) or the packet metadata. Furthermore, a source offset in the packet's header is expressed as a relative offset to a protocol offset, using the protocol IDs offset ([Section A.4](#)), thus leveraging the capabilities of the programmable parser.

**Note:** Any configuration that causes the extractor to cross the header length boundaries (either by crossing the maximal supported header size or by crossing the packet length) is illegal, but an extraction can cross boundaries of internal protocols and can also refer to parts of the payload that are within the extracted header.

### 7.5.1 Programming the Extraction Logic

In general, the extraction logic must be programmed after the relevant profile builder is configured and the Profile ID is allocated. This section describes the configuration method used to program the extraction sequence for a previously allocated Profile ID. When an incoming packet is associated with that Profile ID, the extractor logic must use this configuration to extract fields from the packet's header and metadata to create a fields vector that are used in the given stage.

**Important:** The E810 pipeline supports extraction from packet headers of up to 504 bytes (that is, only from the 504 bytes trailing the start-of-frame delimiter) or the length of the packet (the lowest of both). Any extractor configuration that relates to an offset beyond the maximal packet size or beyond the maximal supported header size is invalid and can cause unexpected hardware behavior.

The extractor CSRs are listed in [Table 7-1](#). Each CSR mentioned in [Table 7-1](#) is instantiated in three pipeline stages (Switch, ACL, and Rx filters), though some might be valid only in specific stages. Therefore, the three rightmost columns in the table specify which of the CSRs is valid in each stage and its functionality in the relevant stage.

Furthermore, each extractor in each stage supports a different output width, based on the needs of that stage. [Table 7-2](#) specifies the output size of each extractor in each stage.

**Important:** Attempting to configure an extractor to output more words than it supports is forbidden and can cause unexpected hardware behavior.

**Table 7-1. Extractor CSRs**

CSR	Description	Switch	ACL	Rx Filters
PRFLM_DATA_0	Each CSR is used to configure protID (see Section A.4)/offset of extraction word N (See Table 7-2 for applicable FV sizes in each stage) for FV of sub-extractor #i (i=[0..2]) of this extractor. If the specified protocol ID is smaller than 255, the source is taken from packet using the protocol ID's offset plus the offset in the protocol (in bytes). If the specified offset is equal to 255, the source is taken from the packet's metadata according to the following rules: <ul style="list-style-type: none"> <li>Offset 0-30: The word is extracted from the pipe status bus. The source word byte offset is the value specified in this field.</li> <li>Offset 32-62: The word is extracted from the packet status bus. The source word byte offset is the value specified in this field minus 32 (for example, a value of 32 extracts a word from byte offset 0 in the packet status bus).</li> </ul> <b>Note:</b> The byte offset values mentioned above should not be confused with the MDID. <b>Note:</b> Offset values 31 and 63 are invalid, as word boundary crosses the relevant status bus width.	Main switch	ACL	Hash
PRFLM_DATA_1		MNG	Invalid	FD
PRFLM_DATA_2		Invalid	Invalid	Quad-Hash
PRFLM_CTRL[0]	When the CSRs is written, it determines the profileID within sub-extractor #i (i=0..2) for which the FV extractions determined in PRFLM_data_i are configured. This CSR is to be written only after all relevant PRFLM_data_i have the correct value. This CSR is also used to read the relevant content into the relevant PRFLM_data_i array. RD WR is controlled by a field in this CSR.	Main switch	ACL	Hash
PRFLM_CTRL[1]		MNG	Invalid	FD
PRFLM_CTRL[2]		Invalid	Invalid	Quad-Hash

**Table 7-2. Extractor Output Width per Stage**

Stage	Extractor Instance	Output Width (Words)
Switch	Main switch	48
	Manageability	32
ACL	ACL	32
Rx Filters	Hash	24
	Quad-hash	32 (24 + 8 for fixed fields)
	Flow-director	24

### 7.5.1.1 Programming Flow

When programming an extraction sequence for a Profile ID #n, the programming entity follows the flow below:

1. For each of the words in the fields vector, define the location of the source word that will be placed in the fields vector:
  - a. Set PRFLM\_DATA\_i.PROT to the protocol ID whose offset in the packet's header will be used as a base offset for the source word.
  - b. Set PRFLM\_DATA\_i.OFF to the byte offset relative to the protocol ID offset. This field's value is added to the protocol offset to generate the final offset of the source word.

**Note:** When the PRFLM\_DATA\_i.PROT field is set to 255, the source word is taken from the packet's metadata and not from the packet's header. In this case, the value of the PRFLM\_DATA\_i.OFF field determines the source in the packet's metadata as described in Table 7-1.

2. Once the sources for all words in the fields vector were configured, complete the programming:
  - a. Set PRFLM\_CTRL[i].PRFL\_IDX to the Profile ID for which the extraction sequence is being programmed.
  - b. Set PRFLM\_CTRL[i].WR\_REQ.
3. Pull for the value of PRFLM\_CTRL[i].WR\_REQ. Once it is cleared, the programming is completed.

### 7.5.1.2 Querying Flow

The extractor logic supports reading back an extraction sequence for a given Profile ID. This flow can be useful for implementing a read-modify-write mechanism allowing a partial change in configuration.

1. Trigger the read of the configuration:
  - a. Set PRFLM\_CTRL[i].PRFL\_IDX to the Profile ID for which the extraction sequence is being read.
  - b. Set PRFLM\_CTRL[i].RD\_REQ.
2. Pull for the value of PRFLM\_CTRL[i].RD\_REQ. Once it is cleared, the read is completed.
3. The values are available in the PRFLM\_DATA\_i array.

## 7.6 Receive Descriptor Builder

### 7.6.1 Overview

The E810 provides new programmable receive descriptor formats on top of the legacy (backward compatible) receive descriptor formats. The new Flex Descriptor feature virtualizes the hardware/software interface on the receive path, allowing software entities to program customized receive descriptors for specific use cases and applications. The feature allows each PF/VF/VM to customize its own Flex Descriptor structure with different fields and flags, exposing to software pre-processing results of interest such as <FlowID>, <ACLRuleID>, offsets to protocol headers or other opaque metadata that generated by the E810.

The Receive Descriptor Builder stage in the E810 pipeline provides the programming infrastructure and the composition logic of the Flex Descriptors.

The generic structure of the receive Flex Descriptor is illustrated in [Figure 7-6](#).

**Figure 7-6. Receive Flex Descriptor**

**Note:** [Figure 7-6](#) shows the structure of the 32-byte receive Flex Descriptor. The shorter 16-byte receive Flex Descriptor uses the first 16 bytes of this structure, while the last 16-byte chunk of the structure is omitted.

The E810 provides 63 x Descriptor Builder Profiles for programming different descriptor formats, including the 16-byte and 32-byte legacy descriptor formats. The *RXDID* field in the Flex Descriptor structure identifies the profile and hence the descriptor format delivered to software, in particular the contents of fields and flags.

**Note:** *RXDID*=7 is reserved and should not be used (in legacy descriptors, *MIRR*=7 means “mirror packet”, and that is the only way to distinguish it from Flex Descriptors).

The Descriptor Builder Profile selected for each packet is derived from two sources:

- **Pipeline Actions** — Based on rules programmed into the pipeline (for example, if the packet matches a rule in the ACL, the action of that rule might request a descriptor profile that exposes the <ACLRuleID> via the Receive Flex Descriptor).
- **Queue Context** — Based on the Destination Q of the packet (for example, packets sent to specific destination queue can have the same descriptor format, like the 16-byte legacy format).

The profile request is an MDID metadata/action carried in the pipeline. Conflicting actions from multiple sources that request different profiles for the same packet are resolved through the standard MDID priority resolution scheme described in [Section 7.3](#).

## 7.6.2 Legacy Descriptor Format

The E810 preserves the legacy (backward compatible) descriptor format (see [Section 10.4.2](#)).

The legacy formats are available for selection as Descriptor Builder Profiles #0 (16-byte) and #1 (32-byte):

- **Descriptor Builder Profiles #0** — Generates the legacy 16-byte descriptor format, identified by *RXDID*=0 in the descriptor structure delivered to software.
- **Descriptor Builder Profiles #1** — Generates the legacy 32-byte descriptor format, identified by *RXDID*=1 in the descriptor structure delivered to software.

**Note:** *RXDID*=7 is reserved and should not be used (in legacy descriptors, *MIRR*=7 means “mirror packet”, and that is the only way to distinguish it from flex descriptors).

The legacy descriptor can be used in applications where it is required to preserve backward compatibility at the driver level. For example, using the legacy X710/XXV710/XL710 VF driver in VFs running over the E810.

The structure of the 32-byte legacy (backward compatible) descriptor is illustrated in [Figure 7-7](#).

The first two QW (Quad Words = 16B) are identical to the 16B legacy descriptor format.

**Figure 7-7. Receive Descriptor (32-Byte) - Legacy Format**

### 7.6.2.1 PTYPE Translation

The legacy (backward compatible) descriptor uses an 8-bit PTYPE, whereas the E810 pipeline provides an advanced 10-bit PTYPE. The E810 provides a PTYPE Translation Table for matching the 10-bit E810 PTYPES to the legacy 8-bit PTYPES.

**Note:** The PTYPE Translation Table also provides the legacy 8-bit PTYPE to the Receive Data Processing Unit (RDPU) for the purpose of checksum generation.

The factory parsing program loaded from NVM provides the default 10-bit PTYPES and their translations to legacy 8-bit PTYPES. Further information is found in [Appendix A](#).

### 7.6.3 Flex Descriptor Format

The Flex Descriptor includes permanent infrastructure fields that appear in all Flex Descriptor formats and user-defined fields that can be programmed differently by different Descriptor Builder Profiles:

- Permanent infrastructure fields:
  - RXDID
  - MirrorID
  - UMBCAST
  - PTYPE
  - Packet Length
  - Header Length
  - SPH
  - Status/Error field(s)
  - L2TAG fields (optionally mapped into FlexiMD user-defined fields)
- User-defined fields:
  - FlexiFlags (user-selectable indications)
  - FlexiMD (user-selectable Metadata) and TS (Timestamp)

Detailed structure of the Flex Descriptor is illustrated in [Figure 7-8](#).

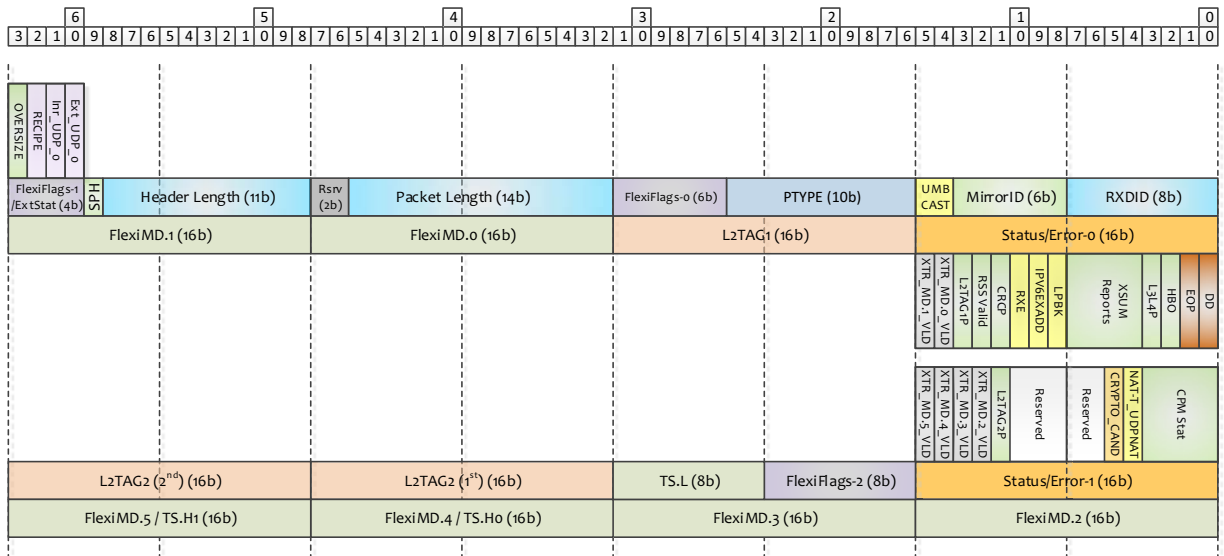

Figure 7-8. Receive Flex Descriptor (with Flags)

Table 7-3. Receive Flex Descriptor Fields

Word	Field Mnemonic	Width (bits)	Description
<b>16-byte/32-byte Receive Flex Descriptors</b>			
0	RXDID	8	<b>Descriptor Builder ProfileID</b> — Denoted the number of profile entry selected for this descriptor. Profiles #0 - Generates the legacy 16B descriptor format, identified by <i>RXDID</i> =0. Profiles #1 - Generates the legacy 32B descriptor format, identified by <i>RXDID</i> =1.
	MirrorID	6	<b>Mirror ID</b> — Identical to the field definition in the legacy descriptor format.
	UMBCAST	3	<b>UMBCAST</b> — Identical to the field definition in the legacy descriptor format.
1	PTYPE	10	<b>Packet Type</b> — Enumerates the packet type according to the packet types programmed into the device. The Flex Descriptor <i>PTYPE</i> is a 10-bit field. It can carry different packet type encoding than the legacy 8-bit <i>PTYPE</i> field in legacy descriptors.
	FlexiFlags.0	6	<b>Flexible Flags Section 0</b> — Up to 6 x user-selectable flags per <i>RXDID ProfileID</i> .
2	Packet Length	14	<b>Packet Length</b> — Identical to the field definition in the legacy descriptor format.
	Reserved	2	Reserved.
3	Header Length	11	<b>Header Length</b> — Identical to the field definition in the legacy descriptor format.
	SPH	1	<b>SPH</b> — Identical to the field definition in the legacy descriptor format.
	FlexiFlags.1/ExtStats	4	<b>Flexible Flags Section 1/Extended Status</b> — Up to 4 x user-selectable flags per <i>RXDID ProfileID</i> . This field can also carry additional status information: Ext_UDP_0, Int_UDP_0, RECIPE, OVERSIZE.
4	Status/Error.0	16	<b>Status/Error Section 0</b> — Status and error indications.
5	L2TAG1	16	<b>L2TAG1</b> — Identical to the field definition in the legacy descriptor format.
6	FlexiMD.0	16	<b>Flexible Metadata Container #0</b> — Generic 16-bit container for conveying metadata/actions from the E810 pipeline to the host.
7	FlexiMD.1	16	<b>Flexible Metadata Container #1</b> — Generic 16-bit container for conveying metadata/actions from the E810 pipeline to the host.

**Table 7-3. Receive Flex Descriptor Fields [continued]**

Word	Field Mnemonic	Width (bits)	Description
<b>32-byte Receive Flex Descriptors Only</b>			
8	Status/Error.1	16	<b>Status/Error Section 1</b> — Additional status and error indications.
9	FlexiFlags.2	8	<b>Flexible Flags Section 2</b> — Up to 8 x user-selectable flags per <i>RXIDID ProfileID</i> .
	TS.L	8	<b>TimeStamp Word Low</b> — Lower word of the TimeStamp value.
10	L2TAG2 (1st)	16	<b>L2TAG2 (1st)</b> — Identical to the field definition in the legacy descriptor format.
11	L2TAG2 (2nd)	16	<b>L2TAG2 (2nd)</b> — Identical to the field definition in the legacy descriptor format.
12	FlexiMD.2	16	<b>Flexible Metadata Container #2</b> — Generic 16-bit container for conveying metadata/actions from the E810 pipeline to the host.
13	FlexiMD.3	16	<b>Flexible Metadata Container #3</b> — Generic 16-bit container for conveying metadata/actions from the E810 pipeline to the host.
14	FlexiMD.4/TS.H0	16	<b>Flexible Metadata Container #4/TimeStamp Word High #0</b> — Generic 16-bit container for conveying metadata/actions from the E810 pipeline to the host / Higher word #0 of the timestamp value.
15	FlexiMD.5/TS.H1	16	<b>Flexible Metadata Container #5/TimeStamp Word High #1</b> — Generic 16-bit container for conveying metadata/actions from the E810 pipeline to the host / Higher word #0 of the timestamp value.

### 7.6.3.1 Status/Error.0 Field

Table 7-4 details the contents of the *Status/Error.0* field.

**Table 7-4. Status/Error.0 Field (16b)**

Bit	Field Mnemonic	Width (Bits)	Description
0	DD	1	<b>Descriptor Done</b> — Identical to the field definition in the legacy descriptor format.
1	EOP	1	<b>End Of Packet</b> — Identical to the field definition in the legacy descriptor format.
2	HBO	1	<b>Header Buffer Overflow</b> — Identical to the field definition in the legacy descriptor format.
3	L3L4P	1	<b>L3 and L4 Integrity Check</b> — Identical to the field definition in the legacy descriptor format.
7:4	XSUM Reports	4	<b>Checksum Reports</b> — Checksum error indications: bit 4 = IPE — IP checksum error indication (for tunneled packets it is the most inner IP header indication). bit 5 = L4E — L4 integrity error indication (most inner L4 header in case of UDP tunneling). bit 6 = EIPE — External (most outer) IP header (only relevant for tunneled packets). bit 7 = EUDPE — External (most outer) UDP checksum error (only relevant for tunneled packets).
8	LPBK	1	<b>Loopback</b> — Identical to the field definition in the legacy descriptor format.
9	IPV6EXADD	1	<b>IPv6 with Destination Options Header or Routing Header</b> — Identical to the field definition in the legacy descriptor format.
10	RXE	1	<b>Receive MAC Errors</b> — Identical to the field definition in the legacy descriptor format.
11	CRCP	1	<b>Ethernet CRC Present</b> — Identical to the field definition in the legacy descriptor format.
12	RSS/HASH Valid	1	<b>RSS/HASH Valid</b> — Indicates that the RSS/HASH result is valid. Qualifies RSS/HASH metadata in <i>FlexiMD</i> fields.

**Table 7-4. Status/Error.0 Field (16b) [continued]**

Bit	Field Mnemonic	Width (Bits)	Description
13	L2TAG1P	1	<b>L2 Tag 1 Presence</b> — Identical to the field definition in the legacy descriptor format.
14	XTR_MD.0_VLD	1	<b>Extract MD.0 Valid</b> — Indicates that extracted data from the packet is valid in MD.0. Extraction is performed according to the <i>ProfileID</i> entry in <i>RXDID</i> .
15	XTR_MD.1_VLD	1	<b>Extract MD.1 Valid</b> — Indicates that extracted data from the packet is valid in MD.1. Extraction is performed according to the <i>ProfileID</i> entry in <i>RXDID</i> .

### 7.6.3.2 Status/Error.1 Field

Table 7-5 details the contents of the *Status/Error.1* field.

**Table 7-5. Status/Error.1 Field (16b)**

Bit	Field Mnemonic	Width (Bits)	Description
0-3	Reserved	4	Reserved.
4	NAT-T/UDP-NAT	1	<b>NAT-T / UDP-NAT</b> — The packet is a UDP tunneled packet (including UDP-NAT-ESP).
10:5	Reserved	6	Reserved.
11	L2TAG2P	1	<b>L2 Tag 2 Presence</b> — Identical to the field definition in the legacy descriptor format.
12	XTR_MD.2_VLD	1	<b>Extract MD.2 Valid</b> — Indicates that extracted data from the packet is valid in MD.2. Extraction is performed according to the <i>ProfileID</i> entry in <i>RXDID</i> .
13	XTR_MD.3_VLD	1	<b>Extract MD.3 Valid</b> — Indicates that extracted data from the packet is valid in MD.3. Extraction is performed according to the <i>ProfileID</i> entry in <i>RXDID</i> .
14	XTR_MD.4_VLD	1	<b>Extract MD.4 Valid</b> — Indicates that extracted data from the packet is valid in MD.4. Extraction is performed according to the <i>ProfileID</i> entry in <i>RXDID</i> .
15	XTR_MD.5_VLD	1	<b>Extract MD.5 Valid</b> — Indicates that extracted data from the packet is valid in MD.5. Extraction is performed according to the <i>ProfileID</i> entry in <i>RXDID</i> .

### 7.6.3.3 ExtStat Field (FlexiFlags.1 Status Overlay)

Table 7-6 details the contents of the *ExtStat* field.

**Table 7-6. ExtStat Field (4b) (When Enabled by ProfileID in FlexiFlags.1)**

Bit	Field Mnemonic	Width (Bits)	Description
0	Ext_UDP_0	1	<b>Outer UDP Checksum Equals 0</b> — Identical to the field definition in the legacy descriptor format.
1	Int_UDP_0	1	<b>Inner UDP Checksum Equals 0</b> — Identical to the field definition in the legacy descriptor format.
2	RECIPE	1	<b>RDPU Recipe Error</b> — Identical to the field definition in the legacy descriptor format.
3	OVERSIZE	1	<b>Oversize Packet Error</b> — Identical to the field definition in the legacy descriptor format.

## 7.6.4 RXDID Descriptor Builder Profiles

For each packet, the format of the receive descriptor and particularly the contents that go into fields of the descriptor, is determined by the RXDID Descriptor Builder profile selected for the packet.

The E810 provides 63 x Descriptor Builder Profiles for programming different descriptor formats, including the 16-byte and 32-byte legacy descriptor formats that are preassigned:

- **Descriptor Builder Profiles #0** — Generates the legacy 16-byte descriptor format, identified by *RXDID*=0 in the descriptor structure delivered to software.
- **Descriptor Builder Profiles #1** — Generates the legacy 32-byte descriptor format, identified by *RXDID*=1 in the descriptor structure delivered to software.

**Note:** *RXDID*=7 is reserved and should not be used (in legacy descriptors, *MIRR*=7 means “mirror packet”, and that's the only way to distinguish it from flex descriptors).

The Descriptor Builder Profile selected for each packet is derived either from a pipeline action that sets the *RXDID* MDID and its priority, or from the Flex Queue Context that defines an *RXDID* and priority per each queue. Conflicts are resolved through the standard MDID priority resolution scheme described in [Section 7.3](#).

The *RXDID* field in the Flex Descriptor structure identifies the profile. Hence, the descriptor format delivered to software, in particular the contents of fields and flags.

The definition of a new Flex Descriptor format is as follows:

- Allocation of a new Descriptor Builder Profile entry.
- Programming the Descriptor Builder Profile entry:
  - FlexiMD contents (up to 6 x FlexiMD in 32-byte Flex Descriptors). Each MDID can provide one of the following:
    - MDID metadata from the pipeline (for example, opaque metadata from classification results).
    - Extracted fields from the packet (either header or payload up to the parsing depth of 504 bytes. See [Section 7.6.7](#)).
    - Pointers to locations of interest in the packet (for example, offset to the outer IPv4 header. [Section 7.6.8](#)).
  - FlexiFlags contents (up to 18 x FlexiFlags in 32-byte Flex Descriptors).

### 7.6.4.1 Programming RXDID Receive Descriptor Profiles

The Receive Descriptor Builder provides 64 x *RXDID* profile entries. The first two entries are preassigned for the legacy descriptor formats.

The configuration of a profile entry is done as follows:

#### For FlexiMD (n=0..5):

- `GLFLXP_RXDID_MD[n].ProtID_MDID`:
  - This field holds either a ProtocolID value or an MDID value. It's decoding is based on *RXDID\_opcode* field.
    - ProtID (ProtocolID): For reporting its offset or for extracting packet bytes from this offset.
    - MDID: For reporting the MDID metadata contents.

- GLFLXP\_RXDID\_MD[n].*extraction\_offset*:
  - Relevant only if *ProtID\_MDID* field is a protID.
  - Used as offset within ProtID to extract bytes from the packet.
  - Its usage is based on *RXDID\_opcode* field.
- GLFLXP\_RXDID\_MD[n].*RXDID\_opcode*:
  - The opcode selects the type of report that goes into FlexiMD[n] in the Flex Descriptor:
    - 00b = “Fixed Value”: Report the value from protID\_MDID field itself (for debug purposes).
    - 01b = “Metadata Offset”: Report the selected MD word from the internal FlexiPipe buses.
    - 10b = “Extraction Offset”: Extract 16 bits (2 bytes) from offset location (ProtocolID offset + byte offset) in the packet.
    - 11b = “Protocol Offset”: Report the offset to the selected ProtocolID.

**For FlexiFlags.0 (6 bits) / FlexiFlags.1 (4 bits) / FlexiFlags.2 (8 bits) (n=0..17, total 18 bits):**

- General:
  - The Receive Flex Descriptor includes 3 x FlexiFlags fields providing a total of 18 flags:
    - flexiflags0[5:0]
    - flexiflags1[3:0]
    - flexiflags2[7:0]
  - Note that the fields *flexiflag\_4n+2/flexiflag\_4n+3* are invalid in last index as there are only 18 flags, not 20.
- GLFLXP\_RXDID\_FLAG [n].*flexiflag\_4n/4n+1/4n+2/4n+3*:
  - Determines the flag index to be reported in flexiflag[4n/4n+1/4n+2/4n+3] from the FLG64 64 x flags available in the pipeline.

FlexiFlags.1 provides additional indications from RDPU that can override the regular flag selections:

- GLFLXP\_RXDID\_FLAGS1\_OVERRIDE.flags1\_override:
  - If Bit 0 is set, EXT\_UDP\_0 indication from RDPU replaces the value of flexiflags1[0].
  - If Bit 1 is set, INT\_UDP\_0 indication from RDPU replaces the value of flexiflags1[1].
  - If Bit 2 is set, RECIPE\_ERROR indication from RDPU replaces the value of flexiflags1[2].
  - If Bit 3 is set, OVERSIZE indication from RDPU replaces the value of flexiflags1[3].

**Note:** Further description of these indications from RDPU can be found in the legacy descriptors chapter section.

A special case is the support for legacy descriptors. For those, the configuration convention is:

- *RXDID* entry#0 is used for legacy 16-byte descriptors, and *RXDID* entry#1 is used for legacy 32-byte descriptors.
- Accordingly, the setting for the CSRs for entries 0 and 1 are:
  - GLFLXP\_RXDID\_MD.*protID\_MDID*[0]=56 (HASH Low)
  - GLFLXP\_RXDID\_MD.*protID\_MDID*[1]=57 (HASH High)
  - GLFLXP\_RXDID\_MD.*protID\_MDID*[4]=5 (FDID Low)

- GLFLXP\_RXDID\_MD.*protID\_MDID*[5]=6 (FDID High)
- GLFLXP\_RXDID\_MD[0].*RXDID\_opcode*=01b (signaling MDID)
- GLFLXP\_RXDID\_MD[1].*RXDID\_opcode*=01b (signaling MDID)
- GLFLXP\_RXDID\_MD[4].*RXDID\_opcode*=01b (signaling MDID)
- GLFLXP\_RXDID\_MD[5].*RXDID\_opcode*=01b (signaling MDID)
- All other fields are don't care for entries 0 and 1.

## 7.6.5 Receive Flex Queue Context

The E810 Flex Descriptor enhances the queue context with additional fields on top of the legacy queue context, as illustrated in Figure 7-9.

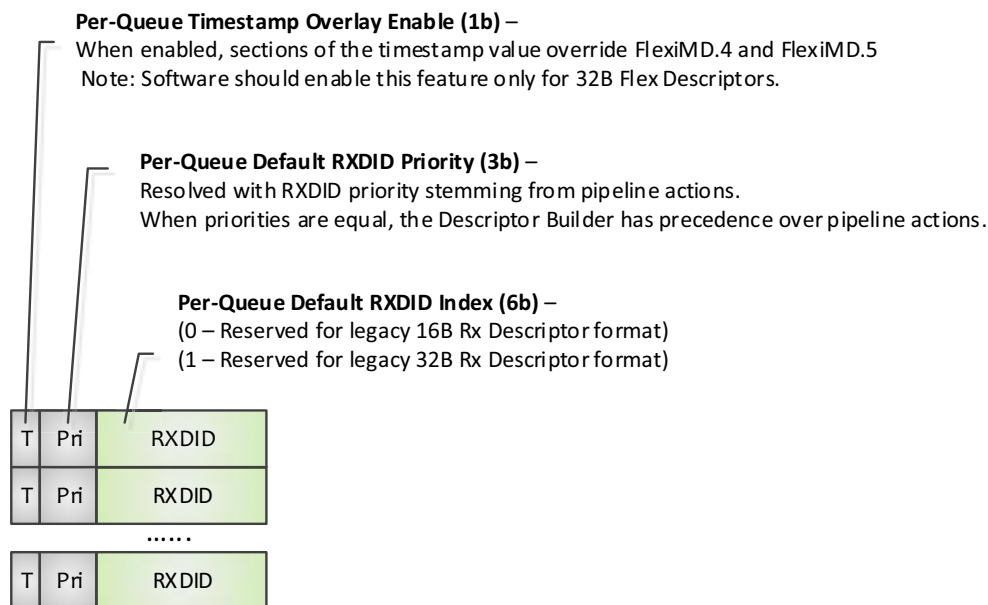

Figure 7-9. Receive Flex Queue Context

### 7.6.5.1 Programming the Receive Queue Context for Flex Descriptors

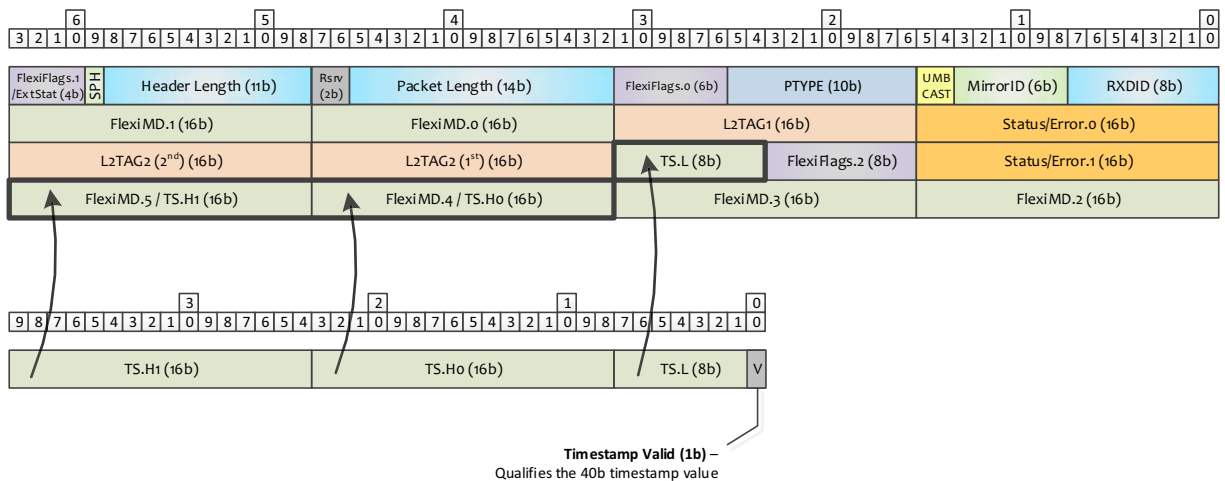

Programming of the additional Flex Queue Context is done via the QRX\_FLEX\_CNTXT CSRs, as follows:

- QRXFLXP\_CNTXT.*RXDID\_idx* – Determines the default *RXDID\_idx* for this Q.
- QRXFLXP\_CNTXT.*RXDID\_prio* – Determines the default priority for the default *RXDID\_idx* for this Q. This value is compared against RXDID priority from the RCU pipe. If this one is equal or higher, it wins, and the *RXDID\_idx* for this pkt is determined by QRX\_FLXP\_CNTXT.*RXDID\_idx*. Otherwise, it is determined by the value from the RCU pipe.
- QRXFLXP\_CNTXT.*TS* – Determines whether timestamp reporting per Rx packet is enabled for this Q. If enabled, the *TS.H1/TS.H0/TS.L* fields in the Rx-Descriptor contains the timestamp for this packet. Bit 0 of the *TS.L* field is the “valid” bit for this timestamp.

## 7.6.6 Timestamp Overlay

The E810 provides a Timestamp Overlay feature for conveying timestamp information from receive ports to the host. The feature is enabled per destination Q via the Flex Queue Context structure, as described in [Section 7.6.5](#).

The 40-bit timestamp value generated by the receive port is populated into fields in the 32-byte Receive Flex Descriptor as illustrated in [Figure 7-10](#). Description of the Receive Flex Descriptor fields is provided in [Section 7.6.3](#).

**Figure 7-10. Timestamp Overlay in 32-Byte Receive Flex Descriptor**

**Note:** The Timestamp Overlay feature is available only in 32-byte Flex Descriptors. The user should program the RXDID Profile for that queue accordingly, so that 32-byte Flex Descriptors are generated for packets arriving at that queue. The user should also enable the Timestamp Overlay feature in the Flex Queue Context as described in [Section 7.6.5](#).

**Note:** The LSb (Bit 0) of the *TS.L* field is the timestamp valid bit, qualifying the timestamp value.

When the `QRX_FLXP_CNTXT.TS` bit in the Flex Queue Context is set, the E810 overlays the 40-bit timestamp value into these fields of the 32-byte Flex Descriptor:

- • TS.H1 (16 bits) — Replacing FlexiMD.5
- • TS.H0 (16 bits) — Replacing FlexiMD.4
- • TS.L (8 bits) — LSb (Bit 0) is the timestamp valid bit

The corresponding FlexiMD.5 and FlexiMD.4 metadata selected by the RXDID Profile for that packet are overwritten and replaced with sections of the timestamp value.

**Note:** When TimeStamp Overlay is enabled for particular queue in the Flex Queue Context, all 32-byte Flex Descriptors associated with packets arriving at that queue contain the timestamp overlay fields, regardless of whether the timestamp value is valid. When a queue is programmed to receive timestamps, software should evaluate the LSb (Bit 0) of *TS.L* of the 32-byte Flex Descriptor to infer whether a timestamp is valid for that packet.

## 7.6.7 Field Extraction into the Flex Descriptor

The E810 provides programmable field extractions from the packet into the Receive Flex Descriptor. Fields can be extracted either from the packet header or from the payload, up to the maximum parsing depth (504 bytes). Packet fields are extracted into the FlexiMD containers of the Receive Flex Descriptor. The number of field extractions provided depends on the size of the Receive Flex Descriptor:

- 16-byte Receive Flex Descriptors provide up to 2 x FlexiMD fields that can be used for field extractions.
- 32-byte Receive Flex Descriptors provide up to 6 x FlexiMD fields that can be used for field extractions.

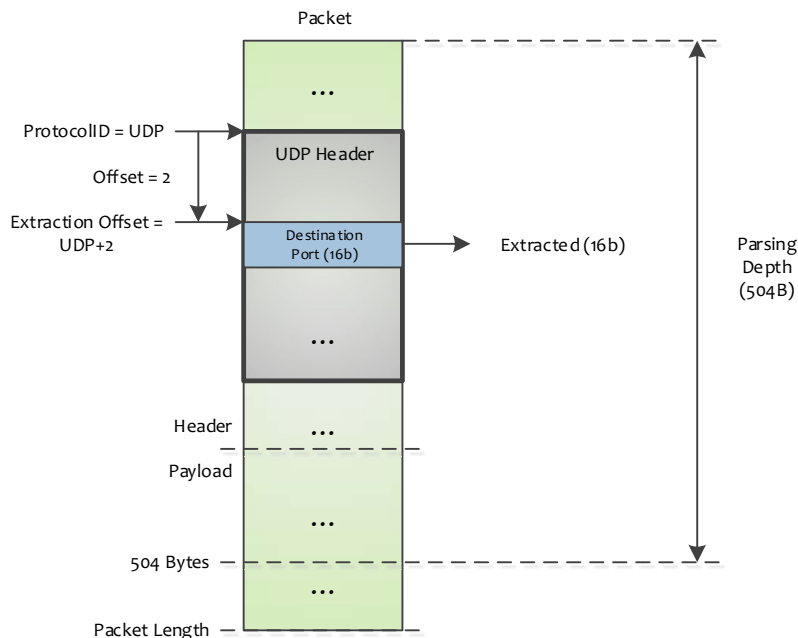

Extraction width is always 16 bits. Software can opt to use smaller parts of the extraction (for example, when a smaller 8-bit is required).

**Note:** Any extraction of fields to the receive descriptor is done before any modification potentially done on the packet (for example, VLAN stripping) with the exception of CRC. Requesting the extraction of the CRC field to the receive descriptor is not allowed.

Each field extraction is defined by the following parameters in the RXDID Profile structure as described in [Section 7.6.4](#):

- ProtocolID — Offset position generated by the parser.
- Offset — Relative byte offset from the ProtocolID position.

For example, to extract the destination port of a UDP packet, the user should program the extraction to use the ProtocolID of UDP with Offset=2 (bytes), as illustrated in [Figure 7-11](#).

**Figure 7-11. Field Extraction into the Flex Descriptor - Example**

**Note:** [Figure 7-11](#) illustrates a particular example in which the packet length is larger than 504 bytes. The packet header in this example is shorter than 504, allowing extraction from the payload.

The E810 indicates successful extraction per FlexiMD container by setting the corresponding XTR\_MD.#\_VLD bit in the Status/Error fields as described in [Section 7.6.3.1](#) and [Section 7.6.3.2](#). When the particular FlexiMD is programmed to contain an extraction result, but the XTR\_MD.#\_VLD bit is clear, software should disregard the value in the FlexiMD field.

The Receive Descriptor Builder validates for each extraction that the requested extraction offset is within packet boundaries. In case the extraction offset exceeds the packet boundary (that is, since the extraction works in word resolution, the byte offset is  $>\{\text{packet size} - 2\}$ ), the Receive Descriptor Builder:

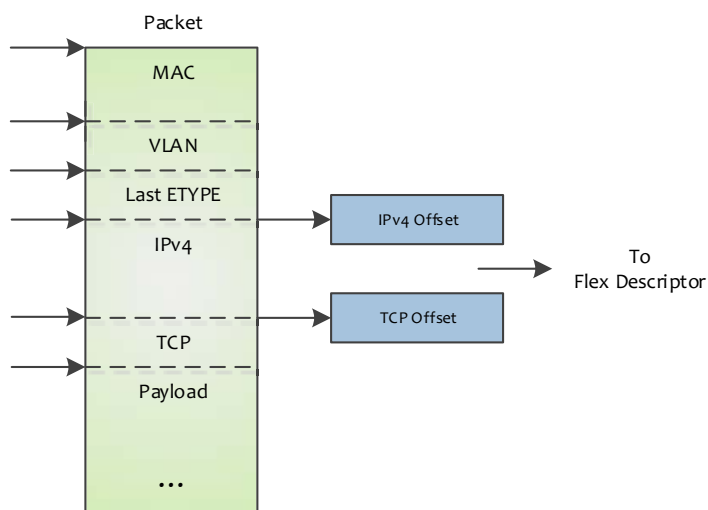

- Places the value 0xFFFF into the corresponding FlexiMD container.
- Clears the corresponding XTR\_MD.#\_VLD bit in the Status/Error field.
- Sets the Malicious Event exception flag.

**Note:** When using 16-byte descriptors, setting an out-of-bound extraction offset in FlexMD[5:2] (which is only relevant for 32-byte descriptors) also sets the malicious exception flag. Therefore, even when using 16-byte descriptors, the extraction offsets programmed for FlexMD[5:2] should contain valid offsets (though not used).

## 7.6.8 Pointers to Location of Interest

The FlexiMD metadata containers in the Flex Descriptor can be programmed to convey pointers to locations of interest in the packet, such as offsets to packet headers. Programming of the feature is done via the GLFLXP\_RXDID\_MD[n].RXDID\_opcode CSR as described in [Section 7.6.4.1](#).

For example, to provide the host with the IPv4 offset and the TCP offset of the packet, the RXDID profile entry is programmed to assign 2 x FlexiMD containers, as illustrated in [Figure 7-12](#).

**Figure 7-12. Field Extraction into the Flex Descriptor - Example**

**Note:** Any offset report generated by the Parser can be placed into the Flex Descriptor. Offset reports normally point to protocol headers, however the Parser can be programmed to report offsets of any other location of interest such as TLV headers, option fields, and so on.

## 7.7 Programmable Parser

### 7.7.1 Introduction

The E810 provides a software programmable Parser (Analyzer) capable of supporting a wide range of well-known and proprietary protocols. The Parser examines the traffic that enters the pipeline, retrieves search parameters from the packet and from associated packet context, and then generates additional context based on certain packet attributes. This context is further used by other packet processing modules in the pipeline to associate the packet with a flow, software hints, and so on.

The factory parsing program loaded into the Parser from NVM supports a large set of frame formats that are common in various networking applications. These formats are provided by the E810 out of the box, not requiring any additional installation or programming.

A detailed description of the Factory Parsing Program appears in [Appendix A](#).

These native formats include various protocols such as:

- L2: VLAN
- L2.5: MPLS
- L3: IPv4, IPv6
- L4: TCP, UDP, ICMP
- Overlay Network Formats: VXLAN, NGE, GRE
- Service chaining: NSH

#### 7.7.1.1 Parsing Policy - Parse Graph

A parse graph is a representation of permitted protocol sequences in the network. The parse graph is composed of nodes and arcs. Each node represents a state, normally a protocol header. It is associated with a {NodeID} identifier. An arc represents traversal between nodes, normally between protocol headers. It originates from a source {NodeID} to a target {NodeID}.

[Figure 7-13](#) illustrates a simple parse graph.

**Figure 7-13. Simple Parse Graph**

The simple parse is made from eight nodes and 14 arcs. The nodes in this parse graph correspond to protocols (Ethernet MAC header, VLANs, IPv4, IPv6, TCP, UDP, ICMP). Traversal conditions between nodes can be unconditional (that is, always take, or conditional (for example based on a protocol identifier in the protocol header such as the protocol field in an IPv4 header).

An example of an advanced parse graph scenario is illustrated in Figure 7-14.

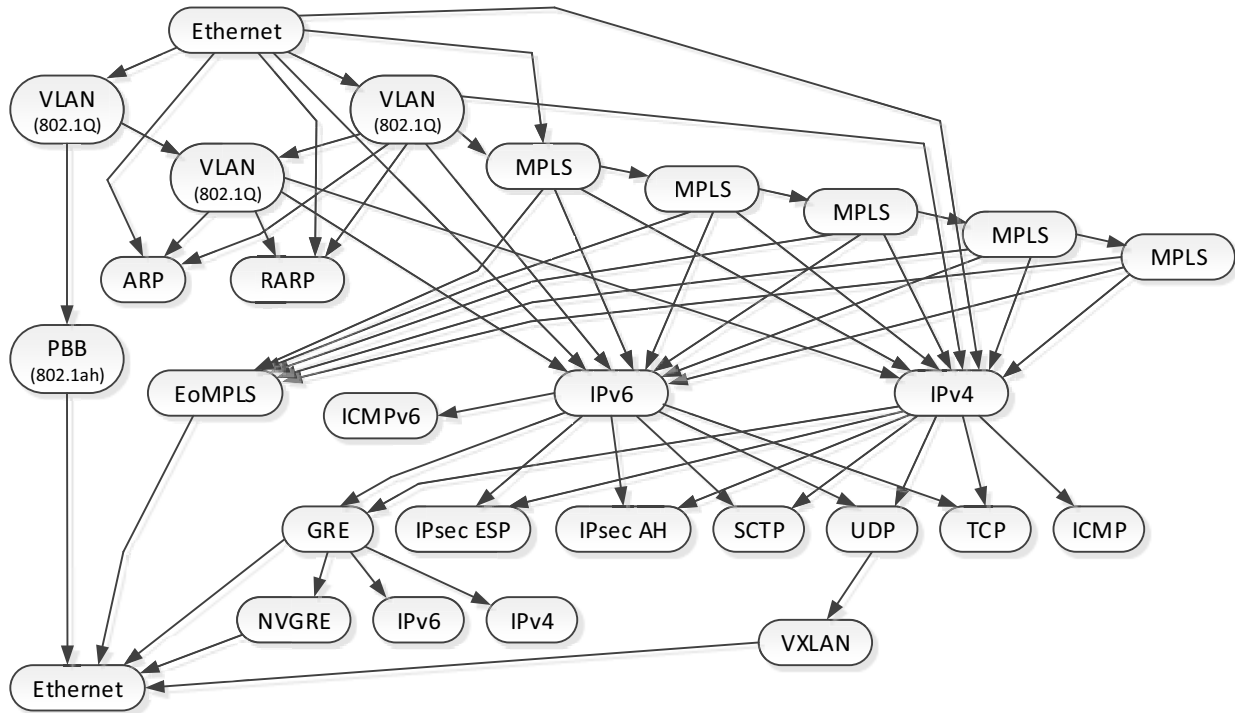

Figure 7-14. Advanced Parse Graph

### 7.7.1.2 Parsing Depth

The E810 Parser processes packet headers included in the first 504 bytes of the packet. The extensive depth covers complex encapsulation scenarios found in Cloud, Overlay-Networks, and Comms applications.

**Note:** Though the parsing depth is 504 bytes, the parser has an additional “protocol parsing depth” limitation allowing it to process up to 16 protocols (as specified in the parse graph) including the payload as the last protocol ID (the “payload” protocol ID is always be reported as the last protocol).

### 7.7.1.3 Parsing Profiles

The FlexiParser provides 16 x Parsing Profiles that determine the parsing execution flow.

A Parsing Profile determines:

- Initial PC (Program Counter) — Where the parsing program begins execution.
- Initial HO (Header Offset) — The offset location in the packet from where parsing starts.
- Initial NodeID — The root node of the parse graph selected.
- Register load — CPU General Purpose Registers (GPRs) loaded with pipeline metadata.

The structure of the profile table is shown in [Table 7-7](#).

**Table 7-7. Parser Profile Table**

Field	Width	Description
TSR	8	Initial value for the TSR register.
HO	9	Initial value for the HO register.
NPC	8	Initial value for the NPC register.
NID	11	Initial value for the NID register.
Control domain	3	Control domain identifier. Used for marker PTYPE TCAM look up operation.
GPR_A_ctrl	1	General purpose register A Control: 0b = Copies constant value to the GPR. 1b = Copies a certain field from interface to GPR_A_ID: GPR_A_ID = MDID_A[MDID_A_start + MDID_A_len - 1 : MDID_A_start] MDID_A_target_GPR = GPR_A_DATA
GPR_A_DATA	16	General purpose register A Data: Bits 0:4 = MDID_A Bits 5:8 = MDID_A_start Bits 9:12 = MDID_A_len Bits 13:16 = Reserved
GPR_A_ID	4	General purpose register A ID.
GPR_B_ctrl	1	General purpose register B Control.
GPR_B_DATA	16	General purpose register B Data.
GPR_B_ID	4	General purpose register B ID.
GPR_C_ctrl	1	General purpose register C Control.
GPR_C_DATA	16	General purpose register C Data.
GPR_C_ID	4	General purpose register C ID.
GPR_D_ctrl	1	General purpose register D Control.
GPR_D_DATA	16	General purpose register D Data.
GPR_D_ID	4	General purpose register D ID.
Flags initial value	64	Initial values for flags register.

### 7.7.1.4 PTYPE Generation

The FlexiParser generates a 10-bit PTYPE (Packet Type) that can be derived from:

- **Terminating NodeID** — When parsing stops at a NodeID that has an attribute of a terminating NodeID, the PTYPE is taken from the terminating NodeID PTYPE table.
- **Marker Sets** — When parsing stops at a NodeID that does not have an attribute of a terminating NodeID, the PTYPE is derived from the Marker Set Rules Table.

### 7.7.1.5 Programming Flow

The following sections describe the programming flows of the Parser.

#### 7.7.1.5.1 Initialization

Following a device core reset the factory parsing program is loaded from NVM. A detailed description of the Factory Parsing Program appears in [Appendix A](#). The parsing program includes complete configuration of the Parser, ready to run, including:

- Program code (iMEM)
- Protocol templates (TCAM)
- ProtocolIDs
- Parse Graph (PG)
- PTYPEs
- Well-Known/Public CDs (CD0+) and Profiles
- Misc tables/regs (e.g., ALU translation tables)

The parsing program carries a version number that the driver can query via a firmware ACQ.

The factory parsing program loaded from NVM is initially unlocked and managed by firmware as a shared resource ownership using existing firmware infrastructure. A PF driver can obtain a lock on pipeline programming to update it via an ACQ.

The sequence is as follows:

1. Parsing image loaded from NVM.
2. First PF driver obtains lock on pipeline programming via ACQ.
3. PF driver queries version of parsing program via ACQ.
4. PF driver can choose to update the parsing program.
5. Firmware keeps timeout to release lock if PF driver fails/crashes.
6. When update is completed, the parsing program is available with updated version number.
7. PF driver continues programming the rest of the pipeline until done.
8. PF driver releases lock (the firmware provides a timeout fall-back procedure).
9. Firmware prevents further updates until next core reset or after the last PF driver goes down.
10. All PF drivers use the same parsing program.

**Note:** Manageability traffic is disabled during the update of the parsing program.

### 7.7.1.5.2 Configuration Access to Parser Resources

The Parser exposes indirect interface for reading and writing tables or execute table lookups using the following set of registers:

- GLGEN\_ANA\_CFG\_CTRL
- GLGEN\_ANA\_CFG\_RDDATA[0..15]
- GLGEN\_ANA\_CFG\_WRDATA

#### 7.7.1.5.2.1 Write Sequence

1. Before writing a line, firmware writes the GLGEN\_ANA\_CFG\_CTRL register to point to the target line in the target table.
2. Firmware writes the GLGEN\_ANA\_CFG\_WRDATA register multiple times until a complete line is accumulated.
3. The Parser accumulates the 32-bit CSR writes into a wide data line. When it detects that a full line is accumulated, it writes it to target line in memory.
4. In case firmware continues writing the WR\_DATA (without writing the CTRL register first), the Parser continues to write the next line in the same memory.

#### 7.7.1.5.2.2 Read Sequence

1. Firmware writes the GLGEN\_ANA\_CFG\_CTRL register to point to the target line in the target table.
2. Firmware reads the relevant data directly from GLGEN\_ANA\_CFG\_RDDATA[0..16] registers.
3. Before reading the next line, firmware must set the GLGEN\_ANA\_CFG\_CTRL register again.

### 7.7.1.5.3 In-Service Programmability

The Parser provides in-service programming of the following resources:

- Add/Remove of PG arc
- Add/Remove of TCAM entry
- Add/Remove/Change of Profile

**Note:** It is assumed that the associated PG nodes and iMEM instructions are already configured in the Parser database.

#### 7.7.1.5.3.1 Add/Remove of PG Arc

The flow of adding/removing of PG is as follows:

1. Firmware writes the PGkey to GLGEN\_ANA\_CFG\_LU\_KEY.
2. Firmware initiates PG lookup via GLGEN\_ANA\_CFG\_CTRL.
3. The Parser hardware returns:
  - The CAM hit result, the CAM bank number (when not in spill buffer), and the CAM line index in GLGEN\_ANA\_CFG\_SPLBUF\_LU\_RESULT and GLGEN\_ANA\_CFG\_HTBL\_LU\_RESULT.
  - TCAM unit 0 capacity - GLGEN\_ANA\_CFG\_RDDATA 0.

- TCAM unit 1 capacity - GLGEN\_ANA\_CFG\_RDDATA 1.
  - TCAM unit 0 bin vector - GLGEN\_ANA\_CFG\_RDDATA 2.
  - TCAM unit 1 bin vector - GLGEN\_ANA\_CFG\_RDDATA 3.
  - TCAM unit 0 HASH value - GLGEN\_ANA\_CFG\_RDDATA 4.
  - TCAM unit 1 HASH value - GLGEN\_ANA\_CFG\_RDDATA 5.
  - Spill buffer capacity vector - GLGEN\_ANA\_CFG\_RDDATA 7/8.
4. Firmware initiates or resets the PG action memory using memory write sequence.
  5. Firmware initiates or resets the PG key using memory write sequence.

#### 7.7.1.5.3.2 Add/Remove of TCAM Entry

The flow of adding/removing of TCAM entry is as follows:

1. Firmware writes an action to a well-known address in the TCAM action memory using the memory write sequence.
2. Firmware writes a key to a well-known address in the TCAM key using the memory write sequence.

#### 7.7.1.5.3.3 Entry Change in Profile Table

Table content change happens only for a Profile that its packets are drained from pipe.

Before changing content:

1. Firmware routes the modified profile N to a stable default profile by writing the default Profile ID to index N in the P2P table.
2. Firmware waits 10  $\mu$ s. During this time period it is guaranteed that:
  - Packets processed in pipe before the change are drained towards the reorder logic.
  - New packets enter the pipe with the default profile.
3. Firmware does table changes for the reset profile using memory write sequence.
4. Firmware enables the modified profile by writing "N" to the index N in the P2P table.

