18	1h RO	**No Command Completed Support (NCCS):** Set to '1' as this port does not implement a Hot Plug controller and can handle back-2-back writes to all fields of the slot control register without delay between successive writes.
17	0h RO	**Electromechanical Interlock Present (EMIP):** Set to 0 to indicate that no electro-mechanical interlock is implemented.

Bit Range	Default & Access	Field Name (ID): Description
16:15	0h RW/O	**Slot Power Limit Scale (SLS):** specifies the scale used for the slot power limit value. BIOS sets this field and it remains set until a platform reset.
14:8	0h RW/O	**Slot Power Limit Value (SLV__14_8):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
7	0h RW/O	**Slot Power Limit Value (SLV__7_7):** Specifies the upper limit (in conjunction with SLS value), on the upper limit on power supplied by the slot. The two values together indicate the amount of power in watts allowed for the slot. BIOS sets this field and it remains set until a platform reset.
6	1h RW/O	**Hot Plug Capable (HPC):** When set, Indicates that hot plug is supported.
5	1h RW/O	**Hot Plug Surprise (HPS):** When set, indicates the device may be removed from the slot without prior notification.
4	0h RO	**Power Indicator Present (PIP):** Indicates that a power indicator LED is not present for this slot.
3	0h RO	**Attention Indicator Present (AIP):** Indicates that an attention indicator LED is not present for this slot.
2	0h RO	**MRL Sensor Present (MSP):** Indicates that an MRL sensor is not present
1	0h RO	**Power Controller Present (PCP):** Indicates that a power controller is not implemented for this slot
0	0h RO	**Attention Button Present (ABP):** Indicates that an attention button is not implemented for this slot.

20.1.19 Slot Control And Slot Status (SLCTL_SLSTS)—Offset 58h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RW/1C/V	**Data Link Layer State Changed (DLLSC):** This bit is set when the value reported in Data Link Layer Link Active field of the Link Status register is changed. In response to a Data Link Layer State Changed event, software must read Data Link Layer Link Active field of the Link Status register to determine if the link is active before initiating configuration cycles to the hot plugged device.
23	0h RO	**Electromechanical Interlock Status (EMIS):** Reserved as this port does not support and electromechanical interlock.
22	0h RO/V	**Presence Detect State (PDS):** If XCAP.SI is set (indicating that this root port spawns a slot), then this bit indicates whether a device is connected ('1') or empty ('0'). If XCAP.SI is cleared, this bit is a '1'.
21	0h RO	**MRL Sensor State (MS):** Reserved as the MRL sensor is not implemented.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**Command Completed (CC):** This register is RO as this port does not implement a Hot Plug Controller..
19	0h RW/1C/V	**Presence Detect Changed (PDC):** This bit is set by the root port when the PDS bit changes state.
18	0h RO	**MRL Sensor Changed (MSC):** Reserved as the MRL sensor is not implemented.
17	0h RO	**Power Fault Detected (PFD):** Reserved as a power controller is not implemented.
16	0h RO	**Attention Button Pressed (ABP):** This register is RO as this port does not implement an attention button
15:14	0h RO	Reserved.
13	0h RW	**Auto Slot Power Limit Disable (ASPLD):** When set, this bit disables automatic sending of Set_Slot_Power_Limit message when the link transitions from non-DL_Up status to DL_Up status. Register Attribute: Dynamic.
12	0h RW	**Data Link Layer State Changed Enable (DLLSCE):** When set, this field enables generation of a hot plug interrupt when the Data Link Layer Link Active field is changed
11	0h RO	**Electromechanical Interlock Control (EMIC):** Reserved as this port does not support an Electromechanical Interlock.
10	0h RO	**Power Controller Control (PCC):** This bit has no meaning for module based hot plug.
9:8	0h RO	**Power Indicator Control (PIC):** This register is RO as this port does not implement a Hot Plug Controller..
7:6	0h RO	**Attention Indicator Control (AIC):** This register is RO as this port does not implement a Hot Plug Controller..
5	0h RW	**Hot Plug Interrupt Enable (HPE):** When set, enables generation of a hot plug interrupt on enabled hot plug events.
4	0h RO	**Command Completed Interrupt Enable (CCE):** This register is RO as this port does not implement a Hot Plug Controller..
3	0h RW	**Presence Detect Changed Enable (PDE):** When set, enables the generation of a hot plug interrupt or wake message when the presence detect logic changes state.
2	0h RO	**MRL Sensor Changed Enable (MSE):** This register is RO as this port does not implement a Hot Plug Controller..
1	0h RO	**Power Fault Detected Enable (PFE):** This register is RO as this port does not implement a Hot Plug Controller...
0	0h RO	**Attention Button Pressed Enable (ABE):** This register is RO as this port does not implement a Hot Plug Controller..