## 7.8 Switch (Binary Classifier)

### 7.8.1 Features

**Table 7-8. Binary Classifier Features**

Description
<p><b>Logical Switching Tables</b></p> <ul style="list-style-type: none"> <li>• Supports up to 64 different switching lookups/recipes (all actions included).</li> <li>• Supports up to 10 concurrent switching lookups per specific packet type @ 90 Mpps.</li> <li>• Each lookup can contain up to five 16-bit tuples. Lookups can be chained to create longer recipes.</li> <li>• Support up to 32K lookup entries. The actual number depends on the length of the recipe and the utilization of the hash.</li> </ul>
<p><b>Built in recipes loaded from NVM to implement basic NIC functionality</b></p> <ul style="list-style-type: none"> <li>• Supports simple L2 switching including VEB and VEPA modes.</li> <li>• Supports default VSI per VEB (using default, direction recipe).</li> <li>• Supports flooding action per VSI.</li> <li>• Anti spoofing.</li> </ul>
<p><b>Sample use cases to be supported</b></p> <ul style="list-style-type: none"> <li>• Multi Channel VEPA (STag based).</li> <li>• Tenant Forwarding (NVGRE, Geneve, and so on).</li> <li>• Q-in-Q forwarding.</li> <li>• Private VLAN.</li> <li>• Local VLAN.</li> <li>• Floating VEB.</li> </ul>
<p><b>Support for multiple switch instances</b></p> <ul style="list-style-type: none"> <li>• Allow classification of traffic to different switch instances based on source or tag in packet.</li> <li>• Tag can be up to four words long from anywhere in header.</li> <li>• Support up to 64 tag based switch IDs.</li> </ul>
<p><b>Allows Tx-Descriptor from trusted driver to define the destination of a packet.</b> Allows the following options:</p> <ul style="list-style-type: none"> <li>• Send To LAN only.</li> <li>• Do not send to LAN. Let switch define the destination within loopback.</li> <li>• Send to a specific VSI</li> </ul>
<p><b>Actions - support multiple type of actions per recipe</b></p> <ul style="list-style-type: none"> <li>• Forwarding - to VSI, VSI list, queue group within a VSI, or queue within a VSI.</li> <li>• Pruning.</li> <li>• Statistics.</li> <li>• Support up to 8K basic actions that can be chained in up to four actions.</li> <li>• Multiple forwarding actions can be prioritized or merged.</li> </ul>
<p><b>Support for different switching Profiles</b></p> <ul style="list-style-type: none"> <li>• Applicable recipes can be selected according to source of packet, packet type, and other packet parameters.</li> <li>• Support bypass of classifier for selected packet profiles.</li> <li>• Allow trusted software to fix destination of packet.</li> </ul>
<p><b>Egress Rules - support additional actions on egress copy of a packet</b></p> <ul style="list-style-type: none"> <li>• Egress mirroring.</li> <li>• Source pruning.</li> <li>• Limit decrypted traffic to function owning the SA.</li> </ul>
<p><b>Support up to 768 VSIs.</b></p> <ul style="list-style-type: none"> <li>• Allow replication to multiple VSIs.</li> </ul>

**Table 7-8. Binary Classifier Features [continued]**

Description
<p><b>Statistics</b></p> <ul style="list-style-type: none"> <li>• Per VSI statistics.</li> <li>• Up to 32 per VEB statistics block.</li> <li>• Up to 128 per VLAN/UP statistics block.</li> </ul>
<p><b>Mirroring</b></p> <ul style="list-style-type: none"> <li>• Ingress mirroring (according to packet source).</li> <li>• Egress Mirroring (according to packet destination).</li> <li>• VLAN/VEB mirroring.</li> <li>• Event based mirroring.</li> <li>• Mirroring destination to local VSI only.</li> </ul>
<p><b>Storm Control</b></p> <ul style="list-style-type: none"> <li>• Per port broadcast and multicast storm control.</li> </ul>
<p><b>Programming API</b></p> <ul style="list-style-type: none"> <li>• Allow Software to add or remove switching recipes on the fly.</li> <li>• Allow Software to classify traffic to profiles on the fly.</li> </ul>
<p><b>Manageability forwarding.</b></p> <ul style="list-style-type: none"> <li>• Supports forwarding of packets to the BMC or the internal EMP based on the MDEF filters described in <a href="#">Section 12.4</a>.</li> </ul>

## 7.8.2 Binary Classifier (Switch) Block Diagram

Figure 7-15 describes the switch blocks:

Figure 7-15. Switch Block Diagram

A packet entering the E810 switch goes through the following steps, depicted Figure 7-15:

1. **Profile Selection** — A Profile ID is selected based on metadata of the packet (typically, the packet type and the source of the packet). The Profile ID later defines the set of recipes and the input set that is relevant for each packet.
2. **Switch ID Generation** — The header and metadata of the packet are used to define a switch ID for the packet. The switch ID associates a packet with a specific switch instance. The switch ID is used in subsequent steps to identify lookup entries that are relevant to this packet.
3. **Field Extraction** — Based on the Profile ID, a set of fields from the header are extracted and organized as a “field vector”. The extracted fields should be all the fields relevant for the different recipes lookups.
4. **Lookups:**
  - a. **Recipes selection** — Based on the Profile ID, a set of lookups to apply to the packet’s field vector are selected.

- b. For each recipe, the Key Generator (KeyGen) selects from the packet's field vector the parts of the header needed to create this lookup and presents the results to the Lookup Table (LUT).
  - c. The LUT is a binary CAM containing the various lookup values and actions. The output of this stage is a set of actions to apply to the packet.
5. **MNG Sub-Block (Manageability Lookup)** — In parallel to the host forwarding lookup, filters specific to traffic that need to be forwarded to the BMC via sideband are applied to implement NC-SI and other pass-through forwarding rules. This stage can add an additional action to the set previously defined. This block has its own profile selection unit.
  6. **Action Resolving** — After all the actions are created, unified actions are created. The output is a list of VSIs that should receive the packet and other actions such as statistic actions and others.
  7. **Replication** — For each VSI in the resulting VSI list, a command to replicate the packet is created.
  8. **Egress Processing** — For each copy of the packet, egress rules are applied. Applied actions can be egress mirroring.
  9. **Priority Resolver and Metadata Updater** — The resulting commands are forwarded to the next stages of the pipe. As part of this the decision of the switching blocks are merged into the global metadata bus.

### 7.8.3 Control Domain and Profile Selection

The profile selection block is described in [Section 7.2.2](#). The usage of this block in the switch context is to select a profile based on the packet type and based on the source of the packet. Selection based on the packet type is used to reduce the lookups to the ones relevant to this packet type. Selection based on the packet source is used to assign different recipes for different networks.

There are up to 256 profiles in the binary classifier, and 512 rules in the TCAM to select them.

A profile is selected according to the following parameters. Some of them are used as part of the current implementation and some are reserved for future expansions:

- Packet Source:
  - Transmit - VSI Number
  - Receive - Physical port# or logical port ID
- Packet Source Type:
  - Receive - from LAN
  - Loopback - from Host
  - Loopback - from EMP/BMC
  - Transmit - query

**Note:** The packet source type and packet source are used to create the first input of the control domain selection, thus allowing selection of a control domain according to the VSI that sent the packet or according to the port on which the packet was received.

- Packet Type — This field allows different profiles for different packet type groups, thus allowing reduction of the number of recipes that can be applied to a single packet, and improving the performance of the switch.

- Flags:
  - Bypass switch command, bad packets, SWPE — Fields that allow a bypass of the switch for packets that do not require a switch decision via the lookup tables.
  - Software command — This field is be used to prevent regular traffic from matching a profile, while allowing software commands to still match the profile (for example, to delete recipes).
- Other optional fields not currently used, but that can impact the profile:
  - TC
  - Other fields can be defined later by software.

## 7.8.4 Ingress Pre-Processing

### 7.8.4.1 Field Extractor

The Fields Extractor is a standard block that extracts a local Field Vector (FV) from the packet info. The list of fields that are extracted is based on the selected Profile ID.

The configuration of this block should be that all the fields used by any of the recipe selected by this Profile ID are represented in the generated field vector.

See [Section 7.5](#) for programming of the extraction vector and encoding of the Protocols.

The resulting vector can be up to 48 words for the main switch and 32 words for the manageability decision. See [Section 7.8.7](#) for details of the manageability filtering Fields Extractor.

The default vector is defined in [Section 7.8.11.3.2](#).

### 7.8.4.2 Switch ID Creation

The ingress switch ID is an identifier of the virtual VEB to which the packet belongs, and it is used as an input to the LUT.

The switch ID is based on the source of the packet (VSI, port or logical port).

The input to this block is the metadata bus and the field vector. The relevant information taken from these buses is the packet source:

- For Transmit - VSI Number
- For Receive - Physical port#

The following data is defined in the block:

- A per-VSI switch ID — Used to identify the switch ID of a packet based on the VSI that sent the packet. This is part of the VSI context and is stored in the VSI\_SWITCHID array (*SWTCHID[7:0]* field).
- A per-port switch ID — Used to identify the default switch ID of packets. Stored in the GL\_VP\_SWITCHID array (*SWITCHID[7:0]* field).

The switch ID is created according to the following logic:

```
if (packet is Tx (loopback or query)) { switch ID = VSI Switch ID}
else if (packet is rx) { switch ID = physical port Switch ID}
```

The output of the Block is switch ID[7:0] and it is added as part of the Field vector.

Per switch ID, a GLSWID\_STAT\_BLOCK register defines if one of 32 VEB statistic block is associated with this switch ID. The GLSWID\_STAT\_BLOCK.VEBID field defines the stat block ID to which the switch ID is associated. A switch ID cannot be associated with any switch block (GLSWID\_STAT\_BLOCK.VEBID\_VALID = 0).

The switch ID extracted as described above should be part of the Field Vector described in [Section 7.8.4.1](#) to enable differentiation between lookup entries of different VEBs.

## 7.8.5 Switching Engine

### 7.8.5.1 Switching Recipes and Key Generation (KeyGen)

The switch recipe block is a set of 64 lines that describes the lookups to do on the field vector. Each recipe can be based on multiple lookups and multiple recipes can be applied to a single packet. The set of recipes to apply on a given packet is defined according to the Profile ID using a per Profile ID bitmap defining which lookups to apply.

In addition, another table maps the dependencies between recipes. For each recipe, there is a bitmap of all the recipe entries that are part of the decision tree of this recipe.

Each lookup line can be defined as a root of a recipe or a line that creates an intermediate lookup used for another calculation. A root line can also serve as an intermediate lookup of another root line. Only root lines points to an action.

The intermediary results are stored back into the field vector and so can be used as part of the input set of subsequent lookups.

Lines that are used as intermediate steps of a recipe should be stored before the root of this recipe. See [Figure 7-16](#) for the multiple lookup recipe diagram.

Per profile, up to 32 lookup lines can be selected, and 24 of them can be recipe roots.

**Figure 7-16. Multiple Lookup Recipe**

Once a lookup line is chosen, the list of lookup words are used by the KeyGen block to build the part of the lookup key extracted from the packet header or the metadata. The generated key, the mask bits, and the RID are then looked up against the Lookup table.

The lookup lines are applied in the order they appear in the table. Hence, entries in the recipe table should be in order so that lines used as an intermediate lookup creates intermediary results before a line that uses the lookup result is run.

Each lookup line contains the following information:

**Table 7-9. Recipe Content**

Field	Byte Range	Width	LSB	MSB	Sub-Field Description
RID	Byte 0	6	0	5	Recipe ID (RID) <sup>1</sup> .
		1	6	6	Reserved (for recipe expansion).
		1	7	7	isroot — Defines if this lookup line is a root of a recipe.
Lookup Index 0	Byte 1	6	8	13	First word to be compared to data from the Field Vector or the metadata. The value is an offset within the extracted Field vector. Unused fields should be masked in the <i>Mask</i> field.
		1	14	14	Reserved.
		1	15	15	Ignore Valid — If set, the field match even if the field is not valid. Should be set for VLAN entries where a value of zero with valid bit clear indicates an untagged packet that should be treated as VLAN = 0.
Lookup Index 1	Byte 2	6	16	21	Second word index in Field Vector.
		1	22	22	Reserved.
		1	23	23	Ignore Valid — If set, the field match even if the field is not valid.
Lookup Index 2	Byte 3	6	24	29	Third word index in Field Vector.
		1	30	30	Reserved.
		1	31	31	Ignore Valid — If set, the field match even if the field is not valid.
Lookup Index 3	Byte 4	6	32	37	Fourth word index in Field Vector.
		1	38	38	Reserved.
		1	39	39	Ignore Valid — If set, the field match even if the field is not valid.
Lookup Index 4	Byte 5	6	40	45	Fifth word index in Field Vector.
		1	46	46	Reserved.
		1	47	47	Ignore Valid — If set, the field match even if the field is not valid.
Mask	Bytes 6-15	16	48	63	Bit-mask of word 0 of the LU key. 1 means the bit is compared.
		16	64	79	Bit-mask of word 1 of the LU key.
		16	80	95	Bit-mask of word 2 of the LU key.
		16	96	111	Bit-mask of word 3 of the LU key.
		16	112	127	Bit-mask of word 4 of the LU key.
Result Index	Byte 16	6	128	133	Word index in which LU result will be placed.
		1	134	134	Reserved.
		1	135	135	Result Enable — LU yields result that should be stored in Field Vector.
Reserved	Bytes 17-19	24	136	159	Reserved.

**Table 7-9. Recipe Content [continued]**

Field	Byte Range	Width	LSB	MSB	Sub-Field Description
Action Control	Bytes 20-23	8	160	167	A bitmap of the join priorities of forwarding actions associated to this recipe. Relevant only for roots. The join priority defines which priorities are joined by this recipe. See <a href="#">Section 7.8.6.1</a> for details.
		4	168	171	The priority of forwarding actions associated to this recipe. Relevant only for roots.
		4	172	175	Reserved.
		1	176	176	Need_pass_l2 — If set, for the action of this recipe to be relevant, a recipe with <i>allow_pass_L2</i> bit set should match <sup>2</sup> .
		1	177	177	Allow_pass_l2 — If set, allows recipes with <i>need_pass_L2</i> bit set to pass <sup>3</sup> .
		1	178	178	Inverse Action — This bit is used to allow forwarding lookups to be used as anti-spoof (Tx) and source pruning (Rx) actions. See <a href="#">Section 7.8.5.1.1</a> for details.
		1	179	179	Reserved.
		2	180	181	Prune Index — Defines the enable bits to use it the VSI context to qualify a pruning action associated with this recipe. The <i>VSI_SRCCTRL.PRUNEENABLE[3:0]</i> and <i>VSI_RXCTRL.PRUNEENABLE[3:0]</i> are used to enable the pruning in Tx and Rx respectively.
		10	182	191	Reserved.
Default Action	Bytes 24-27	19	192	210	Default action according to the format described in <a href="#">Table 7-12</a> . The default action can be a pointer to a large action or a single action.
		12	211	222	Reserved.
		1	223	223	Default Action valid.

1. For normal recipes, the RID should be equal to the index of the recipe. If *Inverse Action* flag is set, the RID might differ from the recipe index. In this case, lookup entries should not be populated with this recipe index. For non-root recipes, the RID must be zero.
2. This bit requires another recipe lookup with *Allow\_pass\_l2* set to match.
3. This bit identifies this filter as an L2 filter, qualifying filters with *Need\_pass\_l2* set.

### 7.8.5.1.1 Inverse Action

The operation of anti-spoof of transmit packets is based on checking the SA or the {SA, VLAN} pair used to send the packet. If this SA or {SA, VLAN} pair where used as DA or {DA, VLAN} it would have to allow the VSI to receive the packet, then it can use them as SA or the SA, VLAN pair.

Similarly the operation of source pruning in receive can be based either on the source VSI as described in [Section 7.8.6.5](#) or on the identification the SA or {SA, VLAN} pair as belonging to a VSI by identifying that if his SA or {SA, VLAN} pair where used as DA or {DA, VLAN} it would have allow the VSI to receive the packet.

This means that in the same MAC Address or MAC/VLAN pair could be used both to forward to a VSI or for anti-spoof or source pruning actions. To save the need for two entries for each of the MAC Address or MAC/VLAN pair in the lookup table, the inverse action mechanism is provided.

If inverse action bit in recipe (Bit 178) is set, any forwarding action to a single VSI or to a queue in the recipe is replaced with comparison of the source VSI of the packet with the VSI or the VSI matching the queue in the action for Tx traffic, and is replaced with a prune (AND NOT) for receive traffic. There is no support for inverse action when the forwarding action points to a list.

This is applied only if the action is a VSI forwarding action to a single VSI or a ToQueue action, either in a regular or large action.

If set, the action is enabled for Tx traffic using the VSI\_SRCCTRL.MACAS bit and for Rx traffic using the VSI\_RXCTRL.MACVSIIPRUNEENABLE bit.

When setting this bit, the RID of the inverse action recipe should be equal to the RID of the matching forwarding recipe.

### 7.8.5.1.2 Sample Recipes

Table 7-10 provide a few examples of recipes (a letter in one of the words indicates usage of intermediary lookups, according to the result field in the intermediary line). Lines 0-10 are the basic recipes loaded from NVM.

**Note:** The layout of the recipes can be different if needed to optimize lookups. For example, if a part of a lookup is common to multiple lookups (for example, {switch ID, tenant ID, Key}), it might be worthwhile to have it a single lookup entry shared by multiple recipes.

**Table 7-10. Sample Recipes**

Recipe Index (RID)	Recipe	Priority (Joint Priority) <sup>1</sup>	Is Root	Word0	Word1	Word2	Word3	Word4	Result <sup>2</sup>
0	EtherType, Direction	4	Y	switch ID	EtherType	Direction	-	-	E
1	DA	2	Y	switch ID	MAC0	MAC1	MAC2	-	B
2	DA, VLAN	2	Y	switch ID	MAC0	MAC1	MAC2	VLAN	-
3	Packet Type, Direction (promiscuous)	1 (1,2,3) <sup>3</sup>	Y	switch ID	Packet Type	Direction <sup>4</sup>	-	-	-
4	VLAN <sup>5</sup>	N/A <sup>6</sup>	Y	switch ID	VLAN	-	-	-	-
5	Default, Direction	0	Y	switch ID	Direction	-	-	-	-
1	SA (inverse action)	N/A <sup>7</sup>	Y <sup>8</sup>	switch ID	SMAC0	SMAC1	SMAC2	-	-
2	SA, VLAN (inverse action)	N/A	Y <sup>9</sup>	switch ID	SMAC0	SMAC1	SMAC2	VLAN	-
8	EtherType, MAC, Direction	4	Y	switch ID	MAC0	MAC1	MAC2	E	-
9	Promiscuous, VLAN, Packet Type, Direction	1 (1,2,3) <sup>3</sup>	Y	switch ID	Packet Type	VLAN	Direction	-	-
10	Logical Port	0	Y	switch ID	Logical Port	-	-	-	-
11	Inner MAC, Tunnel Type	3	Y	switch ID	IMAC0	IMAC1	IMAC2	Tunnel Type	A
12	Inner MAC, Inner VLAN, Tunnel Type	3	Y	A	iVLAN	-	-	-	-
13	Inner MAC, Inner VLAN, Tenant ID, Tunnel Type	3	Y	A	iVLAN	Key0	Key1	-	-
14	Inner MAC, Tenant ID, Tunnel Type	3	Y	A	-	Key0	Key1	-	-
15	Outer MAC, Tenant ID, Inner MAC, Tunnel Type	3	Y	B	A	Key0	Key1	-	-
16		N/A	N	D-IP-0	D-IP-1	D-IP-2	D-IP-3	D-IP-4	C
17	Application Dest IPv6	3	Y	switch ID	D-IP-5	D-IP-6	D-IP-7	C	-
18		N/A	N	S-IP-0	S-IP-1	S-IP-2	S-IP-3	S-IP-4	G
20	Application Dest IPv4	3	Y	switch ID	D-IP-0	D-IP-1	-	-	D

**Table 7-10. Sample Recipes [continued]**

Recipe Index (RID)	Recipe	Priority (Joint Priority) <sup>1</sup>	Is Root	Word0	Word1	Word2	Word3	Word4	Result <sup>2</sup>
21	Application Source IPv6, Inner MAC	3	Y	S-IP-5	S-IP-6	S-IP-7	A	G	-
22	Application Source IPv4, Inner MAC	3	Y	S-IP-0	S-IP-1	A	-	-	-
24	Application Dest IPv4, Application Source IPv4	3	Y	S-IP-0	S-IP-1	D	-	-	-
25	TCP/UDP Port	3	Y	switch ID	DPort	-	-	-	-
26	S-Tag	1	Y	switch ID	S-Tag	-	-	-	-
27	iVLAN	3	Y	switch ID	iVLAN				

1. If a joint priority is not provided, it is equal to the regular priority.
2. The letters in the Result column indicate indexes in the field vectors that are updated by a match of this recipe, and are used as inputs in subsequent recipes.
3. Assuming promiscuous additive to other filters.
4. For rules where a direction is used, it is defined by the type of rule added (T\_LOOKUP\_TX (packet sent by the driver) or T\_LOOKUP\_RX (packet received by the driver)).
5. Should allocate a Prune Index to this rule (assume Prune Index = 0 for the examples and for the NVM default package).
6. Assumption is that VLAN filter is used for pruning.
7. No priority for inverse actions.
8. Use same RID as DA table. Used for anti-spoof/source pruning.
9. Use same RID as DA, VLAN table. Used for anti-spoof/source pruning.

### 7.8.5.2 Lookup Table

The lookup table is a Binary-CAM with 32K entries accessed using the Key generated in the KeyGen. The masked lookup key is searched in the table. If a match is found, the result is provided to the action resolving block that registers an action to do on the packet (if this is a root lookup) and to the KeyGen that can update the Field Vector (if intermediate or root lookup). If a match is not found, a default action per recipe can be used.

The format of each entry in the lookup table is as follows:

**Table 7-11. Field Lookup Entry Format**

Field	Width	LSB	MSB
Action	19	0	18
Ref. Count	16	19	34
Pointer	16	35	50
Filter Key	FV Word 0	16	51
	FV Word 1	16	67
	FV Word 2	16	83
	FV Word 3	16	99
	FV Word 4	16	115
	RID	6	131
	Reserved	9	137
	IsRoot	1	146

### 7.8.5.3 Actions

There are three types of actions supported:

- Single action per lookup (Section 7.8.5.3.1).
- List of actions per lookup divided to three sections of single, double, and quad lists (Section 7.8.5.3.2).
- Default Action, if the lookup does not result in a match (Section 7.8.5.3.3).

Figure 7-17 shows the different types of actions:

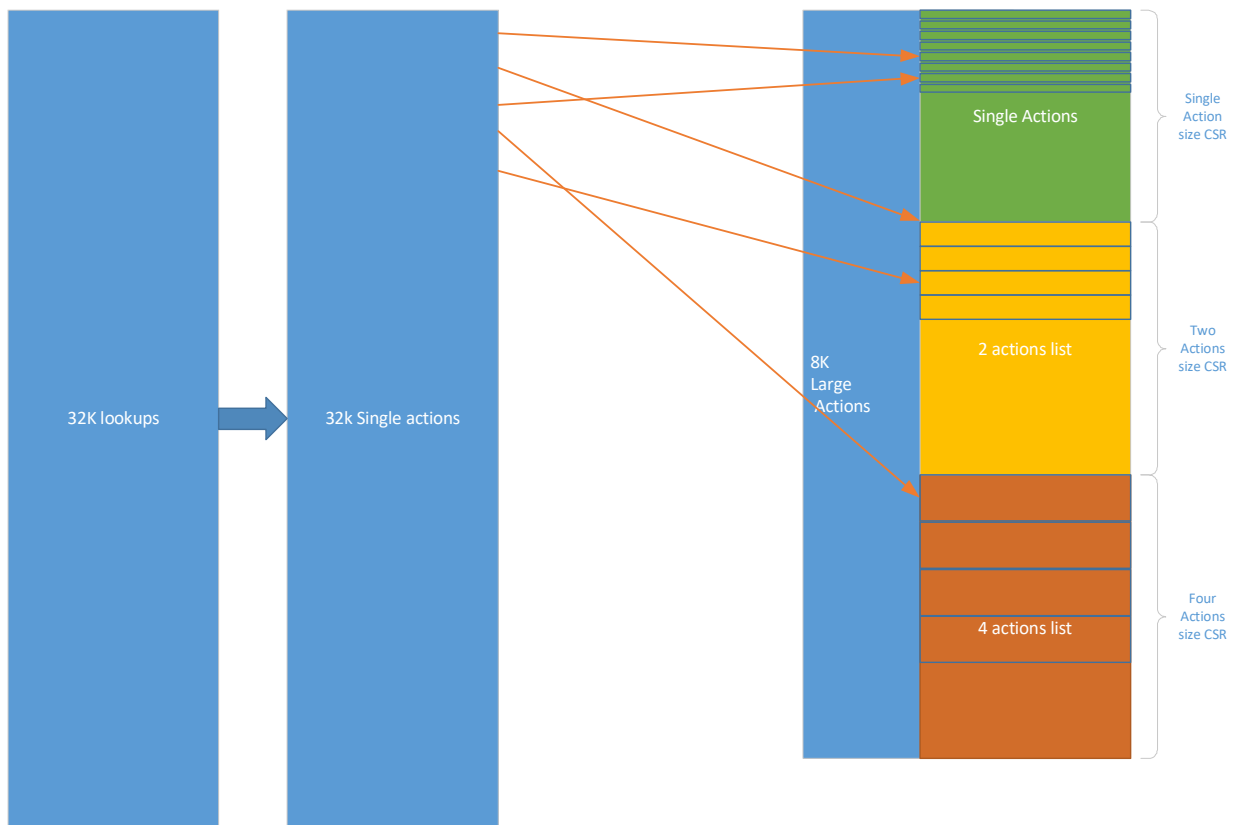

Figure 7-17. Single Actions and Large Actions

#### 7.8.5.3.1 Single Action

For each of the 32K lookups, a single action can be applied if the lookup matches.

The following actions can be requested by a lookup entry:

- Forwarding actions (see Section 7.8.5.3.5)
- Pruning action (see Section 7.8.5.3.7)
  - Prune the existing forwarding list to include only VSIs matching a VSI or VSI list (AND operation). This action can be applied to ingress traffic, egress traffic or both.

**Note:** The usage model is to allow a single VLAN entry to point to different lists for ingress and egress traffic.

— Prune the forwarding list not to include a VSI list (AND NOT operation).

- Statistic actions (see [Section 7.8.5.3.9](#))

If a large action is needed, the single action can be replaced with a pointer to a list of actions described below.

**Note:** All actions are additive, apart from forwarding actions to a VSI or a queue, which are defined by priorities.

The format of the single action is described in [Table 7-12](#).

**Table 7-12. Single Actions Format**

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	
00b (VSI Forwarding)	LB EN <sup>1</sup>	LAN EN <sup>2</sup>	VSI/VSI_list											List	Reserved		Valid <sup>3</sup>	Drop <sup>4</sup>	
01b (To Queue)	LB EN	LAN EN	Q Index <sup>5</sup>											Q Region Size			Q_P RI <sup>6</sup>		
10b (Prune)	LB EN <sup>7</sup>	LAN EN	VSI_list											List = 1 <sup>8</sup>	Egr <sup>9</sup>	Ing <sup>10</sup>	PruneT <sup>11</sup>	0b	
10b (Pointer)	LB EN <sup>7</sup>	LAN EN <sup>12</sup>	Pointer to a large action. Points to the first action in the large action in the 8K range.														hasFWD <sup>13</sup>	1b	
11b (Other Actions)	Reserved		Mirror VSI											Reserved		00b (Mirror)			
	Reserved																	10b/11b (Reserved)	
	Reserved		Statistics Counter Index											Reserved		11b (Stat Count)			

1. Allows packet to be looped back.
2. Might prevent packet from being sent to the network.
3. The *Valid* bit should be set by the software device driver in all forwarding actions. Adding an entry with *Valid* = 0 is allowed if *allow\_pass\_L2* is set in the recipe, and only a hit in the table is needed with no real action.
4. If *Drop* is set, *VSI/VSI\_list* is ignored.
5. The queue index is an absolute queue number in the 0-2K range and should be used as such in the lookup programming commands.
6. Defines queue priority.
7. *LB EN* should not be set for prune actions or for large actions not including a forwarding action.
8. Must be set. Direct pruning is only available according to a VSI list.
9. Apply pruning to egress traffic (traffic received by VSIs).
10. Apply pruning to ingress traffic (traffic sent by a VSI).
11. AND prune (0) or AND NOT prune (1).
12. *LAN EN* is relevant only if large action includes prune or forwarding actions.
13. Should be set if the large action includes a forwarding command.

### 7.8.5.3.2 Large Actions

To allow multiple actions to be activated from a single lookup, on top of the 32K per lookup actions, a table with 8K entries is provided. Each entry represents a single action, and up to four actions can be chained into an action list. If the original action points to one of these action lists, all the combined actions are applied.

These 8K are divided to three programmable sections:

- A section of single actions (to allow usage of new actions not available directly).
- A section of two actions lists.

- A section of four actions lists.

Each lookup can point to any section depending of the number of requested action. The size of each section is programmable from NVM or from software device driver at init time (before any extended action is programmed) via the following registers:

**Table 7-13. Large Actions Table Allocation**

Table Part	Register	Note
Single Action	GL_SWT_LAT_SINGLE.BASE[10:0]	Encoded as base/4
	GL_SWT_LAT_SINGLE.SIZE[10:0]	Encoded as size/4
Double Actions	GL_SWT_LAT_DOUBLE.BASE[10:0]	Encoded as base/4
	GL_SWT_LAT_DOUBLE.SIZE[10:0]	Encoded as size/4
Quad Actions	GL_SWT_LAT_QUAD.BASE[10:0]	Encoded as base/4
	GL_SWT_LAT_QUAD.SIZE[10:0]	Encoded as size/4

The allocation is common to all ports.

**Note:** As there is a single such table, usage of large actions might degrade performance, if applicable for a large part of the traffic and used multiple times on the same packet.

Any of the actions included in the list can implement one of the actions defined above. In addition, the following actions are available only as part of large actions:

- Generic Action to update metadata (see [Section 7.8.5.3.8](#)).
- Increase counter — Used to support event counters.

The format of each action in an action list is described in [Table 7-14](#).

**Table 7-14. Large Actions Entries**

0:2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19:21	22:24	
000b (VSI Forwarding)	VSI/VSI_list										List	Reserved	Valid <sup>1</sup>	Reserved					
001b (To Queue)	Q Index <sup>2</sup>										Q Region Size			QPRI <sup>3</sup>	Reserved				
010b (Pruning)	VSI_list										List = 1 <sup>4</sup>	Egr <sup>5</sup>	Ing <sup>6</sup>	Prune <sup>7</sup>	Reserved				
011b (Mirroring)	Mirror VSI										Reserved								
101b (Generic Action)	Generic Value															Generic Offset	Generic Priority		
110b	Spare																		
010b (Statistics)	Statistics Counter Index										Reserved								

1. The *Valid* bit should be set by the software device driver in any forwarding action.
2. Queue index is the absolute queue number (0-2047) and should be used as such in the lookup programming commands.
3. Defines queue priority.
4. Must be set. Direct pruning is only available according to a VSI list.
5. Apply pruning to egress traffic.
6. Apply pruning to ingress traffic.
7. AND prune or AND NOT prune.

### 7.8.5.3.3 Default Actions

Each entry in the recipe table associated with an RID (isroot = 1) can define a default action to take if a lookup was done but no match was found. For example a VLAN lookup default action might be to prune all VSIs that are doing VLAN filtering (not in ignore VLAN mode). For a MAC lookup, the default action might be null. The default action layout is described as part of the recipe in [Table 7-9](#).

### 7.8.5.3.4 Valid = 0 Action

A recipe can use as sub-entries other root entries. In this case, the entry can match as part of the large lookup, but not induce a match of an actual filter. For example, a MAC/VLAN filter can use a MAC filter as a sub-recipe, but a match of the MAC should not be considered as an action. To indicate this, the hardware sets, for root entries added only as part of another recipe with a *Valid* = 0 bit. This entry is ignored as part of the rules resolution. The only exception is for recipes for which the *allow\_pass\_L2* is set. In this case, an action with *Valid* = 0 is considered as a match.

**Caution:** If it is important to differentiate between an entry added as a part of a larger lookup and an entry added to allow L2 filtering. The recipe used with *allow\_pass\_L2* set should not be used as part of other recipes.

### 7.8.5.3.5 Forwarding Actions

The following forwarding actions are available:

- **Forward to a VSI** — Using VSI forwarding action with *LIST* bit cleared.
- **Forward to a list of VSIs** — Using VSI forwarding action with *LIST* bit set.
- **Forward to a queue group within a VSI** — Using ToQueue action with non zero Qregion. The region base equals "Queue Index" and the region size equals  $2^{(Qregion)}$ . The priority used is defined by the *Q\_PRI* bit.
- **Forward to a queue within a VSI** — Using ToQueue action with zero Qregion.

**Note:** The forwarding actions to a queue do not include the VSI as part of the command and uses the absolute queue. The forwarding action to a queue group uses the absolute queue number of the first queue in the queue group. The VSI number is extracted from the queue number using a queue to VSI table described in [Section 7.8.8.3](#).

- **Do not forward to the LAN** — Using the *LANEN* field. If *LANEN* bit is cleared in any of the matched lookup with a forwarding or pruning action, the packet is not sent to the LAN. This action is relevant only for transmit packets.

**Note:** This action is forced if *LANENABLE* field in the source VSI context is cleared. This means that if *LANENABLE* is cleared, the packet is not sent to the LAN independent of the programmed actions.

- **Allow loopback** — Using the *LBEN* field. If *LBEN* bit is set in any of the matched lookup with a forwarding action, the packet is loopback.

**Note:** This action is gated by the *ALLOWLOOPBACK* field in the source VSI context. This means that if *ALLOWLOOPBACK* is cleared, the packet is not sent to the loopback path independent of the programmed actions.

- **Drop packet**

See below for details on how multiple forwarding actions are applied.

The following table summarizes the impact of the *LANENABLE* and *LBEN* bits in the actions on transmit packets:

OR ( <i>LBEN</i> ) <sup>1</sup>	AND ( <i>LANENABLE</i> ) <sup>2</sup>	Result
0	0	Drop packet.
0	1	Send to loopback only.
1	0	Send to network only.
1	1	Send to both network and loopback.

1. OR of the *LBEN* bits in all matched actions that passes the priority process.
2. AND of the *LANENABLE* bits in all matched actions that passes the priority process.

### 7.8.5.3.5.1 Forwarding Actions Priorities

Each recipe contains two priority values used by forwarding actions:

- **Priority** — A number between 0-7 (represented in the recipe as a one hot bitmap).
- **Join Priority** — An 8-bit bitmap.

The following algorithm is used to define which forwarding actions are retained to create the ultimate forwarding action:

```

For all the matching recipes resulting in a "forwarding" and "to queue" actions {
    find maximum value of Priority --> max_priority
}
For all the matching recipes resulting in a "forwarding" and "to queue" actions {
    If (join_priority[max_priority] == 1) {
        // note that the bit of the max priority should be set in the join priority vector
        Add VSI/VSI list/Queue to resulting VSI list
    }
}

```

### 7.8.5.3.6 Event-Based Mirroring Action

This action allows event-based mirroring of the traffic for which the action is enabled to a mirror VSI. Event based mirroring is independent of the forwarding priorities and the mirror VSI is always added even if the packet is dropped.

Event mirroring action can cause a loopback, even if loopback is not enabled for the ingress VSI.

Port-based mirroring is also available and is described in [Section 7.8.5.4.1](#).

**Note:** The mirror VSI should be used only to receive mirror traffic (either event-based or port-based).

### 7.8.5.3.7 Prune Action

The prune action acts on the VSI list created by the forwarding action. It can either:

- Remove VSI listed in a VSI list from the forwarding list (AND NOT prune - PruneT = 1)
- Remove VSI not listed in a VSI list from the forwarding list (AND prune - PruneT = 0)

Each pruning action is enabled for Rx/loopback or Tx traffic using the Egress (Rx) pruning enables and Ingress (Tx) pruning enables fields in the Add VSI command. The enable index to use is set in the *Prune Index* field in the recipe pointing to this action.

This action is additive and not dependent on the priority of the recipe. Multiple prune actions can be applied.

In addition to these actions, there can be anti-spoofing rules and source pruning rules that also generate an implicit pruning. These rules are implemented in the default configuration using recipes with an inverse action bit set as described in [Section 7.8.5.1.1](#).

### 7.8.5.3.8 Generic Value Action

This action allows setting of metadata forwarded to the next stages of the pipe. The Generic Offset, Generic Value, and Generic Priority define the location, the content, and the priority of the data in the metadata bus.

The encoding of the generic offset is as follows:

**Table 7-15. Generic Offset Encoding**

Value	Field	Priority Field	Notes
0x0	genericMD_word_0	genericMD_word_0_prio	
0x1	genericMD_word_1	genericMD_word_1_prio	
0x2	genericMD_word_2	genericMD_word_2_prio	
0x3	genericMD_word_3	genericMD_word_3_prio	
0x4	genericMD_word_4	genericMD_word_4_prio	
0x5	flowID_word_0	flowID_prio	The priority is common to these two fields. If both are set through actions, the priority is taken from the flowID_word_0 action.
0x6	flowID_word_1		
0x7	RX_descr_structure_prof_idx	RX_descr_structure_prof_idx_prio	Only first six bits of the word are set.

### 7.8.5.3.9 Statistics Actions

Statistics gathering can be done at four different levels:

- At the switch ID level:
  - Per switch ID packets are counted that matched a switch ID, but were dropped.
  - If the switch ID is part of a VEB. There are 32 VEB statistic blocks. In this case, statistics are gathered at the VEB level and at the VEB/UP level.
- At the VSI level, if packet is forwarded to a VSI (egress) or sent by a VSI (ingress).
- At the port level if packet is forwarded to a port (egress) or received from a port (ingress).
- Gather event statistics (usually VEB/VLAN) in statistic block N out of 128 available blocks. These counters are activated using the “statistics” action.

**Note:** See [Section 7.8.6.1.1](#) for limitations on multiple event counting per packet.

Unless noted otherwise, dropped packets are not counted in the statistic counters.

### 7.8.5.3.9.1 Statistics Registers

The following registers are available for statistics gathered by the binary classifier:

- 256 per switch ID registers to count drops — GLSWID\_RUPP[255:0].
- 32 instances of VEB, VEB/UP statistics described in [Section 9.6.5.2](#).
- 128 instances of block statistics also described in [Section 9.6.5.2](#).

All these counters are accessible to all the PF drivers and are read only registers that wrap around after reaching their maximum value.

### 7.8.5.3.9.2 Association of VEB Statistic Block to a VEB

The following flow can be used to associate a VEB statistic block to a VEB.

1. When creating a VEB, decide if a counter is needed.
2. If yes, allocate a VEB counter by using the Allocate Resources (0x0208) command with a resource type of VEB statistic counter (0x0) and get a counter ID.
3. For each VSI added/updated to this VEB, in the Add VSI command (0x0210) set *VEB\_CNT\_VAL* = 1 and *VEB\_CNT\_ID* to the associated counter ID.

### 7.8.5.3.10 VSI Bitmaps

Three types of actions can point to list of VSIs:

- Forward to a list of VSIs
- Prune (AND)
- Prune (AND NOT)

The E810 provides two set of 1024 per-VSI bitmaps that allows setting all the VSIs that are to be included in the action. The first set can be pointed by forwarding actions. The second set can be pointed by the two types of pruning actions.

The 1024 VSI bitmaps used for pruning actions are divided to four banks of 256 entries each. To achieve the nominal performance, pruning actions applied to a single packet should be divided between the four banks, so that in each bank there are up to two pruning lists.

## 7.8.5.4 Post Processing Actions

In addition to the actions generated by the lookup table, a few actions are generated by dedicated logic:

- Transmit Packets received with a non-zero *SWTCH* field from a VSI where the *VSI\_SRCCTRL.ALLOWDESTOVERRIDE* bit is set in their descriptor are forwarded according to this flag:
  - If *SWTCH* = 01b, the packet is sent to the LAN.
  - If *SWTCH* = 10b, the LAN is removed from the list of destinations.
  - If *SWTCH* = 11b, the packet is sent to the VSI specified in the *TARGET\_VSI* field in the descriptor. In this case, the switch cannot set a specific queue destination within the VSI.

**Note:** If the `VSI_SRCCTRL.ALLOWDESTOVERRIDE` bit is not set, and a non-zero value is set, the packet is dropped. In this case, the `GL_OVERRIDEC.OVERRIDE_ATTEMPTC` field is increased, and the `GL_OVERRIDEC.LAST_VSI` field is set with the value of the source VSI.

If `SWTCH = 01b` or `11b`, the switch is bypassed and no action is applied to this packet (for example, event counters, generic actions, prune, MAC source pruning).

If `SWTCH` not equal zero, the ingress prune rules do not apply.

**Note:** When `SWTCH = 11b`, the switch does not check that the packet is sent to a VSI within the same PF. Use with care.

- **SWPE** — A packet received with this bit set, the packet is sent back to the source VSI.
- **Store Bad Packets** — If `PRT_SBPVSI.SBP` is set, packets received with MAC errors as defined in [Section 3.2.1.8](#) are forwarded to queue 0 of the VSI defined in the Bad Frames VSI (`PRT_SBPVSI.BAD_FRAMES_VSI`).
- **Default action for transmit packets** — A transmit packet is sent by default to the LAN, unless a “do not forward to LAN” action is set.

#### 7.8.5.4.1 Port-Based Mirroring

The E810 supports 64 port-based mirror rules that can be a combination of the following four types. These types are implemented using dedicated hardware and not through the regular actions:

- **Mirror ingress traffic from host** — Mirror packets sent from a specific VSI.
- **Mirror egress traffic to host** — Mirror packets sent to a specific VSI.
- **Mirror ingress traffic from LAN** — Mirror packets received from a specific LAN port. This includes packets with L2 errors.
- **Mirror egress traffic to LAN** — Mirror packets sent to a specific LAN port.

Each ingress or egress VSI/Port can be mirrored by one rule only.

Per mirror rule, a mirror VSI is defined that specifies where packets are mirrored. There is no support for mirroring to an external port.

To differentiate packets received according to the different rules, the matched rule is indicated in the Mirror Rule ID (MIRR) field in the receive descriptor.

In addition to these rules, specific traffic can be mirrored by assigning a mirror action to a specific lookup. In this case, the mirrored packet is not identified with a Mirror Rule ID (MIRR) in the receive descriptor. Event based mirroring is described in [Section 7.8.5.3.6](#).

**Note:** The mirror VSI should be used only to receive mirror traffic (either event-based or port-based).

Packets that are dropped by the switch can still be mirrored due to ingress mirror rules. In this case, the packet is counted as dropped in the `GLSWID_RUPP` counters and is not counted in the regular switch counters.

## 7.8.6 Egress Post Processing Actions

### 7.8.6.1 Actions Merging and Priorities

As described above, each recipe can provide one or more actions. Each recipe is associated with a priority and a join priority bitmap applied to forwarding actions only.

The following rules describe the resulting actions in decreasing order of priority:

- If drop action exists, drop packet.
- If any filter matched a non-default action (including a non-valid action) and has the Pass L2 filter in its recipe, the packet is assumed to pass L2 filter. If pass L2 filter is false, the subsequent forwarding actions merging step should take into account only actions not requiring L2 filtering. Otherwise, all actions are considered.
- Forwarding actions merging:
  - From all recipes with forwarding actions, devise the highest priority (H-P) available.
  - Find forwarding actions with H-P bit set in join priority bitmap in recipe and merge VSI destination list of all these actions. Following is an example of this algorithm:

Recipe	Priority	Join Priority	Forwarding Action
1	4	00010000	VSI_1
2	3	00011000	VSI_2
3	2	00011100	VSI_3
4	2	00011100	VSI_4
Result	H-P (4)		VSI_1, VSI_2, VSI_4

- If two of the selected actions points to the same VSI, but one of them defines a queue, the packet is sent to this queue.
- If no “allow loopback” action found and packet is Tx, remove from list all local VSIs.
- If “do not forward to LAN” action found and packet is Tx, remove “LAN” from list.
- If the manageability filters indicate the packet as exclusive to the BMC (MNGONLY), modify the list to include only the BMC VSI (including removal of forwarding to LAN for OS2BMC traffic).
- Pruning actions:
  - All pruning actions should be applied after the forwarding list is ready.
    - Note:** Currently there are two pruning actions applied on the list: Egress/Ingress VLAN (AND), and Source MAC Address (AND NOT). Additional actions (source VSI pruning) are applied per egress replica. See [Section 7.8.6.5](#) for details.
  - Add ingress mirroring rules.
    - Note:** Egress mirroring rules are applied at a later stage, when packets are replicated.
- Statistic actions are always applied if they exist.

### 7.8.6.1.1 Actions Limitations

For a single packet lookup the following limitations applies:

- At most, 16 actions can be generated. The combined VSI forwarding actions counts as a single action.
- Per egress VSI, a single destination Queue can be specified. If more than one is specified, the result is unexpected.
- For a all replications, up to two destination queues for different VSIs can be specified. If there are more than two actions defining a queue, then the first two “to queue” actions from the recipes with the highest RIDs are retained, and all other are translated to simple VSI forwarding actions.
- Per profile, up to 32 lookup lines can be selected and 24 of them can be recipe roots.
- If more than one hit action points to the same counter for the same packet, it is counted only once. The counter with the higher recipe index is counted. If the same wide action has several statistic actions, the last action is chosen.

### 7.8.6.2 Bypassing Actions

The following flags in metadata result in a bypass of the actions described above:

- If the *Switch\_directives*[1:0] field (from descriptor) is set to 01b (to LAN), Tx packet is sent to LAN only (not relevant for receive packets).
- If the *Switch\_directives*[1:0] field (from descriptor) is set to 11b (specific VSI), Tx packet is sent to the VSI set in the *target\_vsi* only (not relevant for packets received from LAN).
- If *SWPE* bit is set, the packet is sent back to the source VSI.
- If *I2\_mac\_err* bit is set and pass bad frame is allowed for the receive port (*PRT\_SBPVSI.SBP*), the packet is sent to Bad Frames VSI (*PRT\_SBPVSI.BAD\_FRAMES\_VSI*).
- If *pkt\_is\_marker* bit is set, no action is taken.
- If *hit\_mirror* bit is set, the packet is looped back only for mirroring, so other lookups should not be applied.
- If *target\_vsi\_is\_mng* bit is set, the packet is looped back only for forwarding to manageability through MDEF filters, so other lookups should not be applied.
- If storm control is active, and packet should be dropped (broadcast/multicast), apply storm control actions and drop the packet. See [Section 7.8.6.3](#) for details.

### 7.8.6.3 Storm Control

As there is no separate path for multicast and broadcast packets, too many replicated packets might cause congestions in the data path. To avoid such scenarios, broadcast and multicast storm control rate limiters are added. The rate controllers define windows and the maximal allowed number of multicast or broadcast bytes/packets per window. Once the threshold is crossed, different types of policies can be applied.

### 7.8.6.3.1 Storm Control Functionality

**Note:** Most of the parameters in this section refer to the Set Storm Control Configuration admin command described in [Section 7.8.12.4.1](#).

The time interval over which Broadcast Storm Control is performed is controlled by three factors:

- PRT\_SWT\_SCBI register (loaded from NVM)
- Port speed
- INTERVAL value (see [Section 7.8.12.4.1](#))

The first two factors determine the Unit time interval as described in [Table 7-16](#). The interval is automatically chosen internal to hardware based on port speed. The third factor (*Interval* field) determines how many of such unit intervals are considered for one Storm Control Interval (SCI).

**Table 7-16. Storm Control Basic Interval by Speed**

Port Speed	MIN Time Arrival	MAX Time Arrival	Default Time Interval (1 Mbit)
100 Gb/s	1 $\mu$ s	1 ms	10 $\mu$ s
50 Gb/s	2 $\mu$ s	2 ms	20 $\mu$ s
25 Gb/s	4 $\mu$ s	4 ms	40 $\mu$ s
10 Gb/s	10 $\mu$ s	10 ms	100 $\mu$ s
1 Gb/s	100 $\mu$ s	100 ms	1 ms
100 Mb/s	1 ms	1 second	10 ms

The number of 64-byte chunk of broadcast or multicast packets that are allowed in a given SCI is determined by the Set Storm Control admin command.

In each SCI, the E810 counts the number of relevant 64-byte chunks received. The count is done per-port and separately for broadcast and multicast packets. This includes packets received from the network and loopback packets sent by local VSI. Once one of the counters crosses the threshold defined in the admin command, a storm event is detected.

**Note:** Every time a threshold is updated, the relevant counter is zeroed.

The E810 supports two modes of reactions to storm events:

- Block all multicast or broadcast packets from the moment the threshold is crossed until the end of the interval. The block is removed at the end of the interval until the threshold is crossed again. This mode is set by setting the *MDICW* (for multicast) and *BDICW* (for broadcasts) bits in the PRT\_SWT\_SCCRL register. This mode is used as a rate limiter.
- Block all multicast or broadcast packets from the moment the threshold is crossed until a full interval without threshold crossing is registered. This mode is set by asserting *MDICW* and *MDIPW* (for multicast) and *BDICW* and *BDIPW* (for broadcasts) bits in the PRT\_SWT\_SCCRL register. This mode is used for storm blocking.

Any change in the storm control state (block or pass of multicast or broadcast packets) is indicated to the PF associated with this port via the PFINT\_OICR.*STORM\_DETECT* interrupt cause. The current state is reflected in the PRT\_SCSTS register.

The number of dropped packets due to storm control events is reflected in the GLPRT\_STDC[7..0] registers.

### 7.8.6.3.2 Storm Control Programming

The following admin commands described are used to program the storm control elements:

- Set Storm Control Configuration (see [Section 7.8.12.4.1](#))
- Get Storm Control Configuration (see [Section 7.8.12.4.2](#))

### 7.8.6.4 Packets Replication

If the combination of actions yields a list of destination VSIs, the packet is replicated to each VSI.

The replicated packets cannot be sent contiguously. If traffic from other traffic classes exists, each copy of the packet is sent when the round-robin arbiter reaches the traffic class queue. See [Section 8.2.1](#) for a full description of the receive path QoS scheme.

### 7.8.6.5 Post-Replication Actions

- **Egress Mirroring** — If an egress mirror rule applies to the destination VSI, the mirroring port should be added to the destination list of the packet. Egress mirroring is programmed through the `VSI_SWT_MIREG` CSRs (see [Section 7.8.5.4.1](#) for details).

**Note:** A packet can be replicated multiple times to the same VSI if additional replications are added as part of port based mirroring actions, or if the VSI is modified in subsequent blocks in the pipe.

- **Source Pruning** — If the destination VSI of this replica is the same as the source VSI, and `VSI_RXSWCTRL.MACVSIPRUNEENABLE` is set for this VSI, this replica is dropped.

## 7.8.7 Manageability Filtering

The manageability filters are described in [Section 12.4](#).

The manageability sub-block has its own field extractor.

The manageability traffic is directed to one of eight MDEF sets according to the port or virtual port number.

The `GL_SWT_PRT2MDEF` registers define the mapping from port to MDEF set. The selection between port and virtual port is done according to `GL_SWT_SWIDFVIDX.PORT_TYPE` field.

The field extractor for all the profiles is pre-programmed from NVM and should include extraction of the following fields which are part of the input set needed for manageability filtering:

- Destination MAC Address
- Destination IP Address (including ARP target IP)
- Destination and Source TCP/UDP port
- EtherType
- ICMP (or IP protocol)
- ICMPv6 types
  - 0x86 (134d) — Router Advertisement.
  - 0x87 (135d) — Neighbor Solicitation.

- 0x88 (136d) — Neighbor Advertisement.
- 0x89 (137d) — Redirect.

- Flex filter match (in metadata)

The result of the manageability filters is a forwarding decision for the traffic of the BMC. The used VSI is defined in the per decision filter, per MDEF set PRT\_MNG\_MDEFVSI registers. In case of multiple matches, the VSI assigned to the MDEF with the highest index is used.

### 7.8.7.1 Manageability Configuration

The field vector used for manageability filtering is described in [Table 7-17](#) and is configured using the regular field extractor logic programming flow.

**Table 7-17. Default Field Vector for Manageability Filtering**

Filter	Words	Notes
Destination MAC Address	0-2	Single/outer
Outer VLAN	3	2nd in case of double VLAN
EtherType	4	Outer
ARP	5	Operation field
	6-7	TPA
Neighbor Discovery and MLD	8	Type field of ICMPv6
RMCP/Flexible Port - Dest	9	TCP destination port
	10	UDP destination port
ICMP	11	Protocol field of single/outer IPv4
IP Address	12-13	Single/outer IPv4
	14-21	Single/outer IPv6
Flexible - SRC	22	TCP Source port
	23	UDP Source Port
Non Valid Packets — If any of these word's valid bit is set, the packet is not a candidate for MDEF lookup. Currently includes outer IPv4 and IPv6.	24	Inner IPv4 - LSB
	25	Inner IPv6 - LSB
	26-31	Reserved

In addition, a set of masks is applied to the 64-bit flag bus to define if a packet is candidate to the MDEF filters. These masks filters packets like GRE or MPLS, which are not relevant for manageability traffic.

### 7.8.8 Virtual Station Interfaces

Virtual Station Interfaces (VSIs) are the connections from the switch to entities interfacing with the host. It can be either the entire queue set of a PCIe function, or part of the queues of a function.

There can be up to 768 VSIs in the E810. All the VSIs are equivalent.

At init time, each physical function is assigned a VSI.

Other VSIs can be assigned to the physical function or to Virtual functions and can be used for the following purposes:

- VMDq2
- VMDq1
- Control ports
- iWARP traffic
- Mirroring

In addition, EMP VSIs can also be defined. The EMP VSIs are used for:

- Pass-through traffic
- Control ports

Each VSI has an Egress and Ingress context as described in [Section 7.8.8.1](#) and [Section 7.8.8.2](#), respectively. In addition, a queue context mapping queues to VSIs is also available.

**Note:** Additional VSI contexts are part of the ACL and Filtering blocks.

### 7.8.8.1 Egress VSI Context

A per-VSI table containing the context of the VSI with the following parameters looked up with the destination VSI (`VSI_RXSWCTRL` and `VSI_VSI2F` registers):

- `VSI_VSI2F.VFVMNUMBER`, `VSI_VSI2F.PFNUMBER`, `VSI_VSI2F.FUNCTIONTYPE` — PF/VF to which the VSI belongs.
- `VSI_VSI2F.BUFFERNUMBER` — The buffer in the manageability block to which traffic is sent if `FUNCTIONTYPE = EMP`.
- `VSI_RXSWCTRL.MACVSIPRUNEENABLE` — Defines if the VSI can receive packets with its own MAC Address. If set, such packets are dropped. Enabling recipes where the *inverse\_action* is set for Rx packets.
- `VSI_RXSWCTRL.SRCPRUNEENABLE` — Defines if a VSI can receive packets it sent.
- `VSI_RXSWCTRL.PRUNEENABLE[3:0]` — Enables prune actions for Rx traffic. According to the *prune\_index* in recipe
- `VSI_VSI2F.VSI_ENABLE` - VSI Enable.

### 7.8.8.2 Ingress VSI Context

A per-VSI table containing the context of the VSI with the following parameters looked up with the source VSI (`VSI_SRCSWCTRL` registers):

- `ALLOWDESTOVERRIDE` — Defines if a source VSI is allowed to bypass the switch using the *SWTCH* flag in Tx-Descriptor.
- `ALLOWLOOPBACK` — Defines if packets sent from a VSI can be looped back.
- `LANENABLE` — Defines if packets sent from a VSI can be sent to the LAN.
- `PRUNEENABLE[3:0]` — Enables prune actions for Tx traffic. According to the *prune\_index* in recipe.
- `MACAS` — Allows MAC anti-spoof for this VSI. Enabling recipes where the *inverse\_action* is set for Tx packets. If set, a packet is sent only if at least one recipe with inverse action provides an indication of a matching VSI to the source VSI.

### 7.8.8.3 Queue Context

A 2K-entries table mapping absolute queue numbers to VSIs and relative queue numbers.

All tables are filled by the Add VSI command.

### 7.8.9 Classifier Performance

The classifier is able to classify up to 171 Mpps Rx/Tx packets assuming up to 10 lookups per packet. The classification includes a forwarding decision and two ingress pruning decisions. Other actions, like statistics or storm control, should not impact the performance of the classifier. Replication or mirroring of a packet causes a reduction of the number of packets handled per second.

The classifier supports up to 500 VM configurations per second (includes VSI and filters configurations) in run time, and up to 5000 filter configurations at init time, to allow bring-up of a complex topology in a short time. This assumes bundling multiple filters configurations within a single Add Switch Rules command (Section 7.8.12.6.1).

There is no requirement on the profile configuration performance.

### 7.8.10 Resource Allocation

The following resources, including Switch, Flow Director, RSS, and per-pipe stage profile configuration resources, are managed by the firmware:

**Table 7-18. Resource Types**

Resource ID	Resource Type	Allocation Type	Notes	Pre-Allocatable in NVM
0x0	VEB Statistic Counter	Specific entries	Up to 32 VEB counter blocks.	
0x1	Event Statistic Counter	Specific entries	Up to 128 events (for example, VEB/VLAN) counter blocks.	
0x2	Mirror rule	Specific entries	Up to 64 mirror rules.	
0x3	VSI List - Replication	Specific entries	Up to 1K lists.	
0x4	VSI List - Prune	Specific entries	Up to 1K lists	
0x5	Recipe	Specific entries	Up to 64 recipes. At init time, all recipes are shared. The default recipes are shared and available for all the functions. If a global package is loaded, all the recipes are replaced by the recipes of the package, and are shared and available for all the functions.	
0x6	Switch Profiles	Specific entries	Up to 256 profiles.	
0x7	SWID	Specific entries	Up to 256 switch IDs.	
0x8	VSI	Specific entries	Up to 768 VSIs.	Yes
0x9	FLU Entry	Quantity only	Up to 32K FLU entries. The allocation and de-allocation assumes each filter uses new entries, so the actual usage can be lower than what is reflected by this command.	Yes

**Table 7-18. Resource Types [continued]**

Resource ID	Resource Type	Allocation Type	Notes	Pre-Allocatable in NVM
0xA	Wide Table 1	Specific entries	Total 8K wide actions. See <a href="#">Table 7-13</a> for the distribution.	
0xB	Wide Table 2	Specific entries		
0xC	Wide Table 4	Specific entries		
0xD-0x1F	Reserved for future switch resources	N/A		
0x20	Global RSS Hash	Specific entries	Up to 16 RSS hash tables.	
0x21	Flow Director Counter Block	Specific 256 counters blocks	One of 32 blocks (total 8K counters).	
0x22	Flow Director Guaranteed Entries (for software-based filters)	Quantity only	The total number of available Flow Director guaranteed entries is <code>GLQF_FD_SIZE.FD_GSIZE</code> . To increase this resource, use the Allocate Resources AQ command. To decrease this resource, use the Free Resources AQ command. Using the Get Allocated Resource Descriptors AQ command for this resource is not relevant and returns an empty buffer.	
0x23	Flow Director Shared Entries (for ATR filters)	Quantity only	The total number of available Flow Director guaranteed entries is <code>GLQF_FD_SIZE.FD_BSIZE</code> , but there can be over-subscription between PFs. To increase this resource, use the Allocate Resources AQ command. To decrease this resource, use the Free Resources AQ command. Using the Get Allocated Resource Descriptors AQ command for this resource is not relevant and returns an empty buffer.	
0x24-0x2F	Reserved for future filtering resources	N/A		
0x30	Flexible Descriptors Programming	Specific entries	Up to 64. Shared by default. These resources are not cleared by PFR. <b>Note:</b> Resources #0, #1, and #7 are pre-allocated, and never allocated to a specific PF. See <a href="#">Section 7.6.4</a> .	
0x31-0x3F	Reserved for filter resources	N/A		
0x40-0x47	Reserved for Parser Profile Builder	N/A		
0x48	Switch Field Vector Table	Specific entries		
0x49	Switch Profile ID TCAM Entries	Specific entries		
0x4A-0x4F	Reserved for Switch Profile Builder	N/A		
0x50	ACL Field Vector Table	Specific entries		
0x51	ACL Profile ID TCAM Entries	Specific entries		
0x52-0x57	Reserved for ACL Profile Builder	N/A		
0x58	Flow Director Field Vector Table	Specific entries		
0x59	Flow Director ID TCAM Table Entries	Specific entries		

**Table 7-18. Resource Types [continued]**

Resource ID	Resource Type	Allocation Type	Notes	Pre-Allocatable in NVM
0x5A-0x5F	Reserved for Flow Director Profile Builder	N/A		
0x60	Hash Field Vector Table	Specific entries		
0x61	Hash Profile ID TCAM Entries	Specific entries		
0x62-0x67	Reserved for Hash Profile Builder	N/A		
0x68	Quad Hash Field Vector Table	Specific entries		
0x69	Quad Hash Profile ID TCAM Entries	Specific entries		
0x6A-0x6F	Reserved for Quad Hash Profile Builder			
0x70-0x7F	Reserved			

The following principles are defined to support these resources management:

- Every resource could be Persistent (unmanaged) or Dedicated (exclusive). Profile builder resources can be also Shared.
- Dedicated resource rules:
  - One resource / one owner.
  - Dedicated resource allocation/de-allocation (explicitly by the owning driver).
  - If a device driver attempts to reference/modify a dedicated resource owned by another function’s driver, it gets an error (shared resource could be referenced/modified by any device driver).
  - During PFR, firmware clears all the dedicated resources owned by the function.

**Note:** Profile Builder resources are defined as Dedicated using the Download Package AQ command. Their ownership is kept across a PFR. However, for Profile ID TCAM, the resource's hardware information is cleared during PFR.

- Persistent resources rules:
  - Not owned by any function driver.
  - Allocation/de-allocation (explicitly by any driver).
  - Any modification possible.
  - PFR has no impact. Cleared by CORER.

**Note:** Profile Builder resources can be deallocated only using the Download Package AQ command sequence.

- Shared resources rules (relevant only to Profile Builder resources):
  - Set ownership as “shared” is done using Download Package AQ command.
  - Can be owned by any function driver using Allocate Resource AQ command (and freed using the Free Resource AQ command).
  - Modification is possible using the Update Package AQ command.

— PFR clears PF usage of resource. For Profile ID TCAM, the resource's hardware information is cleared when no PF is using the resource.

- If the software device driver attempts to reference/modify unallocated resource, it gets an error.

The commands used to manage the resources are described in [Section 7.8.12.2](#).

Profile builder ownership is defined in [Table 7-205](#).

### 7.8.10.1 Shared Resources

The “shared resource” ownership type allows several PFs to own and manage the same resource. It is strictly defined for the use of Link Aggregation (LAG), where several PFs form a bonding group serve the same higher layer application.

[Table 7-19](#) details the behavior of each ownership type.

**Table 7-19. Behavior of Ownership Types**

	Ownership Type		
	Dedicated (Exclusive)	Shared	Persistent (Unmanaged)
<b>Description</b>	Single owner.	Multiple owners.	No ownership control.
<b>Applicable to Resources</b>	All	Lists, actions, and recipes.	All
<b>Allocate</b>	By single PF, which becomes an owner.	By multiple PFs. PF should explicitly allocate a resource to become one of the owners.	By any PF.
<b>Release</b>	By owner. Release returns resource to a free pool.	By any owner. When the last owner releases resource, it returns to a free pool	By any PF.
<b>Read/Write Access</b>	By owner.	By any owner.	By any PF.
<b>Change Ownership Type (Dedicated &lt;-&gt; Shared)</b>	By owner.	By any owner if it is currently the single owner	No
<b>Firmware Tracking</b>	Yes	Yes (tracks all owners).	No
<b>Firmware Cleanup</b>	On release, PFR, CORER.	On last release (no references), PFR - PF related settings only, CORER.	CORER

Only the following resources are allowed to be allocated as Shared ownership:

0x3	VSI list - Replication
0x4	VSI list - Prune
0xA	Wide table 1
0xB	Wide table 2
0xC	Wide table 3

Shared resources are managed by the same commands used for other resource types as described in [Section 7.8.12.2](#).

## 7.8.10.2 Initial Resource Allocations

Resources can be pre-allocated from NVM to a PF, or can be dynamically assigned using the commands in [Section 7.8.12.2](#). The allocation in NVM is done through the SR PF Allocations NVM section. This section allows for the allocation of up to two resources per PF, by setting the “PF allocations -Type” and “PF allocations -Value” words with {resource type, number of resources allocated} pairs.

Regardless, for each PF, a VSI and an FLU entry are allocated per function (PF or VF) associated with this PF. If a different allocation of VSI or FLU entries is specified in NVM, the maximum value between these two is taken to guarantee minimal allocation per PF/VF.

## 7.8.11 Binary Classifier Configuration

### 7.8.11.1 Overview

The configuration of the binary classifier can be done in three modes:

- Basic configuration loaded from NVM. This is a basic configuration that provides a basic L2 switching configuration. This configuration can never be removed.
- Public configurations loaded by driver that can be used by other drivers on the device. For example, a driver loading a set of filters to match the encapsulation used in the network (NVGRE, Geneve, and so on), that can be used by other drivers connected to the same network. Such a configuration can be removed only if no driver is registered to use it.
- A private configuration loaded by a driver and not exposed to other drivers. The driver is free to remove this type of configuration independently.

### 7.8.11.2 Parameters Summary

Table 7-20 summarize the parameters configurable in the switch and the way to configure them.

**Table 7-20. Configurable Parameters**

Parameter	Config Source	Mechanism	Rate	Section Reference
Profile Selection Parameters	NVM	CSRs	Once	<a href="#">7.8.11.3.1</a> through <a href="#">7.8.11.3.3</a>
Initial Recipes and Default Profile	NVM	CSRs	Once	
Initial Population (Basic L2 Filtering)	Firmware	See lookup population.	N/A	
New Control Domain - Add/Remove	Software via firmware	CSRs	500/s	
New Profile - Add/Remove	Software via firmware	CSRs	1000/s. Up to 5000/s combined population requests	
New Set of Recipe - Add/remove	Software via firmware	CSRs	1000/s	
(Dis)Association of Traffic to Profile	Software via firmware	CSRs	N/A	

**Table 7-20. Configurable Parameters [continued]**

Parameter	Config Source	Mechanism	Rate	Section Reference
Add/remove VSI	Software via firmware	CSRs		
Lookup Population	Software via firmware (using packet header) Each population request in a different AQ command.	Command FIFO (lookup and action). CSRs (VSI bitmaps and large actions).		
Lookup Removal	Software via firmware (using index)	Command FIFO (lookup and action) CSRs (VSI bitmaps and large actions)		
FLR/PFR, VFR	Firmware	Hardware iterators to get lookup. Lookup removal as above.		

### 7.8.11.3 NVM Loaded POR

#### 7.8.11.3.1 Default Profiles

Four profiles are defined from NVM:

- **Bypass profile (0x0)** — This profile is used for packets that are not impacted by the switch block.
- **Default profile (0x1)** — Includes all traffic not included in any other profiles.
- **Control Packets profile (0x2)** — Includes LLDP packets and flow control packets (PTYPES = 6, 278).
- **Hardware handled packets (0x3)** — This profile is used for packets for which there is no lookup and special hardware is used to implement the decision.

**Note:** All the flags that are part of the bypass and hardware handled profiles have dedicated hardware to handle them. The inclusion in these profiles is to save the need for regular recipe lookup.

#### 7.8.11.3.2 Default Field Vector

The default field vector is generated for the Default Profile (1) and Control Packets Profile (2), and contains the following data:

**Table 7-21. Default Field Vector**

Offset (Words)	Content	Notes
0	Switch ID	Mandatory in all extractions.
1	MAC DA 0	
2	MAC DA 1	
3	MAC DA 2	
4	MAC SA 0	
5	MAC SA 1	
6	MAC SA 2	
7	Outer VLAN	Not used by basic filters. Equals zero if not present.

**Table 7-21. Default Field Vector [continued]**

Offset (Words)	Content	Notes
8	VLAN	Equals zero if not present
9	EtherType	

For the Bypass Profile (0) and Hardware-Based Profile (3), the extracted vector is empty.

### 7.8.11.3.3 Default Recipes

The first 11 filters defined in [Table 7-10](#) are loaded from NVM.

### 7.8.11.4 Resets

The entire switch configuration is cleared and reloaded from NVM upon a CORER or higher reset.

At a PFR or FLR reset, all the entries populated by the PF, all the recipes and profiles private to this PF, and all the VSI context for VSIs allocated to this PF are cleared.

At a VFR or VMR, there is no modification of the switch configuration.

## 7.8.12 Software Programming Model

The programming of the different switching elements is done using admin commands. Commands to configure a switching element can be received only from the control port of the element.

### 7.8.12.1 Switch Configuration Admin Commands Summary

The set of commands is based on X710/XXV710/XL710 switch commands with adaptations to the new programming paradigm of the E810.

[Table 7-22](#) summarize the different commands used to configure the binary classifier.

**Table 7-22. Switch Configuration Admin Commands (0x02xx)**

Command	Opcode	Description	Section Reference
<b>Common Commands</b>			
The commands common to the entire receive control pipe are described in <a href="#">Section 7.11</a> .			
<b>Generic Commands/Resource Management (0x020x)</b>			
Get Switch Configuration	0x0200	Describe the networking structure of the port.	<a href="#">7.8.12.2.1</a>
Set Port Parameters	0x0203	Define the default parameters of a LAN port.	<a href="#">7.8.12.2.2</a>
Get Resource Allocation	0x0204	Get total resources allocated to the function and shared resources.	<a href="#">7.8.12.2.3</a>
Allocate Resources	0x0208	Allocate a set of resources to a PF/shared.	<a href="#">7.8.12.2.4</a>
Free Resources	0x0209	Free a set of resources.	<a href="#">7.8.12.2.5</a>
Get Allocated Resources Descriptors	0x020A	Return the IDs of a set of allocated resources.	<a href="#">7.8.12.2.6</a>
Change Resource Ownership Type	0x020B	Change resource ownership between "Dedicated" and "Shared".	<a href="#">7.8.12.2.7</a>

**Table 7-22. Switch Configuration Admin Commands (0x02xx) [continued]**

Command	Opcode	Description	Section Reference
Set VLAN Mode Parameters	0x020C	Configure the device-wide settings that must be changed to be compatible with the VLAN mode.	7.8.12.2.8
Get VLAN Mode Parameters	0x020D	Get the values of the specified device-wide settings.	7.8.12.2.9
Other commands in this section supported in previous products are obsolete in the E810.			
<b>VSI Commands (0x021x)</b>			
Add VSI	0x0210	Add a VSI to a switching element.	7.8.12.3.1
Update VSI	0x0211	Update the parameters of a VSI.	7.8.12.3.2
Get VSI Parameters	0x0212	Get the parameters of a VSI.	7.8.12.3.3
Free VSI	0x0213	Remove a VSI.	7.8.12.3.4
Set DMA PASID IDX Map	0x0214	Globally allocate HIF DMA agents to PASID Indexes	7.8.12.3.5
Get DMA PASID IDX Map	0x0215		7.8.12.3.6
<b>Port Virtualizer Control (0x022x)</b>			
All the commands in this section supported in previous products are obsolete in the E810.			
<b>VEB/Port Aggregator Control (0x023x)</b>			
While these commands are no longer supported in the E810, the functionality of the VEB configuration is replaced by the SWID configuration, also known as the Switch ID provided in the Get Switch Config and Add/Update VSI commands.			
<b>Switch Connectivity Configuration (0x024x)</b>			
All the commands in this section supported in previous products are obsolete in the E810.			
<b>Forwarding Table Configuration (0x025x)</b>			
All the commands in this section supported in previous products are obsolete in the E810.			
<b>Storm Control Commands (0x028x)</b>			
Set Storm Control Configuration	0x0280	Define the parameters for the Storm Control engine.	7.8.12.4.1
Get Storm Control Configuration	0x0281	Read the current Storm control configuration.	7.8.12.4.2
<b>Binary Classifier Configuration (0x029x)</b>			
See <a href="#">Section 7.11</a> for profiles configuration			
Add Recipe	0x0290	Add a new recipe.	7.8.12.5.1
Set Recipes-to-Profile Association	0x0291	Associate recipes to a profile.	7.8.12.5.2
Get Recipe	0x0292	Read a recipe's content.	7.8.12.5.3
Get Recipes-to-Profile Association	0x0293	Read recipes-to-profile association.	7.8.12.5.4
<b>Binary Classifier Population (0x02Ax)</b>			
Add Switch Rules	0x02A0	Add switch rules (RID, header of sample packet, metadata (source VSI)) --> assigned entry index.	7.8.12.6.1
Update Switch Rules	0x02A1	Update switch rules (entry index).	7.8.12.6.2
Remove Switch Rules	0x02A2	Remove switch rules (entry index).	7.8.12.6.3
Get Switch Rules	0x02A3	Get switch rules (entry index).	7.8.12.6.4
Clear PF Configuration	0x02A4	Clear all the filters/switch resources allocated to a PF.	7.8.12.6.5
<b>Mirroring Configuration (0x026x)</b>			
Add Mirror Rule	0x0260	Define a mirroring rule.	7.8.12.7.1
Delete Mirror Rule	0x0261	Remove a mirroring rule.	7.8.12.7.2

## 7.8.12.2 Generic Commands (0x020x)

### 7.8.12.2.1 Get Switch Configuration (0x0200)

After receiving this command, firmware returns a list of currently allocated and used resources (VSIs and SWIDs), so a topology tree could be built.

**Table 7-23. Get Switch Configuration Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0200	Command opcode.
Datalen	4-5	(2-2048)	Length of response buffer.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Command Flags	16-17		Reserved.
First Descriptor	18-19	0x0	If not zero, start the report from the requested descriptor.
Reserved	20-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Table 7-24. Get Switch Configuration Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0200	Command opcode.
Datalen	4-5		Length of response buffer.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Flags	16-17		Copy of request flags.
New Element	18-19		If not zero, indicates that not all the configuration was returned and a new command should be sent with this value in the <i>First Descriptor</i> field.
Number of Elements	20-21		Number of elements in response buffer.
Reserved	22-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Table 7-25. Get Switch Configuration Response Buffer**

Offset (Bytes)	Description
0 -5	Port/VSI Element 1 (see Table 7-26).
...	
6*(n-1):6*n-1	VSI Element #n.

**Table 7-26. Get Switch Configuration – Port/VSI Element**

Offset (Bytes)	Description
0-1	<b>Bits 9:0:</b> VSI number/Port Number <b>Bits 13:10:</b> Reserved <b>Bits 15:14:</b> 00b = Physical Port 01b = Virtual Port 10b = VSI 11b = BMSM Service Port
2-3	SWID VSI/port belongs to
4-5	<b>Bits 14:0:</b> PF/VF number, VSI belongs to. <b>Bit 15:</b> VF indication bit

### 7.8.12.2.2 Set Port Parameters (0x0203)

This command is used to define the default parameters of a physical port.

**Table 7-27. Set Port Parameters Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See Section 9.5.5.1.1 for details.
Opcode	2-3	0x0203	Command opcode.
Datalen	4-5	0x0	Length of buffer
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Command Flags	16-17	Bitfield	<b>Bit 0:</b> Save Bad Packets If set, packets with errors are forwarded to the bad frames VSI. <b>Bit 2:</b> Enable Double VLAN If set, this port expects double VLAN packets. <b>Note:</b> Calling this AQ with the <i>Enable Double VLAN</i> bit unset, puts the port into Single VLAN Mode. The TSR value for Single VLAN Mode is 0x80. All other bits are Reserved.
Bad Frames VSI	18-19		Defines the VSI to which bad frames are forwarded. <b>Bit 15:</b> Valid VSI - ignored in this field <b>Bits 14:10:</b> Reserved <b>Bits 9:0:</b> Number of the VSI <b>Note:</b> Relevant only if Command Flags.Save Bad Packets is set.
Port Switch ID	20-21		<b>Bit 15:</b> Valid Switch ID <b>Bits 14:8:</b> Reserved <b>Bits 7:0:</b> Switch ID <b>Note:</b> If a switch ID is already allocated to the port, it is replaced by the new one.

**Table 7-27. Set Port Parameters Command [continued]**

Name	Byte.Bit	Value	Remarks
Loopback Mode	22		<p><b>Bits 7:3:</b> Reserved</p> <p><b>Bit 2:</b> Valid Loopback Mode. If this bit set, then "loopback mode" configuration is valid</p> <p><b>Bits 1:0:</b> Loopback Mode</p> <p>00b = Normal Loopback — This port can have up to line rate (10/25) loopback bandwidth. This is the default value. If former state was different, firmware reconfigures pacer according to all port loopback mode.</p> <p>01b = No Loopback — This port is not allowed to do loopback traffic. Firmware resets VSI_SRCWCTRL.ALLOWLOOPBACK for all VSIs related to this port.</p> <p>10b = High Loopback — This port uses maximal possible loopback bandwidth. Firmware calculates the maximal possible bandwidth, according to all port loopback mode and configures GLTPB_PACING_25G and GLTPB_PORT_PACING_SPEED.</p> <p>11b = Reserved</p> <p>This field is relevant only in 10G configuration or 4x25 configuration. If hybrid mode (25G and 10G) is used, configuration change cannot be done and this command should be ignored.</p> <p>On PFR, loopback mode of the corresponding port resets to default value. Firmware also restores GLTPB_PACING_25G and GLTPB_PORT_PACING_SPEED and calculates again for all remaining ports, new maximal possible bandwidth, and reconfigures GLTPB_PACING_25G and GLTPB_PORT_PACING_SPEED for all remaining ports.</p>
	23-31	0x0	Reserved.

**Table 7-28. Set Port Parameters Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0203	Command opcode.
Datalen	4-5	0x0	Length of buffer
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. The following response might be returned by this command: ENOENT = Index is invalid for one of the chosen resources. EACCES = PF does not own one of the chosen resources.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Command Flags	16-17	Bitfield	
Bad Frames VSI	18-19		
Default Switch ID	20-21		Returns the Switch ID assigned to the port.
Reserved	22-31	0x0	Reserved.

### 7.8.12.2.3 Get Resource Allocation (0x0204)

This command returns the number of resources allocated to a function from each type of resource. For all the subsequent resource management commands, the encoding of the resource type is described in Table 7-18.

**Table 7-29. Get Resource Allocation Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See Section 9.5.5.2.1 for details.
Opcode	2-3	0x0204	Command opcode.
Datalen	4-5		Length of response buffer. Should be enough to store response.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Table 7-30. Get Resource Allocation Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See Section 9.5.5.2.2 for details.
Opcode	2-3	0x0204	Command opcode.
Datalen	4-5		Length of response buffer. Should be number of resource returned x resource entry size.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Entries	16-17		Number of entries in buffer.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Table 7-31. Get Resource Allocation Response Buffer Entry**

Offset (Bytes)	Description
0-1	<b>Bits 6:0:</b> Resource type - see above for encoding. <b>Bits 15:7:</b> Reserved
2-3	Total Capacity — Total number of resources from this type available to all functions (fixed according to hardware capabilities).
4-5	Allocated Function — Number of resources from this type allocated to this function (for most resources but hash based, this means actual entries are owned by the function).
6-7	Allocated Persistent — Number of resources from this type allocated as persistent.
8-9	Total Free — Total number of resources from this type still unallocated and not reserved by any function.
10-11	Allocated Shared — Total number of resources from this type allocated as shared by any PF.

### 7.8.12.2.4 Allocate Resource (0x0208)

**Table 7-32. Allocate Resource Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0208	Command opcode.
Datalen	4-5	(6-4096)	Length of command/response buffer.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Entries	16-17		Number of resource entries in buffer.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

In response, firmware fills buffer (See [Table 7-34](#)) with corresponding resource descriptors.

**Table 7-33. Allocate Resource Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0208	Command opcode.
Datalen	4-5	(6-4096)	Length of command/response buffer.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. Codes returned by firmware: OK = Success EINVAL = One of the requested parameters is invalid. ENOSPC = Allocation failed, all resources until the problematic resource (including) contain the number of resources currently available for allocation. EBUSY = Attempted to join a shared resource which is already owned by the PF.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Entries	16-17		Number of resource entries in buffer.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Table 7-34. Resource Description Table Entry**

Offset (Bytes)	Description
0-1	<p><b>Bits 6:0:</b> Resource type (see Table 7-18 for encoding)</p> <p><b>Bit 7:</b> Persistent 0b = Allocate Dedicated 1b = Allocate Persistent</p> <p><b>Note:</b> This bit is relevant only when Bit 14 is cleared.</p> <p><b>Bits 11:8:</b> VSI prune list hint A bitmap that provides a hint to the firmware from which of the four banks to allocate the VSI prune lists. VSI prune list hint is a suggestion for allocation in one of the list banks, starting from the lowest bank. If the suggestion is failed due to lack of resources than there will be a try to allocate in different bank.</p> <p><b>Bit 12:</b> If this bit is set, firmware scans from the bottom (last) entry (relevant only if Bit 13 is enabled, otherwise index is given in Bytes 2-3).</p> <p><b>Bit 13:</b> If this bit is set, the index values (Bytes 2-3) are be ignored in command and firmware returns in response new allocated indexes.</p> <p><b>Note:</b> Bits 12,13 are relevant only for Profile builder Resource Allocation and reserved otherwise.</p> <p><b>Bit 14:</b> Shared. 0b = Allocate according to Bit 7. 1b = Allocate Shared.</p> <p><b>Bit 15:</b> Resource descriptors valid. If this bit set, descriptors below belong to shared resources and firmware is asked to allocate them for initiator PF also.</p>
2-3	<p>Number of resource descriptors to allocate. Must not be zero or larger than max available number of this resource.</p> <p><b>Note:</b> For Profile Builder Resource Allocation, if Bit 13 in Bytes 0-1 is enabled, these bytes contain an indication of which index to begin the search if it is non-zero (it is assumed that index zero is the top of the list). For example, if the PF driver owned Profile ID TCAM entry X, it might want to start scanning for new elements at X, to ensure that the new entry was higher, that is, closer to the first entry in the table.</p>
4-...	<p>Placeholder for resource descriptors.</p> <p>Two bytes/descriptor, except FLU entries (0x9) and FD filters (0x22 and 0x23): Number of resource descriptors to allocate x 2. In case of ENOSPC, first descriptor contains number of resources currently available for allocation, and no resources within this request are allocated.</p> <p>Two bytes for FLU and FD filters: Ignored on success, number of resources currently available for allocation on ENOSPC.</p> <p>The resource descriptors returned are the indexes in the resource's table.</p> <p><b>Note:</b> When adding Profile Builder resources, firmware checks that the resource is defined as shared (inside downloaded package) and adds PF's usage of the shared resource.</p>

**Note:** Setting Bit 14 or Bit 15 with a resource type that is a non-shared type fails with status EINVAL.

Figure 7-18 describes the relationship between the different resources reported.

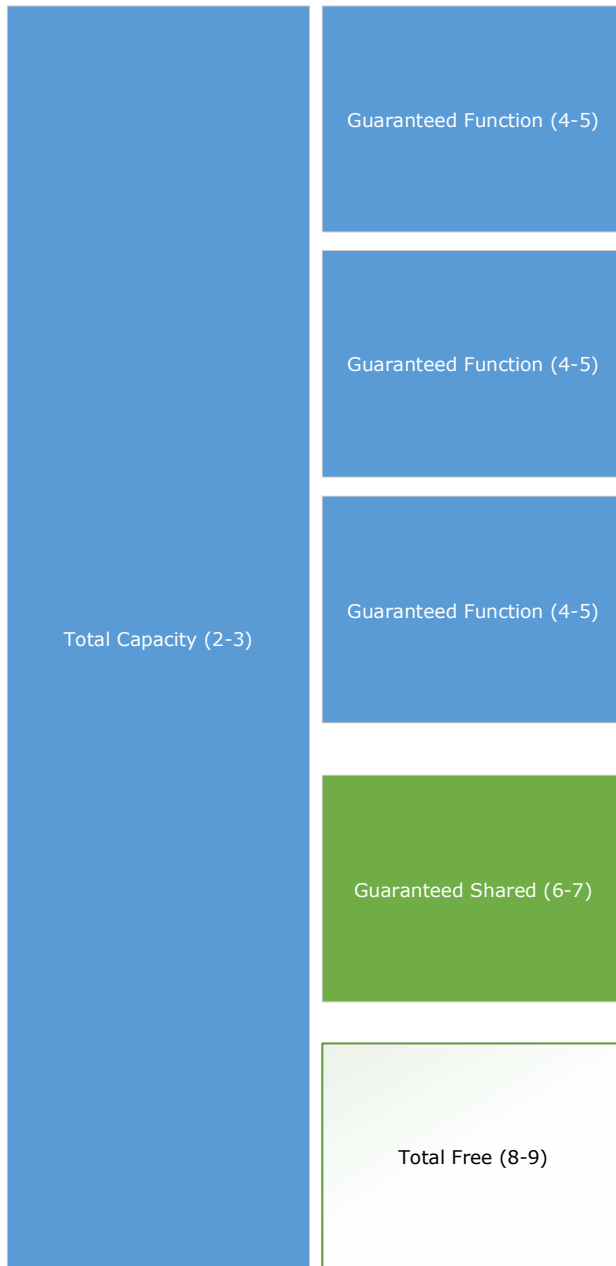

Figure 7-18. Resources Reported

### 7.8.12.2.5 Free Resource (0x0209)

**Table 7-35. Free Resource Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0209	Command opcode.
Datalen	4-5	(6-4096)	Length of command buffer.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Entries	16-17		Number of resource entries in buffer.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Note:** While there is more than a single owner to a shared resource, when software requests to free this resource, the firmware only decreases the reference count/clears PF ownership. Only when the last owner of a shared resource is freed, the does the firmware free the resource (as if it was a dedicated resource).

**Table 7-36. Free Resource Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0209	Command opcode.
Datalen	4-5	(6-4096)	Length of command buffer.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. Codes, returned by firmware: OK = Success EINVAL = Some resources could not be freed, details inside buffer. EBUSY = Trying to release a resource which is in use.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Entries	16-17		Number of resource entries in buffer.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Table 7-37. Free Resource Command Buffer Entry**

Offset (Bytes)	Description
0-1	<b>Bits 6:0:</b> Resource Type (see <a href="#">Table 7-18</a> for encoding) <b>Bits 15:7:</b> Reserved
2-3	Number of resource descriptors to free. Must not be zero or larger than number of this resource allocated to this function.
4-...	Resource descriptors. Two bytes/descriptor, except FLU. In case of EINVAL, every descriptor firmware failed to released is overwritten as follows: Bit 15 is set, the rest of the bits - extended firmware diagnostic codes (like access denied, resource still referenced, and so on). Two bytes for FLU. Ignored on success, number of resources, currently possible to free on EINVAL. The resource descriptors are the indexes in the resource's table. <b>Note:</b> When releasing Profile Builder resources, firmware checks that the resource is defined as shared (inside downloaded package) and removes PF's usage of the shared resource. When releasing Profile ID TCAM resources, firmware clears the resource data inside hardware tables in case no PF uses the resource.

### 7.8.12.2.6 Get Allocated Resource Descriptors (0x020A)

This command is used to get the list of the actual resources allocated to the PF of a given resource type. This command is N/A for FD filters (0x22 and 0x23) resource types. If used for these resources, an empty buffer is returned. For FLU entries (0x9), only root lookup entries actually used are returned. For shared resources (Ownership Type 10b), firmware returns all shared resource descriptors allocated by any PF.

**Table 7-38. Get Allocated Resource Descriptors Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x020A	Command opcode.
Datalen	4-5	(2-2048)	Length of response buffer.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Resource	16-17		<b>Bits 6:0:</b> Resource Type See <a href="#">Table 7-18</a> for encoding. <b>Bits 8:7:</b> Ownership Type 00b = Get Dedicated. 01b = Get Persistent. 10b = Get Shared. <b>Bits 15:9:</b> Reserved
First Descriptor	18-19		If not zero, start the report from the requested descriptor.
Reserved	20-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Table 7-39. Get Allocated Resource Descriptors Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x020A	Command opcode.
Datalen	4-5		Length of response buffer.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. EINVAL = One of the requested parameters is invalid.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Resource	16-17		<b>Bits 6:0:</b> Resource Type See <a href="#">Table 7-18</a> for encoding. <b>Bits 8:7:</b> Ownership Type 00b = Get Dedicated. 01b = Get Persistent. 10b = Get Shared. <b>Bits 15:9:</b> Reserved
Next Descriptor	18-19		If not zero, indicates that not all the configuration was returned and a new command should be sent with this value in the <i>First Descriptor</i> field.
Number of Descriptors	20-21		Number of descriptors in buffer.
Reserved	20-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Table 7-40. Get Allocated Resources Response Buffer**

Offset (Bytes)	Description
0-...	Resource descriptors. Two bytes/descriptor. The resource descriptors returned are the indexes in the resource's table.

**Note:** If *Resource Type* is a non-shared type and *Ownership Type* is Shared, the firmware fails the command with status EINVAL.

### 7.8.12.2.7 Change Resource Ownership Type (0x020B)

This command is used to change resource Ownership Type. Applicable to resources of types “Shared” and “Dedicated” only.

Changing the type from Dedicated to Shared must be done together with the reservation of extra resource from the shared resource pool. If the shared resource pool is empty, the command is rejected with the error code ENOSPC.

Transition from type Dedicated to Shared and vice-versa is possible only if the PF is currently the single owner of the resource.

**Table 7-41. Change Resource Ownership Type Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x020B	Command opcode.
Datalen	4-5	(2-2048)	Length of response buffer.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware. EINVAL = One of the requested parameters is invalid. ENOSPC = Shared resource pool is empty/
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Entries	16-17		Number of resource entries in the buffer.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Table 7-42. Change Resource Ownership Type Command Buffer Entry**

Offset (Bytes)	Description
0-1	<b>Bits 6:0:</b> Resource Type (see <a href="#">Table 7-18</a> for encoding) <b>Bits 8:7:</b> Ownership Type 00b = Dedicated 10b = Shared <b>Bits 15:9:</b> Reserved
2-3	Number of resource descriptors to allocate. Must not be zero or larger than max available number of this resource.
4-...	Resource descriptors. Two bytes/descriptor.

**Note:** If *Resource Type* is a non-shared type and *Ownership Type* is Shared, the firmware fails the command with status EINVAL.

**Note:** Attempting to change an already dedicated resource to “Dedicated”, or changing an already shared resource to “Shared” fails with error code EINVAL.

### 7.8.12.2.8 Set VLAN Mode Parameters (0x020C)

This command is used to configure the device-wide settings that must be changed to be compatible with the VLAN mode.

**Table 7-43. Set VLAN Mode Parameters Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x020C	Command opcode.
Datalen	4-5		Length of response buffer.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Resource	16-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

[Table 7-44](#) describes the structure of the command buffer for the Set VLAN Mode Parameters command.

**Table 7-44. Set VLAN Mode Parameters Command Buffer Entry**

Name	Bytes.Bits	Value	Remarks
Reserved	0	Reserved.	
L2TAG Priority only Tagging	1.0-1.2	000b = Priority-only tagging NOT supported on any of the four Layer 2 tags. 001b = Priority-only tagging supported on STAG (0x88A8). 010b = Priority-only tagging supported on outer CTAG (0x8100). 011b = Priority-only tagging supported on outer VLAN (0x9100). 100b = Priority-only tagging supported on inner CTAG (0x8100). All other values are reserved.	Defines the Layer 2 tag for which priority-only tagging is configured. Only values between 000b and 100b are accepted. If the input value is not within the specified range, firmware returns EINVAL (14) and does not configure the device. The original NVM default configuration sets priority-only tagging on the inner 0x8100 VLAN. This is value 100b.
Reserved	1.3-1.7	Reserved.	
Reserved	2-65	Reserved.	
RDMA Packet Flag 1	66.0-66.5		Defines the packet flag RDMA uses to identify if a VLAN is present in the packet.
Reserved	66.6-66.7	Reserved.	
Reserved	67-68	Reserved.	
MNG VLAN Protocol ID	69		Defines the VLAN Protocol ID to be included in the extraction sequence of the manageability field vector. The specified VLAN Protocol ID is as follows: 0x10 - For the outer VLAN. 0x11 - For the inner VLAN. All other input values shall be rejected.
Reserved	70-99	Reserved.	

**Table 7-45. Set VLAN Mode Parameters Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x020C	Command opcode.
Datalen	4-5	0x0	No return buffer.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Resource	16-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

### 7.8.12.2.9 Get VLAN Mode Parameters (0x020D)

This command is used to get the values of the specified device-wide settings.

**Table 7-46. Get VLAN Mode Parameters Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x020D	Command opcode.
Datalen	4-5		Length of response buffer.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Resource	16-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address

Data Address Low	28-31	Buffer Address	

**Table 7-48. Get VLAN Mode Parameters Response Buffer**

Name	Bytes.Bits	Value	Remarks
VLAN Mode	0.0		<p>This field indicates if any of the physical ports on the device are configured in double VLAN mode.</p> <p>0b = Indicates that none of the physical ports on the device are configured in double VLAN mode.</p> <p>1b = Indicates that at least one physical port on the device is configured in double VLAN mode.</p>
Reserved	0.1-0.7	Reserved.	
L2TAG Priority only Tagging	1.0-1.2		<p>This field specifies which Layer 2 tag priority-only tagging is configured for, based on the following values:</p> <p>000b = Priority-only tagging NOT supported on any of the four layer 2 tags.</p> <p>001b = Priority-only tagging configured on STAG (0x88A8).</p> <p>010b = Priority-only tagging configured on outer CTAG (0x8100).</p> <p>011b = Priority-only tagging configured on outer VLAN (0x9100).</p> <p>100b = Priority-only tagging configured on inner CTAG (0x8100).</p> <p><b>Note:</b> If priority-only tagging is configured for more than one Layer 2 tag, an error value of 111b is returned.</p>
Reserved	1.3-1.7	Reserved.	
Reserved	2-99	Reserved.	

### 7.8.12.3 VSI Commands (0x021x)

#### 7.8.12.3.1 Add VSI (0x0210)

This command is used to add a new VSI.

When an Add VSI command is received, the internal firmware checks if all the requested resources are available and allocate them to the VSI.

Table 7-49 describes the structure of the command buffer for the Add VSI command.

**Table 7-49. Add VSI Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0210	Command opcode.
Datalen	4-5	0x80	Length of buffer.
Return Value/VFID	6-7	0x0	Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
VSI	16-17	0x0	<b>Bit 17.7:</b> VSI is valid <b>Bits 17.6-17.2:</b> Reserved <b>Bits 17.1-16.7:</b> VSI Number If VSI is valid, the VSI should be from resources allocated to this PF. Otherwise, a free VSI is allocated from the shared pool.
Reserved (Connection Type)	18	0x0	Reserved.
Reserved	19	0x0	Reserved.
VF Function Number	20		Defines the VF function to which this VSI connects. Valid only if Function Type is VF. Should be ignored if VSI type is not VF. <b>Note:</b> The VF number here is the absolute VF number (0-255) and not the number relative to the PF first VF.
Reserved	21		Reserved.
Command Flags	22-23		<b>Bits 1:0:</b> VSI type: 00b = VF 01b = VMDq2 (a.k.a. VM) 10b = PF 11b = EMP/MNG <b>Bits 15:2:</b> Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Table 7-50. Add VSI Command Buffer**

Category	Byte.Bit	Field	Description
Valid Sections	0-1		<p>Defines which sections are valid in the command.</p> <p><b>Bit 0:</b> Switching section is valid.  <b>Bit 1:</b> Security section is valid  <b>Bit 2:</b> VLAN handling section is valid.  <b>Bit 3:</b> Outer tag section is valid.  <b>Bit 4:</b> Ingress UP translation section is valid.  <b>Bit 5:</b> Egress UP translation section is valid.  <b>Bit 6:</b> Rx-Queue Mapping section is valid. If set, modified queues must be disabled.  <b>Bit 7:</b> Queuing option section is valid.  <b>Bit 8:</b> Outer UP mapping section is valid.  <b>Bit 9:</b> Reserved.  <b>Bit 10:</b> ACL section valid.  <b>Bit 11:</b> Flow Director section valid.  <b>Bit 12:</b> PASID section valid.  <b>Bits 13:15:</b> Reserved.</p> <p><b>Note:</b> Relevant only for Update VSI command. In Add VSI command, all the sections are assumed to be valid.</p>
Switching	2	Switch ID	Defines the switch ID to which this VSI belongs.
	3.0-3.3	Reserved (Switch ID MSB)	Reserved.
	3.4	Reserved (Is not STag)	Reserved.
	3.5	Allow Loopback	If set, traffic from this VSI can be loopback, unless port is not allowed for loopback on set port parameters setting.
	3.6	Allow Local Loopback	If cleared, inverse actions are applied to Rx traffic to this VSI (used in default image for MAC source pruning).
	3.7	Apply Source VSI Pruning	If set, traffic sent from a VSI can be forwarded to the same VSI. <b>Note:</b> It is recommended to always set this bit, unless there is an explicit need to receive back traffic sent by the VSI.
	4.0-4.3	Egress (Rx) Pruning Enables	Defines which pruning modes are enabled for egress traffic Setting Bit 0 enables VLAN pruning.
	4.4	LAN Enable	If set, traffic from this VSI can be sent to LAN.
	4.5-4.7	Reserved	Reserved.
	5.0-5.4	VEB Statistic Block ID	Defines which VEB statistic block this VSI is associated to.
	5.5	VEB Statistic Block ID Valid	<p>If set, the <i>VEB Statistic Block ID</i> field is valid.</p> <p>0b = When this bit is cleared, this association is removed.  1b = When this bit is set (in Add VSI or Update VSI command), the switch ID associated with this VSI is assigned a VEB statistic block defined by <i>VEB Statistic Block ID</i> field.</p> <p>Must be set for any Add/Update VSI of VSIs associated with a VEB statistic block.</p>
	5.6-5.7	Reserved	Reserved for future switching parameters. Must be zero.

**Table 7-50. Add VSI Command Buffer [continued]**

Category	Byte.Bit	Field	Description
Security	6.0	Allow Destination Override	Allow the VSI to override the switching decision and fix the destination of a transmit packet. This bit should be set only for trusted VSIs. <b>Note:</b> If this bit is set, the <i>Enable MAC Anti-Spoof</i> bit and the VLAN anti-spoofing ( <i>Ingress Pruning Enables[0]</i> ) should not be set.
	6.1	Reserved (Enable VLAN Anti-Spoof)	Reserved.
	6.2	Enable MAC Anti-Spoof	If set, inverse actions are applied to Tx traffic to this VSI (used in default image for MAC anti-spoof).
	6.3	Reserved	Reserved.
	6.4-6.7	Ingress (Tx) Pruning Enables	Defines which pruning modes are enabled for ingress traffic Setting Bit 0 enables VLAN anti-spoofing.
	7	Reserved	Reserved for future security parameters. Must be zero.
Inner VLAN Handling	8-9	Port Based Inner VLAN Insertion (16 bits)	This field specifies the VLAN ID and UP for the inner VLAN that will be inserted into all transmitted packets. The <i>Insert PVID</i> field must be set as well. <b>Note:</b> This field is 16 bits and can include the default PCP priority bits, when applicable.
	10-11	Reserved	Reserved.
	12.0-12.1	Inner VLAN TX Mode	This field defines the type of inner VLAN tag present in the packet on TX. This field controls the inner VLAN regardless of whether the VLAN is inserted via the descriptor or is present in the packet buffer. If the <i>Insert PVID</i> field is set, this field should be set to 01b. 00b = Reserved. 01b = Admit untagged/Priority tagged only - allow only packets without VLAN or with VLAN tag = 0. 10b = Admit.1Q tagged only - Allow only packets with VLAN. 11b = Allow all packets.
	12.2	Insert PVID	Port-based VLAN insertion. This bit controls the port based insertion of VLANs. Should be set for VFs/VMDq2 VSIs according to the VMM request. If this field is set, the <i>PVID + Default UP</i> field should be set to the port-based VLAN.
	12.3-12.4	Inner VLAN and UP Expose Mode (Rx)	This field defines how received VLAN are handled. For non-VF VSIs, 00b or 11b should be used. For VF VSIs, the mode should be set according to the VLAN awareness of the VM and the offload requested. 00b = Show VLAN, DEI and UP in descriptor (legacy behavior). 01b = Hide VLAN, show UP and DEI (VLAN ID = 0). 10b = Hide VLAN, DEI and UP. 11b = Do nothing (leave VLAN in packet).
	12.5	Block Inner VLAN from Tx Descriptor	This field specifies if the hardware will allow an inner VLAN to be inserted into the packet on transmit through the <i>L2TAG1</i> field of the Tx descriptor. <b>Note:</b> This field must be set if the <i>Insert PVID</i> field is set. The inner port VLAN overwrites an inner VLAN offloaded via the <i>L2TAG1</i> field.
	12.6-12.7	Reserved	Reserved for future port VLAN parameters. Must be zero.

Table 7-50. Add VSI Command Buffer [continued]

Category	Byte.Bit	Field	Description
Ingress UP Translation	16-19	Ingress UP Translation Table	<p>Defines the UP translation table for received packets according to the following list:</p> <ul style="list-style-type: none"> <li><b>Bits 16.0-16.2:</b> UP set if received UP is 0.</li> <li><b>Bits 16.3-16.5:</b> UP set if received UP is 1.</li> <li><b>Bits 16.6-17.0:</b> UP set if received UP is 2.</li> <li><b>Bits 17.1-17.3:</b> UP set if received UP is 3.</li> <li><b>Bits 17.4-17.6:</b> UP set if received UP is 4.</li> <li><b>Bits 17.7-18.1:</b> UP set if received UP is 5.</li> <li><b>Bits 18.2-18.4:</b> UP set if received UP is 6.</li> <li><b>Bits 18.5-18.7:</b> UP set if received UP is 7.</li> </ul> <p><b>Byte 19:</b> Reserved.</p> <p>This map is used to translate the 802.1P user priority bits received in the packet to the user priority exposed to the host. Relevant only if the UP is exposed to the host (<i>VLAN and UP Expose Mode</i> not equal 10b).</p>
Egress UP Translation	20-23	Egress UP Translation Table	<p>Defines the UP translation table for transmit packets according to the following list:</p> <ul style="list-style-type: none"> <li><b>Bits 20.0-20.2:</b> UP set if sent UP is 0.</li> <li><b>Bits 20.3-20.5:</b> UP set if sent UP is 1.</li> <li><b>Bits 20.6-21.0:</b> UP set if sent UP is 2.</li> <li><b>Bits 21.1-21.3:</b> UP set if sent UP is 3.</li> <li><b>Bits 21.4-21.6:</b> UP set if sent UP is 4.</li> <li><b>Bits 21.7-22.1:</b> UP set if sent UP is 5.</li> <li><b>Bits 22.2-22.4:</b> UP set if sent UP is 6.</li> <li><b>Bits 22.5-22.7:</b> UP set if sent UP is 7.</li> </ul> <p><b>Byte 23:</b> Reserved.</p> <p>This map is used to translate the 802.1P user priority bits sent by the host to the user priority sent to the network.</p> <p><b>Note:</b> The resulting user priority is further translated using the per TC translation table.</p>
Outer VLAN Handling	24-25	Port Based Outer VLAN Insertion	<p>This field specifies the VLAN ID and UP for the outer VLAN that will be inserted into all transmitted packets. The <i>Port Based Outer VLAN Insert Enable</i> field must be set as well.</p> <p><b>Note:</b> This field is 16 bits and can include the default PCP priority bits, when applicable.</p>
	26.0-26.1	Outer VLAN and UP expose mode (Rx)	<p>This field defines how received outer tags (S-tag/Outer VLAN) are handled.</p> <p><b>Note:</b> If the <i>Port Based Outer VLAN Insert Enable</i> field is set, this field must be set to 10b.</p> <ul style="list-style-type: none"> <li>00b = Extract tag - Show VLAN, DEI and UP in descriptor (legacy behavior)</li> <li>01b = Extract tag - Hide VLAN, show UP and DEI (VLAN ID = 0)</li> <li>10b = Extract tag - Hide VLAN, DEI and UP</li> <li>11b = Do nothing (do not extract tag, leave VLAN in the packet)</li> </ul>
	26.2-26.3	Outer Tag Type	<p>Defines the type of outer tag expected.</p> <ul style="list-style-type: none"> <li>00b = No outer tag.</li> <li>01b = 0x88A8 STag.</li> <li>10b = 0x8100 VLAN.</li> <li>11b = 0x9100 VLAN.</li> </ul>
	26.4	Port Based Outer VLAN Insert Enable	<p>This bit controls the port based insertion of outer tag (S-tag/Outer VLAN).</p> <p><b>Note:</b> If this bit is set, the <i>Block Outer VLAN from Tx Descriptor</i> field must be set.</p>

**Table 7-50. Add VSI Command Buffer [continued]**

Category	Byte.Bit	Field	Description
Outer VLAN Handling (continued)	26.5-26.6	Outer VLAN Tx Mode	Only for the other type specified in the <i>Outer Tag Type</i> field, this field defines the type of outer VLAN tag present in the packet. This field controls the outer VLAN regardless of whether the VLAN is inserted via the descriptor or is present in the packet buffer. For example, if this field is set to 10b and the specified EtherType is 0x88A8, only tagged 0x88A8 VLANs are accepted. A packet with a 0x88A8 VLAN, VID=0 is dropped. This field does not impact the other ether types <b>not</b> specified by the <i>Outer Tag Type</i> field. 00b = Reserved. 01b = Admit untagged/Priority tagged only - allow only packets without VLAN or with VLAN tag = 0. 10b = Admit 1Q tagged only - Allow only packets with VLAN. 11b = Allow all packets.
	26.7	Block Outer VLAN from Tx Descriptor	This field specifies if the hardware will allow an outer VLAN to be inserted into the packet on transmit through the <i>L2TAG2</i> field of the Tx descriptor.
	27	Reserved	Reserved for future port outer tag parameters. Must be zero.
Rx-Queue Mapping	28.0	Mapping Method	Selects between contiguous range of queues for this VSI vs. scattered range: 0b = The VSI is assigned a contiguous range of PF Rx-Queues. 1b = The VSI is assigned a scattered range of PF Rx-Queues.
	28.1-29.7	Reserved	Reserved. Must be zero.
	30-61	Rx-Queue Mapping	If <i>Mapping Method</i> = 0 (contiguous): <b>Bits 30.0-31.2:</b> The first queue allocated for this VSI in the PF space. <b>Bits 31.7-31.3:</b> Reserved <b>Bytes 33-32:</b> Number of queues allocated to this VSI. Used to define the number of queues associated with this VSI <b>Bytes 61-34:</b> Reserved If <i>Mapping Method</i> = 1 (scattered): For each of the queues in the VSI, defines the actual queue in the PF according to the following encoding: For queue 'n' of the VSI offsets 30+2n - 31+2n are used to define the mapping to PF queues. For example for queue 0: <ul style="list-style-type: none"> <li><b>Bits 30.0-31.2:</b> The PF queue matching allocated to queue 'n' of the VSI. For non allocated queue, a value of 0x7FF should be set.</li> <li><b>Bits 31.3-31.7:</b> Reserved.</li> </ul> The same mapping is used for the next queues. In this method, up to 16 queues can be assigned. <b>Note:</b> For VSIs assigned to VFs for which <i>VPLAN_RX_QBASE.VFQTABLE_ENA</i> is set, only the scattered method can be used. <b>Note:</b> The first queue (in both modes) is the default queue of the VSI to which packets not queued by any filter are sent.

**Table 7-50. Add VSI Command Buffer [continued]**

Category	Byte.Bit	Field	Description
Rx-Queue Mapping (continued)	62-77	Number and Offset of Rx-Queue per TCs	<p>Fixes the number of queue pairs assigned to the VSI for each traffic class and the offset of these queues.</p> <p><b>Bits 62.0-63.2:</b> Queue offset for TC0.</p> <p><b>Bits 63.3-63.6:</b> Number of queues allocated to TC0. The actual number is <math>2^n</math>. The allowed number of queues is: 1, 2, 4, 8, 16, 32, 64, 128.</p> <p><b>Bit 63.7:</b> Reserved.</p> <p><b>Note:</b> If no queues needs to be associated to a TC, the queue offset should be set to 0 and the number of queues to 0 (1 queue). This way, traffic associated with this TC is sent to the default queue.</p> <p>The following addresses are used with the same format for the next TCs:</p> <p><b>Bytes 64-65:</b> TC1</p> <p><b>Bytes 66-67:</b> TC2</p> <p><b>Bytes 68-69:</b> TC3</p> <p><b>Bytes 70-71:</b> TC4</p> <p><b>Bytes 72-73:</b> TC5</p> <p><b>Bytes 74-75:</b> TC6</p> <p><b>Bytes 76-77:</b> TC7</p>
Queuing Options	78.1-78.0	RSS LUT Selection	<p>RSS LUT used.</p> <p>00b = VSI LUT</p> <p>01b = Reserved</p> <p>10b = PF LUT</p> <p>11b = Global LUT (one of 16 Global LUTs)</p>
	78.5-78.2	RSS Global LUT	If <i>RSS LUT Selection</i> = 11b (Global LUT), selects the LUT assigned to this VF.
	78.7-78.6	Hash Scheme	<p>Hash scheme.</p> <p>00b = Toeplitz Hash</p> <p>01b = Symmetric Toeplitz</p> <p>10b = Simple XOR</p> <p>11b = Reserved</p>
	79.4-79.0	TC Override Option	TC override option.
	79.6-79.5	Reserved	Reserved.
	79.7	Profile Override TC	Profile override TC.
	80.0	Enable PE Filtering	Enable PE filtering.
	80.1-83.7	Reserved	Reserved for future queuing parameters. Must be zero.
Outer UP Mapping	84-87	Egress Inner UP to Outer Translation Table	<p>Defines the UP translation table for transmit packets from inner to outer UP according to the following list:</p> <p><b>Bits 84.0-84.2:</b> Outer UP set if inner UP is 0.</p> <p><b>Bits 84.3-84.5:</b> Outer UP set if inner UP is 1.</p> <p><b>Bits 84.6-85.0:</b> Outer UP set if inner UP is 2.</p> <p><b>Bits 85.1-85.3:</b> Outer UP set if inner UP is 3.</p> <p><b>Bits 85.4-85.6:</b> Outer UP set if inner UP is 4.</p> <p><b>Bits 85.7-86.1:</b> Outer UP set if inner UP is 5.</p> <p><b>Bits 86.2-86.4:</b> Outer UP set if inner UP is 6.</p> <p><b>Bits 86.5-86.7:</b> Outer UP set if inner UP is 7.</p> <p><b>Byte 87:</b> Reserved.</p> <p>This map is used to translate the 802.1P user priority bits on the inner UP to outer UP.</p> <p>To get a fixed outer UP, all the values should be set to the requested outer UP.</p>

**Table 7-50. Add VSI Command Buffer [continued]**

Category	Byte.Bit	Field	Description
ACL	88.0-88.3	Rx Profile Miss Default Action	Selects one of four predefined actions to be applied in case a receive packet does not match any ACL profile.
	88.4-88.7	Rx Table Miss Default Action	Selects one of four predefined actions to be applied in case a receive packet does not match any ACL table entry.
	89.0-89.3	Tx Profile Miss Default Action	Selects one of four predefined actions to be applied in case a transmit packet does not match any ACL profile.
	89.4-89.7	Tx Table Miss Default Action	Selects one of four predefined actions to be applied in case a transmit packet does not match any ACL table entry.
Flow Director	90.0	Flow Director Enable	Enable Flow Director filtering.
	90.1	Tx Auto-Evict Enable	Enables eviction of ATR filters if a FIN/RST packet is sent.
	90.2	Reserved	Reserved.
	90.3	Flow Director Programming Enable	Enable Flow Director programming.
	90.4-91.7	Reserved	Reserved.
	92-93	Max Dedicated	Max Number of allocated Flow Director filters to a VSI.
	94-95	Max Shared	Max number of shared Flow Director filters any VSI can program. <b>Note:</b> If both dedicated and shared values are zero, the VSI cannot program filters.
	96.0-97.2	Default Queue	This field defines the receive queue index within the VSI of the default FD. Permitted values are in the range of the queues of the VSI.
	97.3	Reserved	Reserved.
	97.6-97.4	Default Queue Group	The <i>ToQueue</i> parameter associate a target queue or a queue group to the FD filter: 0 = The default filter assign a target queue defined by the QINDX 1...7 = The default filter assign a region of queues. The region base equals to QINDX and the region size equals to 2 <sup>(ToQueue)</sup> .
	97.7	Reserved	Reserved.
	98.0-99.2	Reporting Queue	This field defines the receive queue index of the programming VSI on which the FD filter completion status is reported when the <i>COMP_Queue</i> flag in the programming descriptor is set.
	99.3	Reserved	Reserved.
	99.6-99.4	Default Priority	The priority of the default QINDX action.
99.7	Default Drop	When set, a packet that miss the FD filters is dropped.	
PASID Section	102.3-100.0	PASID ID	PASID for this VSI.
	103.6-102.4	Reserved	Reserved.
	103.7	PASID ID Valid	PASID ID is valid.
Reserved	104-127	Reserved	Reserved.

Table 7-51 describes the Add VSI response.

**Table 7-51. Add VSI Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0210	Command opcode.
Datalen	4-5	0x80	Length of buffer.
Return Value/VFID	6-7		Return value. The following error values can be returned: ENOSPC = If there are not enough resources to assign a VSI (in case of VSI number invalid) or part of the requested resources. EINVAL = The VSI is already enabled ENOENT = Index is invalid for one of the VSI resource parameters. EACCES = PF does not own one of the VSI resource parameters.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
VSI	16-17		Returns the assigned VSI number. If VSI is provided in command, the same value is returned. <b>Bit 17.7:</b> VSI is valid (always valid) <b>Bits 17.6-17.2:</b> Reserved <b>Bits 17.1-16.7:</b> VSI Number
Extended Status	18-19		If this value is not zero and there is no error code, the command succeeded but with warnings.
VSI's Allocated from Guaranteed	20-21		Number of VSI's that were either allocated using the Allocate Resource command, or allocated and enabled using the Add VSI command, both from the VSI's pre-allocated in NVM.
Total VSI's Un-Allocated	22-23		Total number of VSI's still unallocated and not reserved by any function.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

### 7.8.12.3.2 Update VSI (0x0211)

This command is used to update the parameters of an existing VSI. A function can update only a VSI it controls. Only sections defined as valid in Bytes 0-1 of the buffer are updated.

**Table 7-52. Update VSI Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0211	Command opcode.
Datalen	4-5	0x80	Length of buffer.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
VSI Number	16-17		<b>Bit 17.7:</b> VSI is valid (should always be set) <b>Bits 17.6-17.2:</b> Reserved <b>Bits 17.1-16.7:</b> VSI Number
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

The command buffer and the completion buffer used to update a VSI is the same as the command buffer of the Add VSI command ([Table 7-50](#)). Specific limitations are listed in the table.

All the filters set before the VSI type updates are kept, and the software device driver should guarantee they are compliant with the new VSI parameters.

**Table 7-53. Update VSI Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0210	Command opcode.
Datalen	4-5	0x80	Length of buffer.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. The following error values can be returned: EACCES = If the VSI is not owned by this PF or PF does not own one of the VSI resource parameters. EINVAL = The VSI was not enabled. ENOSPC = There are not enough resources to allocate new resources requested. ENOENT = Index is invalid for one of the VSI resource parameters.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
VSI Number	16-17	0x0	Copied from command.
Reserved	18-19		Reserved.
VSI's Allocated from Guaranteed	20-21		Number of VSI's that were either allocated using the Allocate Resource command, or allocated and enabled using the Add VSI command, both from the VSI's pre-allocated in NVM.
Total VSI's Un-Allocated	22-23		Total number of VSI's still unallocated and not reserved by any function.

**Table 7-53. Update VSI Response [continued]**

Name	Byte.Bit	Value	Remarks
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

### 7.8.12.3.3 Get VSI Parameters (0x0212)

This command is used to get the parameters of an existing VSI. A function can query only a VSI it controls.

**Table 7-54. Get VSI Parameters Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0212	Command opcode.
Datalen	4-5	0x80	Length of buffer.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
VSI Number	16-17		<b>Bit 17.7:</b> VSI is valid (should always be set) <b>Bits 17.6-17.2:</b> Reserved <b>Bits 17.1-16.7:</b> VSI Number
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Table 7-55. Get VSI Parameters Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0212	Command opcode.
Datalen	4-5	0x80	Length of buffer.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. The following error values can be returned: ENOENT = If the SEID do not point to a valid VSI. EACCES = If the VSI is not owned by this PF.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
VSI Number	16-17		VSI Number (copied from command).
VF Function Number	18		Defines the VF function to which this VSI connects. Valid only if Function Type is VF. Should be ignored if VSI type is not VF. <b>Note:</b> The VF number here is the absolute VF number (0-255) and not the number relative to the PF first VF.

**Table 7-55. Get VSI Parameters Response [continued]**

Name	Byte.Bit	Value	Remarks
Status Flags	19		<b>Bits 1:0:</b> VSI type 00b = VF 01b = VMDq2 (a.k.a. VM) 10b = PF 11b = EMP/MNG <b>Bit 7:2:</b> Reserved.
VSI's Allocated from Guaranteed	20-21		Number of VSI's that were either allocated using the Allocate Resource command, or allocated and enabled using the Add VSI command, both from the VSI's pre-allocated in NVM.
Total VSI's Un-Allocated	22-23		Total number of VSI's still unallocated and not reserved by any function.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

Table 7-56 describes the response buffer received when querying a VSI.

**Table 7-56. Get VSI Parameters Response Buffer**

Byte.Bit	Description
0-95	Same parameters as described in Table 7-50.
96-127	Reserved.

### 7.8.12.3.4 Free VSI (0x0213)

This command is used to remove a VSI. A function can remove only a VSI it owns. The driver should make sure that every queue in a VSI is disabled before a VSI is removed and that no rules pointing to this VSI exists.

As part of this command, the firmware should clear all the Flow Director filters assigned to this VSI by applying the flow of the Clear FD Table AQ command (0x0B06) described in [Section 7.10.12.1](#) and clear the RSS key of the VSI as if the Set RSS Key (0x0B02) command was received with an all-zero key.

**Table 7-57. Free VSI Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0213	Command opcode.
Datalen	4-5	0x0	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
VSI	16-17	VSI	The VSI to remove <b>Bit 17.7:</b> VSI is valid (should always be set) <b>Bits 17.6-17.2:</b> Reserved <b>Bits 17.1-16.7:</b> VSI Number
Command Flags	18-19		<b>Bits 19.7-18.1:</b> Reserved <b>Bit 18.0:</b> Keep VSI Allocation If set, the VSI stays part of the PF allocated resources. Otherwise, it is returned to the shared pool.
Reserved	20-31		Reserved. Must be zero.

**Table 7-58. Free VSI Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0213	Command opcode.
Datalen	4-5	0x0	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. The following error values can be returned: EACCES = If the element is not owned by this PF. ENOENT = VSI number is invalid.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-19		Reserved.
VSI's Allocated from Guaranteed	20-21		Number of VSI's that were either allocated using the Allocate Resource command, or allocated and enabled using the Add VSI, both from the VSI's pre-allocated in NVM.
Total VSI's Un-Allocated	22-23		Total number of VSI's still unallocated and not reserved by any function.
Reserved	24-31		Reserved.

### 7.8.12.3.5 Set DMA PASID IDX Map (0x0214)

This command is used to globally allocate HIF DMA agents to PASID Indexes. Unique per VSI values of PASID to be used for HIF transactions, are taken from specific VSI Table (Add Link).

NVM initiates all HIF DMA agents to use default PASID Index 0.

If a specific VSI doesn't have the mapped PASID Index (indicated by this command) configured (indicated by enabled bit), HIF transaction PASID will not be applied.

**Table 7-59. Set DMA PASID IDX Map Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0214	Command opcode.
Datalen	4-5	0x0	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
DMA Agent	16	DMA Index	DMA Agent to specify DMA Agent ID: 1 = RLAN 2 = TCLAN 3 = PQM_DBL 4 = PQM_DESC 5 = PQM_TS_DESC (new client for CNV) 6 = RDPU type 0 7 = RDPU type 1 8 = TDPU type 0 9 = TDPU type 1 10 = MBX 11 = MNG 12 = LEMPAMT (new client for CNV - LEM+Modifier) 13 = RX PE 14 = TX PE 15 = PEPMAT 16 = FPMAT
PASID IDX	17	PASID Index	<b>Bits 17.1-17.0:</b> PASID Index Value <b>Bits 17.7-17.2:</b> Reserved
Reserved	18-31	0xs0	Reserved. Must be zero.

**Table 7-60. Set DMA PASID IDX Map Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0214	Command opcode.

Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware. 0 = Success 1 = Failure
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31	0xs0	Reserved. Must be zero.

### 7.8.12.3.6 Get DMA PASID IDX Map (0x0215)

**Table 7-61. Get DMA PASID IDX Map Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0215	Command opcode.
Datalen	4-5	0x0	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
DMA Agent	16	DMA Index	DMA Agent to specify DMA Agent ID: 1 = RLAN 2 = TCLAN 3 = PQM_DBL 4 = PQM_DESC 5 = PQM_TS_DESC (new client for CNV) 6 = RDPU type 0 7 = RDPU type 1 8 = TDPU type 0 9 = TDPU type 1 10 = MBX 11 = MNG 12 = LEMPAMT (new client for CNV - LEM+Modifier) 13 = RX PE 14 = TX PE 15 = PEPMAT 16 = FPMAT
Reserved	17-31	0xs0	Reserved. Must be zero.

**Table 7-62. Get DMA PASID IDX Map Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0215	Command opcode.
Datalen	4-5	0x0	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by device driver. Written by firmware. 0 = Success 1 = Failure
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
DMA Agent	16	DMA Index	DMA Agent to specify DMA Agent ID: 1 = RLAN 2 = TCLAN 3 = PQM_DBL 4 = PQM_DESC 5 = PQM_TS_DESC (new client for CNV) 6 = RDPU type 0 7 = RDPU type 1 8 = TDPU type 0 9 = TDPU type 1 10 = MBX 11 = MNG 12 = LEMPAMT (new client for CNV - LEM+Modifier) 13 = RX PE 14 = TX PE 15 = PEPMAT 16 = FPMAT
PASID IDX	17	PASID Index	<b>Bits 17.1-17.0:</b> PASID Index Value <b>Bits 17.7-17.2:</b> Reserved
Reserved	18-31	0xs0	Reserved. Must be zero.

## 7.8.12.4 Storm Control Commands (0x028x)

### 7.8.12.4.1 Set Storm Control Configuration (0x0280)

This command is used to configure the Storm Control Mechanism of the port.

This command can be applied only by the function that controls the physical port.

**Table 7-63. Set Storm Control Configuration Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0280	Command opcode.
Datalen	4-5	0x0	Length of buffer.
Return Value/VFID	6-7		Return value. Zeroed by device driver.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Broadcast Threshold	16-19	0x0	<b>Bits 18:0:</b> Traffic Upper Threshold Size Represents the upper threshold for broadcast storm control. <b>Bits 31:19:</b> Reserved
Multicast Threshold	20-23	0x0	<b>Bits 18:0:</b> Traffic Upper Threshold Size Represents the upper threshold for multicast storm control. <b>Bits 31:19:</b> Reserved
Storm Control Control	24-27	0x0	<b>Bit 0:</b> MDIPW Drop multicast packets (excluding flow control and manageability packets) if multicast threshold is exceeded in previous window. <b>Bit 1:</b> MDICW Drop multicast packets (excluding flow control and manageability packets) if multicast threshold is exceeded in current window. <b>Bit 2:</b> BDIPW Drop broadcast packets (excluding flow control and manageability packets) if broadcast threshold is exceeded in previous window. <b>Bit 3:</b> BDICW Drop broadcast packets (excluding flow control and manageability packets) if broadcast threshold is exceeded in current window. <b>Bits 7:4:</b> Reserved <b>Bits 27:8:</b> INTERVAL - BSC/MSC Time-interval-specification The interval size for applying Ingress Broadcast or Multicast Storm Control. Interrupt decisions are made at the end of each interval (and most flags are also set at interval end). <b>Bits 31:28:</b> Reserved
Reserved	28-31		Reserved.

**Table 7-64. Set Storm Control Configuration Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0280	Command opcode.
Datalen	4-5	0x0	Length of buffer.
Return Value/VFID	6-7		Return value. There is no specific error code for this command.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31		Reserved.

### 7.8.12.4.2 Get Storm Control Configuration (0x0281)

This command is used to query the configuration of the storm control mechanism. Note that the current status of the storm control is received via the SCSTS register.

**Table 7-65. Get Storm Control Configuration Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0281	Command opcode.
Datalen	4-5	0x0	Reserved
Return Value/VFID	6-7	0x0	Must be zero.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31		Reserved.

**Table 7-66. Get Storm Control Configuration Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0281	Command opcode.
Datalen	4-5	0x0	Length of buffer.
Return Value/VFID	6-7		Return value. There is no specific error code for this command.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Broadcast Threshold	16-19	0x0	<b>Bits 18:0:</b> Traffic Upper Threshold Size Represents the upper threshold for broadcast storm control. <b>Bits 31:19:</b> Reserved
Multicast Threshold	20-23	0x0	<b>Bits 18:0:</b> Traffic Upper Threshold Size Represents the upper threshold for multicast storm control. <b>Bits 31:19:</b> Reserved

**Table 7-66. Get Storm Control Configuration Response [continued]**

Name	Byte.Bit	Value	Remarks
Storm Control Control	24-27	0x0	<p><b>Bit 0:</b> MDIPW Drop multicast packets</p> <p><b>Bit 1:</b> MDICW Drop multicast packets</p> <p><b>Bit 2:</b> BDIPW Drop broadcast packets</p> <p><b>Bit 3:</b> BDICW Drop broadcast packets</p> <p><b>Bit 4:</b> BIDU BSC Includes Destination Unresolved packets:</p> <p><b>Bits 7:5:</b> Reserved</p> <p><b>Bits 27:8:</b> Interval - BSC/MSC Time-interval-specification The interval size for applying Ingress Broadcast or Multicast Storm Control.</p> <p><b>Bits 31:28:</b> Reserved</p>
Reserved	28-31		Reserved.

## 7.8.12.5 Switch Recipes Configuration (0x029x)

### 7.8.12.5.1 Add Recipe (x0x290)

This command adds a recipe to the 64-entry recipe table. The recipe can include multiple entries to create a composite rule. After the recipe is added, it should be associated with packet profiles using the Set Recipes to Profile Association command.

If the recipe exists, it is updated. It is the responsibility of software not to change recipes pointing to populated rules, unless the change is to add a result to the recipe to be able to use it as a sub-recipe.

**Table 7-67. Add Recipe Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0290	Command opcode.
Datalen	4-5	Buffer Length	(Number of recipe +1) * 32
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Sub-Recipes	16-17		Number of sub-recipe entries in buffer.
Reserved	18-23	0x0	Reserved. Must be zero.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

The buffer in the command is as follows:

**Table 7-68. Add Recipe Buffer<sup>1</sup>**

Byte	Description
0 + n *64	Recipe index.
1 + n *64 - 3 + n *64	For command: Reserved. For response: 0: Recipe was updated. 23:1: Reserved.
4 + n *64 - 11+ n *64	Bitmap of the recipe indexes associated with this recipe A recipe can make use of already programmed entries that might not be part of the recipes described in this command.
12+ n *64 - 15+ n *64	Reserved.
16 + n *64 - 43 + n *64	Content of recipe as described in <a href="#">Table 7-9</a> .
44 + n *64 - 63 + n *64	Reserved.

1. Repeated n times, based on the number of programmed recipe entries.

**Table 7-69. Add Recipe Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0290	Command opcode.
Datalen	4-5	Buffer Size	
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. The following error values can be returned: EACCES = If one of the resources is not owned by this PF. ENOENT = Bad resource index.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Sub-Recipes	16-17		Number of sub-recipe entries in buffer.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

### 7.8.12.5.2 Set Recipes-to-Profile Association (0x0291)

This command is use to associate recipes with packet profiles.

**Table 7-70. Set Recipes-to-Profile Association Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0291	Command opcode.
Datalen	4-5	Buffer Length	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Profile ID	16-17		The profile to associate recipes to.
Reserved	18-23	0x0	Reserved. Must be zero.
Recipe Association	24-31		Bitmap of the recipe indexes associated with this profile. The bitmap should include both root and non-root recipe associated with the profile.

**Table 7-71. Set Recipes-to-Profile Association Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0291	Command opcode.
Datalen	4-5	0x0	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. The following error values can be returned: EACCES = If one of the resources is not owned by this PF. ENOENT = Bad resource index. ERANGE = A root recipe is added to the association list without its dependent recipes.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31		Reserved.

### 7.8.12.5.3 Get Recipe (0x0292)

This command returns a recipe and all the associated entries.

**Table 7-72. Get Recipe Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0292	Command opcode.
Datalen	4-5	Buffer Length	Should be 4 KB.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Rules	16-17		Reserved in command. Filled in response.
Recipe Root Number	18-19		Index of the root recipe to return (0-63). All the child recipes of this root recipe are also returned. A value of 0xFFFF means to start from the very first root and return all the active recipes with their children. <b>Note:</b> The recipes returned are either allocated to the PF or persistent.
Reserved	20-23	0x0	Reserved. Must be zero.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Table 7-73. Get Recipe Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0292	Command opcode.
Datalen	4-5	0x0	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. The following error values can be returned: ENOENT = Bad resource index.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Rules	16-17		Reserved in command. Filled in response according to the number of rules associated with the requested root ID.
Recipe Number	18-19		Index of root recipe requested.
Reserved	20-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

The buffer in the response is as follows:

**Table 7-74. Get Recipe Response Buffer<sup>1</sup>**

Byte.Bit	Description
0 + n *64	Recipe Index (the recipes are ordered numerically). The Root recipe is the last one in the list
1 + n *64 - 3 + n *64	Reserved.
4 + n *64 - 11+ n *64	Bitmap of the recipe indexes associated with this recipe (all the recipe that participates in the creation of the requested recipe). These recipes should appear earlier in the buffer.
12+ n *64 - 15+ n *64	Reserved.
16 + n *64 - 43 + n *64	Content of recipe as described in <a href="#">Table 7-9</a> .
44 + n *64 - 63 + n *64	Reserved.

1. The list is repeated *Number of Rules* times.

### 7.8.12.5.4 Get Recipes-to-Profile Association (0x0293)

This command is use to read the recipes associated with a packet profile.

**Table 7-75. Get Recipes-to-Profile Association Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0293	Command opcode.
Datalen	4-5	Buffer Length	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Profile ID	16-17		The profile to read the association of.
Reserved	18-31	0x0	Reserved. Must be zero.

**Table 7-76. Get Recipes-to-Profile Association Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0293	Command opcode.
Datalen	4-5	0x0	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. The following error values can be returned: EACCES = if one of the resources is not owned by this PF. ENOENT = Bad resource index.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Profile ID	16-17		The profile to read the association of.
Reserved	18-23	0x0	Reserved.
Recipe Association	24-31		Bitmap of the recipe indexes associated with this profile.

## 7.8.12.6 Switch Rules Population Commands (0x02Ax)

### 7.8.12.6.1 Add Switch Rules (0x02A0)

This command is used to populate the switch. It can be used to program a combination of lookup rules + actions, large actions or VSI lists.

A single buffer can include multiple commands from different types. The commands are applied in order, so if a rule points to a large action or a VSI list, the list and the large action should be programmed before the lookup + action.

If a rule already exists and needs to be updated, the Update Switch Rules command should be used.

**Table 7-77. Add Switch Rules Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x02A0	Command opcode.
Datalen	4-5	Buffer Length	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Rules	16-17		Number of rules in buffer.
Reserved	18-23	0x0	Reserved. Must be zero.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Table 7-78. Add Switch Rules Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x02A0	Command opcode.
Datalen	4-5	0x0	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. The following error values can be returned: EACCES = If one of the resources is not owned by this PF. ENOSPC = If one of the filters cannot be allocated. EINVAL = Invalid parameters or rule already exists. ENOENT = Bad resource index. <b>Note:</b> If an ENOSPC error is returned, check the return buffer for the exact list of filters not allocated. Other errors indicates that the entire command was not executed.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

The content of the return buffer is the same as the input buffer. The *Status* field and the LUT index are updated as part of the response. The first filter allocation that fails due to lack of resources stops the command.

### 7.8.12.6.1.1 Add Switch Rules Buffer Format

The buffer contains a “Number of Rules” structures with the following format:

```

struct
{
#define T_LOOKUP_RX          0x0 // Used to add a rule for traffic from network.
#define T_LOOKUP_TX          0x1 // Used to add a rule for traffic from VSI.
#define T_LARGE_ACTION       0x2 // Used to define content of large action.
#define T_VSI_LIST_SET       0x3 // Used to set VSIs in a multicast VSI list.
#define T_VSI_LIST_CLEAR     0x4 // Used to clear VSIs from a multicast VSI list or to
                                // clear the entire list.
#define T_PRUNE_LIST_SET     0x5 // Used to set VSIs in a prune VSI list.
#define T_PRUNE_LIST_CLEAR   0x6 // Used to clear VSIs from a prune VSI list or to clear
                                // the entire list.

    __le16 Type; // One of #defines above.
    __le16 Status; // Return status. For Add/Update indicates the resource was
                  // successfully allocated/updated. For Get, always succeed for
                  // entries in range. A status of zero means a success. A non
                  // zero status reflects one of the errors listed in Table 7-78
                  // for return value.

union
{
    struct
    {
        __le16 RID; // Recipe ID.
        __le16 Source; // Source VSI for LOOKUP_TX and source port for
                       // LOOKUP_RX. This field is used by the hardware to
                       // derive the switch ID (based on source of packet).
                       // Reserved for Get command.
        __le32 Action; // Action as defined in Table 7-12.
        __le16 Index; // LUT index. Return value for Add, parameter for
                      // Get/Update.
        __le16 HeaderLen; // Header length (in bytes) for add command. Should be
                           // zero for remove and update command. Should be 24 for
                           // query. Should be aligned to four bytes.
        u8 HeaderData[0]; // Header data, array of HeaderLen for add and update
                           // commands. For query, contains the content of the
                           // FLU. Should be null for remove command.
    } LOOKUP; // LOOKUP_TX and LOOKUP_RX

    struct
    {
        __le16 Index; // Index in Large action table.
        __le16 Size; // 0/1/2/4 - 0 is used for free commands.
        __le32 Action[0]; // Array of Size of actions as defined in Table 7-14.
    } LARGE_ACTION;

    struct
    {
        __le16 Index; // Index of VSI/Prune list.
        __le16 NumberOfVSIs; // Should be zero to clear the entire list.
    }
}
}

```

```

    __le16 VSI[0];          // Array of NumberOfVSIs VSI numbers.
} VSI_LIST; // Used for VSI_LIST_SET, VSI_LIST_CLEAR, PRUNE_LIST_SET and
           // PRUNE_LIST_CLEAR.

struct
{
    __le16 Index;          // Index of VSI/Prune list.
    __le8 VSI_LIST[96]    // Bitmap of VSI list.
} VSI_LIST_QUERY; //Used for queries of VSI_LIST_SET/CLEAR

u8 Padding[0]; //Array of padding bytes
} Data;
} PopulationEntry;

```

**Note:** The option to clear an entire VSI list by using an empty VSI\_LIST and a PRUNE\_LIST\_CLEAR action is available only as part of a Remove Switch Rules command.

The buffer header should be a valid packet header.

### 7.8.12.6.1.2 Population Example

The following is an example of a population request to implement a rule that upon reception of a multicast packet with DA = DA1, it forwards it to VSI1 and VSI3 and mirrors it to VSI12. It is assumed that all the resources are already allocated.

The buffer consists of 3 rules:

- Populate a VSI list with VSI1 and VSI3.
- Create a large action with two actions:
  - Forward to VSI list.
  - Mirror to VSI.
- Create a lookup rule with the packet header and with an action pointing to the larger action mentioned in the previous step.

Assume that VSI List VL<sub>n</sub> and Large Action LA<sub>k</sub> are the resources the software device driver chooses to use for this rule and assume RID = 0 is the MAC forwarding recipe used.

To create this, the following buffer is created:

```

struct
{
    __le16 Type = T_VSI_LIST_SET;
    __le16 Status; // filled in response
    struct
    {
        __le16 Index = n;          //VLn
        __le16 NumberOfVSIs = 2;
        __le16 VSI[0] = {1,3};    // VSI1 and VSI3
    } VSI_LIST;
} Entry_1;

struct
{
    __le16 Type = T_LARGE_ACTION;
    __le16 Status; // filled in response
    struct

```

```

    struct
    {
        __le16 Index = k; // IAK
        __le16 Size = 2; // 2 actions in large action
        __le32 Action[0] = {VSI List forward action(000), Mirror action(011),...}
    } LARGE_ACTION;
} Data;
} Entry_2;

struct
{
    __le16 Type = T_LOOKUP_TX;
    __le16 Status; // filled in response
    struct
    {
        struct
        {
            __le16 RID = 0 ; //MAC Forwarding
            __le16 Source = 1; // VSI1 is one of the VSIs in the VEB
            __le32 Action = {Pointer Action};
            __le16 Index; // filled in response
            __le16 HeaderLen = 14; //Header length of an L2 packet
            u8 HeaderData[0] = {DA1,Dummy SA, any EtherType }; // Do not use an EtherType
                                                                // of IP if IP header not
                                                                // provided.
        } LOOKUP;
    } Data;
} Entry_3;

```

## 7.8.12.6.2 Update Switch Rules (0x02A1)

**Table 7-79. Update Switch Rules Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x02A1	Command opcode.
Datalen	4-5		Length of command buffer.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Filters	16-17		Number of filters in buffer.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

Data buffer format is described in [Section 7.8.12.6.1.1](#). For update commands, the lookup rules should be accessed by index.

**Note:** For Large Action and VSI list updates, the Add Switch Rules command and this command can be used interchangeably.

**Table 7-80. Update Switch Rules Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x02A1	Command opcode.
Datalen	4-5	0x0	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. The following error values can be returned: EACCES = If one of the resources is not owned by this PF. ENOENT = If the lookup rule does not exist.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

### 7.8.12.6.3 Remove Switch Rules (0x02A2)

**Table 7-81. Remove Switch Rules Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x02A2	Command opcode.
Datalen	4-5		Length of command buffer.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Filters	16-17		Number of filters in buffer.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

Data buffer format is described in [Section 7.8.12.6.1.1](#). For remove commands, the lookup rules should be accessed by index.

**Table 7-82. Remove Switch Rules Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x02A2	Command opcode.
Datalen	4-5	0x0	Reserved
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. The following error values can be returned: EACCES = If one of the resources is not owned by this PF. ENOENT = If the lookup rule does not exist.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

**Note:** Removing a shared VSI list resource only removes from the list of VSIs owned by the PF sending the AQC.

**Note:** Removing a shared resources type (Wide Table) clears the configuration from hardware only when owned by a single owner.

### 7.8.12.6.4 Get Switch Rules (0x02A3)

**Table 7-83. Get Switch Rules Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x02A3	Command opcode.
Datalen	4-5		Length of command buffer.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Number of Filters	16-17		Number of filters in buffer.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

Data buffer format is described in [Section 7.8.12.6.1.1](#). For Get command, the lookup rules should be accessed by index. In the case of Get command there is no difference between T\_VSI\_LIST\_CLEAR and T\_VSI\_LIST\_SET types, and no difference between T\_PRUNE\_LIST\_CLEAR and T\_PRUNE\_LIST\_SET types. For large actions, the buffer size should be set according to the expected size of the action.

**Table 7-84. Get Switch Rules Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x02A3	Command opcode.
Datalen	4-5		Length of command buffer.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware. The following error values can be returned: EACCES = If one of the resources is not owned by this PF. ENOENT = If the lookup rule does not exist.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

### 7.8.12.6.5 Clear PF Configuration (0x02A4)

This command clears all the configuration of the PF, including all VSIs and all Flow Director filters allocated to this PF.

The command does not release resources allocated to the function and the switch ID allocation of the port.

The following resources are removed (but not deallocated) as part of the command:

- Port Configuration
- Switch Rules
- Mirror Rules
- VSI lists
- VSIs
- VEB Counters
- FD Filters

Resource management, Recipes (and Recipe to Profile associations), PE filters are not cleared by this command.

The original topology (VSI + port MAC filter) is not initiated after this command and should be built by the software device driver.

**Table 7-85. Clear PF Configuration Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x02A4	Command opcode.
Datalen	4-5	0x0	Reserved.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31		Reserved.

**Table 7-86. Clear PF Configuration Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x02A4	Command opcode.
Datalen	4-5		Length of return buffer.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31		Reserved.

## 7.8.12.7 Mirroring Commands (Opcode 0x026x)

The mirroring behavior is described in [Section 7.8.5.4.1](#).

### 7.8.12.7.1 Add/Update Mirror Rule (0x0260)

This command is used to add a port mirror rule. Rules can be added for any ingress or egress port, virtual (VSI) or physical (Ethernet port). Lookup based mirroring (a.k.a. VLAN mirroring), is programmed via the regular Add Switch Rules command ([Section 7.8.12.6.1](#)).

**Table 7-87. Add/Update Mirror Rule Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0260	Command opcode.
Datalen	4-5		Length of buffer. Should be equal to 2 * <i>Number of Mirrored Entries</i> .
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Rule ID	16-17		<p><b>Byte 17:</b> Reserved  <b>Bit 16.7:</b> Rule ID Valid  <b>Bit 16.6:</b> Reserved  <b>Bits 16.5-16.0:</b> Rule ID</p> <p>If <i>Rule ID Valid</i> is set, the requested <i>Rule ID</i> is used. If the rule is already in use, the new mirroring rules are added to this rule. The rule should be owned by the PF requesting the it.</p> <p>If <i>Rule ID Valid</i> is cleared, a new <i>Rule ID</i> is assigned from the shared pool of rules.</p>
Rule Type	18-19		<p><b>Bits 2:0:</b> Rule Type</p> <p>000b = Reserved.  001b = Virtual port ingress mirroring. All traffic sent from the VSIs in the buffer  010b = Virtual port egress mirroring. All traffic received by the VSIs in the buffer  011b = Reserved (VLAN mirroring in previous products).  100b = Reserved (All ingress traffic in previous products).  101b = Reserved (All egress traffic n previous products).  110b = Physical Port ingress mirroring. All traffic received by this LAN port.  111b = Physical Port egress mirroring. All traffic sent by this LAN port.</p> <p><b>Bits 15:3:</b> Reserved.</p> <p><b>Note:</b> If the <i>Rule Type</i> is 110b or 111b (ingress/egress port mirroring), there is no associated buffer. The flags in bytes 0-1 should be set accordingly and <i>Number of Mirrored Entries</i> should be zero.</p>
Number of Mirrored Entries	20-21		Defines the number of VSIs that should be mirrored. The values are in the command buffer.
Destination VSI	22-23		Defines the VSI to which the packets matching the mirror rule will be mirrored. <b>Bits 15:10:</b> Reserved <b>Bits 9:0:</b> VSI Number
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

The Command Buffer is built as *Number of Mirrored Entries* entries of two bytes each containing a single VSI/VLAN, depending on the rule requested as described in [Table 7-88](#).

**Table 7-88. Add/Update Mirror Rule Command Buffer**

Byte.Bit	Description
1.7	Action 0b = Remove VSI from mirror rule. 1b = Add VSI to mirror rule.
1.6-1.2	Reserved.
1.1-1.0	Mirrored VSI.

[Table 7-89](#) describes the Add/Update Mirror rule response (with no buffer).

**Table 7-89. Add/Update Mirror Rule Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0260	Command opcode.
Datalen	4-5	0x0	No return buffer.
Return Value/VFID	6-7		Return value. The following error values can be returned: ENOENT = If the mirrored or mirroring VSI do not point to a valid VSI. ENOSPC = If there are not enough resources to assign a mirror rule. EACCES = If the <i>Rule ID</i> is not owned by this PF. EEXIST = VSI is already mirrored by another rule. <b>Note:</b> If an error is returned, the entire command was not executed.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Rule ID	16-17		<b>Byte 17:</b> Reserved <b>Bit 16.7:</b> Rule ID valid (always set) <b>Bit 16.6:</b> Reserved <b>Bits 16.5-16.0:</b> Rule ID Defines the <i>Rule ID</i> that is returned in the receive descriptor. This number is assigned by the firmware and should be used as a handle when requesting deletion of an existing rule. If the <i>Rule ID Valid</i> flag was set in the command, the returned <i>Rule ID</i> is the same as the requested one.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	Address of Buffer
Data Address Low	28-31	Buffer Address	

### 7.8.12.7.2 Delete Mirror Rule (0x0261)

This command is used to delete an existing mirror rule.

**Table 7-90. Delete Mirror Rule Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0261	Command opcode.
Datalen	4-5	0x0	
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Rule ID	16-17		<b>Byte 17:</b> Reserved <b>Bit 16.7:</b> Rule ID valid (always set) <b>Bit 16.6:</b> Reserved <b>Bits 16.5-16.0:</b> Rule ID Defines the Rule ID to delete.
Reserved	18-19		Reserved.
Command Flags	20-21		<b>Bits 21.7-20.1:</b> Reserved <b>Bit 20.0:</b> Keep m Allocation If set, the VSI stays part of the PF allocated resources. Otherwise, it is returned to the shared pool.
Reserved	22-31	Buffer Address	Reserved.

[Table 7-91](#) describes the Delete Mirror rule response (with no buffer)

**Note:** When a mirror rule is shared (VSIs of multiple PFs are mirrored through the same rule), this command should not be used. Instead, each PF should remove its VSIs using the Update Mirror rule command and this command should be used only by the last PF to remove the rule itself.

**Table 7-91. Delete Mirror Rule Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0261	Command opcode.
Datalen	4-5	0x0	
Return Value/VFID	6-7		Return value. The following error values can be returned: EINVAL = If the Rule ID does not exist. ENOENT = If the Rule ID is not owned by this PF.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31	Buffer Address	Reserved.

### 7.8.12.8 Default Configuration at Init Time

On each function, a single VSI is initiated with a distinct switch ID. This VSI is set in VLAN promiscuous mode with loopback disabled and source pruning enable.

On each VSI, a single filter is added to allow reception of the default MAC Address of the port.

## 7.9 ACL (Ternary Classifier)

### 7.9.1 Overview

#### 7.9.1.1 General

The Packet Processor pipeline in the E810 provides a programmable Ternary Classifier stage for implementing functions such as ACL (Access Control List), IP LPM (Longest Prefix Match), and so on. The Ternary Classifier is SDN/NFV-enabled, supporting a wide range of network protocols, both standard-based and proprietary. The architecture is fully programmable, protocol-agnostic and action-agnostic, capable of adapting to future protocol headers and use cases.

Since the architecture of the Ternary Classifier is protocol-agnostic and action-agnostic, it can be programmed to serve as a switch extension and thus provide packet forwarding based on programmable rules, augmenting the capabilities of the switch.

The ACL's block logical location in the E810 data-path is illustrated in [Figure 7-19](#).

On the receive side, the ACL is located on an internal egress port of the switch. This means that it can base its decisions on the switch switching decision (destination information). The ACL block gets the packet's header as received by the switch. Any potential transposition (for example, VLAN stripping) occurs in the data path following the packet processing by the ACL block.

On the transmit side, the ACL is location on an internal ingress port of the switch. This means that the ACL block can base its decisions based on the source information. The ACL block gets packet header in its final transmitted form. Any potential transposition (for example, VLAN insertion) occurs in the data path prior to the packet processing by the ACL block.

**Figure 7-19. ACL Logical Location in the Data Path**

## 7.9.1.2 Features

- Provides ACL lookup tables:
  - Table contain association between ACL entries and actions.
  - ACL match is done using up to 16 TCAM blocks.
  - Each TCAM block has 512 entries of 40 bits.
  - TCAM cascading.
- Hit result of consecutive range of TCAM block indexes can be used to create an ACL table with wider rules (multiple of 40 bits).
  - TCAM stacking.
- Multiple TCAM blocks, with consecutive index range, can be stacked to create a table with more than 512 rules (cascaded table can be stacked as well).
- 128 lookup profiles:
  - Standard FlexiPipe method of profile selection.
  - One profile is used for by pass (profile number 1).
  - Eight range checkers per profile:
    - Range checker works on a word (16-bit value).
    - Range checker apply a mask on the value and checks if it is between a start value and an end value.
  - Profile controls the extractions:
    - Extraction of a field vector (FV) built from 32 words.
    - Build of three arrays from the FV:
      - 32-byte array with also contain the Profile ID and the eight range checks result (pass/fail per each checker).
      - 32-word array.
      - 16 double word array.
- Profiles selects a scenario.
- 64 Scenario

### 7.9.1.3 Basic Operation and Terms

A ternary classifier is a unique filtering mechanism able to compare a given dataset (referred hereafter as a “key”) to a set (referred hereafter as a “table”) of multiple entries (referred hereafter as “table entries”) at the same time being able to ignore bits in the compare process. This means that a compare operation for each bit in the table entry has three match conditions:

- Match if ‘0’
- Match if ‘1’
- Match always (Don’t care)

A match in a table entry is achieved only if there is a match on all of the bits of that table entry.

In case of a multiple hit to different table entries, a priority mechanism is used to determine the highest priority-matched entry. The priority mechanism implemented in the E810’s ACL block, which selects the lowest hit entry’s index in the table. For example, if entries 3, 7, and 11 are hit, the result is entry 3.

Employing the priority mechanism essentially means that a specific key search in a specific entry can yield multiple hits, but only a single result (referred hereafter as a “result entry”).

The ternary match and priority mechanisms are implemented using a TCAM block. Multiple TCAM blocks in parallel are used to extend the functionality of a single TCAM block by:

- Extending the number of entries.
- Producing wider entries.
- Doing a match on multiple tables in parallel.

## 7.9.1.4 Table Configuration Options

### 7.9.1.4.1 General

The ACL block supports a flexible arrangement of its TCAM blocks to support tables with various key widths and entry amounts. This section depicts the various tools implemented in the ACL block that can be used to manifest tables in different sizes.

The TCAM blocks arrangement is a scenario based configuration (see [Section 7.9.1.8](#)), which means that the ACL block can support up to 64 independent TCAM block configurations.

### 7.9.1.4.2 Table Sizing Support

Since the TCAM blocks used in the design are 40 bits wide, supporting a table with a wider key requires cascading several TCAM blocks (see [Section 7.9.1.4.2.1](#)). Each TCAM block cascaded to the other increases the supported key width of the table by 40 bits.

Similarly, since the TCAM blocks used in the design support a total of 512 entries, supporting a table with a larger amount of entries requires stacking several TCAM blocks.

As the E810 implementation uses 16 TCAM blocks, and given the description above, the maximal supported key width for an ACL table in the E810 is 640 bits (16 cascaded TCAM blocks yielding 512 entries), and the maximal supported entry amount for an ACL table in the E810 is 8,192 (16 stacked TCAM blocks and using 40-bit entries).

#### 7.9.1.4.2.1 TCAM Cascade

A TCAM cascade is used to support tables with a key width wider than 40 bits. The TCAM cascade mechanism operates by running several TCAM blocks lookup in parallel and returning a hit in a given entry only if the same entry was hit in all the cascaded TCAM blocks (that is, perform a logic AND operation).

**Figure 7-20. TCAM Cascading Example**

The ACL block requires cascaded TCAM blocks to be adjacent (i.e., to have consecutive indexes). For example, a table supporting an 80-bit wide key can be implemented using TCAM blocks index 1 and 2, but not using TCAM block 1 and 3.

When cascaded, the hit vector, representing the hit indications for an entire TCAM, is propagated to the next TCAM. The result of that next TCAM block is the logical AND of the previous TCAM block’s hit vector and its own local hit vector. That result can also be used in the next TCAM block and so forth to support wider keys.

The basic mechanism that controls TCAM cascading is that each TCAM block can either use its local hit vector or the result of a logical AND between the previous TCAM hit vector and its local hit vector. This setting is controlled by the StartCompare configuration, which is part of the scenario configuration per TCAM (see Section 7.9.2.5.1). When setting StartCompare for a given TCAM block, it uses its local hit vector. When clearing StartCompare for a given TCAM block, it uses the result of a logical AND between the previous TCAM hit vector and its local hit vector.

Given this explanation, the StartCompare setting is set for independent TCAM blocks and for the first TCAM block in a TCAM cascade.

The unified result entry is reflected in the output of the last TCAM block in the cascade. Therefore, when using a cascade, the action memories (see Section 7.9.1.5.3) are associated with the last memory in the cascade.

Figure 7-21 illustrates an example of cascading two TCAM blocks to manifest a table with an 80-bit key. Using the configuration illustrated in the figure, a hit indication in the last TCAM (TCAM  $n+1$  in the figure) is only possible if the same entry is hit in both the last TCAM and the previous TCAM (TCAM  $n$  in the figure) because the StartCompare input for TCAM  $n+1$  is cleared. The first TCAM, however, ignores the previous TCAM block (TCAM  $n-1$  in the figure) hit indications, since its StartCompare input is set.

**Note:** As highlighted in the figure, the first TCAM block’s (TCAM  $n$  in the figure) priority logic is unused. and instead, the last TCAM block’s (TCAM  $n+1$  in the figure) priority logic output reflects the cascade hit indication and hit index. Therefore, in the case described in this example, the action memories associated with the table implemented using this cascade is associated with TCAM  $n+1$ .

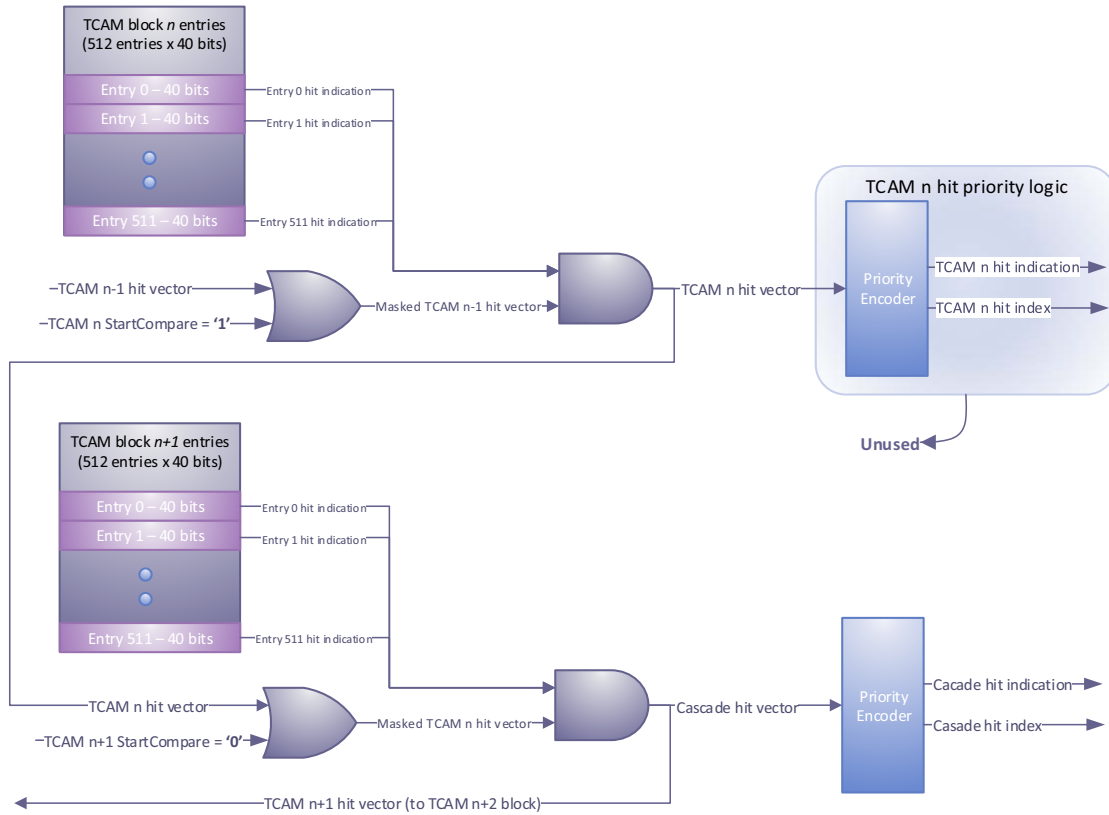

Figure 7-21. TCAM Cascade Example

### 7.9.1.4.2.2 TCAM Stacking

TCAM stacking is used to support tables with a key amount higher than 512. The TCAM stacking mechanism operates by running several TCAM blocks lookup in parallel and returning a unified result entry that represents the highest indexed entry hit in the highest indexed TCAM block in the stack. Figure 7-22 shows an example of two cascaded tables 1024x80b table and a 1024x40b table.

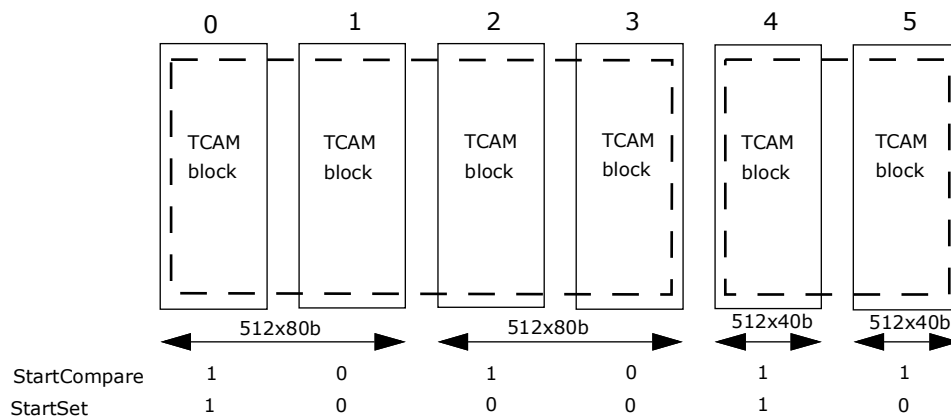

Figure 7-22. Cascaded TCAM Example

The ACL block requires stacked TCAM blocks to be adjacent one to another (that is, to have consecutive indexes). For example, a table supporting an 40-bit wide key and 1,024 entries can be implemented using TCAM blocks index 1 and 2, but not using TCAM block 1 and 3.

When stacked, the hit vector, representing the hit indications for an entire TCAM, disables the hit of the next TCAM. As such, only the first hit of the cascaded TCAM provides the result of the entire table.

**Note:** TCAM stacking and TCAM cascading can be used jointly to form. For example, a table with 1,024 entries and a key of 80 bits.

This setting is controlled by the StartSet configuration, which is part of the scenario configuration per TCAM (see Section 7.9.2.5.1). The action memory are associated with every TCAM that completes a table entry.

### 7.9.1.4.3 Concurrent Table Support

Concurrent tables are tables that are searched in parallel for the same input. An example of concurrent tables is a MAC Address table and an IPv4 Address table which can be searched concurrently for the same input. Figure 7-23 shows a concurrent TCAM example. The two tables can be searched concurrently since they occupies different TCAMs

Figure 7-23. Concurrent Tables Example

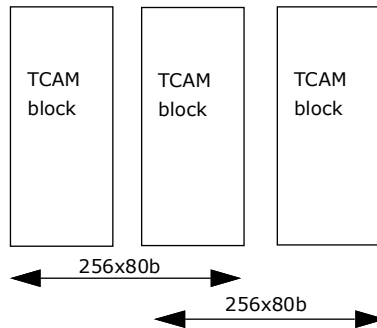

The ACL block in the E810 supports multiple concurrent tables. This is done by using several TCAM blocks in parallel for implementing different tables that are searched in parallel for each input. Each table supports its own key structure configuration.

The amount of concurrent tables supported by the design is equal to the amount of TCAM blocks in the design (that is, support a case where each TCAM block is used to implement a single table).

**Note:** Concurrent tables usage is not related to TCAM cascading (see Section 7.9.1.4.2.1) or TCAM stacking (see Section 7.9.1.4.2.2). This means that some of the concurrent tables can use a stacked or cascaded TCAM configuration.

### 7.9.1.4.4 Non-Concurrent Table Support

The ACL block in the E810 supports multiple non-concurrent tables (or, tables that are not working concurrently). An example of non-concurrent tables is an inner IPv6 Address table and an inner IPv4 Address table that are naturally never searched concurrently. Figure 7-24 shows an example of non-concurrent tables. Because the two tables consume the same TCAM block they cannot be searched concurrently. In fact they are going to be define in a different scenarios.

**Figure 7-24. Non-Concurrent Tables Example**

Supporting multiple non-concurrent tables is used to optimize the use of TCAM blocks when tables are not using the full amount of entries supported by a TCAM block used to implement it.

The ACL block in the E810 supports multiple non-concurrent tables by allowing the same TCAM block to store multiple tables while masking the hits in the irrelevant tables on a per-input basis. Entry masking is possible in 64-entries resolution.

**Note:** Though the example given above is implying using the packet type as a mean to select the relevant (or masking the irrelevant tables) per input, this feature can use other information (like the function ID) for selecting the active tables to allow different functionality (like function isolation).

## 7.9.1.5 Actions

### 7.9.1.5.1 General

If a table yielded a hit, the result entry points to a specific set of actions associated with the entry. The ACL block supports at least two actions per entry and up to 20,480 actions in total for all entries. Example actions might be: count bytes, count packets, drop, and change VSI.

The action format supported by the ACL block is the format supported by the flexible pipeline architecture and includes an action priority, action value and action metadata ID (MDID).

The ACL block supports up to 8 actions per a single output.

### 7.9.1.5.2 Aggregation and Prioritization

As mentioned in [Section 7.9.1.3](#), the ACL block supports multiple concurrent tables working simultaneously. Potential multiple tables hit results in multiple actions being aggregated to a single set of actions.

A single set of ACL actions may include only a single action per action type (or, metadata ID). When two or more table hits result in the same action type, a priority mechanism uses the action priority, which is part of the action definition associated with each action, to determine which is used in the output. When two or more table hits result in the same action type with the same priority, the action from the highest index action memory is used in the output.

**Note:** Any combination of table hit that results in an action set of more than eight unique actions, corresponding to the ACL block limit mentioned in [Section 7.9.1.5.1](#), is considered as an invalid programming and might result in unexpected behavior.

Similar to the aggregation and prioritization mechanism in the ACL block, the ACL block's actions are aggregated with and prioritized against the pipeline's actions. When a result action in the ACL block has the same type of a pipeline action, the highest priority action prevails. When two priorities of the same action type are equal, the ACL action prevails unless the priority is set to 0.

### 7.9.1.5.3 Action Memories

The actions are stored in arrays referred to as action memories. The ACL block in the E810 includes 20 action memories, where each memory has 512 entries containing up to two actions per entry.

Any action memory can be associated with any of the TCAM blocks so that a hit in a specific entry of the TCAM block points to the same entry in the associated action memory. This allows the action memories to support flexible table sizing as mentioned in Section 7.9.1.4.2. Several action memories can also be associated with the same TCAM block, allowing the support for more than two actions per table hit.

Figure 7-25 shows an example of action memory-to-TCAM block association. A single action memory can be associated with only one TCAM block per scenario.

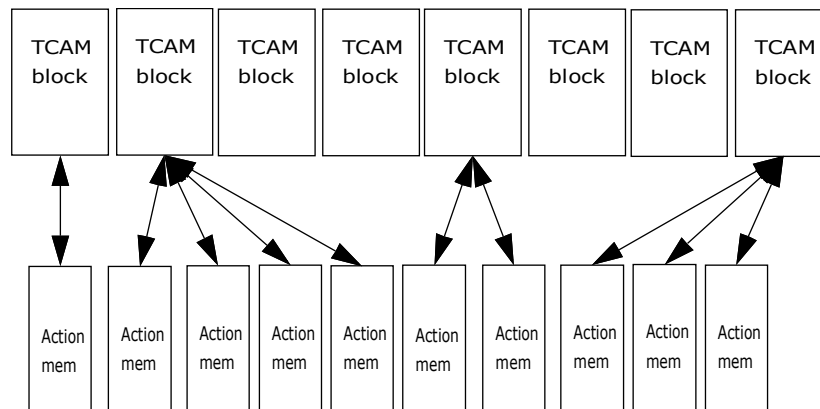

Figure 7-25. Action Memory-to-TCAM Association Example

### 7.9.1.5.4 Default Action

There are three special cases that involve associating an action with an incoming command when there is no valid action as a result of the ACL operation:

- Profile miss — An incoming command that did not select any profile (see Section 7.9.2.2) and was thus associated with by pass profile.
- Tables miss — An incoming command that did not match any entry in the ACL (that is, missed all tables it searched through).

3. Table hit without any valid action.

When any of these cases occurs, the output actions is defined by the default action mechanism. The default action mechanism allows associating each VSI with four independent default action sets. An independent action set can be selected for profile miss and table miss and for Rx and Tx traffic (see Section 7.9.2.8).

Each default action set contains up to four predefined actions. An example for a default action set might be: drop the packet, count packets, and set a special tag that is reflected in the Rx-Descriptor for software.

**Note:** It is not expected that there are two actions in the default set with the same MDID and different priority. However, if this happens, only one of them is selected, disregarding the other.

**Note:** A hit where all the action associated with it has priority 0 results the invocation of the default actions. To avoid that, the NOP action with non-0 priority value is used. Then, the hit causes no action.

### 7.9.1.5.5 VSI Reassignment

One of the actions supported by the ACL block is to change the destination VSI (applicable only for Rx packets). When this action is selected and based on its priority compared to previous set VSI actions, it causes the destination VSI associated with the packet to change.

When a VSI change occurs, the ACL block also updates the function context based on the new VSI value, according to the value in the applicable VSI\_VSI2F CSR.

The following cases causes the ACL block to mark the packet to be dropped following a VSI reassignment:

- The newly assigned VSI is disabled (i.e., VSI\_VSI2F[VSI].ENABLE is clear).
- The packet was an encrypted packet that went through in-line decryption. The newly assigned VSI is different than the original VSI, and GL\_SWT\_FUNCFLT.FUNCFILT is asserted.

### 7.9.1.6 Counters

#### 7.9.1.6.1 General

The count action is a fundamental feature of the ACL block. One or more count actions can either be associated with an entry hit by programming it to the relevant entry in the action memory (see [Section 7.9.1.5.3](#)), or be associated with a default action for a table/profile miss (see [Section 7.9.1.5.4](#)).

**Note:** Counters are an action associated with an entry(ies). Therefore, counters are agnostic to the traffic type or properties, and can count, for example, Tx/Rx traffic in the same counter.

**Note:** In case VSI reassignment has occurred, the VSI used for checking the enablement for counting is the "new VSI" as defined in [Section 7.9.1.5.5](#).

#### 7.9.1.6.2 Counting Drops

Count actions might be part of an action set that includes a drop command (that is, one or more tables hit resulted in both count and drop actions).

**Note:** Counter always counts. This allows the ability to count the number of dropped packets.

#### 7.9.1.6.3 Counter Banks

The ACL block in the E810 supports 2048, 40-bit wide, counters arranged in four banks/arrays, and is able to support up to four counter updates for the same search.

Each counter bank/array contains 512 counters according to the following distribution:

- Bank 0 contains counter indexes 0-511.
- Bank 1 contains counter indexes 512-1023.

- Bank 2 contains counter indexes 1024-1535.
- Bank 3 contains counter indexes 1536-2047.

**Note:** The update of more than a single counter in the same bank is forbidden and can yield unexpected behavior.

#### 7.9.1.6.4 Counters Read and Reset

The ACL counters are accessible via the following CSRs, where “bank offset” is the offset of the counter within the bank:

- Bank 0 counters are accessible via GLSTAT\_ACL\_CNT\_0\_L/H[bank offset].
- Bank 1 counters are accessible via GLSTAT\_ACL\_CNT\_1\_L/H[bank offset].
- Bank 2 counters are accessible via GLSTAT\_ACL\_CNT\_2\_L/H[bank offset].
- Bank 3 counters are accessible via GLSTAT\_ACL\_CNT\_3\_L/H[bank offset].

Since the counters are wider than a single 32-bit CSR access, the ACL block counters supports a 64-bit CSR access. A 64-bit access causes the hardware to latch the entire value of the counter and allows reading it using two consecutive 32-bit transactions without needing to check for wrap-around terms.

The counters are also accessible for write transaction. Any write transaction to a counter causes its value to be reset.

#### 7.9.1.6.5 Supported Count Actions

The ACL block supports three different action commands/MDIDs (see [Section 7.9.1.5.1](#)) for manipulating counters:

- **Count packets (MDID 56)** — When this action is used, the counter referenced by the action’s value field is incremented by one. The counter ID used in this command can be in the full range of counter indexes (0-2047) under the restriction on updates in the same bank (see [Section 7.9.1.6.3](#)).
- **Count bytes (MDID 57)** — When this action is used, the counter referenced by the action’s value field is incremented by the amount of bytes contained in the packet (the packet length). The counter ID used in this command can be in the full range of counter indexes (0-2047) under the restriction on updates in the same bank (see [Section 7.9.1.6.3](#)).
- **Count packets and bytes (MDID 58)** — When this action is used, the action’s value field references a counter dual and updates two counters in two separate banks. The counter referenced in the action’s value field is incremented by the one (that is, serves as a packet counter), while the counter indexed (index in the command +1024) is incremented by the amount of bytes contained in the packet (in other words, serves as a byte counter). The counter ID used in this command can be in half the range of counter indexes (0-1023) under the restriction on updates in the same bank (see [Section 7.9.1.6.3](#)).

Given that the ACL block only allows a single action of each type (see [Section 7.9.1.5.2](#)) and the restriction on same bank counter updates (see [Section 7.9.1.6.3](#)), the amount of valid combinations of counter manipulation actions for a single search is limited and is summarized in [Table 7-92](#).

**Table 7-92. Counter Actions Possible Combinations**

Counter Updates	Bank 0 (Index 0-511)	Bank 1 (Index 512-1023)	Bank 2 (Index 1023-1535)	Bank 3 (Index 1536-2047)
0	None	None	None	None
1	Count bytes or packets	None	None	None
1	None	Count bytes or packets	None	None
1	None	None	Count bytes or packets	None
1	None	None	None	Count bytes or packets
2	Count bytes	Count packets	None	None
2	Count packets	Count bytes	None	None
2	Count bytes	None	Count packets	None
2	Count packets	None	Count bytes	None
2	Count bytes	None	None	Count packets
2	Count packets	None	None	Count bytes
2	None	Count bytes	Count packets	None
2	None	Count packets	Count bytes	None
2	None	Count bytes	None	Count packets
2	None	Count packets	None	Count bytes
2	None	None	Count bytes	Count packets
2	None	None	Count packets	Count bytes
2	Count bytes and packets	None	None	None
2	None	Count bytes and packets	None	None
3	Count bytes and packets	Count bytes or packets	None	None
3	Count bytes or packets	Count bytes and packets	None	None
3	Count bytes and packets	None	None	Count bytes or packets
3	None	Count bytes and packets	Count bytes or packets	None
4	Count bytes and packets	Count bytes	None	Count packets
4	Count bytes and packets	Count packets	None	Count bytes
4	Count bytes	Count bytes and packets	Count packets	None
4	Count packets	Count bytes and packets	Count bytes	None

**Note:** When an action set contains two actions of the same type (for example, two “count bytes” actions), the hardware uses the priority mechanism to prioritize and yields a single action of each type, thus such programming is allowed (see [Section 7.9.1.5.2](#)). However, the hardware does not implement a mechanism to resolve multiple counter updates in the same counter bank.

## 7.9.1.7 Key Selection

### 7.9.1.7.1 General

The key used for each input depends on multiple factors including the packet type, the function, and the matched fields. It is therefore done in three separate levels:

1. Global level, selection base creation (see Section 7.9.1.7.2).
2. TCAM block level selection (see Section 7.9.1.7.3).

Each level is controlled by a different configuration. The three-level approach allows both flexible usage and optimized utilization of the TCAM blocks which are a relatively limited resource.

### 7.9.1.7.2 Selection Base

Figure 7-26 shows the generation of the selection base.

Figure 7-26. Selection Base Generation

### 7.9.1.7.2.1 Selection Base Vectors

The creation of the selection base involves the selection of the packet's properties and header fields that are available for all the TCAM blocks.

This stage is implemented using two sub-stages:

1. The extractor creates an extracted fields vector containing up to 32 words from the packet's header fields and status.
2. The key generation block selects fields from the extracted fields vector and generates the selection base.

Both extractor and key generation block configuration source is associated with a profile (see [Section 7.9.2.2](#)).

The selection base is comprised of the selection base vectors accumulating to 160 bytes (see [Figure 7-26](#)):

1. **Byte selection base** — A 32-byte vector containing byte-sized fields (32 fields supported). Selection of bytes from this vector for a match is done in byte resolution.
2. **Word selection base** — A 64-byte vector containing word-sized fields (32 fields supported). Selection of bytes from this vector for a match is done in word resolution.
3. **Double-word selection base** — A 64-byte vector containing double-word-sized fields (16 fields supported). Selection of bytes from this vector for a match is done in double-word resolution.

### 7.9.1.7.2.2 Range Checkers

A range checker is a mechanism that allows checking if a specific field, representing a natural number, is within range of two given natural numbers (that is, defining the boundaries).

The range checker output is positive if the field associated with it is within range (is higher than or equal to the low boundary and is lower than or equal to the high boundary), and is negative if it is out of the given range (is lower than the low boundary or is higher than the high boundary).

The ACL block in the E810 supports eight word-sized range checkers working concurrently. Each of the eight range checkers is associated with a specific word in the word selection base (see [Figure 7-26](#)). Also, each of the words mapped to a range checker includes a bit-level masking mechanism, which allows checking ranges for a sub-field in each word.

**Note:** Masking of words mapped to the range checkers is done between the word in the word selection base and the associated range checker, and is employed only for range checking purposes. This means that if a table selects one of these words as part of its key, it gets the unmasked version of the word.

The range checkers output is mapped to the byte selection base (see [Section 7.9.1.7.2](#)) and can be used for matching.

The range checkers boundaries are a profile dependent configuration (see [Section 7.9.2.6](#)), and thus the ACL block can virtually support 1,024 range checkers (eight range checkers per profile).

**Note:** Logical combination of several checkers for forming a single match is possible. For example, by requiring several range checkers positive/negative output in the relevant table entry a logical AND can be created between range checkers.

### 7.9.1.7.2.3 Fixed Fields and Restrictions

The selection of fields to each selection base vector is part of the profile specific programming (see [Section 7.9.2.2](#)) and is (in general) flexible, meaning that any field can be selected to any location in the selection base. There are, however, several fixed fields located in the selection base, which impose restrictions that apply for selection of fields to the selection base.

#### Byte selection base fixed fields:

- Byte index 31 contains the range checkers output (see [Section 7.9.1.7.2.2](#)). Each bit index  $n$  in this byte corresponds to a range checker index  $n$  output.
- Byte index 30 contains the selected Profile ID.

#### Word selection base restrictions:

- Word indexes 0-7 are the only words that can be used for range check (see [Section 7.9.1.7.2.2](#)). Each word index  $n$  is associated with range checker index  $n$  input.

**Note:** It is emphasized that the restriction mentioned above, only relates to the ability of selecting a source for the range checkers. This does not impose any restriction on the ability of selecting a word from the extracted fields to these words in the word selection base.

#### Double-word selection base fixed fields:

- Double-word index 15 contains the extracted fields vector valid indication per word (a total of 32 valid indication bits). Each word  $n$  of the extracted fields vector valid indication is associated with bit  $n$  in double-word 15.

### 7.9.1.7.3 TCAM Key Byte Selection

The TCAM key byte selection occur in each TCAM level. As mentioned in [Section 7.9.1.4.2](#), the ACL block in the E810 includes 16 TCAM blocks, each supporting a 40-bit wide key. Each TCAM block supports selecting each of the five bytes of the key used for a match out of the three fields vectors constituting the selection base (see [Section 7.9.1.7.2](#)).

The configuration of the TCAM byte selection is associated with a scenario (see [Section 7.9.1.8](#)) and depends on the structure of the selection base, the tables being used (that is, the fields being matched) and the specific table configuration used to implement the tables (see [Section 7.9.1.4](#)). The same factors are taken into account when programming the contents of each TCAM block.

The TCAM byte selection available options are defined in [Table 7-93](#), where each byte is selected independently.

**Table 7-93. TCAM Byte Selection Options**

Byte Index	Bit Indexes	Byte Fields	Word Fields	Double Word Fields
4	[39:32]	Any byte (32 options)	Not available	Not available
3	[31:24]	Any byte (32 options)	Bits 15:8 of any word (32 options)	Bits 31:24 of any double word (16 options)
2	[23:16]	Any byte (32 options)	Bits 7:0 of any word (32 options)	Bits 23:16 of any double word (16 options)
1	[15: 8]	Any byte (32 options)	Bits 15:8 of any word (32 options)	Bits 15:8 of any double word (16 options)
0	[7: 0]	Any byte (32 options)	Bits 7:0 of any word (32 options)	Bits 7:0 of any double word (16 options)

## 7.9.1.8 The Scenario Mechanism

A scenario is a set of configuration including:

- TCAM blocks configuration (cascading or stacking) for supporting flexible table sizing (see [Section 7.9.1.4.2](#)).
- TCAM blocks enablement for supporting concurrent table support (see [Section 7.9.1.4.3](#)).
- TCAM blocks specific entries enablement for supporting non-concurrent table support (see [Section 7.9.1.4.4](#)).
- Key selection configuration for each TCAM block (see [Section 7.9.1.7.3](#)).
- Association of action memories to TCAM blocks and enablement of each action memory (see [Section 7.9.1.5.3](#)).

The ACL block in the E810 supports 64 independent scenario sets. The selection of which scenario set to use for a given input is based on the profile selected (see [Section 7.9.2.6](#)) and the PF.

## 7.9.2 ACL Programming

### 7.9.2.1 General

This section depicts the relevant flows and methods for programming the ACL block.

### 7.9.2.2 Configuration Sources

There are three types of configuration origins in the ACL block (see [Figure 7-27](#)):

- **Global Configuration** — A block-wide configuration that is not dependent on the incoming command.
- **Profile-Based Configuration** — Settings are loaded according to the selected Profile ID. Each of these settings has a unique value for each Profile ID.
- **Scenario-Based Configuration** — Settings are loaded according to the selected scenario. Each of these settings has a unique value for each scenario.

Figure 7-27. Configuration Sources<sup>1</sup>

1. Number of profiles is 127 to signify that one profile is the bypass one.

### 7.9.2.3 TCAM Entry Configuration

As described in Section 7.9.1.4, a TCAM block is 40 bits wide and can be used to implement a table or part of a table. No matter which of part of the table the TCAM block is implementing, its entry is configured using the same basic principals.

The programming of the TCAM blocks' entries is done using the indirect access mechanism. Each TCAM block entry programming is comprised of writing two values:

- **The key** — A 40-bit wide value that is matched against an incoming key/key part. This value is programmed using the GL\_ACL\_TCAM\_KEY\_L/H CSRs.
- **The key invert** - A 40-bit wide 1's compliment value of the key used to define a "don't care" or a mask operation (see Section 7.9.1.3). This value is programmed using the GL\_ACL\_TCAM\_KEY\_INV\_L/H CSRs.

The functionality per entry bit derived from the different combinations of key and key invert programming is explained in Table 7-94.

Table 7-94. Key and Key Invert Programming Effect

Key Value	Key Invert Value	Functionality
1	1	Don't care (bit always matches)
1	0	Entry bit holds a '0' value.
0	1	Entry bit holds a '1' value.
0	0	Bit never matches (invalidate entry)

### 7.9.2.4 Action Memory Entry Configuration

As described in Section 7.9.1.5.3, the ACL block includes 20 action memories, each containing 512 entries of two actions.

The programming of action memories entries is done using the indirect access mechanism. The two actions associated with each entry is programmed using the GL\_ACL\_ACTMEM\_CFG array.

- The GL\_ACL\_ACTMEM\_CFG[action index].PRIORITY field is programmed with the action’s priority to be used for the action prioritization mechanism (see Section 7.9.1.5.2).
- The GL\_ACL\_ACTMEM\_CFG[action index].MDID field is programmed with the action’s metadata identifier.
- The GL\_ACL\_ACTMEM\_CFG[action index].VALUE field is programmed with the action’s value (the meaning of the value depends on the action type).

### 7.9.2.5 Scenario-Dependent Configuration

As described in Section 7.9.1.8, the ACL block supports a total of 64 scenarios.

The programming of the scenario dependent configuration is done using the indirect access mechanism.

The configuration associated with each scenario is divided to two configuration sets (see Figure 7-28):

- Scenario Configuration per TCAM block (see Section 7.9.2.5.1).
- Action memories association to TCAM blocks (see Section 7.9.2.5.2).

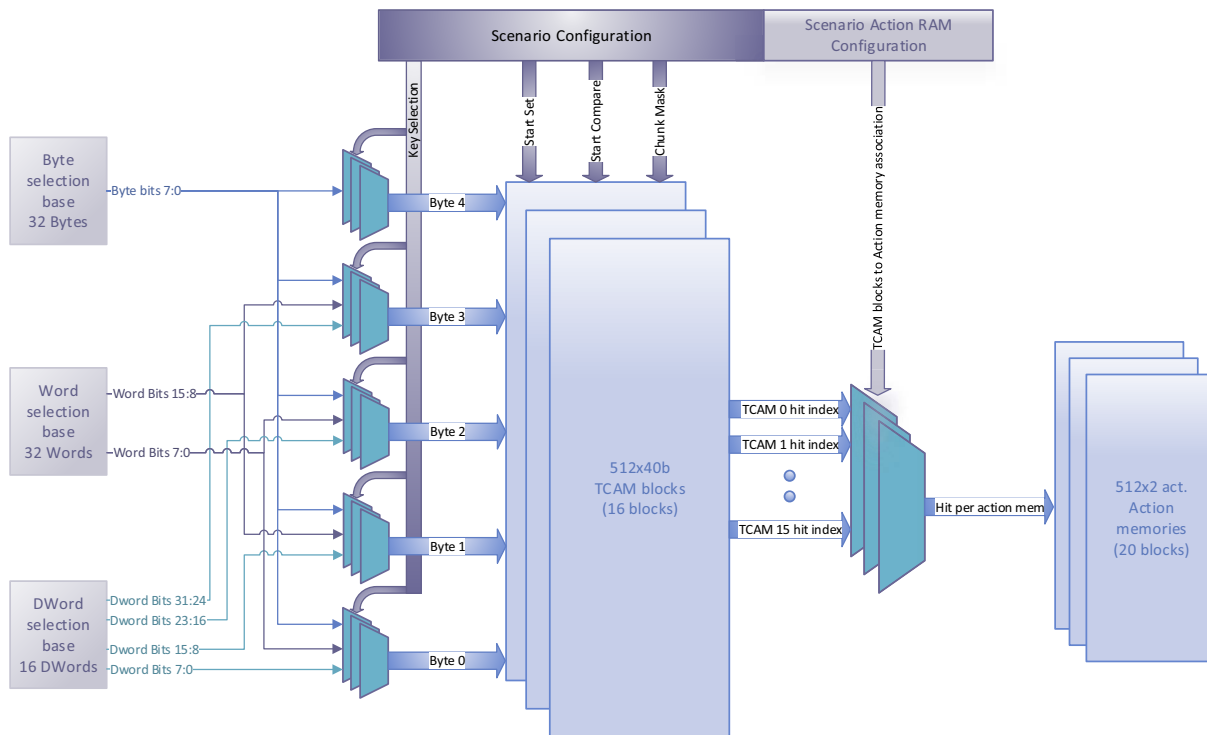

Figure 7-28. Scenario-Dependent Configuration

### 7.9.2.5.1 Scenario Configuration per TCAM

Scenario Configuration per TCAM block includes:

- Key selection for each of the 5-byte key for each TCAM (see [Section 7.9.1.7.3](#)):
  - Byte 0 selection is programmed in `GL_ACL_SCENARIO_CFG_L[TCAM index].SELECT0`.
  - Byte 1 selection is programmed in `GL_ACL_SCENARIO_CFG_L[TCAM index].SELECT1`.
  - Byte 2 selection is programmed in `GL_ACL_SCENARIO_CFG_L[TCAM index].SELECT2`.
  - Byte 3 selection is programmed in `GL_ACL_SCENARIO_CFG_L[TCAM index].SELECT3`.
  - Byte 4 selection is programmed in `GL_ACL_SCENARIO_CFG_H[TCAM index].SELECT4`.
  - See CSR fields description for more information about the selection value.
- **Note:** Refer to [Table 7-93](#) for the selection options.
- Entry masking in 64-entries resolution for each TCAM (see [Section 7.9.1.4](#)):
  - The masking is programmed in `GL_ACL_SCENARIO_CFG_H[TCAM index].CHUNKMASK`.
  - Each bit masks 64 entries (that is, bit 0 masks entries 0-63, bit 1 masks entries 64-127, and so on).
- **Note:** When an entire TCAM is masked (`CHUNKMASK` for a specific TCAM is set to 0x00), the TCAM block is power gated.
- TCAM blocks configuration for implementing flexible table sizes (see [Section 7.9.1.4.2](#)):
  - The StartCompare setting is programmed in `GL_ACL_SCENARIO_CFG_H[TCAM index].START_COMPARE`.
  - The StartSet setting is programmed in `GL_ACL_SCENARIO_CFG_H[TCAM index].START_SET`.

### 7.9.2.5.2 Action Memories-to-TCAM Association

The mapping of action memories to TCAMs is programmed using the indirect access mechanism.

Each memory can be associated to a single TCAM block, thus making it possible to support a topology in which the same TCAM block is associated with several action memories (to support more than two actions per hit) or be completely disabled (allowing it to be power-gated). When using TCAM cascade (see [Section 7.9.1.4.2.1](#)), the action memory(ies) associated with the cascade is associated with the last TCAM block in the cascade.

The TCAM block index associated with the action memory is programmed in `GL_ACL_SCENARIO_ACT_CFG[action memory index].ACTMEM_SEL`.

Action memory enable/disable status is programmed in `GL_ACL_SCENARIO_ACT_CFG[action memory index].ACTMEM_EN`.

### 7.9.2.6 General Profile-Dependent Configuration

Any incoming command passes through the profile selection stage as the initial stage in the ACL. The selection of the profile is similar to all blocks in the packet processing pipeline and depends on the packet's properties and associated function.

The profile selection result is the Profile ID which loads a specific profile dependent configuration which is unique per profile. The profile dependent configuration in the ACL block includes (see [Figure 7-27](#)):

- **Fields extractor selection** (see [Section 7.5](#)).
- **Byte selectionbase select** — Selection for each of the bytes in the byte selection base programmed in `GL_ACL_PROFILE_BWSB_SEL[byte index].BSB_SRC_OFF`.
- **Word selectionbase select** — Selection for each of the words in the words selection base programmed in `GL_ACL_PROFILE_BWSB_SEL[word index].WSB_SRC_OFF`.
- **Double-word selection base select** — Selection for each of the double-words in the double-words fields vector programmed in `GL_ACL_PROFILE_DWSB_SEL[DWord index].DWORD_SEL_OFF`.

Scenario selection per PF programmed in `GL_ACL_PROFILE_PF_CFG[PF index].SCEN_SEL`. Profile-dependent configuration access is done using the indirect access mechanism.

**Note:** As mentioned in [Section 7.9.1.5.4](#), profile index 0 is a special profile index reserved for input commands that are not associated with any profile and are thus not performing any search in the ACL. Attempting to program a profile dependent configuration for profile index 0 is treated by the hardware as an error.

**Note:** As mentioned in [Section 7.9.1.7.2.3](#), bytes indexes 30 and 31 in the byte selection base are occupied by fixed fields and thus the value of `GL_ACL_PROFILE_BWSB_SEL[30].BSB_SRC_OFF` and `GL_ACL_PROFILE_BWSB_SEL[31].BSB_SRC_OFF` is ignored by hardware.

## 7.9.2.7 Range Checkers Profile-Dependent Configuration

As mentioned in [Section 7.9.1.7.2.2](#), the range checkers configuration is a profile-dependent configuration. The range checkers profile dependent configuration in the ACL block includes (see [Figure 7-27](#)):

- Range checkers boundaries for each of the range checkers programmed in `GL_ACL_PROFILE_RC_CFG[range checker index]`.
- Range checkers fields mask for each of the range checkers programmed in `GL_ACL_PROFILE_RCF_MASK[range checker index]`.

The range checkers profile dependent configuration access is done using the indirect access mechanism.

## 7.9.2.8 Default Action Programming

As described in [Section 7.9.1.5.4](#), the ACL block allows each VSI to be associated with two sets of actions (out of possible four) that are used as the action set in case of a profile miss or a table miss.

The action sets are configured in the `GL_ACL_DEFAULT_ACT` array in which every array member defines a single action (out of possible four) in a single set (out of possible four).

- `GL_ACL_DEFAULT_ACT[set index*4action index].PRIORITY` is used to program the action's priority.
- `GL_ACL_DEFAULT_ACT[set index*4+action index].MDID` is used to program the action's Metadata ID.
- `GL_ACL_DEFAULT_ACT[set index*4+action index].VALUE` is used to program the action's value.

For an Rx input, the selection of default action set is programmed for a destination VSI (as determined by a previous block such as the switch) in `VSI_ACL_DEF_SEL[VSI index].RX_PROFILE_MISS_SEL` for profile miss, and in `VSI_ACL_DEF_SEL[VSI index].RX_TABLES_MISS_SEL` for tables miss.

For a Tx input, the selection of default action set is programmed for a source VSI in `VSI_ACL_DEF_SEL[VSI index].RX_PROFILE_MISS_SEL` for profile miss, and in `VSI_ACL_DEF_SEL[VSI index].RX_TABLES_MISS_SEL` for tables miss.

**Note:** If one or more of the default actions involves counter manipulation, all the rules and restrictions related to counter manipulation is followed (see [Section 7.9.1.6](#)).

## 7.9.2.9 VSI Count Programming

Count enablement per VSI (see [Section 7.9.1.6.1](#)) is programmed in `VSI_ACL_CNT_EN[VSI].COUNT_EN`.

**Note:** In case of a VSI reassignment, the VSI referred to with respect to VSI count enablement is be the new VSI.

## 7.9.2.10 Reset and Initialization

### 7.9.2.10.1 Reset Sources

The ACL block's main reset source is the device's core reset (CORER) or any higher level reset source that triggers a core reset. When CORER is asserted, the hardware clears:

- Profile association and profile dependent configuration (see [Section 7.9.2.6](#)).
- Scenario configuration per TCAM (see [Section 7.9.2.5.1](#)).
- Action memories to TCAM association (see [Section 7.9.2.5.2](#)).
- Counters (see [Section 7.9.1.6](#)).
- Default action configuration (see [Section 7.9.2.8](#)).

Hardware does not handle function resets. It is up to the firmware or software to handle these resets.

When a PF is being reset, firmware releases the resources allocated to it (see [Section 7.9.3.2](#)), which makes the resources available and guarantees that no incoming command searches the reseted PF tables. It is emphasized that the firmware is not required to invalidate the table entries contents.

**Note:** When a graceful PF reset occurs (that is, the software driver unloads), the software driver is expected to release its resources in a graceful manner (see [Section 7.9.3.2](#)) by issuing a command to the firmware to release all its resources (see [Section 7.9.3.4.2.9](#)).

When a VF is being reset, software (the relevant PF driver) clears (invalidate) the entries associated with the VF being reset.

### 7.9.2.10.2 Initialization

#### 7.9.2.10.2.1 Initial State and Reset Values

With the exception of the default action sets (see [Section 7.9.1.5.4](#)) that are expected to be loaded by either NVM or firmware, the ACL block has no pre-configured content following a hardware reset event (see [Section 7.9.2.10.1](#)). This means that there will not be any profiles allocated or associated with any traffic type and hence no scenarios are allocated nor tables populated. All incoming traffic is expected to hit the default "no profile hit" profile (programmed in `GL_ACLEXT_DFLT_L2PRFL_ACL`).

The only applicable flow at this state is the default action flow related to profile miss (see [Section 7.9.1.5.4](#)). This flow is only relevant once VSIs are added to the system and thus, when adding a VSI to the system, the default action set selection for that VSI must be programmed (see [Section 7.9.2.8](#)) as part of the process.

### 7.9.2.10.2.2 Allocated Resources Initialization

No assumption is made on the initial content of allocated resources (see [Section 7.9.3.2](#)). Whenever a resource is allocated, the software driver that received the resource allocation completely initializes/programs the resource.

Specifically, no assumption is made regarding the contents of the allocated table entries (see [Section 7.9.3.2.1](#)) and software is expected to invalidate all allocated entries prior to enabling the table entries in the scenario.

As mentioned in [Section 7.9.2.10.2.1](#), when a PF reset occurs, the EMP firmware releases the relevant function's allocated resources but does not clear/invalidate the contents.

## 7.9.3 ACL Operation and Management

### 7.9.3.1 General

This section depicts the concepts and flows related to the operation and management of the ACL block.

### 7.9.3.2 Resource Allocation

The ACL block's resources are shared by the system's functions. To allow efficient use of the ACL block's resources, the EMP firmware is used for managing the ACL block resources allocation.

When a PF driver wishes to populate any of the resources in the list below, it requests an allocation from EMP firmware using the relevant AQ command. Similarly, when a PF driver wishes to release an allocated resource it requests the EMP firmware to deallocate the relevant resources and allow other PFs to use it.

**Note:** When a PF is reset, the EMP firmware releases its resources without requiring the PF to issue the relevant AQ command/s.

The ACL block resources allocated by the EMP firmware are:

- TCAM blocks and entries
- Action memories
- Profiles
- Scenarios
- Counters

#### 7.9.3.2.1 Tables and Actions Allocation and Programming

The driver is able to request a table allocation and a set of corresponding action memory entries in the ACL block using the `allocate_acl_table` AQ command (see [Section 7.9.3.4.2.1](#)). The EMP firmware allocates TCAM blocks and entries according to the rules and restrictions described in [Section 7.9.1.4](#).

When allocating a new table, the software indicates whether the table is a non-concurrent table (see [Section 7.9.1.4.4](#)), which can be allocated in any TCAM block unrelated to other allocated tables, or a concurrent table (see [Section 7.9.1.4.3](#)), and then the software can specify up to 12 previously allocated tables which cannot share a TCAM block with the new table.

The allocated tables is rounded to 64x40-bit units. For example, when the driver requests to allocate a table of 120 entries of 60 bits, it allocates a 128x80-bit table (that is, two blocks of 64 entries in two adjacent TCAM blocks).

In addition, the EMP firmware allocates action memories according to the amount of actions requested in the command. Action memories are allocated according to the guidelines described in [Section 7.9.1.5.3](#).

**Note:** Action pairs can be allocated and added to the allocated table in a later stage using the `allocate_acl_actionpair` command (see [Section 7.9.3.4.2.3](#)). The minimal allocated action pairs (a set of two actions) per table is 1.

Similarly, the driver is able to request releasing a table allocated to it using the `deallocate_acl_table` AQ command (see [Section 7.9.3.4.2.2](#)). Following this command, the EMP firmware is allowed to allocate the TCAM blocks and entries in addition to the action memories associated with the released table to other drivers usage.

**Note:** An action pair that was allocated and added to an allocated table using the `allocate_acl_actionpair` command (see [Section 7.9.3.4.2.3](#)) can be deallocated using the `deallocate_acl_actionpair` command (see [Section 7.9.3.4.2.4](#)) without deallocating the entire table resources.

Table entry programming is done using the `program_acl_entry` command (see [Section 7.9.3.4.3.5](#)) and querying an entry is done using the `query_acl_entry` command (see [Section 7.9.3.4.4.4](#)). When programming or querying a table entry, the EMP firmware follows the guidelines described in [Section 7.9.2.3](#).

Action pairs can be programmed using the `program_acl_actionpair` command (see [Section 7.9.3.4.3.2](#)) and querying an action pair is done using the `query_acl_actionpair` command (see [Section 7.9.3.4.3.5](#)). When programming or querying an action pairs, the EMP firmware follows the guidelines described in [Section 7.9.2.4](#).

### 7.9.3.2.2 Profile Allocation and ACL-Related Configuration

Profile allocation and deallocation in the ACL block is similar to the methods defined in other blocks (for example, the switch or post-switch) defined in [Section 7.8.10, "Resource Allocation"](#), and are beyond the scope of this discussion.

When a profile is requested by the driver, the EMP firmware allocates a free Profile ID and associates the profile with the requesting PF. It then allows the PF to program the general and range checkers profile-dependent configuration for the allocated Profile ID (see [Section 7.9.2.6](#) and [Section 7.9.2.7](#)).

General profile-dependent configuration is done using the `program_acl_profile_extraction` command (see [Section 7.9.3.4.3.3](#)) and querying a general profile dependent configuration is done using the `query_acl_profile` command (see [Section 7.9.3.4.4.1](#)). When programming or querying a general profile-dependent configuration, the EMP firmware follows the guidelines described in [Section 7.9.2.6](#).

Range checkers profile-dependent configuration is done using the `program_acl_profile_ranges` command (see [Section 7.9.3.4.3.4](#)) and querying a range checker profile dependent configuration is done using `query_acl_profile_ranges` command (see [Section 7.9.3.4.4.2](#)). When programming or querying a range checkers profile dependent configuration, the EMP firmware follows the guidelines described in [Section 7.9.2.7](#).

### 7.9.3.2.3 Scenario Allocation and Programming

The driver is able to request a scenario allocation in the ACL block using the `allocate_acl_scenario` AQ command (see [Section 7.9.3.4.2.5](#)). When allocating a scenario, the software is able to program it with an initial programming.

The EMP firmware allocates a free scenario for the software and programs it with the initial programming requested in the command. Updating the configuration is possible using the `update_acl_scenario` command (see [Section 7.9.3.4.3.1](#)) and querying an allocated scenario configuration is done using the `query_acl_scenario` command (see [Section 7.9.3.4.2.6](#)).

When configuring/updating/querying a scenario, the EMP firmware follows the guidelines described in [Section 7.9.2.5](#).

Similarly, the driver can request to deallocate a scenario allocated for it using the `deallocate_acl_scenario` command (see [Section 7.9.3.4.2.6](#)).

### 7.9.3.2.4 Counters Allocation

The driver is able to request an allocation of a block of counters using the `allocate_acl_counters` command (see [Section 7.9.3.4.2.7](#)). The counters allocated are of the same type (see more information about counter types in [Section 7.9.1.6](#)).

Similarly, the driver can request to deallocate a group of counters previously allocated for it using the `deallocate_acl_counters` command (see [Section 7.9.3.4.2.8](#)).

**Note:** The driver is not required to deallocate an entire block of counters allocated for it using the `allocate_acl_command` and can elect to deallocate only part of the counters allocated for it.

When allocating counters, the EMP firmware attempts to allocate a contiguous block of counters according to the driver's request. If the allocation fails, the driver might be able to allocate the same amount of counter in a non-contiguous block by invoking several allocation requests for smaller amounts of counters.

**Note:** The driver is responsible on maintaining the VSI related counters configuration ([Section 7.9.2.9](#)).

## 7.9.3.3 Software Flows

### 7.9.3.3.1 Initialization

As mentioned in [Section 7.9.2.10.2](#), the ACL block default state is uninitialized. This means that even if software does not wish to use the ACL block, it has to define the default set of actions that is applied for each added VSI (see [Section 7.9.1.5.4](#) and [Section 7.9.2.8](#)).

The configuration of the default action set used by the VSI for a profile miss and table miss is done using the Add VSI and Update VSI commands (see [Table 7-50](#) for buffer format).

As there is no default configuration associated with the ACL block, all traffic that misses the profiles lookup, should be associated with profile 0 and be applied with the default action set associated with the VSI.

### 7.9.3.3.2 General Table Allocation Flow

As a prerequisite, before allocating and populating a table (and for each allocated table), software needs to determine the following items:

- Which header fields is available for lookup and range checking.
- What is the fields location in the selection base (byte/words/double words).
- The desired key structure that is used for lookup.

When the software wishes to allocate and populate a table in the ACL block, it executes the following flow:

1. Request a table allocation using the `allocate_acl_table` command (see [Section 7.9.3.4.2.1](#)). The table can be either concurrent or non-concurrent (see [Section 7.9.3.2.1](#)). The table width corresponds to the determined key width and the table depth corresponds to the expected amount of entries that is populated.

**Note:** If the amount of action pairs associated with the table is known at this stage, software specifies it in the command. Otherwise, software specifies 1 (the minimal value) as the requested amount of action pairs to be associated with the table.

2. Initialize the resources allocated in [Step 1](#):
  - a. Invalidate all allocated TCAM entries by setting all key and key invert bits to each entry using the `program_acl_entry` command (see [Section 7.9.3.4.3.5](#)).
  - b. Invalidate all allocated action pairs by clearing the action entries using the `program_acl_actionpair` command (see [Section 7.9.3.4.3.2](#)).
3. Allocate a scenario using the `allocate_acl_scenario` command (see [Section 7.9.3.4.2.5](#)) or alternatively, use a previously-allocated scenario and configure it to use the resources allocated in [Step 1](#):
  - a. Configure which TCAM blocks and entries are masked for this scenario.  
**Note:** Any TCAM block and entries that were not allocated for the driver must be masked.
  - b. Configure the configuration of TCAM blocks (for example. cascaded, stacked).
  - c. Configure the selection of key bytes into each of the TCAM blocks from the selection base vectors.
  - d. Configure the association of action memories to TCAM blocks.
4. If no relevant profile was previously allocated, allocate a profile and configure the extracted fields vector.
5. Configure the ACL profile dependent configuration for the profile allocated/used in [Step 4](#):
  - a. Program the byte, word, and double-word selection bases composition by configuring the relevant selections.
  - b. Program the scenario ID allocated in [Step 3](#) to be associated with this profile.
6. Associate the ACL profile allocated/used in [Step 4](#) with the relevant traffic/VSI.

**Note:** At this stage, the table is allocated and a lookup is being performed for each relevant incoming packet. The software can start adding entries to the table (see [Section 7.9.3.3.4](#)) or action pairs to it (see [Section 7.9.3.3.3](#)).

### 7.9.3.3.3 Action Pair Allocation Flow

A prerequisite for allocating an action pair is to allocate a table using the table allocation flow (see [Section 7.9.3.3.2](#)).

When software wants to add another action pair to an existing table, it executes the following flow:

1. Request an action pair allocation using the `allocate_acl_actionpair` command (see [Section 7.9.3.4.2.3](#)).
2. Initialize the resources allocated in [Step 1](#):
  - a. Invalidate all allocated action pairs by clearing the action entries using the `program_acl_actionpair` command (see [Section 7.9.3.4.3.2](#)).
3. Update the relevant scenario using the `update_acl_scenario` command (see [Section 7.9.3.4.3.1](#)):
  - a. Configure the association of allocated action memories to TCAM blocks.

**Note:** At this stage, the action pair is allocated and is associated with the relevant tables. The software can start adding actions to it by invoking the `program_acl_actionpair` command (see [Section 7.9.3.4.3.2](#)).

### 7.9.3.3.4 Table Entries Addition Flow

A prerequisite for adding an entry to a table is to allocate a table using the table allocation flow (see [Section 7.9.3.3.2](#)).

When software wants to add an entry to a table, it executes the following flow:

1. Optionally, if used by the entry, configure the range checkers that is used in the profiles enabling this table using the `program_acl_profile_ranges` command (see [Section 7.9.3.4.3.4](#)).
2. Optionally, if used by the entry, allocate counter(s) for the entry using the `allocate_acl_counters` command (see [Section 7.9.3.4.2.7](#)).
3. Program the action pairs associated with the table (either by the action pair allocation flow or the table allocation flow) using the `program_acl_actionpair` command (see [Section 7.9.3.4.3.4](#)).
4. Program the entry key and key invert to the relevant entry using the `program_acl_entry` command (see [Section 7.9.3.4.3.5](#)) for all TCAM blocks forming the table.

**Note:** At this stage, the entry is programmed in the table and any packet hitting it invokes the actions associated with it.

### 7.9.3.3.5 Table Entries Removal Flow

When software wants to remove an entry from a table, it executes the following flow:

1. Invalidate the relevant entry by setting all bits in the key and key invert using the `program_acl_entry` command (see [Section 7.9.3.4.3.5](#)) for all TCAM blocks forming the table.

**Note:** At this stage, no packet hits the entry.

2. Optionally, if counter(s) were used by the entry and are no longer required, deallocate the counter(s) used by the entry using the `deallocate_acl_counters` command (see [Section 7.9.3.4.2.8](#)).
3. Optionally, if additional action pairs were added to the table using the `allocate_acl_actionpair` command (see [Section 7.9.3.4.2.3](#)) and are no longer required, deallocate the additional action pairs by using the `deallocate_acl_actionpair` command (see [Section 7.9.3.4.2.4](#)).

**Note:** At this stage, the entry is removed and all its private resources free.

### 7.9.3.3.6 Table Removal Flow

When software wants to remove an entire table, it executes the following flow:

1. If there are active scenarios that are enabling the table, mask the relevant TCAM entries/slices in all the scenarios that are enabling the table by using the `update_acl_scenario` command (see [Section 7.9.3.4.3.1](#)).

**Note:** At this stage, no packet performs a lookup in the table.

2. Optionally, if counter(s) were used by the table and are no longer required, deallocate the counter(s) used by the table using the `deallocate_acl_counters` command (see [Section 7.9.3.4.2.8](#)).

3. Deallocate the table using the `deallocate_acl_table` command (see [Section 7.9.3.4.2.2](#)).

**Note:** At this stage, the table is removed and all its private resources freed.

### 7.9.3.3.7 Scenario Removal Flow

**Important:** An active profile (a profile associated with active traffic) must point to a valid scenario. Therefore, the profile must be either disabled (for example, by preventing the relevant PF from selecting it), removed, or routed to a different valid scenario prior to removing the scenario.

When software wants to remove a scenario, it executes the following flow:

1. Prevent all profiles selecting the scenario from selecting the scenario by either:
  - a. Preventing the PFs selecting the scenario from selecting the relevant profiles (unsubscribe the relevant VSIs from the profiles).
  - b. Remove the profiles.
  - c. Change the scenario pointed by the profiles to a different valid scenario by using the `program_acl_profile_extraction` command (see [Section 7.9.3.4.3.3](#)).
2. Deallocate the scenario by using the `deallocate_acl_scenario` command (see [Section 7.9.3.4.2.6](#)).

**Note:** At this stage, the scenario is free.

## 7.9.3.4 ACL Block Admin Queue Commands

### 7.9.3.4.1 General

This section describes the Admin Queue commands related to the ACL operation and management. The Admin Queue operation is described in [Section 9.5](#), and the general Admin Queue command format is described in [Section 9.5.5](#).

The ACL block's Admin Queue commands are divided into three main groups:

- **Resource allocation commands** — These commands are used for resource allocation/deallocation and, in some cases, initial programming or configuration of the resources.
- **Programming/update commands** — These commands are used for allocated resources programming or updating.

- **Query commands** — These commands are used for querying the allocated resources programming/status for reprogramming or debug.

The ACL block Admin Queue commands are summarized in [Table 7-95](#).

**Table 7-95. Admin Queue Commands Summary**

Resource	Allocation/Deallocation	Programming	Querying
Tables	<ul style="list-style-type: none"> <li>• allocate_acl_table Command (<a href="#">Section 7.9.3.4.2.1</a>)</li> <li>• deallocate_acl_table Command (<a href="#">Section 7.9.3.4.2.2</a>)</li> </ul>	<ul style="list-style-type: none"> <li>• program_acl_entry Command (<a href="#">Section 7.9.3.4.3.5</a>)</li> </ul>	<ul style="list-style-type: none"> <li>• query_acl_entry Command (<a href="#">Section 7.9.3.4.4.4</a>)</li> </ul>
Actions	<ul style="list-style-type: none"> <li>• allocate_acl_actionpair Command (<a href="#">Section 7.9.3.4.2.3</a>)</li> <li>• deallocate_acl_actionpair Command (<a href="#">Section 7.9.3.4.2.4</a>)</li> </ul> <p><b>Note:</b> Action pairs are also allocated/deallocated as part of the table allocation.</p>	<ul style="list-style-type: none"> <li>• program_acl_actionpair Command (<a href="#">Section 7.9.3.4.3.2</a>)</li> </ul>	<ul style="list-style-type: none"> <li>• query_acl_actionpair Command (<a href="#">Section 7.9.3.4.4.5</a>)</li> </ul>
Scenarios	<ul style="list-style-type: none"> <li>• allocate_acl_scenario Command (<a href="#">Section 7.9.3.4.2.5</a>)</li> <li>• deallocate_acl_scenario Command (<a href="#">Section 7.9.3.4.2.6</a>)</li> </ul>	<ul style="list-style-type: none"> <li>• update_acl_scenario Command (<a href="#">Section 7.9.3.4.3.1</a>)</li> </ul> <p><b>Note:</b> The initial scenario configuration is done on allocation.</p>	<ul style="list-style-type: none"> <li>• query_acl_scenario Command (<a href="#">Section 7.9.3.4.4.3</a>)</li> </ul>

## 7.9.3.4.2 Resource Allocation Commands

### 7.9.3.4.2.1 allocate\_acl\_table (0x0C10)

The `allocate_acl_table` command is used by software to allocate a virtual table and its associated action entries in the ACL block.

**Table 7-96. allocate\_acl\_table Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C10	Command opcode.
Datalen	4-5	32	Indirect data length in bytes, with space for completion.
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
TableWidth	16-17		Requested table width in bits. Minimum width is TCAP entry which is 40 bits.
TableDepth	18-19		Requested table depth.
Action Pairs for Entry	20		Amount of action pairs per table entry. The minimal valid value for this field is 1 (a single pair of actions).
TableType	21		Table type. This field is set to 0x0 for a non-concurrent table (see <a href="#">Section 7.9.1.4.4</a> ) allocation. For a concurrent table (see <a href="#">Section 7.9.1.4.3</a> ) allocation, this field specifies the amount of concurrent tables whose Alloc IDs are specified in the <i>Concurrent AllocIDs</i> field (up to 15 concurrent tables). Thus, the new allocated table is concurrent with the table IDs specified in Alloc IDs. <b>Note:</b> The EMP firmware blocks commands with an out-of-bound value in this field.
Reserved	22-23		Reserved.
Data Address High	24-27		Indirect data pointer high.
Data Address Low	28-31		Indirect data pointer low.

[Table 7-97](#) specifies the format of the indirect buffer:

**Table 7-97. allocate\_acl\_table Buffer Format**

Name	Bytes.Bits	Comments
Dependent AllocIDs	0-29	Dependent tables AllocIDs. Each word in this 15-word array specifies a dependent table Alloc ID (up to 15 Alloc IDs can be specified) according to the amount specified in the <i>TableType</i> field. All unused words are set to 0xFFFF.

The EMP firmware responds with a completion command (described in [Table 7-98](#)) containing an allocation status and, if allocation succeeded, the allocated resources IDs.

**Table 7-98. Completion for allocate\_acl\_table Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C10	Command opcode.
Datalen	4-5	32	Indirect data length in bytes, with space for completion.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
TableWidth	16-17		Requested table width.
TableDepth	18-19		Requested table depth.
Action Pairs for Entry	20		Amount of action pairs per table entry. The minimal valid value for this field is 1 (a single pair of actions).
TableType	21		Table type. This field is set to 0x0 for a non-concurrent table (see <a href="#">Section 7.9.1.4.4</a> ) allocation. For a concurrent table (see <a href="#">Section 7.9.1.4.3</a> ) allocation, this field specifies the amount of concurrent tables whose Alloc IDs are specified in the <i>Concurrent AllocIDs</i> field (up to 15 concurrent tables). Thus, the new allocated table is concurrent with the table IDs specified in Alloc IDs. <b>Note:</b> The EMP firmware blocks commands with an out-of-bound value in this field.
Reserved	22-23		Reserved.
Data Address High	24-27		Indirect data pointer high.
Data Address Low	28-31		Indirect data pointer low.

Table 7-99 specify the format of the indirect buffer.

**Table 7-99. Completion for allocate\_acl\_table Buffer Format**

Name	Bytes.Bits	Comments
Alloc_ID	0-1	If <i>Alloc_ID</i> is below 0x1000, allocation failed due to unavailable resources. Otherwise, successful allocation, this field is used by firmware to identify the table allocation.
First_TCAM	2	Index of the first allocated TCAM block. This field is set to 0xFF for a failed allocation.
Last_TCAM	3	Index of the last allocated TCAM block. This index is set to the value of <i>First_TCAM</i> for a single TCAM block allocation. This field is set to 0xFF for a failed allocation.
First_Entry	4-5	Index of the first allocated entry (in both TCAMs and action memories). This field is set to 0xFFFF for a failed allocation.
Last_Entry	6-7	Index of the last allocated entry (in both TCAMs and action memories). This field is set to 0xFFFF for a failed allocation.
Action memory 0	8	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 1	9	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 2	10	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 3	11	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 4	12	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.

**Table 7-99. Completion for allocate\_acl\_table Buffer Format [continued]**

Name	Bytes.Bits	Comments
Action memory 5	13	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 6	14	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 7	15	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 8	16	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 9	17	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 10	18	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 11	19	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 12	20	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 13	21	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 14	22	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 15	23	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 16	24	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 17	25	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 18	26	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 19	27	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.

### 7.9.3.4.2.2 deallocate\_acl\_table (0x0C11)

The deallocate\_acl\_table command is used by software to release a table allocation.

**Table 7-100. deallocate\_acl\_table Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C11	Command opcode.
Datalen	4-5	32	Indirect data length in bytes, with space for completion.
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Alloc_ID	16-17		Allocation ID of the table being released. This is the <i>Alloc_ID</i> field supplied in the completion of the allocate_acl_table command for this table.
Reserved	18-23		Reserved.
Data Address High	24-27		Indirect data pointer high.
Data Address Low	28-31		Indirect data pointer low.

The EMP firmware responds with a completion command (described in [Table 7-101](#)) containing a release status and, if deallocation succeeded, the deallocated resources IDs.

**Table 7-101. Completion for deallocate\_acl\_table Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C11	Command opcode.
Datalen	4-5	32	Indirect data length in bytes, with space for completion.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Alloc_ID	16-17		Allocation ID of the table being released. This is the <i>Alloc_ID</i> field supplied in the completion of the allocate_acl_table command for this table.
Reserved	18-23		Reserved.
Data Address High	24-27		Indirect data pointer high.
Data Address Low	28-31		Indirect data pointer low.

**Table 7-102. Completion for deallocate\_acl\_table Buffer Format**

Name	Bytes.Bits	Comments
Alloc_ID (result)	0-1	If <i>Alloc_ID</i> is below 0x1000, deallocation failed due to unavailable resources. Otherwise, successful deallocation.
First_TCAM	2	Index of the first released TCAM block. This field is set to 0xFF for a failed deallocation.
Last_TCAM	3	Index of the last released TCAM block. This index is set to the value of <i>First_TCAM</i> for a single TCAM block allocation. This field is set to 0xFF for a failed deallocation.
First_Entry	4-5	Index of the first deallocated entry (in both TCAMs and action memories). This field is set to 0xFFFF for a failed deallocation.
Last_Entry	6-7	Index of the last deallocated entry (in both TCAMs and action memories). This field is set to 0xFFFF for a failed deallocation.
Action memory 0	8	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 1	9	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 2	10	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 3	11	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 4	12	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 5	13	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 6	14	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 7	15	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 8	16	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 9	17	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 10	18	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 11	19	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 12	20	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 13	21	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 14	22	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 15	23	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 16	24	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 17	25	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 18	26	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 19	27	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.

### 7.9.3.4.2.3 allocate\_acl\_actionpair (0x0C12)

The `allocate_acl_actionpair` command is used by software to allocate an additional array of action pairs to an existing table allocated using the `allocate_acl_table` command (see [Section 7.9.3.4.2.1](#)).

**Table 7-103. allocate\_acl\_actionpair Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C12	Command opcode.
Datalen	4-5	32	Indirect data length in bytes, with space for completion.
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Alloc_ID	16-17		Allocation ID of the table being associated with the allocated action pair. This is the <i>Alloc_ID</i> field supplied in the completion of the <code>allocate_acl_actionpair</code> command for that table.
Reserved	18-23		Reserved.
Data Address High	24-27		Indirect data pointer high.
Data Address Low	28-31		Indirect data pointer low.

The EMP firmware responds with the `allocate_acl_actionpair` completion (described in [Table 7-104](#)).

**Table 7-104. Completion for allocate\_acl\_actionpair Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C12	Command opcode.
Datalen	4-5	32	Indirect data length in bytes, with space for completion.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Alloc_ID	16-17		Allocation ID of the table being associated with the allocated action pair. This is the <i>Alloc_ID</i> field supplied in the completion of the <code>allocate_acl_actionpair</code> command for that table.
Reserved	18-23		Reserved.
Data Address High	24-27		Indirect data pointer high.
Data Address Low	28-31		Indirect data pointer low.

**Table 7-105. Completion for allocate\_acl\_actionpair Structure Format**

Name	Bytes.Bits	Comments
Alloc_ID (result)	0-1	If <i>Alloc_ID</i> is below 0x1000, allocation failed due to unavailable resources. Otherwise, successful allocation.
Reserved	2-3	Reserved.
First_Entry	4-5	Index of the first allocated entry (in both TCAMs and action memories). This field is set to 0xFFFF for a failed allocation.
Last_Entry	6-7	Index of the last allocated entry (in both TCAMs and action memories). This field is set to 0xFFFF for a failed allocation.
Action memory 0	8	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 1	9	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 2	10	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 3	11	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 4	12	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 5	13	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 6	14	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 7	15	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 8	16	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 9	17	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 10	18	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 11	19	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 12	20	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 13	21	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 14	22	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 15	23	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 16	24	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 17	25	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 18	26	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.
Action memory 19	27	Specify the order of the memory in the allocation starting from 0. If the memory is not allocated, its order is 0xFF.

### 7.9.3.4.2.4 deallocate\_acl\_actionpair (0x0C13)

The deallocate\_acl\_actionpair command is used by software to release an allocation of an action pair array associated with an existing table using the allocate\_acl\_actionpair command (see Section 7.9.3.4.2.3).

**Note:** The deallocate\_acl\_actionpair command cannot be used to release an action pair array allocated using the allocate\_acl\_table.

**Table 7-106. deallocate\_acl\_actionpair Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See Section 9.5.5.1.1 for details.
Opcode	2-3	0x0C13	Command opcode.
Datalen	4-5	32	Indirect data length in bytes, with space for completion.
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Alloc_ID	16-17		Allocation ID of the table being associated with the allocated action pair. This is the <i>Alloc_ID</i> field supplied in the completion of the allocate_acl_actionpair command for that table.
Reserved	18-23		Reserved.
Data Address High	24-27		Indirect data pointer high.
Data Address Low	28-31		Indirect data pointer low.

**Table 7-107. deallocate\_acl\_actionpair Structure Format**

Name	Bytes.Bits	Comments
Reserved	0-3	Reserved.
First_Entry	4-5	Index of the first allocated entry (in both TCAMs and action memories). This field is set to 0xFFFF for a failed allocation.
Last_Entry	6-7	Index of the last allocated entry (in both TCAMs and action memories). This field is set to 0xFFFF for a failed allocation.
Action memory 0	8	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 1	9	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 2	10	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 3	11	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 4	12	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 5	13	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 6	14	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 7	15	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.

**Table 7-107. deallocate\_acl\_actionpair Structure Format [continued]**

Name	Bytes.Bits	Comments
Action memory 8	16	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 9	17	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 10	18	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 11	19	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 12	20	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 13	21	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 14	22	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 15	23	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 16	24	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 17	25	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 18	26	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 19	27	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.

The EMP firmware responds with the deallocate\_acl\_actionpair completion (described in [Table 7-108](#)).

**Table 7-108. Completion for deallocate\_acl\_actionpair Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C13	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Alloc_ID	16-17		Allocation ID of the table being associated with the allocated action pair. This is the <i>Alloc_ID</i> field supplied in the completion of the allocate_acl_actionpair command for that table.
Reserved	18-31		Reserved.

**Table 7-109. Completion for deallocate\_acl\_actionpair Structure Format**

Name	Bytes.Bits	Comments
Alloc_ID (result)	0-1	If alloc ID is below 0x1000, deallocation failed due to unavailable resources. Otherwise, successful deallocation, deallocated <i>Alloc_ID</i> .
Reserved	2-3	Reserved.
First_Entry	4-5	Index of the first allocated entry (in both TCAMs and action memories). This field is set to 0xFFFF for a failed allocation.
Last_Entry	6-7	Index of the last allocated entry (in both TCAMs and action memories). This field is set to 0xFFFF for a failed allocation.
Action memory 0	8	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 1	9	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 2	10	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 3	11	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 4	12	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 5	13	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 6	14	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 7	15	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 8	16	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 9	17	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 10	18	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 11	19	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 12	20	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 13	21	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 14	22	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 15	23	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 16	24	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 17	25	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 18	26	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.
Action memory 19	27	Specify the order of the memory in the deallocation starting from 0. If the memory is not deallocated, its order is 0xFF.

### 7.9.3.4.2.5 allocate\_acl\_scenario (0x0C14)

The `allocate_acl_scenario` command is used by software to allocate a scenario in the ACL block and configure it. If software only wants to change a configuration of an existing scenario, it uses the `update_acl_scenario` command (see [Section 7.9.3.4.3.1](#)).

Due to the large data structure required for scenario configuration, the AQ command is an indirect command.

**Table 7-110. allocate\_acl\_scenario Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C14	Command opcode.
Datalen	4-5	84	Usable length of additional buffer (132 bytes).
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The buffer associated with the command has the format described in [Table 7-111](#).

**Table 7-111. allocate\_acl\_scenario Buffer Format**

Name	Bytes.Bits	Comments
TCAM 0 Select0	0.0-0.6	Byte 0 selection for the TCAM key. See <code>GL_ACL_SCENARIO_CFG_L.SELECT0</code> description for more details on applicable values.
Reserved	0.7	Reserved.
TCAM 0 Select1	1.0-1.6	Byte 1 selection for the TCAM key. See <code>GL_ACL_SCENARIO_CFG_L.SELECT1</code> description for more details on applicable values.
Reserved	1.7	Reserved.
TCAM 0 Select2	2.0-2.6	Byte 2 selection for the TCAM key. See <code>GL_ACL_SCENARIO_CFG_L.SELECT2</code> description for more details on applicable values.
Reserved	2.7	Reserved.
TCAM 0 Select3	3.0-3.6	Byte 3 selection for the TCAM key. See <code>GL_ACL_SCENARIO_CFG_L.SELECT3</code> description for more details on applicable values.
Reserved	3.7	Reserved.
TCAM 0 Select4	4.0-4.4	Byte 4 selection for the TCAM key. See <code>GL_ACL_SCENARIO_CFG_H.SELECT4</code> description for more details on applicable values.
Reserved	4.5-4.7	Reserved.

**Table 7-111. allocate\_acl\_scenario Buffer Format [continued]**

Name	Bytes.Bits	Comments
TCAM 0 Chunk Mask	5	TCAM block entry masking. See GL_ACL_SCENARIO_CFG_H.CHUNKMASK description for more details on applicable values. This value is set to 0x0 for an unused TCAM. <b>Note:</b> The EMP firmware blocks attempts of a PF to enable entries/TCAM blocks which were not allocated to it using the allocate_acl_table command (see Section 7.9.3.4.2.1).
TCAM 0 StartCompare	6.0	TCAM block StartCompare setting (see Section 7.9.2.5.1 for additional details). This value is set to 0x1 for an unused TCAM.
TCAM 0 StartSet	6.1	TCAM block StartSet setting (see Section 7.9.2.5.1 for additional details). This value is set to 0x0 for an unused TCAM.
Reserved	6.2-6.7	Reserved.
TCAM 1 configuration	7-13	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 2 configuration	14-20	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 3 configuration	21-27	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 4 configuration	28-34	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 5 configuration	35-41	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 6 configuration	42-48	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 7 configuration	49-55	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 8 configuration	56-62	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 9 configuration	63-69	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 10 configuration	70-76	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 11 configuration	77-83	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 12 configuration	84-90	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 13 configuration	91-97	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 14 configuration	98-104	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 15 configuration	105-111	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
Action memory 0 TCAM association	112.0-112.6	Action memory association to a TCAM block (see Section 7.9.2.5.2 for more details) for this scenario. This field is set to 0x0 for a disabled action memory. <b>Note:</b> The EMP firmware blocks attempts of a PF to program an out-of-bound value in this field.

**Table 7-111. allocate\_acl\_scenario Buffer Format [continued]**

Name	Bytes.Bits	Comments
Action memory 0 enable	112.7	Action memory enable for this scenario see <a href="#">Section 7.9.2.5.2</a> for more details). <b>Note:</b> The EMP firmware blocks attempts of a PF to use an action memory no associated to it using the <code>allocate_acl_table</code> command (see <a href="#">Section 7.9.3.4.2.1</a> ) or the <code>allocate_acl_actionpair</code> command (see <a href="#">Section 7.9.3.4.2.3</a> ).
Action memory 1 configuration	113	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 2 configuration	114	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 3 configuration	115	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 4 configuration	116	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 5 configuration	117	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 6 configuration	118	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 7 configuration	119	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 8 configuration	120	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 9 configuration	121	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 10 configuration	122	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 11 configuration	123	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 12 configuration	124	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 13 configuration	125	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 14 configuration	126	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 15 configuration	127	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 16 configuration	128	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 17 configuration	129	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 18 configuration	130	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 19 configuration	131	Action memory configuration including the same structure defined in byte 112 for action memory 0.

The EMP firmware responds with a completion command (described in [Table 7-112](#)) containing an allocation status and, if allocation succeeded, the allocated scenario ID.

**Table 7-112. Completion for allocate\_acl\_scenario Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C14	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Scenario_ID	16-17		If the value of this field is less than 0x1000, the allocation failed. Otherwise, for a successful allocation, this field holds the allocated scenario ID where the low eight bits of the ID specify the scenario index.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address copied from the command.
Data Address Low	28-31	Buffer Address	Low bits of buffer address copied from the command.

#### 7.9.3.4.2.6 deallocate\_acl\_scenario (0x0C15)

The deallocate\_acl\_scenario command is used by software to release a scenario allocation.

**Table 7-113. deallocate\_acl\_scenario Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C15	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Scenario_ID	16-17		Scenario ID of the scenario being released. This is the <i>Scenario_ID</i> field supplied in the completion of the allocate_acl_scenario command for this scenario.
Reserved	18-31		Reserved.

The EMP firmware responds with a completion command (described in [Table 7-114](#)) containing a release status and, if deallocation succeeded, the deallocated scenario ID.

**Table 7-114. Completion for deallocate\_acl\_scenario Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C15	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31		Reserved.

### 7.9.3.4.2.7 allocate\_acl\_counters (0x0C16)

The allocate\_acl\_counters command is used by software to allocate a contiguous block of counters to be used in the actions related to its entries.

**Note:** After several occurrences of counter allocation and deallocation, the counters might get fragmented, which affects the ability of EMP firmware ability to allocate a large contiguous block of counters. In case software was unable to get its initial request, it might want to repeat the allocation request with a smaller amount request.

**Table 7-115. allocate\_acl\_counters Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C16	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Counter Amount	16		Amount of contiguous counters requested. <b>Note:</b> The minimal valid value for this field is 1. The maximal valid value is 255. If the software requires more counters, it issues an additional allocate_acl_counters command.
Counters Type	17		0x0 = Byte or Packet counters 0x1 = Byte/Packet counter duals 0x2-0xFF = Reserved
Counter Bank	18		Requested counter bank allocation. The valid values for Byte or Packet counters are 0-3. The valid values for Byte/Packet counter duals are 0-1. <b>Note:</b> The EMP firmware blocks attempts of a PF to program an out-of-bound value in this field.
Reserved	19-31		Reserved.

The EMP firmware responds with a completion command (described in [Table 7-116](#)) containing an allocation status and, if allocation succeeded, the allocated counter IDs.

**Table 7-116. Completion for allocate\_acl\_counters Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C16	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Counter Amount	16		Amount of contiguous counters requested. <b>Note:</b> The minimal valid value for this field is 1. The maximal valid value is 255. If the software requires more counters, it issues an additional allocate_acl_counters command.
Counters Type	17		0x0 = Byte or Packet counters 0x1 = Byte/Packet counter duals 0x2-0xFF = Reserved
Counter Bank	18		Requested counter bank allocation. The valid values for Byte or Packet counters are 0-3. The valid values for Byte/Packet counter duals are 0-1. <b>Note:</b> The EMP firmware blocks attempts of a PF to program an out-of-bound value in this field.
Reserved	19		Reserved.
First_Counter	20-21		First allocated counter index. For unsuccessful allocation, this value is set to 0xFFFF.
Last_Counter	22-23		Last allocated counter index. For unsuccessful allocation, this value is set to 0xFFFF.
Reserved	24-31		Reserved.

### 7.9.3.4.2.8 deallocate\_acl\_counters (0x0C17)

The deallocate\_acl\_counters command is used by software to release a contiguous block of counters to be used in the actions related to its entries.

When using the deallocate\_acl\_counters command, software is not obligated to release a full counter block it allocated using the allocate\_acl\_counters command. It can choose to release all of it or a part of it. Since counters are a limited resource, software is encouraged to release counters it does not use.

**Table 7-117. deallocate\_acl\_counters Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C17	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
First_Counter	16-17		First released counter index.

**Table 7-117. deallocate\_acl\_counters Command [continued]**

Name	Byte.Bit	Value	Remarks
Last_Counter	18-19		Last released counter index.
Counters Type	20		0x0 = Byte or Packet counters 0x1 = Byte/Packet counter duals 0x2-0xFF = Reserved
Counter Bank	21		Requested counter bank allocation. The valid values for Byte or Packet counters are 0-3. The valid values for Byte/Packet counter duals are 0-1. <b>Note:</b> The EMP firmware blocks attempts of a PF to program an out-of-bound value in this field.
Reserved	22-31		Reserved.

The EMP firmware responds with a completion command (described in [Table 7-118](#)).

**Table 7-118. Completion for deallocate\_acl\_counters Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C17	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
First_Counter	16-17		First released counter index.
Last_Counter	18-19		Last released counter index.
Counters Type	20		0x0 = Byte or Packet counters 0x1 = Byte/Packet counter duals 0x2-0xFF = Reserved
Counter Bank	21		Requested counter bank allocation. The valid values for Byte or Packet counters are 0-3. The valid values for Byte/Packet counter duals are 0-1. <b>Note:</b> The EMP firmware blocks attempts of a PF to program an out-of-bound value in this field.
Reserved	22-31		Reserved.

### 7.9.3.4.2.9 deallocate\_acl\_resources (0x0C1A)

The deallocate\_acl\_resources command is used by software to release all the resources allocated for it using a single command.

**Table 7-119. deallocate\_acl\_resources Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C1A	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31		Reserved.

In response, the EMP firmware responds with a completion command (described in [Table 7-107](#)) containing a release status.

**Table 7-120. Completion for deallocate\_acl\_resources Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C1A	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-31		Reserved.

### 7.9.3.4.2.10 Generic Allocate Resource Command

The command is fully described in [Section 7.8.12.2.4, "Allocate Resource \(0x0208\)"](#). This command can allocate the following resources:

- ACL profile builder CDID
- ACL profile builder TCAM table entries
- ACL profile builder Profile ID

A list of resource descriptors is supplied as a response to this admin command. For the ACL, each descriptor of two bytes specifies the number of the resource.

### 7.9.3.4.2.11 Generic Free Resource Command

The command is fully described in [Section 7.8.12.2.5, “Free Resource \(0x0209\)”](#). This command can deallocate the following resources:

- ACL profile builder CDID
- ACL profile builder TCAM table entries
- ACL profile builder Profile ID

A list of resource descriptors is supplied as a to this admin command. For the ACL, each descriptor of two bytes specifies the number of the resource.

### 7.9.3.4.3 Programming/Update Commands

#### 7.9.3.4.3.1 update\_acl\_scenario (0x0C1B)

The update\_acl\_scenario command is used to update the context of a scenario previously allocated using the allocate\_acl\_scenario command (see [Section 7.9.3.4.2.3](#)).

Due to the large data structure required for scenario configuration, the AQ command is an indirect command.

**Table 7-121. update\_acl\_scenario Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C1B	Command opcode.
Datalen	4-5	0x84	Usable length of additional buffer (132 bytes).
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Scenario_ID	16-17		Updated scenario ID. <b>Note:</b> The firmware blocks attempts by software to update configuration for a scenario not allocated to it.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The buffer associated with the command has the format described in [Table 7-122](#).

**Table 7-122. update\_acl\_scenario Buffer Format**

Name	Bytes.Bits	Comments
TCAM 0 Select0	0.0-0.6	Byte 0 selection for the TCAM key. See GL_ACL_SCENARIO_CFG_L.SELECT0 description for more details on applicable values. This value is set to 0x0 for an unused TCAM.
Reserved	0.7	Reserved.

**Table 7-122. update\_acl\_scenario Buffer Format [continued]**

Name	Bytes.Bits	Comments
TCAM 0 Select1	1.0-1.6	Byte 1 selection for the TCAM key. See GL_ACL_SCENARIO_CFG_L.SELECT1 description for more details on applicable values. This value is set to 0x0 for an unused TCAM.
Reserved	1.7	Reserved.
TCAM 0 Select2	2.0-2.6	Byte 2 selection for the TCAM key. See GL_ACL_SCENARIO_CFG_L.SELECT2 description for more details on applicable values. This value is set to 0x0 for an unused TCAM.
Reserved	2.7	Reserved.
TCAM 0 Select3	3.0-3.6	Byte 3 selection for the TCAM key. See GL_ACL_SCENARIO_CFG_L.SELECT3 description for more details on applicable values. This value is set to 0x0 for an unused TCAM.
Reserved	3.7	Reserved.
TCAM 0 Select4	4.0-4.4	Byte 4 selection for the TCAM key. See GL_ACL_SCENARIO_CFG_H.SELECT4 description for more details on applicable values. This value is set to 0x0 for an unused TCAM.
Reserved	4.5-4.7	Reserved.
TCAM 0 Chunk Mask	5	TCAM block entry masking. See GL_ACL_SCENARIO_CFG_H.CHUNKMASK description for more details on applicable values. This value is set to 0x0 for an unused TCAM. <b>Note:</b> The EMP firmware blocks attempts of a PF to enable entries/TCAM blocks which were not allocated to it using the allocate_acl_table command (see Section 7.9.3.4.2.1).
TCAM 0 StartCompare	6.0	TCAM block StartCompare setting (see Section 7.9.2.5.1 for additional details). This value is set to 0x1 for an unused TCAM.
TCAM 0 StartSet	6.1	TCAM block StartSet setting (see Section 7.9.2.5.1 for additional details). This value is set to 0x0 for an unused TCAM.
Reserved	6.2-6.7	Reserved.
TCAM 1 configuration	7-13	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 2 configuration	14-20	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 3 configuration	21-27	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 4 configuration	28-34	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 5 configuration	35-41	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 6 configuration	42-48	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 7 configuration	49-55	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 8 configuration	56-62	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.

**Table 7-122. update\_acl\_scenario Buffer Format [continued]**

Name	Bytes.Bits	Comments
TCAM 9 configuration	63-69	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 10 configuration	70-76	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 11 configuration	77-83	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 12 configuration	84-90	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 13 configuration	91-97	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 14 configuration	98-104	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
TCAM 15 configuration	105-111	TCAM configuration including the same structure defined in bytes 0-6 for TCAM 0.
Action memory 0 TCAM association	112.0-112.6	Action memory association to a TCAM block (see <a href="#">Section 7.9.2.5.2</a> for more details) for this scenario. This field is set to 0x0 for a disabled action memory. <b>Note:</b> The EMP firmware blocks attempts of a PF to program an out-of-bound value in this field.
Action memory 0 enable	112.7	Action memory enable for this scenario (see <a href="#">Section 7.9.2.5.2</a> for more details). The EMP firmware blocks attempts of a PF to use an action memory no associated to it using the <code>allocate_acl_table</code> command (see <a href="#">Section 7.9.3.4.2.1</a> ) or the <code>allocate_acl_actionpair</code> command (see <a href="#">Section 7.9.3.4.2.3</a> ).
Action memory 1 configuration	113	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 2 configuration	114	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 3 configuration	115	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 4 configuration	116	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 5 configuration	117	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 6 configuration	118	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 7 configuration	119	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 8 configuration	120	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 9 configuration	121	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 10 configuration	122	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 11 configuration	123	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 12 configuration	124	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 13 configuration	125	Action memory configuration including the same structure defined in byte 112 for action memory 0.

**Table 7-122. update\_acl\_scenario Buffer Format [continued]**

Name	Bytes.Bits	Comments
Action memory 14 configuration	126	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 15 configuration	127	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 16 configuration	128	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 17 configuration	129	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 18 configuration	130	Action memory configuration including the same structure defined in byte 112 for action memory 0.
Action memory 19 configuration	131	Action memory configuration including the same structure defined in byte 112 for action memory 0.

The EMP firmware responds with a completion command (described in [Table 7-123](#)).

**Table 7-123. Completion for update\_acl\_scenario Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C1B	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Scenario_ID	16-17		If failed value smaller than 0x1000, unsuccessful update. Otherwise, successful update, this field holds the updated scenario ID.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address copied from the command.
Data Address Low	28-31	Buffer Address	Low bits of buffer address copied from the command.

### 7.9.3.4.3.2 program\_acl\_actionpair (0x0C1C)

The program\_acl\_actionpair command is used by software to program and/or update action entries.

**Table 7-124. program\_acl\_actionpair Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C1C	Command opcode.
Datalen	4-5	0x8	Reserved.
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
action_mem_index	16		Action memory index to program/update. <b>Note:</b> The firmware blocks attempts by software to update an action memory not allocated to it.
Reserved	17		Reserved.
action_entry_index	18-19		The entry index in the action memory to be programmed/updated. <b>Note:</b> The firmware blocks attempts by software to update an entry not allocated to it.
Reserved	20-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The buffer associated with the command has the format described in [Table 7-125](#).

**Table 7-125. program\_acl\_actionpair Buffer Format**

Name	Bytes.Bits	Comments
Action0_Priority	0	Action priority. Applicable values are between 0 to 7.
Action0_MDID	1	Action metadata identifier. This field is set to 0x0 for a NOP action.
Action0_value	2-3	Action value.
Action1_Priority	4	Action priority. Applicable values are between 0 to 7.
Action1_MDID	5	Action metadata identifier. This field is set to 0x0 for a NOP action.
Action1_value	6-7	Action value.

The EMP firmware responds with a completion command described in [Table 7-126](#).

**Table 7-126. Completion for program\_acl\_actionpair Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C1C	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.

**Table 7-126. Completion for program\_acl\_actionpair Command [continued]**

Name	Byte.Bit	Value	Remarks
action_mem_index	16		Action memory index to program/update. <b>Note:</b> The firmware blocks attempts by software to update an action memory not allocated to it.
Reserved	17		Reserved.
action_entry_index	18-19		The entry index in the action memory to be programmed/updated. <b>Note:</b> The firmware blocks attempts by software to update an entry not allocated to it.
Reserved	20-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address copied from the command.
Data Address Low	28-31	Buffer Address	Low bits of buffer address copied from the command.

### 7.9.3.4.3.3 program\_acl\_profile\_extraction (0x0C1D)

The program\_acl\_profile\_extraction command is used by software to program or update the profile-dependent configuration (see Section 7.9.2.6) for a profile allocated to it.

Due to the large data structure required for scenario configuration, the AQ command is an indirect command.

**Table 7-127. program\_acl\_profile\_extraction Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See Section 9.5.5.1.1 for details.
Opcode	2-3	0x0C1D	Command opcode.
Datalen	4-5	0x4C	Usable length of additional buffer (76 bytes).
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Profile ID	16		Programmed/updated Profile ID.
Reserved	17-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The buffer associated with the command has the format described in Table 7-128.

**Table 7-128. program\_acl\_profile\_extraction Buffer Format**

Name	Bytes.Bits	Comments
Byte selection base-select for byte 0	0.0-0.5	Byte selection for the byte selection base from the extracted fields (expressed as a byte offset in the extracted fields). Applicable values are 0-63.
Reserved	0.6-0.7	Reserved.
Byte selection base-select for byte 1	1	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 2	2	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 3	3	Byte selection using the same structure defined in byte 0 for byte 0.

**Table 7-128. program\_acl\_profile\_extraction Buffer Format [continued]**

Name	Bytes.Bits	Comments
Byte selection base-select for byte 4	4	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 5	5	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 6	6	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 7	7	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 8	8	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 9	9	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 10	10	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 11	11	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 12	12	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 13	13	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 14	14	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 15	15	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 16	16	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 17	17	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 18	18	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 19	19	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 20	20	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 21	21	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 22	22	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 23	23	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 24	24	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 25	25	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 26	26	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 27	27	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 28	28	Byte selection using the same structure defined in byte 0 for byte 0.
Byte selection base-select for byte 29	29	Byte selection using the same structure defined in byte 0 for byte 0.
Word selection base-select for word 0	30.0-30.4	Word selection for the word selection base from the extracted fields (expressed as a word offset in the extracted fields). Applicable values are 0-31.
Reserved	30.5-30.7	Reserved.
Word selection base-select for word 1	31	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 2	32	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 3	33	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 4	34	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 5	35	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 6	36	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 7	37	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 8	38	Word selection using the same structure defined in byte 30 for word 0.

**Table 7-128. program\_acl\_profile\_extraction Buffer Format [continued]**

Name	Bytes.Bits	Comments
Word selection base-select for word 9	39	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 10	40	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 11	41	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 12	42	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 13	43	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 14	44	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 15	45	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 16	46	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 17	47	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 18	48	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 19	49	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 20	50	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 21	51	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 22	52	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 23	53	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 24	54	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 25	55	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 26	56	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 27	57	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 28	58	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 29	59	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 30	60	Word selection using the same structure defined in byte 30 for word 0.
Word selection base-select for word 31	61	Word selection using the same structure defined in byte 30 for word 0.
Double word selection base-select for double-word 0	62.0-62.3	Double word selection for the double-word selection base from the extracted fields (expressed as a double-word offset in the extracted fields). Applicable values are 0-15.
Reserved	62.4-62.7	Reserved.
Double word selection base-select for double-word 1	63	Double word selection using the same structure defined in byte 60 for double-word 0.
Double word selection base-select for double-word 2	64	Double word selection using the same structure defined in byte 60 for double-word 0.
Double word selection base-select for double-word 3	65	Double word selection using the same structure defined in byte 60 for double-word 0.
Double word selection base-select for double-word 4	66	Double word selection using the same structure defined in byte 60 for double-word 0.
Double word selection base-select for double-word 5	67	Double word selection using the same structure defined in byte 60 for double-word 0.
Double word selection base-select for double-word 6	68	Double word selection using the same structure defined in byte 60 for double-word 0.
Double word selection base-select for double-word 7	69	Double word selection using the same structure defined in byte 60 for double-word 0.

**Table 7-128. program\_acl\_profile\_extraction Buffer Format [continued]**

Name	Bytes.Bits	Comments
Double word selection base-select for double-word 8	70	Double word selection using the same structure defined in byte 60 for double-word 0.
Double word selection base-select for double-word 9	71	Double word selection using the same structure defined in byte 60 for double-word 0.
Double word selection base-select for double-word 10	72	Double word selection using the same structure defined in byte 60 for double-word 0.
Double word selection base-select for double-word 11	73	Double word selection using the same structure defined in byte 60 for double-word 0.
Double word selection base-select for double-word 12	74	Double word selection using the same structure defined in byte 60 for double-word 0.
Double word selection base-select for double-word 13	75	Double word selection using the same structure defined in byte 60 for double-word 0.
Double word selection base-select for double-word 14	76	Double word selection using the same structure defined in byte 60 for double-word 0.
PF0 scenario	77	PF0 scenario number
PF1 scenario	78	PF1 scenario number
PF2 scenario	79	PF2 scenario number
PF3 scenario	80	PF3 scenario number
PF4 scenario	81	PF4 scenario number
PF5 scenario	82	PF5 scenario number
PF6 scenario	83	PF6 scenario number
PF7 scenario	84	PF7 scenario number

The EMP firmware responds with the completion command described in [Table 7-129](#).

**Table 7-129. Completion for program\_acl\_profile\_extraction Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C1D	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Profile ID	16		Programmed/updated Profile ID.
Reserved	17-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

### 7.9.3.4.3.4 program\_acl\_profile\_ranges (0x0C1E)

The program\_acl\_profile\_ranges command is used by software to program or update the range checkers profile dependent configuration (see Section 7.9.2.7) for a profile allocated to it.

Due to the large data structure required for scenario configuration, the AQ command is an indirect command.

**Table 7-130. program\_acl\_profile\_ranges Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See Section 9.5.5.1.1 for details.
Opcode	2-3	0x0C1E	Command opcode.
Datalen	4-5	0x30	Usable length of additional buffer (48 bytes).
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Profile ID	16		Programmed/updated Profile ID.
Reserved	17-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The buffer associated with the command has the format described in Table 7-131.

**Table 7-131. program\_acl\_profile\_ranges Buffer Format**

Name	Bytes.Bits	Comments
Range checker 0 low boundary	0-1	Range checker low boundary. The range checker output is negative when the value related to this range checker is lower than the low boundary.
Range checker 0 high boundary	2-3	Range checker high boundary. The range checker output is negative when the value related to this range checker is higher than the high boundary.
Range checker 0 mask	4-5	Range checker bit-mask. A value of '0' in a bit clears the relevant bit input to the range checker.
Range checker 1 configuration	6-11	Range checker configuration using the same format specified in bytes 0-5 for range checker 0.
Range checker 2 configuration	12-17	Range checker configuration using the same format specified in bytes 0-5 for range checker 0.
Range checker 3 configuration	18-23	Range checker configuration using the same format specified in bytes 0-5 for range checker 0.
Range checker 4 configuration	24-29	Range checker configuration using the same format specified in bytes 0-5 for range checker 0.
Range checker 5 configuration	30-35	Range checker configuration using the same format specified in bytes 0-5 for range checker 0.
Range checker 6 configuration	36-41	Range checker configuration using the same format specified in bytes 0-5 for range checker 0.
Range checker 7 configuration	42-47	Range checker configuration using the same format specified in bytes 0-5 for range checker 0.

The EMP firmware responds with the completion command described in [Table 7-132](#).

**Table 7-132. Completion for program\_acl\_profile\_ranges Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C1E	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Profile ID	16		Programmed/updated Profile ID.
Reserved	17-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

#### 7.9.3.4.3.5 program\_acl\_entry (0x0C20)

The program\_acl\_entry command is used by software to program or update an entry in a TCAM block allocated to it using the allocate\_acl\_table command (see [Section 7.9.3.4.2.1](#)).

**Table 7-133. program\_acl\_entry Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C20	Command opcode.
Datalen	4-5	0x8	
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
TCAM Index	16		Updated TCAM block index. <b>Note:</b> The firmware blocks attempts by software to update a TCAM block not allocated to it.
Reserved	17		Reserved.
Entry Index	18-19		Updated entry index. <b>Note:</b> The firmware blocks attempts by software to update an entry not allocated to it.
Reserved	20-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

**Table 7-134. program\_acl\_entry Buffer Format**

Name	Bytes.Bits	Comments
Entry key	0-4	Entry key (40 bits). See <a href="#">Section 7.9.2.3</a> for more details.
Reserved	5-7	Reserved.
Entry key invert	8-12	Entry key invert (40 bits). See <a href="#">Section 7.9.2.3</a> for more details.
Reserved	13-15	Reserved.

The EMP firmware responds with the completion described in [Table 7-135](#).

**Table 7-135. Completion for program\_acl\_entry Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C20	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
TCAM Index	16		Updated TCAM block index.
Reserved	17		Reserved.
Entry Index	18-19		Updated entry index.
Reserved	20-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

### 7.9.3.4.4 Query Commands

#### 7.9.3.4.4.1 query\_acl\_profile (0x0C21)

The query\_acl\_profile command is used by software to query a profile dependent configuration (see [Section 7.9.2.6](#)) for a profile allocated for it.

Due to the large data structure required for scenario configuration, the AQ command is an indirect command.

**Table 7-136. query\_acl\_profile Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0C21	Command opcode.
Datalen	4-5	0x4C	Usable length of additional buffer (76 bytes)
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Profile ID	16		Queried Profile ID.
Reserved	17-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The EMP firmware responds with a completion described in [Table 7-137](#).

**Table 7-137. Completion for query\_acl\_profile Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0C21	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Profile ID	16		Programmed/updated Profile ID.
Reserved	17-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The buffer associated with the completion has the format described in [Table 7-128](#).

### 7.9.3.4.4.2 query\_acl\_profile\_ranges (0x0C22)

The query\_acl\_profile\_ranges command is used by software to query the range checkers profile dependent configuration (see [Section 7.9.2.7](#)) for a profile allocated to it.

Due to the large data structure required for scenario configuration, the AQ command is an indirect command.

**Table 7-138. query\_acl\_profile\_ranges Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0C22	Command opcode.
Datalen	4-5	0x30	Usable length of additional buffer (48 bytes)
Return Value/VFID	6-7		Return value/VF ID for command or event. Only sent by firmware or PF driver. See <a href="#">Section 9.5.9</a> .
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Profile ID	16		Queried Profile ID.
Reserved	17-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The buffer associated with the command has the format described in [Table 7-131](#).

The EMP firmware responds with the completion command described in [Table 7-139](#).

**Table 7-139. Completion for query\_acl\_profile\_ranges Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0C22	Command opcode.
Datalen	4-5		Reserved.
Return Value/VFID	6-7		Return value/VF ID for command or event. Only sent by firmware or PF driver. See <a href="#">Section 9.5.9</a> .
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Profile ID	16		Queried Profile ID.
Reserved	17-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The buffer associated with the completion has the format described in [Table 7-131](#).

### 7.9.3.4.4.3 query\_acl\_scenario (0x0C23)

The query\_acl\_scenario command is used by software to query the scenario dependent configuration for a scenario associated with it.

Due to the large data structure required for scenario configuration, the AQ command is an indirect command. The buffer associated with the command has the format described in [Table 7-111](#).

**Table 7-140. query\_acl\_scenario Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0C23	Command opcode.
Datalen	4-5	0x0	Usable length of additional buffer (132 bytes)
Return Value/VFID	6-7		Return value/VF ID for command or event. Only sent by firmware or PF driver. See <a href="#">Section 9.5.9</a> .
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Scenario ID	16-17		Updated scenario ID. <b>Note:</b> The firmware blocks attempts by software to query configuration for a scenario not allocated to it.
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The EMP firmware responds with a completion command (described in [Table 7-141](#)).

**Table 7-141. Completion for query\_acl\_scenario Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0C23	Command opcode.
Datalen	4-5		Reserved.
Return Value/VFID	6-7		Return value/VF ID for command or event. Only sent by firmware or PF driver. See <a href="#">Section 9.5.9</a> .
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Scenario ID	16-17		
Reserved	18-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address copied from the command.
Data Address Low	28-31	Buffer Address	Low bits of buffer address copied from the command.

The buffer associated with the completion has the format described in [Table 7-122](#).

#### 7.9.3.4.4.4 query\_acl\_entry (0x0C24)

The query\_acl\_entry command is used by software to query an ACL entry contents.

**Table 7-142. query\_acl\_entry Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C24	Command opcode.
Datalen	4-5	0x0	Reserved. 8 bytes for result.
Return Value/VFID	6-7		Return value/VF ID for command or event. Only sent by firmware or PF driver. See <a href="#">Section 9.5.9</a> .
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
TCAM Index	16		Updated TCAM block index. <b>Note:</b> The firmware blocks attempts by software to query a TCAM block not allocated to it.
Reserved	17		Reserved.
Entry Index	18-19		Updated entry index. <b>Note:</b> The firmware blocks attempts by software to query an entry not allocated to it.
Reserved	20-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The EMP firmware responds with the completion described in [Table 7-143](#).

**Table 7-143. Completion for query\_acl\_entry Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C24	Command opcode.
Datalen	4-5	0x8	
Return Value	6-7		Return Value
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
TCAM Index	16		Updated TCAM block index.
Reserved	17		Reserved.
Entry Index	18-19		Updated entry index.
Reserved	20-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The buffer associated with the completion has the format described in [Table 7-134](#).

### 7.9.3.4.4.5 query\_acl\_actionpair (0x0C25)

The query\_acl\_actionpair command is used by software to query an action pair allocated to it.

**Table 7-144. query\_acl\_actionpair Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C25	Command opcode.
Datalen	4-5	0x0	Reserved. 8 bytes for result.
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
action_mem_index	16		Action memory index to program/update. <b>Note:</b> The firmware blocks attempts by software to query an action memory not allocated to it.
Reserved	17		Reserved.
action_entry_index	18-19		The entry index in the action memory to be programmed/ updated. <b>Note:</b> The firmware blocks attempts by software to query an entry not allocated to it.
Reserved	20-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The EMP firmware responds with a completion described in [Table 7-145](#).

**Table 7-145. Completion for query\_acl\_actionpair Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C25	Command opcode.
Datalen	4-5	0x8	
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
action_mem_index	16		Action memory index to program/update.
Reserved	17-23		Reserved.
Data Address High	24-27	Buffer Address	High bits of buffer address.
Data Address Low	28-31	Buffer Address	Low bits of buffer address.

The buffer associated with the completion has the format described in [Table 7-125](#).

### 7.9.3.4.4.6 query\_acl\_counter (0x0C27)

The query\_acl\_counter command is used by software to query the value of a counter allocated to it.

**Table 7-146. query\_acl\_counter Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.1</a> for details.
Opcode	2-3	0x0C27	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Zeroed. Used for return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Counter Index	16-17		Queried counter index. This field is the relative counter index within the queried counter bank.
Counter Bank	18		Queried counter bank.
Reserved	19-31		Reserved.

The EMP firmware responds with a completion command (described in [Table 7-147](#)).

**Table 7-147. Completion for query\_acl\_counter Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.1.2</a> for details.
Opcode	2-3	0x0C27	Command opcode.
Reserved	4-5		Reserved.
Return Value	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Counter Index	16-17		Queried counter index. This field is the relative counter index within the queried counter bank.
Counter Bank	18		Queried counter bank.
Counter Value/Counter Value	19-23		This field holds the counter value.
Reserved	24-31		Reserved.

### 7.9.3.4.4.7 Generic Get Resource Allocation Command

The command is fully described in [Section 7.8.12.2.3, "Get Resource Allocation \(0x0204\)"](#). This command retrieve the allocation information for the following resources:

- ACL profile builder CDID
- ACL profile builder TCAM table entries
- ACL profile builder Profile ID

A list of resource descriptors is supplied as a response to this admin command. For the ACL, each descriptor of two bytes specify the number of the resource.

## 7.9.4 ACL Configuration Example

### 7.9.4.1 Requested Scenario

- Create a table with 64 entries.
- Create scenario to partition the table.
- create a key to access the flow entry (IPv4 5 tuple).
- Create a flow entry to allow all packets with source IP 10.0.10.10 with a port range from 1000 to 50000.

### 7.9.4.2 Configuration Flow

#### 7.9.4.2.1 Assumptions

GL\_ACL\_DEFAULT\_ACT array is pre-programmed in such a way that:

- The first set of four actions are filled with non-valid actions so it does not do anything (set 0).
- The second set of four actions are filled with valid pkt\_drop actions (MDID 0x8).

Profile section mechanism is pre-configured (using packages) in such a way that:

- PTYPE is transformed to PTG (PTYPE group) using XTL1 table.
  - The extractor is programmed to extract the relevant fields for every PTYPE.
  - For this example it is assumed that whenever IPv4 exists in the packets, the first two words extracted are the IPv4 source address, where its bytes are noted as SIP[0], SIP[1], SIP[2], and SIP[3].
- VSI is transformed to VSIG (VSI group) using XTL2 table.
  - Default VSIG of uninitialized VSI is 0, which causes the ACL to be by passed.

In this example, the profile that the VSI uses is noted as ACL\_ProfileID.

Table 7-148 specify the configuration flow. For general table allocation see Section 7.9.3.3.2.

**Table 7-148. ACL Example Command Table**

Command	Input	Output	Comment
In add VSI command	Rx profile miss default action =1 Rx table miss default action =1 Tx profile miss default action =0 Tx table miss default action =0		This is set so that the default VSI behavior is to allow the Tx packet and to not allow Rx packet with table miss or profile miss.
<b>Table Allocation</b>			
allocate_acl_table command	TableWidth=40 (5 bytes) TableDepth=64 (entries) Action Pairs Per Entry=1 TableType =0	Alloc_ID First_TCAM Action memory 0 First Entry Last Entry	Allocate a single table of 64 entries of width five bytes (four bytes for the IP Address and one byte for range check results). The table spans over 1 TCAM. Last_Entry is First_Entry + 63. It is expected that First entry is 64 entries aligned.

**Table 7-148. ACL Example Command Table [continued]**

Command	Input	Output	Comment
<b>Resource initialization</b>			
For j=First_Entry to Last_Entry do program_acl_entry	TCAM index=First TCAM Entry index=j Entry key=0x0000000000 Entry key=0x0000000000		Make all entries of the table as never match.
for i=First_Entry to Last_Entry do program_acl_actionpair	action_mem_index=Action memory 0 action_entry_index=i Action0_Priority=0 Action1_Priority=0		Clear action memory making all action invalid.
<b>Allocate ACL scenario</b>			
allocate_acl_scenario	for i=0 to 15 {TCAM i Chunk Mask =0 TCAM i StartCompare=1 TCAM i StartSet=0} j=First_TCAM TCAM j Chunk Mask= 1 <<(First+Entry/64) TCAM j Startset=1 TCAM j Select0=0 (IPv4 SIP[0]) TCAM j Select1=1 (IPv4 SIP[1]) TCAM j Select2=2 (IPv4 SIP[2]) TCAM j Select3=3 (IPv4 SIP[3]) TCAM j Select4=31 (range check) for k=0 to 19 Action memory k enable=0 m=Action memory 0 Action memory m enable=1 Action memory m TCAM association=First_TCAM	Scenario_ID	Program everything into the scenario. Byte 31 looks at the range result byte.
<b>Program/update selection base and scenario into profile</b>			
query_acl_profile_extraction	Profile ID=ACL_ProfileID		It is assumed that the profile is already configured such that: Byte selection base-select for byte 0 =IPv4 SIP[0] Byte selection base-select for byte 1 =IPv4 SIP[1] for byte 2 =IPv4 SIP[2] for byte 3 =IPv4 SIP[3] So the first four bytes extract the source IP.
program_acl_profile_extraction	Profile ID=ACL_ProfileID i=PF number associated with the VSI PFi_scenario=Scenario_ID		Associate the scenario to the Profile for the PF of the VSI.
query_acl_profile_ranges	Profile ID=ACL_ProfileID	for i=0 to 7 { Range checker i low boundary Range checker i high boundary Range checker i mask}	According to the mask if the next available range is found. Available range is identified by mask==0. The next available range is noted by N.

**Table 7-148. ACL Example Command Table [continued]**

Command	Input	Output	Comment
program_acl_profile_ranges	Profile ID=ACL_ProfileID Range checker N low boundary=1000 Range checker N high boundary=50000 Range checker N mask=0xffff		Only for range checker N the parameters change.
upload section Command	Section Type Number=0x17 (XLT2 table for ACL)		Get current XLT2 table.
upload section Command	Number=0x17 (XLT2 table for ACL) Update the VSIG in XLT2 data buffer		Program VSIG for that VSI to use the profile.
<b>Add rule to table (can be done while packets are being received)</b>			
program_acl_actionpair	action_mem_index =Action memory 0 action_entry_index=First Entry Action0_Priority=0x7 Action0_MDID=55 (nop) Action1_Priority=0		The NOP allows the packet by doing no change. Because of the NOP, the default action is not applied.
program_acl_entry	TCAM index=First TCAM Entry index=First Entry m=1<<N; Entry key=~0x0A000A0A00 ~m Entry key invert=0x0A000A0AFF		The four high bytes are pre-configured to identify 10.0.10.10. The least significant byte is programed to identify the bit set of the bit indicated by 1<<N.

## 7.10 Receive Classification Filters

### 7.10.1 Introduction

This section describes the receive classification filters that direct inbound packets to a processing engine or cluster out of the LAN engine and RDMA engine (also named as Protocol Engine or PE). The filters also define a specific queue or a context within the selected engine. All the filters described in this section relate to filtering within a specific VSI that is defined by the switch filters or ACL filters.

The classification filters and other header processing units in the device inspect the first 504 bytes of the received packets.

#### 7.10.1.1 Association with a Packet Engine

The general rule is that a frame is tested to be PE type or LAN. Filtering to the PE is subject to a set of rules defined in the subsections of [Section 7.10.9, "Protocol Engine \(PE\) Filters"](#): APBVT L4 port table and PE Quad-hash filter (described in detail in [Section 7.10.9.1](#)).

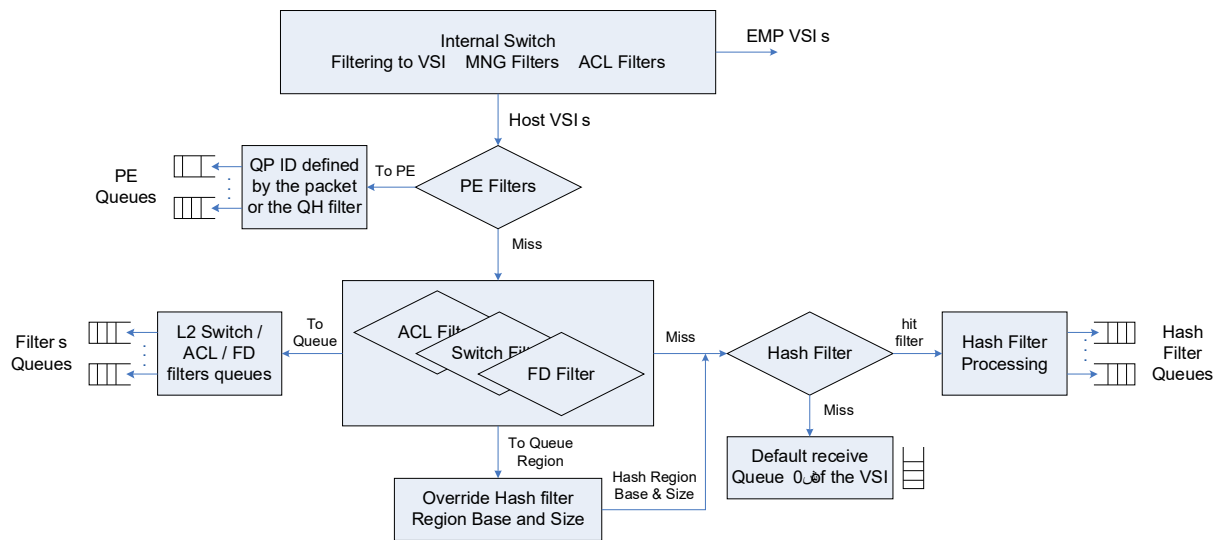

#### 7.10.1.2 Receive Classification Filters Priority and Usage

Received traffic goes through a set of filters that determine the destination of each received frame. The receive classification filters operate on frames received from the network as well as frames forwarded by the internal switch from a local port (VSI). If a frame is replicated by the internal switch, each replica goes independently through the filters.

The classification filters operate in the following priority ordering (illustrated in the [Figure 7-29](#)):

- The PE filters (described in [Section 7.10.9.1](#)) direct packets to the PE at strict highest priority.
- The ACL filters (described in [Section 7.10.6](#)), the L2 switch filters (described in [Section 7.10.5](#)) and the Flow Director filter (described in [Section 7.10.8](#)) compete on queue selection according to its programmed priority (any priority setting equals to 1 or higher). These filters can optionally define a region of queues (on the same priority of queue selection) that operate together with the hash filter.
- At lowest priority, the hash filter define a region of queues and the specific queue within the region (as described in [Section 7.10.7](#)).
- Packets that do not hit any of the above filters are posted to the default queue zero of the VSI.

**Note:** In nominal operation, the following filters are expected to be mutually exclusive. Meaning, the same packet is not expected to match more than one of them: PE Quad hash filter, L2 Switch filter that assigns a queue, and FD filter.

**Figure 7-29. Receive Classification Filters - Top Level**

[Table 7-149](#) below shows typical use cases of the classification filters and its programming option per function.

**Table 7-149. Classification Filters per PF/VF**

VSI	L2 Switch Filters	ACL Filters	PE Quad Hash	Flow Director	Hash
Main Usage	VMDq1 / Control Ports / L2 Protocols		RDMA	Flex Filters <sup>1</sup>	Load Balance
Programming exposed to the PF	Yes	Yes	Yes <sup>2</sup>	Yes	Yes <sup>3</sup>
Programming exposed to the VF	No	No	Yes <sup>2</sup>	Yes <sup>1</sup>	No <sup>3</sup>

1. There are two main usages for Flow Director filters: Software driver controlled filters for Automatic Target Routing (ATR), and user/OS controlled filters. FD programming is exposed to VSIs of the PFs and the VFs as enabled by the parent PF.
2. The hardware supports RDMA offload for all PFs and up to 32 VFs (enabled by its parent PFs). Software should enable the filter only to VSIs of the PFs and the enabled VFs. Note that the software enables the VSIs, while the PE programs the specific filters.
3. Hash filters are allocated per VSI for the PFs and the VFs. Programming is enabled by the hardware for both PFs and VFs, but as a product it is exposed by the driver only for the PFs.

Table 7-150 shows the filters actions enabled per-filter type:

**Table 7-150. Filter Actions by Filter Type**

Action	L2 Switch Filters and ACLs	ACL Filters	PE Quad Hash	Flow Director
Target Engine: LAN, PE	LAN	PE	LAN	LAN
Receive Queue index / Context ID	Queue index within the VSI or setting a queue region for the Hash filter	QPN (QP ID)	Queue index within the VSI or setting a queue region for the Hash filter	Queue index within the region of queues within the VSI
Accept / Reject	Yes		Yes	
Increment Statistic Counter	Yes		Yes	
Flow ID	Flow ID	Report QPN (QP Index) to the PE	Report FDID in the Rx-Descriptor	Report Hash Signature in the Rx-Descriptor
Report selected bytes from the receive packet	Yes		Yes	
Flexible Actions	Yes	No	Yes	No

### 7.10.1.3 Resource Allocation

Some of the filter’s resources can be allocated in a flexible manner between the functions, and the VSIs. allocation to the PFs are configured during run time by the Allocate Resource admin command (see Section 7.8.12.2.4).

Table 7-151 lists those parameters that are allocated using this admin command. The Flow Director table can be further allocated to VSIs by the Add VSI or Update VSI admin commands (Section 7.8.12.3.1 and Section 7.8.12.3.2, respectively).

**Table 7-151. Resource ID and Types Used by the “Get Resource Allocation” Command**

Resource ID	Resource Type	Allocation Type
0x20	Global RSS hash	A Global RSS LUT
0x21	Flow director Counters	Any number of counters
0x22	Guaranteed Flow director entries	Any number of filter entries
0x23	Best Effort Flow director entries	Any number of filter entries

### 7.10.1.4 Filter’s Candidacy Rules

The Table 7-152 below list the candidacy rules for matching a filter. Complete description of the filters in the following sections.

**Table 7-152. Filter’s Candidacy Rules**

Rule	Relevancy	Mechanism
The filter is enabled for the function	PE filters	Setting options (PFQF_PE_ENA, VPQF_PE_ENA)
The filter is enabled for the PF	FD filter	Setting options (PFQF_FD_ENA)
The filter is enabled per VSI	FD and PE filters	VSI Setting options
The filter is enabled per TC	QH filter	PF Setting options (PFQF_PE_TC_CTL)
The filter is enabled per VSI group	All filters	Packet profile selection logic

**Table 7-152. Filter’s Candidacy Rules [continued]**

Rule	Relevancy	Mechanism
The packet’s profile is enabled for the filter	All filters	Packet profile selection logic
Matched packet’s VSI and packet profile	FD and QH filters	Hard -coded
Exact match of the packet’s fields	FD and PE filters <sup>1</sup>	Matched fields are defined by the input set per packet profile.
Packet must match the APBVT	PE filters	Setting option per packet profile (GLQF_PE_CTL2)
Enable filter programming by Tx packets	FD filter	VSI Setting options
Enable filter removal by Tx FIN/RST packets	FD filter	VSI Setting option plus enabled per filter
Rx LPBK packets and Rx from the network	All filters	Both are enabled for the filters - hard-coded.

1. FD and QH filters must match complete pattern. PE filters that bypass the QH filter just match the packet profile. Hash filters that match the packet profile always pass this criteria

### 7.10.1.5 Filter’s Candidacy Exceptions

Received packets with exception status are handled according to the rules listed below in [Table 7-153](#).

**Table 7-153. Packets Exceptions Handling<sup>1</sup>**

Exception	Handling	Mechanism
L2 error.	Not candidate for any classification filters.	Handled by profile selection (I2_mac_error).
L3, L4 integrity error.	The packet is processed by the Hash and FD filters, but is not candidate for the PE filters.	Handled by profile selection (L3/L4 XSUM done/pass).
MPA CRC or RoCE iCRC integrity error.	Relevant only for the PE filters. Packet is posted in all cases to the PE with a hint on the CRC integrity check.	N/A
The packet includes IPv4 options or IPv6 extension headers.	Not candidate for the PE filters.	Handled by profile selection (L3/L4 XSUM not done).
The packet includes ESP extension header.	Not candidate for the PE filters.	Handled by profile selection (L3/L4 XSUM not done   pkt_is_esp). Dedicated hardware (no setting option).
The packet includes MPLS header(s).	Not candidate for the PE filters.	Handled by profile selection (outer_mpls_present_0x8847 and outer_mpls_present_0x8848).
The packet is fragmented.	Not candidate for the PE filters.	Handled by profile selection (L3/L4 XSUM not done).
Any tunneled packets.	Not candidate for the PE filters.	Handled by profile selection (L3/L4 XSUM not done).
“Drop” indication by previous units (like parser, switch, and ACL filters).	Not candidate for any classification filters.	Handled by profile selection (pkt_is_drop).
Packets indicated as DSI.	Not candidate for any classification filters.	Handled by profile selection (pkt_is_DSI).
Pre-Parser no checksum offload.	Not candidate for the PE filters.	Handled by profile selection (pprs_no_offload).
Parser Abort indication.	Not candidate for any classification filters.	Handled by profile selection (abort).
Malicious detect.	Not candidate for any classification filters.	Handled by profile selection (abort).

1. See additional candidacy criteria per filters in the following sections of the PE, Hash and FD filters

### 7.10.1.6 Configuration and Filter Programming Rates

Table 7-154. Performance Summary Table

Parameter	Configuration Source	Mechanism	Rate
Initial Control Domain	NVM	CSRs	Once
Profile selection parameters	NVM	CSRs	Once
Control Domain and profiles for the PE filters	NVM	CSRs	Once
Add / Remove Control Domain and profiles for the FD or RSS filters	Software via firmware	CSRs	10/Sec
PE QH Filter population	PE to hardware	Internal PE to hardware config path	Shared 0.5 M/s restriction
PE QH Filter removal	PE to hardware	Internal PE to hardware config path	
FD Filter Population	Software Application <sup>1</sup>	Tx packet descriptor + packet (sum of the two)	
	Software driver for ATR		
FD Filter Removal	Software <sup>1</sup>	Tx packet descriptor + packet	
	Auto Filter Removal by Tx or Rx traffic	Tx or Rx packet with SYN/FIN	
RSS table and Key	Software	CSR	10/sec

1. For performance considerations, FD filter population and removal by software application is expected to be made by dummy packets. Meaning, an extra 1 Mpps for population and removal.

### 7.10.1.7 Receive Queue Index

As indicated in the previous section, one of the filter's actions is the packet classification to LAN queues. The LAN queue indexes defined by the classification filters are within the VSI space (the VSI inherited by the switch or ACL filters). Assuming a classification filters defines a queue index 'n', then:

- VSI that is defined by the VSILAN\_QTABLE (VSILAN\_QBASE.VSIQTABLE\_ENA = 1b). The queue index in the PF space equals:
  - VSILAN\_QTABLE[vsi\_idx, n/2].QINDEX\_0 for even 'n'
  - VSILAN\_QTABLE[vsi\_idx, (n-1)/2].QINDEX\_1 for odd 'n'

Where 'n' is the VSI Queue (values in [0..15]).

- VSI that is defined by the VSILAN\_QBASE (VSILAN\_QBASE.VSIQTABLE\_ENA = 0b). The queue index in the PF space equals to VSILAN\_QBASE.VSIBASE + 'n'.
- VF queues: The mapping of the above queue indexes to relative indexes in the VF space is not a direct mapping. The mapping is defined by the queue indexes in the PF space that are programmed in the VSILAN\_QTABLE and the VPLAN\_QTABLE registers. For example, assuming a VF with four queues in a single VSI with the following settings:
  - VPLAN\_QTABLE[0:3] = A,B,C,D (where A...D are the queue indexes in the PF space)
  - VSILAN\_QTABLE[0].QINDEX\_0 = C
  - VSILAN\_QTABLE[0].QINDEX\_1 = D
  - VSILAN\_QTABLE[1].QINDEX\_0 = A
  - VSILAN\_QTABLE[1].QINDEX\_1 = B

Then receiving a packet to queue '0' of the VSI is mapped to queue C in the PF space, which is queue index 2 in the VF space.

**Note:** VF queues accessed by software can be mapped as scattered queues (in the PF space) by the VPLAN\_QTABLE registers or as contiguous queues (in the PF space) by the VPLAN\_QBASE register.

The hash filter is a little bit more complex, as the queue index is a relative index within a specific range of queues of a VSI. See [Section 7.10.7, "Hash Filter"](#). This range of queues is also referred as "region" of queues.

Following are some exception rules for the receive queue index:

- If a frame does not match any of the classification filters below (with a queue action), the frame is directed to the default queue (queue zero of the VSI).
- The receive queue index that defines an "invalid" queue causes dropping of the packets. Such packets are counted by the GLV\_RDPC counter of the VSI. The following cases are considered as "invalid" queue:
  - A VSI that is defined by VSILAN\_QTABLE is limited to 16 queues (which is the size of this table). Therefore, a queue index that equals or is larger than 16 is considered "invalid".
  - The queues in a VSI that is defined by VSILAN\_QTABLE are enabled by the QINDEX\_0 and QINDEX\_1 parameters. A queue index that points to a VSILAN\_QTABLE entry with a value of 0x3FFF is considered "invalid".
  - A VSI that is defined by VSILAN\_QBASE.VSIBASE is limited only by the PF queue space. A queue index that exceeds the PF space is considered "invalid".

### 7.10.1.8 Initialization

This section lists all registers associated with the classification filters directly or indirectly and its required initialization.

**Note:** This section does not provide a complete description of the registers.

This description is given in the following sections as well as in the [Section 13, "Programming Interface"](#). The initialization sequence should be executed according to the following order (described in the subsections below):

1. Function Private Memory Allocation
2. Queue Allocation
3. Profiles Allocation
4. Static Classification Filters Registers
5. Dynamic Classification Filters Registers

**Note:** It is expected that all EMP VSIs are not enabled to any of the classification filters. Specifically the PE\_ENA and the FD\_ENA flags in the Add VSI commands are expected to be cleared. In addition, the EMP VSIs should be associated with VSI Groups that are not enabled for any of the classification filters.

### 7.10.1.8.1 Function Private Memory Allocation

The PE Quad hash filters are stored in the Function Private Memory (FPM), while part of them are fetched to the on-chip cache. The FPM allocation registers are described in [Section 9.4.2, “Function Private Memory Space Configuration”](#). These registers should be initialized per PF prior to any settings of the LAN queues and before enabling these filters.

### 7.10.1.8.2 Queue Allocation

LAN queues should be allocated to the functions before packets are directed to these queues. If this rule is not kept, packets directed to these queues are dropped.

PE quad hash filters, as well as TCP port filters, should be programmed before matched packets are expected. Received packets with non-matched filters are directed to the LAN queues of the function.

### 7.10.1.8.3 Profile Allocation

The association between packets and filters type is made through profiles. The profiles are a standard method of selecting and action based on source and type of the functions.

### 7.10.1.8.4 Static Classification Filters Registers

Table 7-155 describes static classification registers:

**Table 7-155. Static Classification Filters Registers Initialization**

CSR	Installation Comment
<b>QH (PE) Registers</b>	
GLQF_PEMASK_SEL	Global Classification Filter - PE Mask Select is loaded from the NVM
GLQF_PEINSET	Global Classification Filter - PE Input Set is loaded from the NVM
GLQF_PEMASK	Global Classification Filter - PE Mask is loaded from the NVM
GLQF_PE_CTL2	Global Classification Filter - PE Control 2 is loaded from the NVM
GLQF_PE_CTL	Global Classification Filter Control
GLQF_PE_OSR_STS	Global PE Classification Filter outstanding request counter
GLQF_APBVT	Global Classification Filter Accelerated Port Bit Vector
GLQF_PE_OSR_LIM	QH FLU - PCIe/FOC Outstanding Request limits
VSIQF_PE_CTL1	VSI Classification Filter - PE Control 1 (programmed by add VSI)
PFQF_PE_CTL2	PF Classification Filter - PE Control
PFQF_PE_TC_CTL	PF Classification Filter - QH TC Enable
PFQF_PE_CTL1	PF Classification Filter - PE Control
PFQF_PE_ST_CTL	PF Control register for the Statistic counter
PFQF_PE_ENA	PF Classification Filter - PE Enable
VPQF_PE_ENA	VF Classification Filter - PE Enable
VPQF_PE_CTL2	PF Classification Filter - PE Control
VPQF_PE_FLHD	VF Free List head array
VPQF_PE_CTL1	VF Classification Filter - PE Control

VSIQF_HLUT	VSI Classification Filter - Hash LUT: programmed by Set RSS LUT command.
VSIQF_HKEY	VSI Classification Filter - Hash Key: programmed by Set RSS LUT command

## 7.10.2 Block Diagram

A top-level block diagram of the classification filters is illustrated in [Figure 7-30](#) and described below. Each of the filters: FD filter, QH filter, and Hash filter has its own dedicated logic.

- **Profile Chooser** and **Field Extractor** — The building blocks of the Fields Extractor logic are similar to those ones used by the switch filters and the ACL filters. The extractor logic extracts a local Field Vector (FV) from the packet headers based on the packet profile (Profile ID) per filter. The Profile ID is a function of the packet structure (packet type and flags) that is configured per filter per VSI group and per control domain that are defined per VSI.
- **Field Vector (FV) and Input Set** — Input set is a set of fields from the packet that are used for the packet classification. The input set is taken from the FV while some of the fields might be partially masked and some of the fields might be swapped or XORed. See details in [Section 7.10.4](#).
- **Filter Lookup** — In this stage the lookup is performed either by an exact match or hash distribution (RSS). This associates the packet with a set of actions.
- **Filter Action** and **Priority Resolver** — Filter action can be classification to engine (LAN/PE), selecting a target queue, pass/reject the packet and other actions listed in [Table 7-150](#). The action is defined by the filter with highest priority defined by the priority resolver. The default setting of the priority resolver is illustrated in [Figure 7-29](#).

**Figure 7-30. Classification Filters Block Diagram**

## 7.10.3 Profile Chooser

- **Control Domain (CDID)** and **VSI Group (VSIG)** — The VSIs are mapped to control domains and VSI groups that are used by the extractor logic. Then the CDIS and VSIG maps the Packet Type Groups (PTGs) and the packet flags (FLGs) to packet profiles.
- **Packet Types** and **Flags** — Some combinations of the packet headers are defined by unique identification called “packet types”. A portion of these packet types are defined by a smaller set of PTGs. The PTG tables map the packet types per filter per, per control domain and per VSI to a small set of 64 PTGs. On top of the PTG, there is some portion of the FLGs that are used for the classification task. A set of 16 FLGs are selected from the global set of flags per filter and per control domain.

Figure 7-31 shows the default profile chooser diagram.

Figure 7-31. Profile Chooser - Packet Types to Profile ID and Input Set Flow

### 7.10.3.1 Settings for the Classification Filters

See default setting of the packet Profile IDs and the field vectors for the FD, Hash, and PE in [Section 7.10.13, “Default Extractor Configuration”](#).

## 7.10.4 Input Sets Generator

The input set is cleared to zero's for every packet (before the fields are posted to it from the field vector). The hardware supports any mapping between the field vector to the input set. Yet, in most cases (default setting), the input set equals exactly to the field vector. Cases in which the input set differs from the field vectors relates to swapped fields, masked fields, and asymmetric input sets. Bit fields that are masked, are replaced by zeros in the input set.

### 7.10.4.1 Generating PE Input Set from the Field Vector

Unique parameters of the FV to input set extraction of the PE filter are:

- The FV is mapped to the Input Set vector by the GLQF\_PEINSET registers. Default settings of these registers (loaded from the NVM) map all valid words in the FV to the Input Set vector at the same word offsets. The GLQF\_PEINSET is a two-dimensional array: 32 profiles x 24 words offsets per profile.
- Masking option. The mask registers are used to mask bit fields per words in the FV. There is a global set of 16 x mask registers for the PE filter. A mask register can mask out any selected bits in a FV word. Multiple mask registers can be selected for a packet profile. Multiple profiles can share the same registers. The mask options are defined by the following registers:
  - 16 x GLQF\_PEMASK registers — Each register defines the byte index in the input set that should be masked and the 16-bit masking.
  - 32 x GLQF\_PEMASK\_SEL registers — Register 'n' in the array is associated with packet profile 'n'. It defines the GLQF\_PEMASK registers that should be used for profile 'n'.

**Note:** By default setting (loaded from the NVM), none of the words in the input set are masked.

### 7.10.4.2 Generating FD Input Set from the Field Vector

Unique parameters of the FV to input set extraction of the FD filter are:

- The FV is mapped to the Input Set vector by the GLQF\_FDINSET registers. Default settings of these registers (loaded from the NVM) map all valid words in the FV to the Input Set vector at the same word offsets. The GLQF\_FDINSET is a two-dimensional array: 128 profiles x 24 words offsets per profile.
- The swap option is defined by the GLQF\_FDSWAP registers. The swap functionality is meaningful only at FD programming time with the GLQF\_FDINSET registers. If the SWAP flag in the programming descriptor is set, the input set is defined by the GLQF\_FDSWAP registers. Otherwise, it is defined by the GLQF\_FDINSET registers.
- Masking option. The mask registers are used to mask bit fields per words in the input set. There is a global set of 32 x mask registers for the FD filter. A mask register can mask out any selected bits in an input set word. Multiple mask registers can be selected for a packet profile. Multiple profiles can share the same registers. The mask options are defined by the following registers:
  - 32 x GLQF\_FDMASK registers — Each register defines the byte index in the input set that should be masked and the 16-bit masking.
  - 128 x GLQF\_FDMASK\_SEL — Register 'n' in the array is associated with packet profile 'n'. It defines the GLQF\_FDMASK registers that should be used for profile 'n'.

**Note:** By default setting (loaded from the NVM), none of the words in the input set are masked.

### 7.10.4.3 Generating Hash Input Set from the Field Vector

Unique parameters of the FV to input set extraction of the Hash filter are:

- The FV is mapped to the Input Set vector by the GLQF\_HINSET registers. Default settings of these registers (loaded from the NVM) map all valid words in the FV to the Input Set vector at the same word offsets. The GLQF\_HINSET is a two-dimensional array: 128 profiles x 24 words offsets per profile.
- Symmetric hash is defined by the GLQF\_HSYMM registers. Symmetric hash is enabled for a VSI (by the Hash Scheme field in the Add VSI AQC). The symmetric hash registers structure is identical to the GLQF\_HINSET registers with one difference: the *Valid* flag in the GLQF\_HINSET registers is replaced by a *SYMM\_ENA* flag in the GLQF\_HSYMM registers. For each word with active *SYMM\_ENA* flag, the input set is defined by a XOR function of the words defined by the matched GLQF\_HSYMM and GLQF\_HINSET registers.
- Masking option. The mask registers are used to mask bit fields per words in the input set. There is a global set of 32 x mask registers for the Hash filter. A mask register can mask out any selected bits in an input set word. The masking operation is executed after any possible symmetric action described above. Multiple mask registers can be selected for a packet profile. Multiple profiles can share the same registers. The mask options are defined by the following registers:
- 32 x GLQF\_HMASK registers — Each register defines the byte index in the input set that should be masked and the 16-bit masking.
- 128 x GLQF\_HMASK\_SEL — Register 'n' in the array is associated with packet profile 'n'. It defines the GLQF\_HMASK registers that should be used for profile 'n'.

**Note:** By default setting (loaded from the NVM), none of the words in the input set are masked.

### 7.10.5 Switch Filters

The switch filters are enabled only for packets that are not rejected for filtering by exception rules that are listed in [Section 7.10.1.5](#). For queue-related programming in the switch, see [Section 7.8.12.3.1](#).

### 7.10.6 ACL Filters

The ACL filters are enabled only for packets that are not rejected for filtering by exception rules that are listed in [Section 7.10.1.5](#).

Some of the ACL filters can be programmed to define a target queue or a target region of queues for the hash filter. [Section 7.9.3.4.3.2](#) for details.

### 7.10.7 Hash Filter

The hash filter is a mechanism to statistically distribute received packets into several receive queues. Software allocates the queues among the different processors, therefore sharing the load of packet processing among several processors. One of the most common use cases of hash filters is the RSS hash defined by Microsoft and used widely by other operating systems as well. Other generic hash functions are used by embedded systems as well. The hash filter directs the received packets to queue index within a "region" of queues of the VSI, as illustrated in the [Figure 7-32](#). Listed below are some terms relating the hash filter.

## Hash Filter Candidate Rules

The receive packet is not rejected for the filter by the exception rules listed in [Section 7.10.1.5](#). The Hash filter is enabled per VSI group as shown in [Section 7.10.13.1](#) (the VSI is associated to a VSI group (VSIG) that is enabled for the Hash filter by profile selection mechanism).

The hash filter priority selecting a queue is hard-coded as the lowest priority between ACL filter, PE filter, L2 Switch filter, and FD filter.

## Queue Index

The queue index within the VSI is defined by the sum of the Region base and the output of the hash lookup table (modulo the region size).

## Queue Region

A region of queues is defined by two parameters: Region base and Region Size. The region of queues can be defined by one of the following options in priority order:

1. **Switch filters** with *ToQueue* parameters greater than zero. In this case the region base is the "Queue Number" parameter and the region size is equal to  $2^{(ToQueue)}$ . Priority is defined by the *ToQueue\_PRIO* of the switch filter. If the packet does not match the RSS filter, the packet is directed to queue zero of the VSI.
2. **ACL filters** with *ToQueue* parameters greater than zero - same functionality as the switch filter. In this case, the region base is the "Queue Number" parameter and the region size is equal to  $2^{(ToQueue)}$ , (same as the switch filters). Priority is defined by the *ToQueue\_PRIO* of the FD filter.
3. **FD filter** with *ToQueue* parameter greater than zero - same functionality as the switch filter. In this case, the region base is the "Queue Number" parameter and the region size is equal to  $2^{(ToQueue)}$ , (same as the switch filters). Priority is defined by the *ToQueue\_PRIO* of the FD filter.
4. The **packet's profile** is indicated as "Override TC" by one of 32 global GLQF\_PROF2TC tables. These tables are enabled for VSIs by the TC override option and *Profile Override TC* fields in the Add VSI admin command. In this case, the region base and size are defined by the TC region described below. Priority is lower than the above filters switch and FD filters, and higher than the TC of the packet.
5. The **TC of the packet** defines the queue region. The region base and size are defined by the number and offset of Rx-Queues per TCs parameters in the Add VSI admin command. Priority is lowest of all the above options.

## Hash LUT

The queue index in the region is defined by a hash value on the input set of the packet. The LS bits of the hash value selects an entry in the hash LUT. Then the LS bits of the programmed value in the LUT is the queue index within the region. The number of bits used to select the entry in the LUT match the LUT size. The number of LS bits taken from the LUT are defined by the region size. The E810 supports three sizes of Hash LUTs. Any of these LUT options is selected per VSI according to the RSS LUT selection field in the Add VSI command.

- 8 LUTs (one table per PF) that support 256 queues per region. These tables are 2K entries and support a reduces size of 512 entries and a reduced size of 128 entries as well (controlled by the *H SIZE* field in the PFQF\_HLUT\_SIZE registers).
- 16 global LUTs of 512 entries that support 64 queues per region. These tables support a reduces size of 128 entries (controlled by the *H SIZE* field in the matched GLQF\_HLUT\_SIZE registers). Selecting the Global LUTs, a specific table is selected by the RSS global LUT parameter in the Add VSI command.

- Per VSI LUT with 64 entries that support 16 queues per region.

### Hash Key

See [Section 7.10.10.1, “Microsoft Toeplitz-Based Hash”](#).

### Hash Function

The hash is calculated on the input set words. Masked bits within the input set are replaced by zeros for the hash calculation (as indicated in [Section 7.10.4](#)). The Hash signature is used to select a queue index as explained above. It can also be reported in the receive descriptor as detailed in [Section 7.6.3](#).

The E810 supports one of the following 32-bit hash schemes selected per-VSI by the *Hash Scheme* field in the Add VSI command

- **Toeplitz Hash** — The hash key for the VSI is defined by the VSIQF\_HKEY registers (detailed in [Section 7.10.10](#)).
- **Symmetric Toeplitz Hash** — The hash key is defined as above by the VSIQF\_HKEY registers. Symmetric hash provides the same signature for packets in both Tx and Rx direction. It is done by a XOR function between “source” and “destination” tuples (see description of the GLQF\_HSYMM registers in [Section 7.10.4.3](#) and [Section 7.10.10](#)).
- **XOR Hash** — Simple XOR function between the DWords of the input set. Furthermore, 16-bit XOR function is made if the required XOR output is 16 bits or less and further 8-bit XOR is made if the required XOR output is 8 bits or less.
- **Jenkin's Hash** — This options is provided only for small input sets up to four bytes long (detailed in [Section 7.10.10](#)).

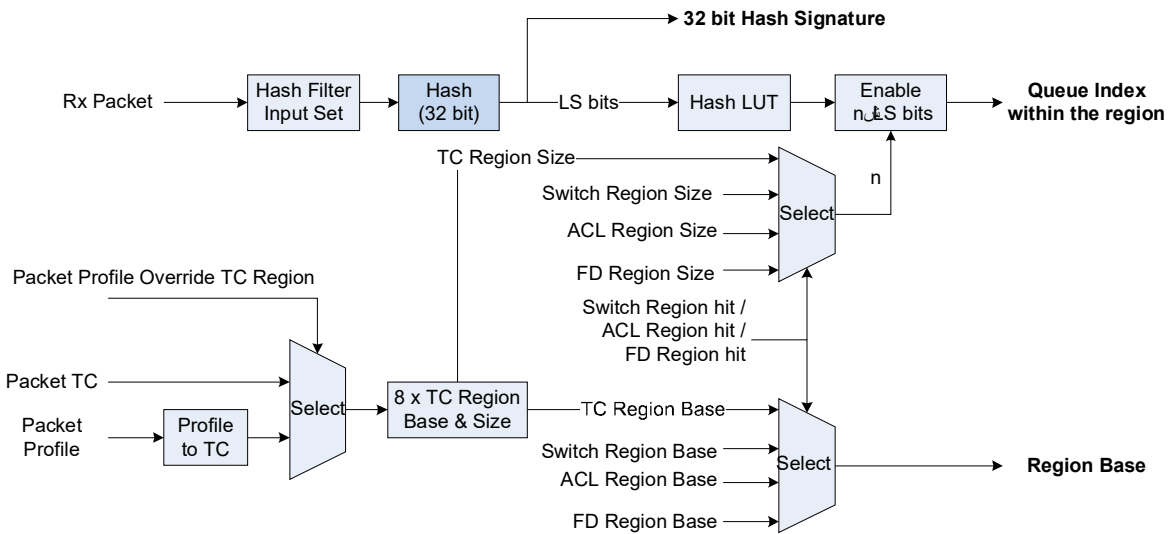

Figure 7-32. Hash Filter Block Diagram

## 7.10.8 Flow Director (FD) Filter

The Flow Director (FD) filter is aimed to match specific flow or flows with “some” action. The FD filter is based on “exact” match of the selected tuples named as “input set” for filtering purposes. The FD filter is composed of the following components.

### FD Filter Candidacy Rules

The FD filtering is enabled by the following parameters:

- The receive packet is not rejected for the filter by the exception rules listed in [Section 7.10.1.5](#).
- The FD filter is enabled for the parent PF by the *FD\_ENA* flag in the *PFQF\_FD\_ENA* register.
- The FD filter is enabled for the VSI by the *FD\_ENA* flag in the Add VSI admin command.
- The FD filter is enabled per VSI group as shown in [Section 7.10.13.1](#) (the VSI is associated to a VSI group that is enabled for the FD filter by the *VSIG\_FD* parameter in the Add VSI admin command).
- Filtering is also qualified per packet for matched profile before a search in FD table is triggered.

### FD Filter Match Criteria

Packet matches a filter entry if the following packet’s parameters match the filter context:

- Input Set fields.
- Packet’s VSI and Packet profile.

### Filter Action

The filter actions are defined by specific fields in the FD programming descriptor and are listed here (see [Section 10.5.3.3](#) for FD programming descriptor structure):

- Pass/Reject the packet is defined by the *DROP* flag.
- Destination queue or region of queues for the hash filter and its priority are defined by the *QINDEX*, *ToQueue* and *ToQueue\_PRIO* parameters in the FD programming descriptor. See [Figure 7-32](#) for details on region of queues action.
- Statistic counters (see [Section 7.10.8.1](#) for more details). Packet and byte counters are enabled by the *STAT\_CNT* and *STAT\_ENA*. The *STAT\_ENA* field could be set to one of the following: No stat counter:
  - Packet counter
  - Both packet and byte counters
- Report the FD filter ID (FDID) and its priority in the Rx-Descriptor are defined by the *FDID\_VAL*, *FDID\_MDID*, and *FDID\_PRIO* parameters in the FD programming descriptor.
- Post selected fields from the packet or metadata of the packet to the Rx-Descriptor. The selected fields that should be posted are defined by the *DESC\_PROF* and *DESC\_PROF\_PRIO* parameters in the FD programming descriptor. For more details on the Rx-Descriptor profiles, see [Section 7.6.4](#).

## Default Filter Action

Packets that are subjected to look up in the FD table but do not match any entry are handled according to the default FD action.

**Note:** In case of any default action other than drop, the relevant Rx-Descriptor reflects no hit occurred in the FD table.

The default is defined by the following parameters in the Add VSI admin command:

- Pass/Reject the packet is defined by the *Default Drop* flag.
- Destination queue or region of queues parameters with a priority option as defined for packets that hit the FD table:
  - Default Queue
  - Default queue group
  - Default Priority.
- If the *Default Drop* flag is cleared and the *Default Priority* equals to zero, packets that miss the FD table are handled by the next classification filter(s) according to its priority order, as shown in [Figure 7-29](#).

## FD Programming Enable

FD filters programming is enabled by the following parameters:

- Programming is enabled for the parent PF by the *FD\_ENA* flag in the *PFQF\_FD\_ENA* register.
- Programming is further enabled for the programming VSI by the Flow Director programming enable flag in the Add VSI command.
- Programming is further enabled for the VSI defined by the *FD\_VSI* field in the programming descriptor for the best effort space or guaranteed space in the table by the *Max Dedicated* and *Max Shared* parameters in the Add VSI command. Best effort and guaranteed spaces are described in this section.
- All conditions for the packet match the FD filter criteria including enable for the VSI group, matched profile, and no errors.
- Programming request that failed the above conditions is ignored silently.

## Programming

FD filter programming is done through packets that pass through the FD. The packet causes an FD Filter programming when it is associated with a "Flow Director Programming Descriptor" described in [Section 10.5.3.3](#) followed by packet structure that contains the filter fields.

- The descriptors used for programming (in order) are:
  - Optional Context Descriptor
  - Optional IPsec context descriptor
  - FD filter programming descriptor
  - Tx Data descriptor

**Note:** Programming of the FD table cannot occur if the programming packet (described above), is dropped by any of the pipeline mechanisms.

- Programming can be selected to be on the Guaranteed space or Best Effort space according to the *FD\_SPACE* field in the FD programming descriptor. It can be one of the following options:
  - Guaranteed
  - Best Effort
  - Prefer-Guaranteed
  - Prefer-Best Effort
- Programming completion status can be reported back (by the “Programming Status” Descriptor described in [Section 10.4.2.2.3](#)). It is enabled by the *COMP\_REP* field in the programming descriptor that can be one of the following options:
  - No completion status
  - Completion status on failed programming
  - Completion status at all cases.
- The receive queue for the completion status is selected by the *COMP\_QUEUE* flag in the FD programming descriptor. It selects between queue zero of the programming VSI or *Reporting Queue* field in the Add VSI admin command.
- *ToQueue* field in the FD programming descriptor. If there are no descriptors in the target receive queue the completion indication is dropped and counted as a dropped packet by the *GLV\_RDPC* counter of the VSI.
- The packet that is used to program the filter can be a single packet or a TSO and it can be transmitted or not depending on the *Dummy* flag in the transmit data descriptor.
- Reprogramming an existing filter updates its parameters.
- The “source” and “destination” fields in the transmitted packets of the filter programming are usually presented in a reversed order with respect to the expected received packets. It can be adjusted by the device.

## Filter Removal

Filters are removed in one of the following options:

- **Remove a single filter** by the software using the FD filter programming sequence (as above).
- **Auto-evict a single filter** by the hardware following a transmission or reception of TCP packet with *FIN* or *RST* flags. Packets that are candidates for auto-eviction are enabled per-profile by the *GLQF\_FDEVICTENA*. The TCP flags that matters for auto-eviction are defined by the *GLQF\_FDEVICTFLAG* register. Filters are enabled for auto-evict by the *EVICT\_ENA* flag in the filter programming descriptor. The auto-eviction is also qualified per VSI by the appropriate *VSIQF\_FD\_CTL1.EVICT\_ENA* bit and per profile by the appropriate *GLQF\_FDEVICTENA*.
- **PF Reset** — Auto-evict all filters of the PF following a PF reset.
- **VF Reset** — As part of the VF reset flow the parent PF software is expected to initiate a request to remove all the filters of all the VSIs of the VF.
- **VM Reset** — As part of the VM reset flow the parent PF software is expected to initiate a request to remove all the filters for the VM VSI.
- **Software initiated request to remove all filters of the PF(VSI of the PF) or a VSI** — It is done by initiating the Clear FD Table admin command. Removing the filters of a PF removes the filters of all VSIs of the PF. This action can be done during nominal operation without impacting the functionality of other entities.

## VSI Rules - Summary

Table 7-157 summarizes the VSI's FD actions and validity rules:

**Table 7-157. VSI Rules - Summary**

Action/Validity Check	The VSI by which the Action/Validity is Checked / Configuration Completion
Enable for programming	<i>CFG_ENA</i> for the source VSI and <i>FD_ENA</i> for the parent PF.
Programming Budget	Guaranteed and Best Effort spaces for the VSI defined by the <i>FD_VSI</i> field in the FD programming descriptor.
Enable for Filtering	<i>FLT_ENA</i> for the destination VSI + <i>FD_ENA</i> for the parent PF.
VSI in the FD filter context	Equals to the <i>FD_VSI</i> field in the FD programming descriptor.
Tx ATR filter removal	The source VSI from which the packet is sent is compared against the VSI in the filter context.
Rx ATR filter removal	The destination VSI is compared against the VSI in the filter context.
Configuration Completion	Completion is reported to the same VSI that initiated the configuration/removal command.

## FD Table Size and Space

The FD table is stored in the device and can hold up to 16K filters. There are two spaces in the FD table: Guaranteed space and Best Effort space.

- **Global Setting** — These spaces are defined for the whole device by the *GLQF\_FD\_SIZE.FD\_GSIZE* and *GLQF\_FD\_SIZE.FD\_BSIZE* registers. Each space can be defined up to 16K filters as long as the sum of the two does not exceed the table size (of 16K filters).
- **Per PF Setting** — Each PF can be allocated a guaranteed space and best effort space by the *PFQF\_FD\_SIZE.FD\_GSIZE* and *PFQF\_FD\_SIZE.FD\_BSIZE* registers. Each space can be defined up to 16K filters as long as the sum of the Guaranteed spaces of all the PFs do not exceed the global guaranteed space and as long as the best effort of each PF does not exceed the global best effort space.
- **Per VSI Setting** — Each VSI can be allocated a guaranteed space and best effort space by the *VSIQF\_FD\_SIZE.FD\_GSIZE* and *VSIQF\_FD\_SIZE.FD\_BSIZE* registers. Each space can be defined up to 16K minus 1 filters as long as the sum of the Guaranteed spaces of all the VSIs of a PF do not exceed guaranteed space of its parent PF, and as long as the best effort of each VSI does not exceed its parent PF's best effort space.

At programming, the software can chose the space on which the filter is counted. If there is no space on the selected space, the programming request is rejected.

The software can track the number of programmed filters.

- **Per PF** — By *PFQF\_FD\_CNT.FD\_GCNT* and *PFQF\_FD\_CNT.FD\_BCNT* counters.
- **Per VSI** — By *VSIQF\_FD\_CNT.FD\_GCNT* and *VSIQF\_FD\_CNT.FD\_BCNT* counters.
- **Globally** — By the *GLQF\_FD\_CNT.FD\_GCNT* and *GLQF\_FD\_CNT.FD\_BCNT* counters.

## FD Filter Context

Each filter entry is consisted of 64 bytes with the following parameters:

- **Parameters extracted from the packet** — Input Set (48 bytes) and the Matched packet profile.
- **Parameters from the programming descriptor** — Target Queue and control, Filter ID and control; Packet's VSI, Statistic Counter, Receive Descriptor Profile and control, and Other control flags.

- **Self table management parameters** — Linked list pointers.
- **Self storage managed parameters** — PF/VF/VSI identification, *Valid* flag, and *Dirty* flag.

### FD Filter Match Criteria

Packet matches a filter entry if the following packet's parameters match the filter context:

- Input Set fields
- Packet's VSI
- Packet profile

### Hash and Buckets

The FD table is organized in buckets. Buckets are sets of filters addressed by a hash function on the input set (Toeplitz hash using a global key defined by the GLQF\_HKEY registers). Multiple filters might share the same hash. In such case the hardware checks for perfect match between these filters one entry at a time. The number of searches is compared against the FDLONG parameter in the GLQF\_FD\_CTL register.

## 7.10.8.1 Statistic Counters

There are 8K statistic counters that can be used by the FD filters. These counters are organized in two banks of 4K counters each. The statistic counters are allocated in blocks of 256 counters to the PFs by the Allocate Resource admin command (resource type = Flow Director counter block). An FD filter can assign no counters; a single counter (counting bytes of packets) or count both (bytes and packets). Assigning a single counter, software can select any counter out of the two banks. Assigning two counters, software defines a single counter index in the two banks for these counters. In this case, the packets are counted in bank zero and the bytes are counted in bank one.

## 7.10.8.2 Performance

### 7.10.8.2.1 Programming and Removal Performance Targets

The FD filter is expected to be used by two main usage models. Filters programming initiated by software application (above the driver). And filters programmed and owned by the driver (usually for ATR functionality).

Expected filter programming rate initiated by software application is in the range of up to 0.5M filters per second. Same rate of removing filters. Targeting Si performance for programming and removing filters at double rate of the above.

Expected filter programming by the driver is in the order of once every 20 packets. Expected auto-removal by FIN/RST is in the order of 1M filters per second.

**Notes:** The hardware does not provision the rate of programming nor the rate of transmit FIN/RST packets that are candidates for auto-removal of filters from the table. It is the responsibility of software to follow the above programming and auto-removal performance. Exceeding these rates, might impact transmission and reception rates. Therefore, the PF driver should enable direct programming and auto filter removal only for trusted VSIs. The PF driver could add and remove FD filters for non-trusted VSIs that are not enabled for direct programming (non-trusted VFs).

The interface by which these VFs request FD filter programming and remove FD filters is outside the scope of this document.

## 7.10.9 Protocol Engine (PE) Filters

The PE filters direct received packets to the Protocol Engine. It is mainly (but not limited) to iWARP and RoCEv2 traffic. The PE filter is composed of an APBVT filter and a Quad Hash (QH) filter described below.

### Accelerated Port Bit Vector Table - APBVT

The L4 destination port number is compared against an internal Accelerated Port Bit Vector Table (GLQF\_APBVT registers). The E810 includes a 64K x 1-bit vector for the whole device (all eight LAN ports). An active bit in the table means that the port number is enabled by one (or more) functions. Programming the table is done by the PE interface, as described in [Section 11.5.3.18](#).

For the sake of the APBVT functionality, the destination L4 port number is posted by the extractor logic to word zero in the Field Vector.

### Quad Hash Filter - QH

The QH Filter checks for perfect match between selected fields in the packet (called input set) and pre-programmed values in the filter table. The E810 stores some of the QH filters in an internal cache (holding up to 1K filters) while the other filters are kept in host memory (FPM). The maximum number of PE contexts for the device is 256K. These contexts can be allocated in a flexible manner between the functions with a maximum limit per function of 256K minus 1.

### Filter Candidate Rules

Packets are forwarded to the PE if they meet the following conditions:

- The receive packet is not rejected for the filter by the exception rules listed in [Section 7.10.1.5](#).
- Receive to a PF — The PE is enabled for the PF by the *PE\_ENA* flag in the PFQF\_PE\_ENA register.
- Receive to a VF — The PE is enabled for the VF and its parent PF by the *PE\_ENA* flags in the matched VP/PFQF\_PECTL registers.
- Receive to a VSI — The PE is enabled for the VSI by the *PE\_ENA* flags in the matched VSIQF\_PE\_CTL1 register (should be set by add VSI).
- The packet profile is enabled for the VSI group as shown in [Table 7-173](#) (the VSI is associated to a VSI group for the PE by the *VSIG\_PE* parameter in the Add VSI admin command). The add VSI admin command PE enable sets *PE\_FLTENA* bit in the corresponding VSIQF\_PE\_CTRL1 CSR.
- The packet's TC is enabled by the PFQF\_PE\_TC\_CTL registers (programmed by the PF driver).
- The packet hits the APBVT table (if required by the *APBVT\_ENA* flag in the GLQF\_PE\_CTL2 register of the matched packet profile). By default, iWARP packets are candidate for the APBVT. If the packet is candidate for the APBVT, hitting the filter is a prerequisite condition for lookup in the QH filter.
- The packet hits the QH filter (if required by the *TO\_QH* field in the GLQF\_PE\_CTL2 register of the matched packet profile). By default setting:
  - iWARP packets must match the QH filter as a criteria for PE hit.
  - Non-unicast RoCEv2 packets are subjected to QH filter check but they are forwarded to the PE regardless of hit or miss.

### 7.10.9.1 PE Quad Hash Filter (QH filter)

The Quad Hash Filter (QH filter) is aimed to match specific flows with the protocol engine. The E810 maintains some of the Quad Hash filter in internal cache, while the other filters are stored in host memory (FPM). The number of quad hash filters per function is a function of the number of flows supported by that function. The Quad Hash Filter is composed of the following components:

#### QH Filter Candidate Rules

See Section 7.10.9, “Protocol Engine (PE) Filters”.

#### QH Filter Match Criteria

A packet matches a filter entry if the following packet’s parameters match the filter context:

- Input Set fields
- Packet’s VSI
- Packet profile

#### Filter Action

The filter provides a hit/miss indication. In the case of hit, the matched quad hash filter index (QPN) is reported to the PE together with the packet. In case of a miss, the destination queue pair from the packet is reported to the PE with the packet.

#### Filter Programming

A QH filter is added or removed by the PE (using direct internal interface to the filter logic). As part of the filter parameters, the PE provides the identification fields, the packet’s profile, and the QPN.

**Note:** A filter should be programmed by the PE only if the PF or VF are enabled for the PE and the packet profile is enabled for the VSI group.

#### Filter Removal

Filters are removed in one of the following options:

- Remove a single filter by the PE using its programming interface.
- PF Reset — Auto-evict all filters of the PF and its VFs following a PF reset. After the reset is completed, or before the PE QH filter is re-enabled, the software driver must clear all the filter entries in the Hash space in the FPM (the Hash space is indicated by PEHSIZE in the [Figure 7-33](#)). Only then it can set the *PE\_ENA* flag in the PF/VPQF\_PE\_ENA register.
- VF Reset initiated by the software driver — Auto-evict all filters of the VFs following a VF reset. After the reset is completed, or before the PE QH filter is re-enabled, the parent PF software driver must clear all the filter entries in the Hash space in the FPM (the Hash space is indicated by PEHSIZE in [Figure 7-33](#)). Only then it can set the *PE\_ENA* flag in the VPQF\_PE\_ENA register.
- Explicit request by the PE to remove all filters of the function (PF or VF) from the cache. The PE driver initiates a request to clear all filters of a function through the CSR fabric.

#### QH Table Size

The E810 supports up to 256K Quad Hash contexts for the whole device. These filters are fetched to internal cache that can hold up to 1K filters. The number of supported QH filters is limited by the *PEHSIZE* parameters in the PFQF\_PE\_CTL register for the PF and VPQF\_PE\_CTL registers for the VFs. Programming request for a QH filter above these limits is rejected.

## QH Filter Context

Each filter entry is consisted of 64 bytes.

### Storage in Host Memory

The filters are backed up in the function’s private memory (FPM) in buckets as described in Figure 7-33. Filters are stored in the “hash space” at address defined by the hash value that is calculated on the input set (the hash function is Toeplitz using a global key defined by the GLQF\_HKEY registers). If this location is occupied (hash collision), the filter is stored in a free location in the “collision space”.

The filter in the “hash space” points to all the other filters in the “collision space” that share the same hash. It is organized in a linked list structure. The number of supported buckets (hash space) and the number of supported filters (collision space) are defined per function by the *PEHSIZE* and *PEDSIZE* parameters in the PFQF\_PE\_CTL and VPQF\_PE\_CTL registers. Software should clear the hash space in the FPM before filters are programmed. The QH filters of the PF and its VFs are stored in the FPM of the PF.

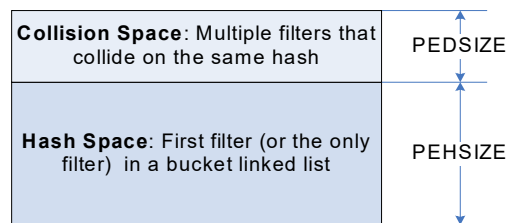

Figure 7-33. Buckets and Collided Filter Entries Space

The actual number of Hash Table entries for the PF is programmed using the PFQF\_PE\_CTL1 and PFQF\_PE\_CTL2. Per VF it is programmed through the VPQF\_PE\_CTL1 and VPQF\_PE\_CTL2 registers.

## 7.10.9.1.1 Performance

### 7.10.9.1.1.1 Programming and Removal Performance Targets

Expected filter programming and removal rate equals to 0.5M filters per second.

### 7.10.9.1.1.2 Buckets Length Impact on Filter Search Performance

The E810 is able to sustain its maximum packet rate when the matched QH filters are stored in the cache. In the case of miss, the E810 fetches the filters from the FPM (host memory). Host memory latency for fetching the filtering depends on the bucket length. The E810 reports the number of buckets for the function in the PF/VPQF\_PECNT\_0.BUCKETCNT. It also reports the number of programmed filters by the function in the PF/VPQF\_PECNT\_1 registers. The ratio between these two numbers provides an indication for the QH table distribution and hence for possible long buckets.

On top of it the PE QH table counts each packet positioning in its bucket at reception time. Received packets at a position shorter or equal than GLQF\_PE\_CTL.PELONG are counted by PFQF\_PE\_CLSN0.HITSBCNT, while packets at position longer than PELONG are counted by the PFQF\_PE\_CLSN1.HITLBCNT. When GLQF\_PE\_CTL.PELONG equals 0, the functionality is disabled and all packets are counted by PFQF\_PE\_CLSN1. The counting is qualified by PFQF\_PE\_ST\_CTL CSR.

The *PELONG* threshold applies to all PE packets, including iWARP and RoCEv2. However, for RoCEv2 packet, where there is no QH lookup, the “position in bucket” is always considered as shorter than or equal to `GLQF_PE_CTL.PELONG`.

Received packets that match PE filters at position longer than `GLQF_PE_CTL.PELONG` are reported by the *PELONGB* flag in the receive descriptor. Thus, software can use these parameters as a criteria for the QH table performance. It then could decide to remove some filters that possibly hit performance or flush the whole table.

## 7.10.10 Hash Functions

The E810 supports several hash functions to be used by the various filters:

- Bucket number of the FD filter and the PE quad hash filter use the Toeplitz scheme with a shared global key defined by the `GLQF_HKEY` registers.
- The hash filter uses one of the following schemes selected per VSI by the *Hash Scheme* field in the Add VSI command.
  - **Toeplitz Hash** — The hash key for the VSI is defined by the `VSIQF_HKEY` registers (detailed in [Section 7.10.10.1](#)).
  - **Symmetric Toeplitz Hash** — The hash key is defined as above by the `VSIQF_HKEY` registers. Symmetric hash is calculated by XOR function between “source” and “destination” tuples providing the same hash signature for Tx and Rx packets of the same “flows” (detailed in [Section 7.10.10.2](#)).
  - **XOR Hash** — Simple XOR hash function between the DWords of the input set. The input set is padded with zeros if not whole number of DWords. If the hash function is used as an address to a lookup table smaller or equal then 64K entries, a 16-bit hash is used by XOR function of the 16 MS bits and 16 LS bits of the 32-bit hash. If the hash function is used as an address to a lookup table smaller or equal than 256 entries, an 8-bit hash is used by a XOR function of the four bytes of the 32-bit hash.
  - **Jenkin's Hash** — This options is provided only for small input sets up to four bytes long (detailed in [Section 7.10.11](#)).

The following notations are used to describe the hash functions:

- Ordering is big endian in both bytes and bits. For example, the IP Address 161.142.100.80 translates into 0xA18E6450.
- A “^” denotes bit-wise XOR operation of same-width vectors.
- **@x-y** denotes bytes x through y (inclusive) of the incoming packet, where Byte 0 is the first byte of the IP header. In other words, all byte-offsets are considered as offsets into a packet where the framing layer header has been stripped out. Therefore, the source IPv4 Address is referred to as @12-15, while the destination IPv4 Address is referred to as @16-19.
- **@x-y, @v-w** denotes concatenation of bytes x-y, followed by bytes v-w, preserving the order in which they occurred in the packet.

### 7.10.10.1 Microsoft Toeplitz-Based Hash

The hash uses a random secret key of 416 bits (52 bytes). The key is defined per VSI by the `VSIQF_HKEY` registers. The algorithm works by examining each bit of the hash input from left to right. Our nomenclature defines left and right for a byte-array as follows:

Given an array K with k bytes, our nomenclature assumes that the array is laid out as follows:

K[0] K[1] K[2] ... K[k-1]

Where:

- K[0] is the left-most byte, and the MSB of K[0] is the left-most bit.
- K[k-1] is the right-most byte, and the LSB of K[k-1] is the right-most bit.

```

ComputeHash(input[], N)
  For input[] of length N bytes (8N bits) and a random secret key K of 416 bits
    Result = 0;
  For each bit b in input[] {
    if (b == 1) then Result ^= (left-most 32 bits of K);
    shift K left 1 bit position; // Cyclic shift while the right-most bit of
                                // K gets the leftmost bit of K
  }
  return Result;

```

### 7.10.10.1.1 Pseudo-Code Examples

The following four pseudo-code examples are intended to help clarify exactly how the hash is performed in four cases: IPv4 with and without ability to parse the L4 header, and IPv6 with and without a L4 header.

**Table 7-158. Examples of Input Fields for the Hash Function**

Packet Type	Hash Input	Hash Result
IPv4 with TCP or UDP	SourceAddress, DestinationAddress, SourcePort, DestinationPort: Input[12] = @12-15, @16-19, @20-21, @22-23	Result = ComputeHash(Input, 12)
IPv4 without L4	SourceAddress, DestinationAddress: Input[12] = @12-15, @16-19	Result = ComputeHash(Input, 8)
IPv6 with TCP or UDP	SourceAddress, DestinationAddress, SourcePort, DestinationPort: Input[12] = @8-23, @24-39, @40-41, @42-43	Result = ComputeHash(Input, 36)
IPv6 without L4	SourceAddress, DestinationAddress: Input[12] = @8-23, @24-39	Result = ComputeHash(Input, 32)

### 7.10.10.1.2 RSS Verification Suite

This section provides a verification suite used to validate that the hash function is computed according to MSFT nomenclature.

Assume that the random key byte-stream is:

```

0x6d, 0x5a, 0x56, 0xda, 0x25, 0x5b, 0x0e, 0xc2,
0x41, 0x67, 0x25, 0x3d, 0x43, 0xa3, 0x8f, 0xb0,
0xd0, 0xca, 0x2b, 0xcb, 0xae, 0x7b, 0x30, 0xb4,
0x77, 0xcb, 0x2d, 0xa3, 0x80, 0x30, 0xf2, 0x0c,
0x6a, 0x42, 0xb7, 0x3b, 0xbe, 0xac, 0x01, 0xfa,
0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00,
0x00, 0x00, 0x00, 0x00

```

**Table 7-159. IPv4**

Destination Address/Port	Source Address/Port	IPv4 Only	IPv4 with TCP
161.142.100.80 / 1766	66.9.149.187 / 2794	0x323E8FC2	0x51CCC178
65.69.140.83 / 4739	199.92.111.2 / 14230	0xD718262A	0xC626B0EA
12.22.207.184 / 38024	24.19.198.95 / 12898	0xD2D0A5DE	0x5C2B394A
209.142.163.6 / 2217	38.27.205.30 / 48228	0x82989176	0xAFC7327F
202.188.127.2 / 1303	153.39.163.191 / 44251	0x5D1809C5	0x10E828A2

The IPv6 Address tuples are only for verification purposes, and might not make sense as a tuple.

**Table 7-160. IPv6**

Destination Address/Port	Source Address/Port	IPv4 Only	IPv4 with TCP
3FFE:2501:200:3:1 / 1766	3FFE:2501:200:1FFF:7 / 2794	0x2CC18CD5	0x40207D3D
FF02:1 / 4739	3FFE:501:8:260:97FF:FE40:EFAB / 14230	0x0F0C461C	0xDDE51BBF
FE80:200:F8FF:FE21:67CF / 38024	3FFE:1900:4545:3:200:F8FF:FE21:67CF / 44251	0x4B61E985	0x02D1FEEF

### 7.10.10.2 Symmetric Hash

A symmetric hash provides the same value if its respective source and destination fields are swapped. For example, suppose that the hash is done on the frame source and destination IP Addresses. A symmetric hash guarantees that: **hash(src IP, dst IP) = hash(dst IP, src IP)**.

The motivation behind symmetric hash is to route frames of a specific “flow” between two nodes to the same receive queue independent of the transmission direction (Tx or Rx).

The symmetric hash is useful for matched pairs of tuples like:

- IP Addresses
- L4 port numbers
- MAC Addresses

Symmetric hash is defined per packet profile by its GLQF\_HSYMM registers. For each word with active SYMM flag in the GLQF\_HSYMM registers, the input set is defined by a XOR function of the words defined by the matched GLQF\_HSYMM and GLQF\_HINSET registers.

#### 7.10.10.2.1 Symmetric Hash Example for IPv4 with TCP

Non Symmetric input vector is:

Input[12] = @12-15, @16-19, @20-21, @22-23

Symmetric input vector is:

Input[12] = @12-15 ^ @16-19, @12-15 ^ @16-19, @20-21 ^ @22-23, @20-21 ^ @22-23.

## 7.10.11 Receive Filters Admin Commands

### 7.10.11.1 Set RSS Key (0x0B02)

This command is used to set the RSS Key of a VSI. It can be used by a PF or a VF for VSIs assigned to it. A PF can set the RSS key on behalf of its VFs.

**Table 7-161. Set RSS Key Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0B02	Command opcode.
Datalen	4-5	0x34	Length of buffer. Should be equal to 0x34 (hash key size).
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
VSI#	16-17	0x0	<b>Bit 15:</b> Valid VSI# Must always be set. Ignored by firmware. <b>Bits 14:10:</b> Reserved <b>Bits 9:0:</b> VSI Number
Reserved	18-23	0x0	Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

The command buffer of this command contains the RSS key to set:

Offset	Content
0x0 - 0x27	Standard RSS Key
0x28 - 0x33	Extended hash key. Must be zero for regular RSS.

**Table 7-162. Set RSS Key Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0B02	Command opcode.
Datalen	4-5	0x0	No return buffer.
Return Value/VFID	6-7		Return value. The following error values can be returned: ENOENT = If not a valid VSI. EACCES = If the VSI is not owned by this PF/VF.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-23	0x0	Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

### 7.10.11.2 Set RSS LUT (0x0B03)

This command is used to set the RSS LUT of a VSI or RSS LUT of the PF or one of the global RSS LUT. This command can be initiated only by the PF. A VF can request its parent PF to configure an RSS LUT for its use via software interface or by the Mailbox AQ. It can be used by a PF or a VF for VSIs assigned to it. A PF can set the RSS LUT on behalf of its VFs.

**Table 7-163. Set RSS LUT Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0B03	Command opcode.
Datalen	4-5	64/128/512	Length of buffer. Should be equal to 0x
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
VSI#	16-17		<b>Bit 15:</b> Valid VSI# Is set if <i>Table Type</i> = VSI. Otherwise, ignored by firmware. <b>Bits 14:10:</b> Reserved <b>Bits 9:0:</b> VSI Number
Command Flags	18-19		<b>Bits 0:1:</b> Table Type 00b = VSI 01b = PF 10b = Global LUT 11b = Reserved <b>Bits 2:3:</b> LUT Size For VSI LUT this field is reserved and must be set to 00b. For PF LUT: 00b = 128 01b = 512 10b = 2K 11b = Reserved For Global LUT: 00b = 128 01b = 512 All other values are reserved. <b>Bits 4:7:</b> Global LUT Index Relevant only for <i>Table Type</i> equals to "Global LUT". Otherwise it must be 0. <b>Bits 15:8:</b> Reserved
Reserved	20-23	0x0	Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

The command buffer of this command contains the LUT to set:

Offset	Content
0x0 - LUT Size	LUT content. Must match the format of the VSIQF_HLUT or PFQF_HLUT registers or GLQF_HLUT registers. For VSI LUT - 64 bytes For PF LUT or Global LUT it is according to the LUT size.

Upon reception of this command, the firmware:

1. Checks if the VSI or the Global LUT belongs to the function that sent the command.
2. Writes the VSIQF\_HLUT or PFQF\_HLUT registers or GLQF\_HLUT registers from the command buffer according to the *Table Type* flag. When a PF table is written, the software might choose to write only the first 128 entries.

**Table 7-164. Set RSS LUT Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0B03	Command opcode.
Datalen	4-5		No return buffer.
Return Value/VFID	6-7		Return value. The following error values can be returned: ENOENT = If not a valid VSI. EACCES = If the VSI or the global LUT is not owned by this PF.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-23		Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

### 7.10.11.3 Get RSS Key (0x0B04)

This command is used to get the RSS Key of a VSI. It can be used by a PF or a VF for VSIs assigned to it. A PF can query the RSS key of its VFs.

**Table 7-165. Get RSS Key Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0B04	Command opcode.
Datalen	4-5	0x34	Length of buffer. Should be equal to 0x34 (has key size) or more.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
VSI#	16-17		<b>Bit 15:</b> Valid VSI# Must always be set. Ignored by firmware. <b>Bits 14:10:</b> Reserved <b>Bits 9:0:</b> VSI Number
Reserved	18-23	0x0	Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

Upon reception of this command, the firmware:

1. Checks if the VSI belongs to the function that sent the command using the VSI\_VSI2F[VSI] register.
2. Reads the VSIQF\_HKEY[VSI] registers and fill the response buffer.

**Table 7-166. Get RSS Key Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0B04	Command opcode.
Datalen	4-5	0x0	0x34
Return Value/VFID	6-7		Return value. The following error values can be returned: ENOENT = If not a valid VSI. EACCES = If the VSI is not owned by this PF/VF.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-23	0x0	Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

The response buffer of this command contains the RSS key currently set:

Offset	Content
0x0 - 0x27	Standard RSS Key
0x28 - 0x33	Extended hash key. Must be zero for regular RSS.

### 7.10.11.4 Get RSS LUT (0x0B05)

This command is used to get the RSS LUT of a VSI or RSS LUT of the PF or one of the global RSS LUT. This command can be initiated only by the PF. A VF can request its parent PF to configure an RSS LUT for its use via software interface or by the Mailbox AQ. It can be used by a PF or a VF for VSIs assigned to it. A PF can query the RSS LUT of its VFs.

**Table 7-167. Get RSS LUT Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0B05	Command opcode.
Datalen	4-5	64/512	Length of buffer. Should be equal to 512 or more for a PF table, or 64 or more for a VSI table.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.

**Table 7-167. Get RSS LUT Command [continued]**

Name	Byte.Bit	Value	Remarks
VSI#	16-17		<b>Bit 15:</b> Valid VSI# Is set if <i>Table Type</i> = VSI. Otherwise, ignored by firmware. <b>Bits 14:10:</b> Reserved <b>Bits 9:0:</b> VSI Number
Command Flags	18-19		<b>Bits 0:1:</b> Table Type 00b = VSI 01b = PF 10b = Global LUT 11b = Reserved <b>Bits 2:3:</b> Reserved Must be set to zero. <b>Bits 4:7:</b> Global LUT Index Relevant only for <i>Table Type</i> equals to "Global LUT". Otherwise it must be 0. <b>Bits 15:8:</b> Reserved
Reserved	20-23	0x0	Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

Upon reception of this command, the firmware:

1. Checks if the VSI or the Global LUT belongs to the function that sent the command.
2. Reads the VSIQF\_HLUT or PFQF\_HLUT registers and fill the response buffer according to the *Table Type* flag. When a PF table is read, the entire 512 entries are read.

**Table 7-168. Get RSS LUT Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0B05	Command opcode.
Datalen	4-5	0x0	0x2
Return Value/VFID	6-7		Return value. The following error values can be returned: ENOENT = If not a valid VSI. EACCES = If the VSI is not owned by this PF.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Reserved	16-23	0x0	Reserved.
Data Address High	24-27		Address of buffer.
Data Address Low	28-31		

The response buffer contains the LUT currently set:

Offset	Content
0x0 - LUT Size	LUT content as read from the VSIQF_HLUT or PFQF_HLUT registers or GLQF_HLUT registers. For VSI LUT - 64 bytes For PF LUT or Global LUT it is according to the LUT size.

## 7.10.12 Filter Clearing Commands and Flows

### 7.10.12.1 Clear FD Table (0x0B06)

This command is used to clear the FD filters associated with a given PF or a specific VSI. Upon reception of this command, the firmware must execute the flow described in [Section 7.10.12.1.1](#).

**Note:** As part of a PF reset processing, the same flow is executed by the firmware for the PF being reset, without the need for software to send an AQC.

**Table 7-169. Clear FD Table Command**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.1</a> for details.
Opcode	2-3	0x0B06	Command opcode.
Reserved	4-5		Reserved.
Return Value/VFID	6-7		Return value. Zeroed by driver. Written by firmware.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Clear_type	16		Clear Type 0x0 = Reserved 0x1 = VSI 0x2 = PF 0x3-0xFF = Reserved
Reserved	17		Reserved.
VSI_index	18-19		VSI Index This field is not applicable and should be set to 0x0 if function type is PF. <b>Note:</b> Inapplicable MSBs should always be set to 0x0.
Reserved	20-31	0x0	Reserved.

**Table 7-170. Clear FD Table Response**

Name	Byte.Bit	Value	Remarks
Flags	0-1	0	See <a href="#">Section 9.5.5.2.2</a> for details.
Opcode	2-3	0x0B06	Command opcode.
Reserved	4-5		Reserved.
Return Value/VFID	6-7		Return value.
Cookie High	8-11	Cookie	Opaque value copied by the firmware into the completion of this command.
Cookie Low	12-15	Cookie	Opaque value copied by the firmware into the completion of this command.
Clear_type	16		Clear Type 0x0 = Reserved 0x1 = VSI 0x2 = PF 0x3-0xFF = Reserved
Reserved	17		Reserved.

**Table 7-170. Clear FD Table Response [continued]**

Name	Byte.Bit	Value	Remarks
VSI_index	18-19		VSI Index This field is not applicable and should be set to 0x0 if function type is PF. <b>Note:</b> Inapplicable MSBs should always be set to 0x0.
Reserved	20-31	0x0	Reserved.

### 7.10.12.1.1 FD Table Clearing Flow

This section describes the flow, executed by the EMP firmware, for clearing the FD filters associated with a given function. The flow can be either initiated by the EMP firmware, for PF reset events, or by software using the relevant AQC.

Clearing the FD table is composed of the following main steps:

1. Block new inputs (searches and configuration) associated with the entity being cleared.
2. Wait for any ongoing/"in-flight" operations associated with the entity being cleared complete.
3. Clear/remove the table entries associated with the cleared entity.
4. Fix the filter counters so they correspond to the new filter amounts.

#### 7.10.12.1.1.1 Clearing the FD Filter Flow

1. Set the following CSR fields:
  - GLQF\_FDPIPE\_CLR.DIS\_CFG
  - GLQF\_FDPIPE\_CLR.DIS\_FLT
  - GLQF\_FDPIPE\_CLR.FD\_BUSY
  - GLQF\_FDPIPE\_CLR.VM\_VF\_TYPE to the *Clear\_type* operand value.
  - GLQF\_FDPIPE\_CLR.PF\_NUM to the PF index.
  - GLQF\_FDPIPE\_CLR.VM\_VF\_NUM to the *VSI\_index* operand value.

**Note:** As a response to the CSR write, the hardware blocks new search requests and new configuration requests for the cleared entity (PF or VSI). It does so by clearing the following flags:

For PF entity, it clears the PFQF\_FD\_ENA.FD\_ENA flag.

For VSI entity, it clears the FLT\_ENA, CFG\_ENA, and EVICT\_ENA flags in the VSIQF\_FD\_CTL1 register.

Once there are no pending searches and configuration requests in the pipe, the *FD\_BUSY* flag is cleared. This flow is implemented by initiating a "mini marker" in the post (from extractor input till end of FLU). Following a marker done indication, the *FD\_BUSY* flag is cleared.

2. The EMP firmware pulls the status of GLQF\_FDPIPE\_CLR.FD\_BUSY flag until it is cleared by the hardware.

**Note:** At this stage, no additional inputs associated with the cleared entity are allowed to enter the pipe and there are no ongoing operations associated with the cleared entity.

3. The EMP firmware sets the following CSR fields:

- GLQF\_FDTABLE\_CLR.FD\_CLEAR
- GLQF\_FDTABLE\_CLR.FD\_BUSY
- GLQF\_FDTABLE\_CLR.VM\_VF\_TYPE to the *Clear\_type* operand value.
- GLQF\_FDTABLE\_CLR.VM\_VF\_NUM to the *VSI\_index* operand value.

**Note:** As a response to the CSR write, the hardware invalidates all the filters of the requested entity and clears the GLQF\_FDTABLE\_CLR.FD\_BUSY flag.

4. The EMP firmware pulls the status of GLQF\_FDTABLE\_CLR.FD\_BUSY flag until it is cleared by the hardware.

**Note:** At this stage, the filter entries associated with the cleared entity are cleared/invalidated.

5. In case of a VSI entity clear:

a. The EMP firmware records the value of the following fields:

- VSIQF\_FD\_CNT[VSI\_index].FD\_GCNT
- VSIQF\_FD\_CNT[VSI\_index].FD\_BCNT

b. The EMP firmware clears VSIQF\_FD\_CNT[VSI\_index].FD\_GCNT and VSIQF\_FD\_CNT[VSI\_index].FD\_BCNT by writing zero to the relevant fields.

c. The EMP firmware writes the values, recorded in step a above, to PFQF\_FD\_SUBTRACT[PF\_index].FD\_GCNT and PFQF\_FD\_SUBTRACT[PF\_index].FD\_BCNT.

6. This operation subtracts the filter count of the removed VSI from the PFQF\_FD\_CNT and GLQF\_FD\_CNT registers.

**Note:** For PF reset case, all the counters associated with the reseted PF's VSIs are zeroed by software as part of the driver initialization. Therefore they do not need to be addressed as part of the clear flow.

In case the filters associated with a PF are being cleared not as part of a PF reset event (that is, the clearing is initiated by the software), the software can follow the steps specified above for fixing the counters' values. If software does not decrement the counters, the counters' values will not correspond to the actual amount of filters stored in the FD storage.

7. The EMP firmware clears the GLQF\_FDPIPE\_CLR.DIS\_CFG and GLQF\_FDPIPE\_CLR.DIS\_FLT bits, and reports the completion of the clear flow to software.

**Note:** At this stage, the PF/VSI is still not enabled yet, as hardware cleared FD\_ENA(PF) or FLT\_ENA/CFG\_ENA/EVICT\_ENA (VSI) as described at the note in [Step 1](#).

8. The software can re-enable the FD for the VSI/PF by setting the applicable flags:

- For PF entity, it sets the PFQF\_FD\_ENA.FD\_ENA flag.
- For VSI entity, it sets the FLT\_ENA, CFG\_ENA, and EVICT\_ENA flags in the VSIQF\_FD\_CTL1 register.

## 7.10.12.2 QH Table Clearing

### 7.10.12.2.1 QH Table Clearing Flow

This section describes the flow for clearing the PE QH table for a specific PF/VF.

**Note:** This flow is not expected to be executed by software, and clearing of the QH filters is done solely by the PE firmware in functional environment. The option for software to clear the QH filters, mentioned in this section is therefore for debug purposes only.

**Note:** Removing the filters from the FPM is the responsibility of software.

The same flow can also be processed by the PE firmware as part of an internal table removal process. In this case, the instance index #0 for CSRs that appear in this flow should be replaced by instance index #1.

1. The software/firmware sets the following CSR fields:

- GLQF\_PEPPIPE\_CLR[0].DIS\_FLT
- GLQF\_PEPPIPE\_CLR[0].PE\_BUSY
- GLQF\_PEPPIPE\_CLR[0].PF\_VF\_TYPE to the *Clear\_type* operand value.
- GLQF\_PEPPIPE\_CLR[0].PF\_VF\_NUM to the *VF\_index* operand value.

**Note:** As a response to the CSR write, the hardware blocks new search requests and new configuration requests for the entity being cleared by clearing the *PE\_ENA* flag in the relevant PF/VPQF\_PE\_ENA registers.

Once there are no pending searches and pending configuration requests, the hardware clears the GLQF\_PEPPIPE\_CLR[0].PE\_BUSY flag. This flow is implemented by initiating a “mini marker” in the post (from extractor input till end of FLU). Following a marker done indication, the *PE\_BUSY* flag is cleared.

2. The software/firmware polls the status of GLQF\_PEPPIPE\_CLR[0].PE\_BUSY flag until it is cleared.

**Note:** At this stage, no additional inputs associated with the cleared entity are allowed to enter the pipe and there are no ongoing operations associated with the cleared entity.

3. The software/firmware sets the following CSR fields:

- GLQF\_PETABLE\_CLR[0].PE\_CLEAR
- GLQF\_PETABLE\_CLR[0].PE\_BUSY
- GLQF\_PETABLE\_CLR[0].PF\_VF\_TYPE to the *Clear\_type* operand value.
- GLQF\_PETABLE\_CLR[0].PF\_VF\_NUM to the *VF\_index* operand value.

**Note:** As a response to the CSR write, the hardware clears the table pointers associated with the cleared function and then clear the GLQF\_PETABLE\_CLR[0].PE\_BUSY flag.

4. The software/firmware polls the status of GLQF\_PETABLE\_CLR[0].PE\_BUSY flag until it is cleared.

**Note:** At this stage, the logical tables holding the QH filters for the cleared function are cleared.

5. The software/firmware clears the filter counters associated to the function being cleared:

a. For a VF Clear, clear following fields:

- VPQF\_PECNT1[VF\_index].FLTCNT
- VPQF\_PECNT0[VF\_index].BUCKETCNT

- VPQF\_PE\_FLHD[VF\_index].FLHD

**Note:** Since VF counter values are not accumulated in the associated PF counter, there is no need to touch the PF counter in that case.

b. For a PF Clear, clear the following associated fields:

- PFQF\_PECNT1[PF\_index].FLTCNT
- PFQF\_PECNT0[PF\_index].BUCKETCNT
- PFQF\_PE\_FLHD[PF\_index].FLHD

6. The software/firmware clears the GLQF\_PEPPIPE\_CLR[0].DIS\_FLT bit.

7. Software steps to re-enable the filter:

- Clear the filter entries in the Hash space in the FPM (the Hash space is indicated by PEHSIZE in the [Figure 7-33](#)).
- Set the PF/VPQF\_PE\_ENA.PE\_ENA flags that were cleared in the clear process.

This step is similar to any PF/VF initialization flow.

### 7.10.13 Default Extractor Configuration

This section describe the default configuration of the packet profile tables as well as the field vector extraction tables in the NVM.

**Note:** The device is programmed to the NVM default when the driver does not load any package. Therefore, the configuration described in this section is provided as sample configuration, while the driver might load different configuration package during initialization.

#### 7.10.13.1 Profiles, Field Vector, and Input Sets

[Table 7-171](#) through [Table 7-173](#) show the default setting of the field vector and input set for the FD filter and Hash filter selected by control domain zero. And also the default setting of the PE quad hash filter.

**Table 7-171. Default Hash filter Field Vector Configuration**

Profile ID	Description	Hash Filter Field Vector	Possible Symmetric Fields
<b>Miss the Filter</b> - Combination of packet types and flags that do no match any profile results with a default profile index.			
0	No Match	None	None
1	Reserved for Bypass the filter	None	None
<b>IPv4 Packets</b>			
2	NonF IPv4, TCP <b>and</b> VSIG[2]=0	IP-S, IP-D, TCP-S, TCP-D	IP-S, IP-D, TCP-S, TCP-D
3	NonF IPv4, UDP-(incl. RoCEv2) <b>and</b> VSIG[2]=0	IP-S, IP-D, UDP-S, UDP-D	IP-S, IP-D, UDP-S, UDP-D
4	NonF IPv4, Payload/Other <b>or</b> Fragmented IPv4 <b>or</b> VSIG[2]=1	IP-S, IP-D	IP-S, IP-D
<b>IPv4 Tunneled Packets (fields are inner header fields)</b>			
5	NonF IPv4, TCP <b>and</b> VSIG[2]=0	IP-S, IP-D, TCP-S, TCP-D	IP-S, IP-D, TCP-S, TCP-D
6	NonF IPv4, UDP-(incl. RoCEv2) <b>and</b> VSIG[2]=0	IP-S, IP-D, UDP-S, UDP-D	IP-S, IP-D, UDP-S, UDP-D

**Table 7-171. Default Hash filter Field Vector Configuration [continued]**

Profile ID	Description	Hash Filter Field Vector	Possible Symmetric Fields
7	NonF IPv4, Payload/Other <b>or</b> Fragmented IPv4 <b>or</b> VSIG[2]=1	IP-S, IP-D	IP-S, IP-D
<b>IPv6 Packets</b>

37	IPv6, GTP-U, service != 0xFF	IP-S, IP-D, UDP-S,UDP-D, TEID	IP-S, IP-D, UDP-S, UDP-D

**Table 7-172. Default FD Filters Profiles and Key Structure (Loaded from NVM) [continued]**

Profile ID	PTG(XLT1) and PFLAG_G	FD Filter Key	Possible Swapped Field (FD Filter)
<b>L2 Packet Types</b>			
38	NSH	Service path header and Index	
39	ARP	TPA	SPA, TPA
40	Other L2 packets	L2 EtherType	
<b>Notes:</b>			
<ul style="list-style-type: none"> <li>All PTGs above are derivatives of tunneled and non-tunneled packet types. For tunneled packets, it is expected that the OAM flag is inactive. Active OAM will yield "no Match" PTG.</li> <li>By default, settings the profiles for the packet types depends on the VSIG(XLT2), as follows: <ul style="list-style-type: none"> <li>VSIG 0x00 – The filter is not enabled (all packet types Miss).</li> <li>VSIG bit 0 = 1 – Mapping of the packet types other than ESP is according to this table. ESP packets are mapped to IP, Other.</li> <li>VSIG bit 1 = 1 – Use only IP tuples for all IPv6 packets.</li> <li>VSIG bit 2 = 1 – Use only IP tuples for all IPv4 packets.</li> <li>VSIG bit 3 = 1 – Treat TCP/SYN (with/without ACK) packets as TCP packets.</li> </ul> </li> </ul> <p>Although the different VSIGs are supported in the NVM. The NVM generate only the VSIG=0x80 case.</p> <ul style="list-style-type: none"> <li>In the FD filters this is a possible setting but not mandatory for all fields to be "left shifted" in the Input set. In those fields that the mask option is used, it is recommended to locate them in the same location in the Input set for all packet profiles. This way, the mask registers utilization is optimized.</li> </ul>			

**Table 7-173. Default PE Filter Profiles and Input Sets (Loaded from NVM)**

Profile ID	PTG and PFLAG_G	PE Filter FV and Input Set	Additional Match Criteria
<b>Miss the Filter</b> - Combination of packet types and flags that do no match any profile results with a default profile index.			
0	No Match	None	None
1	Reserved for Bypass the filter	None	None
<b>TCP iWARP Packets</b>			
2	NonF IPv4, TCP, SYN No ACK (Unicast)	D-MAC+VLAN, IP-D, TCP-D	Packet must match the APBVT to be a candidate for the QH filter. Then, it should match the QH filter to be a candidate for the PE.
3	NonF IPv4, TCP (Unicast)	D-MAC+VLAN, IP-S, IP-D, TCP-S, TCP-D	
4	NonF IPv6, TCP, SYN No ACK (Unicast)	D-MAC+VLAN, IP-D, TCP-D	
5	NonF IPv6, TCP (Unicast)	D-MAC+VLAN, IP-S, IP-D, TCP-S, TCP-D	
<b>UDP Packets</b>			
6	NonF IPv4, UDP, Unicast	D-MAC+VLAN, Dest IP, Dest UDP port	Packet must match the APBVT to be a candidate for the QH filter. Then, it should match the QH filter to be a candidate for the PE.
7	NonF IPv6, UDP, Unicast	D-MAC+VLAN, Dest IP, Dest UDP port	
8	NonF IPv4, UDP, Multicast	D-MAC+VLAN, Dest IP, Dest UDP port	
9	NonF IPv6, UDP, Multicast	D-MAC+VLAN, Dest IP, Dest UDP port	
<b>RoCEv2 Packets</b>			
10	NonF IPv4, UDP-RoCEv2, Unicast	Dest Queue Pair(5)	Packet bypass both APBVT and QH filter.
11	NonF IPv6, UDP-RoCEv2, Unicast	Dest Queue Pair(5)	

**Table 7-173. Default PE Filter Profiles and Input Sets (Loaded from NVM) [continued]**

Profile ID	PTG and PFLAG_G	PE Filter FV and Input Set	Additional Match Criteria
12	NonF IPv4, UDP-RoCEv2, non-Unicast	D-MAC+VLAN, Dest IP, Dest Queue Pair(5)	Packet bypass the APBVT. It is forwarded to the PE regardless if it matches the QH filter or not.
13	NonF IPv6, UDP-RoCEv2, non-Unicast	D-MAC+VLAN, Dest IP, Dest Queue Pair(5)	

**Notes:**

- All PTGs above are derivatives of non-tunneled packet types. Tunneled packets would miss all packet profiles.
- By default, settings the profiles for the packet types depends on the VSIG, as follows:
  - VSIG 0x00 — PE is not enabled (all packet types Miss).
  - VSIG bit 0 = 1 — TCP packets are enabled.
  - VSIG bit 1 = 1 — UDP (unicast and multicast) are enabled.
  - VSIG bit 2 = 1 — Unicast RoCEv2 are enabled.
  - VSIG bit 3 = 1 — Multicast RoCEv2 are enabled.
- The match criteria in this column are set by the GLQF\_PE\_CTL2 registers per packet profile.
- In case of RoCE the *Queue Pair* field width is 24 bits.
- All "Unicast", "non-Unicast", and "Multicast" notations used in this table relate to the MAC DA.

**Note:** Whenever a partial field is needed (sub-word), a mask should be applied to mask out the non-relevant bits of the word. There are 16 GLQF\_PEMASK registers. Each register contains a mask and the word it can be applied to. There is a GLQF\_PEMASK\_SEL register per profile. GLQF\_PEMASK\_SEL selects the set of GLQF\_PEMASK registers that are be applied when the associated profile is selected.

## 7.11 Packages and Configuration

### 7.11.1 Introduction

A host system initializes many programmable aspects of the E810 packet processing pipeline through the use of AQ commands and **Packages**. A package contains low-level configuration data representing a broad category packet handling. For example, a package can be tailored to match the networking capabilities of a specific operating system.

Packages primarily contain static configuration information applied during initialization, and only one package can be active at a time. Firmware loads an initial package from NVM, which the host can override with a Download Package command. The E810 supports limited runtime alteration of the current package using the Update Package command. For example, a PF driver might use Update Package to add or remove Packet Profiles dynamically.

Packages have names and version numbers according to the Version Numbers convention in [Section 7.11.4](#). The E810 devices are factory-configured with a default package named DEFAULT (case sensitive). By using the version number, the host can check for driver vs. package compatibility.

A package is a composite of smaller, often interdependent data structures, each mapping to a specific hardware block. A package provides the means to keep these interdependent structures and associated metadata together as an intact unit. For example, a package might contain configuration data for both the Parse Graph CAM and Parser Instruction Memory.

Off-line compiler tools typically produce packages. At runtime, the host can dynamically create package updates to alter the configuration of the current package. In either case, the data structures follow the format specified in this section.

## 7.11.2 Overriding the Default Package

Using the Download Package command (Section 7.11.9.1), the host system can override the default package loaded from NVM by firmware. The Download Package command changes the configuration of the packet processing pipeline, but does not modify the NVM. A subsequent Core Reset, Global Reset, or power cycle causes firmware to reload the default package and therefore discard the host’s custom package. In this case, the host must re-issue another Download Package command.

In the pre-boot environment, the host operating system has not yet loaded and has no opportunity to override the default package. Deployment of a custom package in the pre-boot environment requires either a custom NVM image or host BIOS to issue the Download Package command.

## 7.11.3 Endianness

Unless otherwise specified, all values in a package use little-endian memory layout. When serialized to a storage device, bytes are placed starting from lowest address to highest address. See Table 7-174.

**Table 7-174. Little-Endian Memory Layout for All Value Fields**

31	24	23	16	15	8	7	0	Byte Offset
char 15 (Highest Address)		char 14		char 13		char 12		12
int 0								8
short 1				short 0				4
char 3		char 2		char 1		char 0 (Lowest Address)		0

## 7.11.4 Version Numbers

To convey version and compatibility information, packages use the Major.Minor.Update.Draft (M.m.u.d) convention described in this section.

Consider a hypothetical version 3.0.1.4

**Table 7-175. Version Number Fields for Example Version 3.0.1.4**

Digit	Name	Description
3	Major	The most significant version number. Configurations with differing Major version numbers might not be compatible with each other.
0	Minor	Within a Major version, the Minor version number indicates compatibility with less-than-or-equal Minor version numbers. A new Minor version number often indicates the addition of new features.
1	Update	A bug fix or refactoring for an existing Major.Minor version.
4	Draft	For internal use only and used to distinguish developmental versions. Shipping configurations should always have a 0 Draft digit.

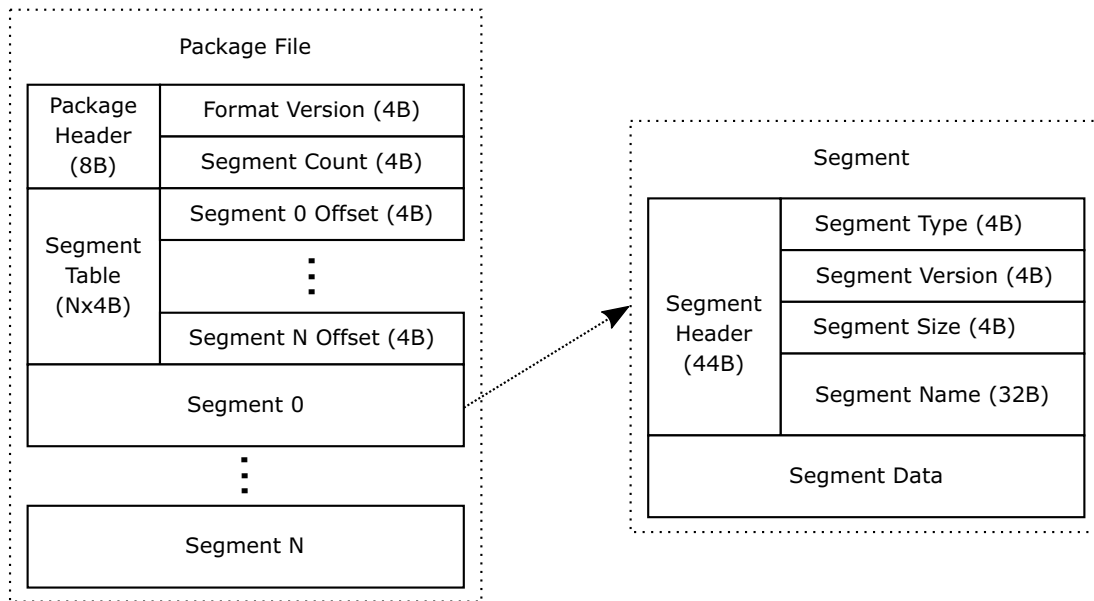

Each part of the version number is stored in a byte, for a total of four bytes. When stored in memory, the Major number resides in the lowest address byte up to Draft number in the highest address byte. Version numbers are stored as unsigned integer bytes, not as UTF-8 characters. See Table 7-176 for an example.

**Table 7-176. Version Number Encoding for Example Version 3.0.1.4**

Address	Value	Description
0x1000	0x03	Major
0x1001	0x00	Minor
0x1002	0x01	Update
0x1003	0x04	Draft

### 7.11.5 Package Format

A package contains a nested hierarchy of structures. In the outermost layer, the package contains an 8-byte fixed-length Package Header. The Package Header contains a version number for the format of the package itself, and a field specifying the number of segments contained in the package. Following those fields, a Segment Table provides the byte offset from the start of package file to each segment in the file. See [Figure 7-34](#).

**Figure 7-34. Basic Structure of a Package**

Each Segment begins with a Segment Header, followed by segment specific data. Segments can contain any amount of data as appropriate for the specified Segment Type.

[Table 7-177](#) describes each field of the Package Header in detail. The Segment Table is sorted from smallest to largest Segment Offset value. All segments start with the Segment Header as shown in [Figure 7-34](#).

**Table 7-177. Package Header**

Field		Size (Bytes)	Offset	Description
Package Format Version		4	0	M.m.u.d style format for the package itself. The version number follows the convention described in <a href="#">Section 7.11.4</a> . This document describes package format 1.0.1.0.
Segment Count		4	4	Number of segments in the segment table. A value of 0 is reserved.
Segment Table	Segment 0 Offset	4	8	Byte offset from the start of the package file to the first byte of the first segment. Values less than 12 are reserved.
	...			Offsets of all subsequent segments. The Segment Table is sorted from smallest to largest offset, so each Segment Offset value must be at least 44 bytes (Segment Header size) greater than the previous offset.

Table 7-178 describes the fields of the Segment Header in detail.

**Table 7-178. Segment Header**

Field	Size (Bytes)	Offset	Description
Segment Type	4	0	Type value identifying this segment.
Segment Format Version	4	4	M.m.u.d style format for the package itself. The version number follows the convention described in <a href="#">Section 7.11.4</a> .
Segment Size	4	8	Size in bytes of this segment, including the Segment Header. Values less than 44 bytes are reserved.
Segment Identifier	32	12	Free form (UTF-8 by convention) null-terminated 31-byte name of the segment. The 32nd byte of the name must be a binary 0.

Table 7-179 defines Segment Type numbers relevant to the E810.

**Table 7-179. Segment Type Numbers**

Segment Type Number	Description	Section Reference
0x0	Reserved	
0x1	Global Metadata Segment	<a href="#">7.11.5.1</a>
0x2	Package Notes Segment	<a href="#">7.11.5.2</a>
0x3-0xF	Reserved	
0x10	Configuration Data Segment	<a href="#">7.11.5.3</a>

### 7.11.5.1 Global Metadata Segment

The Global Metadata Segment contains information about the entire package.

Table 7-180 describes the fields of the Global Metadata Segment in detail.

**Table 7-180. Global Metadata Segment**

	Field	Size (Bytes)	Offset	Description
Segment Header	0x00000001	4	0	This segment has a Type value of 1.
	0x00000001	4	4	This document describes Version 1.0.0.0 of this segment.
	0x00000054	4	8	This segment has a length of 84 bytes.
	"Global Metadata"	32	12	This segment has case sensitive name "Global Metadata" without the quote characters. Bytes after the string are padded with binary 0 to full 32-byte length.
Segment Data	Package Version	4	44	Version of the entire Package file as specified by a <i>version</i> statement at global scope in an assembly source file. Software tools can use 255.255.255.255 as a reserved value meaning the version is unknown.
	Reserved	4	48	This value is reserved for the E810 and newer devices. Software tools must set this value to 0xFFFFFFFF.
	Package Name	32	52	Free form (UTF-8 by convention) null-terminated 31-byte name of the entire package as specified by a <i>name</i> statement at global scope in an assembly source file. Software tools reserve a zero length string (first byte is binary 0) to mean the name is unknown. Software tools always sets the last five bytes of the name to a binary 0.

### 7.11.5.2 Package Notes Segment

The Package Notes Segment contains free form UTF-8 text about this package. The content of the notes segment is informational only. The notes segment does not affect the configuration of any hardware device.

Table 7-181 shows the content of the Package Notes Segment.

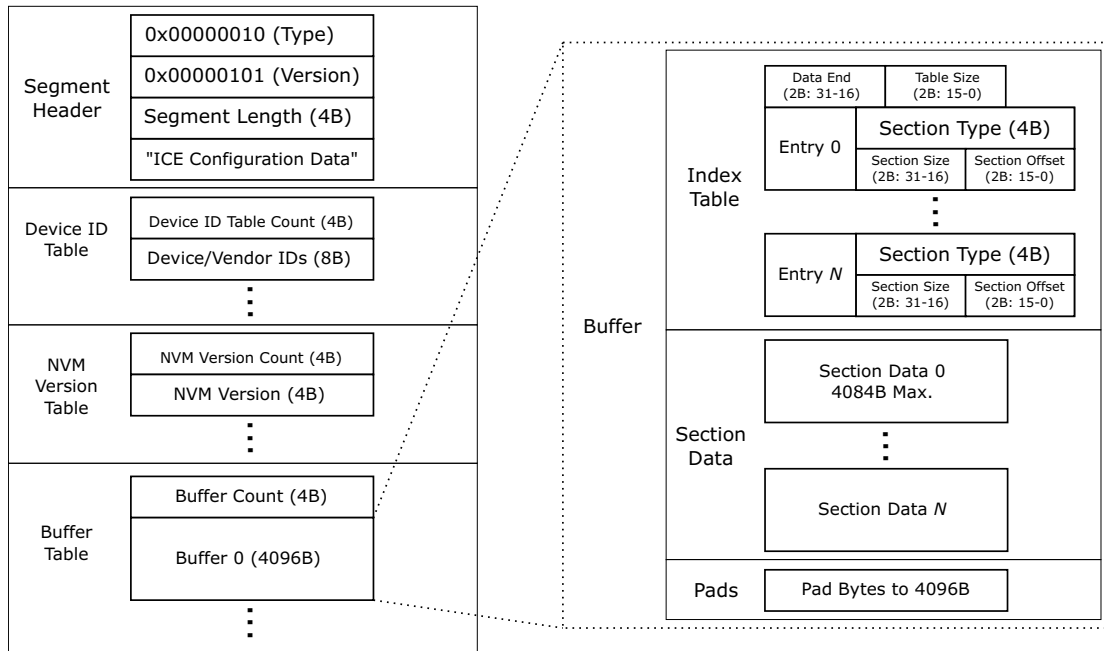

**Table 7-181. Package Notes Segment**

	Field	Size (Bytes)	Offset	Description
Segment Header	0x00000002	4	0	This segment has a Type value of 2.
	0x00000001	4	4	This document describes Version 1.0.0.0 of this segment.
	<variable>	4	8	This segment has variable length.
	"Notes"	32	12	This segment has case sensitive name "Notes" without the quote characters. Bytes after the string are padded with binary 0 to full 32-byte length.
Segment Data	UTF-8 content	<variable>	44	UTF-8 text for informational purposes only. Line feed style is '\n'. The final note in the notes segment always ends with '\0'.

### 7.11.5.3 Configuration Data Segment

Configuration data for the E810 resides in the ICE Configuration Segment with Segment Type value from [Table 7-179](#). [Figure 7-35](#) shows an overview of these segments.

**Figure 7-35. Overview of the E810 Data Segments**

[Table 7-182](#) shows the layout of these segments.

**Table 7-182. E810 Data Segment**

Field		Size (Bytes)	Description
Segment Header	<variable>	4	This segment has a Type value as specified in <a href="#">Table 7-179</a> .
	0x00000001	4	This document describes Version 1.0.1.0 of this segment.
	<variable>	4	This segment has variable length.
	<variable>	32	The Configuration Data Segment has case sensitive name "ICE Configuration Data" without the quote characters.

**Table 7-182. E810 Data Segment [continued]**

Field		Size (Bytes)	Description
Device ID Table	Device ID Table Count	4	Number of entries in the Device ID Table. May be zero.
	Device ID Table Entry 0	8	Device ID Table Entry consisting of two 4-byte fields. <b>Bytes 1-0:</b> Device ID PCI Device ID number of a device for which this configuration data applies. <b>Bytes 3-2:</b> Vendor ID PCI Vendor ID number of a device for which this configuration data applies. <b>Bytes 5-4:</b> Sub-Device ID PCI Sub-Device ID number of a device for which this configuration data applies. <b>Bytes 7-6:</b> Sub-Vendor ID PCI Sub-Vendor ID number of a device for which this configuration data applies.
	...	Nx4	All subsequent Device ID Table entries
NVM Version Table	NVM Version Count	4	Number of entries in the NVM version table. Maybe 0 if the table contains no entries.
	NVM Version Entry 0	4	NVM Version information. Details TBD.
	...		All subsequent NVM Version Table entries.
Buffers	Buffer Count	4	Number of 4KB buffers in this segment.
	Buffer 0	4096	First buffer in the segment
	...		All subsequent 4 KB buffers.

### 7.11.5.4 Package Buffers

A package contains one or more fixed-length Package Buffers. A Package Buffer contains a header, followed by a variable number of configuration data sections, followed by pad bytes for a total fixed size of 4096 bytes. As shown in [Figure 7-34](#), a Package Buffer begins with a Package Buffer Header. The Package Buffer Header contains an *Index Table Size* field, a *Data End* field, and a variable length Index Table. Following the Index Table, the data for each section contained in the Package Buffer.

[Table 7-183](#) shows the format of the Package Buffer Header.

**Table 7-183. Package Buffer Header**

Field	Size (Bytes)	Offset	Description
Index Table Size	2	0	Number of entries in the Index Table (1-511). A value of zero and values greater than 511 are reserved.
Data End	2	2	Byte offset from the start of the Package Buffer to the first unused byte in the buffer (12-4095). The minimum valid value of this field is 12, which accommodates the 4-byte Buffer Header and one 8-byte Index Table entry. If the entire buffer is used, this field must be set to 4096. Values less than 12 or greater than 4096 are reserved.

**Table 7-183. Package Buffer Header [continued]**

Field		Size (Bytes)	Offset	Description
Entry 0	Section Type	4	4	Section Type for the first section in the Package Buffer. Valid Section Type values are shown in <a href="#">Table 7-184</a> .
	Section Offset	2	8	Byte offset from the start of the Package Buffer to the start of the first section in the Package Buffer (12-4095). Values less than 12 and greater than 4095 are reserved. The section offset for each entry in the index table must be aligned on a 32-bit boundary. All sections whose size is not a multiple of four bytes must be followed by pad bytes of 0xFF to the next 4-byte multiple.
	Section Size	2	10	Size in bytes of this section (1-4084). Values of zero and greater than 4084 are reserved. The section size must exclude any pad bytes added to acquire 32-bit alignment.
...	...	...	...	Subsequent Index Table entries, if any.

A Package Buffer can contain one or more Data Sections and these sections can appear in any order in the buffer. The format of a Data Section depends on the nature and purpose of the contained configuration data. The maximum possible size of a Data Section is 4084 bytes, which can occur when a Package Buffer contains only one section.

## 7.11.6 Section Type Enumeration

As described in [Section 7.11.5](#), the Index Table field of the E810 Configuration Data Segment identifies the content, location and size of individual configuration sections. To unambiguously identify section content, the Section Type field provides a unique identifier for all possible content types.

[Table 7-184](#) shows the Section Type values.

**Table 7-184. E810 Configuration Segment Section Type Numbers**

Section Type Number		Ownership Metadata Section Type Number (Section Type + 0x200)	Description	Section Reference
Dec.	Hex			
1	0x1	N/A	Segment Metadata	<a href="#">7.11.7</a>

1. Owner section size of 0 indicates that the section cannot be modified with an Update Package command.

## 7.11.7 Segment Metadata Section

The E810 Configuration Segment Metadata Section contains user defined metadata about the segment. This section has a Section Type value of 1. The Get Package Info List command (see [Section 7.11.9.4](#)) returns the information contained in this section.

The structure of this section is shown in [Table 7-186](#).

**Table 7-186. Segment Metadata Section**

Field	Size (Bytes)	Description
Segment Version	4	The version of the segment. The version number follows the convention defined in <a href="#">Section 7.11.4</a> . Software tools set this value from the version statement in an assembly language source file. Software tools can reserve the value 255.255.255.255 to mean the version is unknown.
Segment Name	32	Free form UTF-8 null-terminated 28-byte name of the segment. Software tools set this value from the name statement in an assembly language source file. Software tools can reserve a zero length string (first byte is binary 0) to mean the name is unknown. Software tools enforce that at least the 28th byte of the name must be a binary 0.
Track ID	4	The Track ID is a numerical representation of the package type and uniquely identifies the type of package as specified by a track statement at segment scope in an assembly source file. The Track ID and package name are immutable for each package type; OS, Comms, etc. Software tools can use 0xFFFFFFFF as a reserved value meaning the Track ID is unknown.

## 7.11.8 Segment Security Manifest

This section defines the structure of the ICE Segment Security Manifest. This manifest enables firmware or other software to verify selected segment buffers are genuine before transferring configuration to control registers.

### 7.11.8.1 Security Manifest Overview

The segment security manifest consists of two parts.

- An ordered list of secure hashes, one for each 4 KB buffer in the remainder of the segment.
- The PKCS v2.2 structure returned from the signing server. This structure contains a signature, a manifest hash of the buffer hashes and the security version number.

The chain of trust for downloaded package buffers is as follows:

- Firmware verifies the manifest hash using the Intel RSA signature.
- Firmware verifies the list of buffer hashes using the manifest hash.
- Firmware verifies each buffer using corresponding buffer hash.

The error messages that are issued when firmware detects an issue in the security manifest are as follows:

- **Missing security manifest** — Return missing signature error on AQ command. Firmware should not issue CORER.
- **RSA signature mismatch on the manifest hash** - Return bad signature error on AQ command. Firmware should not issue CORER.
- **Secure Version Number too low** — Return bad SVN error on AQ command. Firmware should not issue CORER.
- **Manifest hash mismatch on the buffer hashes** — Return bad manifest error on AQ command. Firmware must issue CORER.
- **Buffer hash mismatch on the buffer** — Return bad buffer hash error on AQ command. Firmware must issue CORER.
- **Non-security error in buffer processing** — Return appropriate error on AQ command. Firmware must issue CORER.

### 7.11.8.2 Protection Provided by a Segment Security Manifest

A segment security manifest provides a limited scope of protection within a package file. Specifically, the security manifest protects only parts of the ICE segment, not the entire segment nor package. The parts of a package not covered by a security segment rely on host security for protection, for example, file system root access. The rationale is that a corrupted host cannot be trusted to check itself, therefore a security manifest can protect only the buffers visible to firmware. See [Table 7-187](#) for an overview.

**Table 7-187. Content Protected or Excluded by a Segment Security Manifest**

Package Content Type	Protected?
Package Header	No
Package Notes Segment	No
Package Global Metadata Segment	No
Segment Header	No
Other device configuration segments	No
Segment buffers transferred to firmware with Download Package AQ command	Yes
Segment buffers NOT transferred to firmware. (or example, segment metadata)	No

### 7.11.8.3 Segment Security Requirements

Production packages downloaded by the host via the Download Package AQ command must have a valid security manifest in the ICE configuration segment. Non-production packages might have a valid or invalid security manifest.

#### 7.11.8.3.1 Development Mode

To facilitate package development, firmware must support a permissive mode that bypasses security manifest checking. In this mode, the downloaded package might omit the security manifest. If the package contains a security manifest, firmware must ignore the manifest content.

Table 7-188 shows the security enforcement options. These options depend on the CSR protection fuse and the NVM *Security Enable* bit.

**Table 7-188. Package Manifest Enforcement Options**

CSR Protection Enable (GL_UFUSE_SOC[6])	NVM_SEC_EN (NVM Offset 0x02)	Firmware Requires Valid Package Security Manifest
0	0	No
0	1	Yes
1	0	Yes
1	1	Yes

#### 7.11.8.3.2 NVM Packages

The ICE NVM signature already provides protection for the packages stored in NVM. To conserve NVM storage, these packages should omit the security manifest. If an NVM package does contain a security manifest, firmware must ignore the manifest content.

### 7.11.8.4 Security Manifest Section Numbers

Table 7-189 provides section numbers associated with the security manifest:

**Table 7-189. Security Manifest Section Numbers**

Section	Number
Security Manifest Header	2 (0x2)
Security Manifest	3 (0x3)

### 7.11.8.5 Security Manifest Header Section

The manifest header section consists of the PKCS v2.2 structure.

**Table 7-190. Security Manifest Header Section Fields**

Field	Size (Bits)	CSR	Description
Module Type	32	N/A	The module type. Must be 0x6.
Header Length	32	N/A	The header length. Must be 0xA1.
Header Version	32	N/A	The header version. Must be 0x000100000.
Module ID	32	N/A	The module ID. Must be 0x0.
Module Vendor	32	N/A	The vendor ID. Must be 0x8086.
Date	32	N/A	The date on which the signature was created.
Size	32	N/A	The number of 32-bit (DWORD) units. Must be 0xC8.
Key Size	32	N/A	The size of the key. Must be 0x40.
Modulus Size	32	N/A	The modulus size. Must be 0x40.
Exponent Size	32	N/A	The size of the exponent. Must be 0x1.
SVN	32	N/A	Secure version number. This monotonically increasing number represents the security version of this package. If this number is less than the persistent SVN number stored in the NVM, then firmware will reject this package. Otherwise, firmware accepts the package.
Reserved	32	N/A	Reserved (0).
Reserved	32	N/A	Reserved (0).
Reserved	32	N/A	Reserved (0).
Unique ID	32	N/A	Unique ID of this configuration, taken from the support team ETrack ID.