20.1.20 Root Control (RCTL)—Offset 5Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	0h RW	**PME Interrupt Enable (PIE):** When set, enables interrupt generation when RSTS.PS is in a set state (either due to a '0' to '1' transition, or due to this bit being set with RSTS.PS already set).
2	0h RW	**System Error on Fatal Error Enable (SFE):** When set, an SERR# will be generated if a fatal error is reported by any of the devices in the hierarchy of this root port, including fatal errors in this root port. This register is not dependent on CMD.SEE being set.
1	0h RW	**System Error on Non-Fatal Error Enable (SNE):** When set, an SERR# will be generated if a non-fatal error is reported by any of the devices in the hierarchy of this root port, including non-fatal errors in this root port. This register is not dependent on CMD.SEE being set.
0	0h RW	**System Error on Correctable Error Enable (SCE):** When set, an SERR# will be generated if a correctable error is reported by any of the devices in the hierarchy of this root port, including correctable errors in this root port. This register is not dependent on CMD.SEE being set.

20.1.21 Root Status (RSTS)—Offset 60h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RO/V	**PME Pending (PP):** Indicates another PME is pending when the PME status bit is set. When the original PME is cleared by software, it will be set again, the requestor ID will be updated, and this bit will be cleared. Root ports have a one deep PME pending queue.
16	0h RW/1C/V	**PME Status (PS):** Indicates that PME was asserted by the requestor ID in RID. Subsequent PMEs are kept pending until this bit is cleared.
15:0	0h RO/V	**PME Requestor ID (RID):** Indicates the PCI requestor ID of the last PME requestor. Valid only when PS is set. Root ports are capable of storing the requester ID for two PM_PME messages, with one active (this register) and a one deep pending queue. Subsequent PM_PME messages will be dropped.

20.1.22 Device Capabilities 2 (DCAP2)—Offset 64h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 80837h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:18	2h RW/O	**Optimized Buffer Flush/Fill Supported (OBFFS):** 00b - OBFF is not supported. 01b - OBFF is supported using Message signaling only. 10b - OBFF is supported using WAKE# signaling only. 11b - OBFF is supported using WAKE# and Message signaling. Note: OBFF is not supported. BIOS should program this field to 00b.
17:12	0h RO	Reserved.
11	1h RW/O	**LTR Mechanism Supported (LTRMS):** A value of 1b indicates support for the optional Latency Tolerance Reporting (LTR) mechanism capability. BIOS must write to this register with either a '1' or a '0' to enable/disable the root port from declaring support for the LTR capability.
10:6	0h RO	Reserved.
5	1h RO	**ARI Forwarding Supported (AFS):** ARI Forwarding Supported (AFS): Applicable only to Switch Downstream Ports and Root Ports; must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. Note: This bit is not made RWO to simplify implementation, since there is a requirement that the ARI Forwarding Enable bit must be hardwired to 0b if ARI Forwarding Supported bit is 0b. It is low risk to keep this risk 1b. Register Attribute: Static.
4	1h RO	**Completion Timeout Disable Supported (CTDS):** A value of 1b indicates support for the Completion Timeout Disable mechanism.
3:0	7h RO	**Completion Timeout Ranges Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. Four time value ranges are defined: Range A: 50us to 10ms Range B: 10ms to 250ms Range C: 250ms to 4s Range D: 4s to 64s Bits are set according to the table below to show timeout value ranges supported. 0000b Completion Timeout programming not supported. 0001b Range A 0010b Range B 0011b Ranges A and B 0110b Ranges B and C 0111b Ranges A, B, and C [lt]-- This is what PCH supports 1110b Ranges B, C, and D 1111b Ranges A, B, C, and D All other values are reserved.

20.1.23 Device Control 2 And Device Status 2 (DCTL2_DSTS2)—Offset 68h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0h RO	Reserved.
10	0h RW	**LTR Mechanism Enable (LTREN):** When Set to 1b, this bit enables the Latency Tolerance Reporting (LTR) mechanism. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status. If DCAP2.LTRMS is clear, programming this field to any non-zero values will have no effect.
9:6	0h RO	Reserved.
5	0h RW	**ARI Forwarding Enable (AFE):** ARI Forwarding Enable (AFE): When set, the Downstream Port disables its traditional Device Number field being 0b enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port. Register Attribute: Dynamic.
4	0h RW	**Completion Timeout Disable (CTD):** When set to 1b, this bit disables the Completion Timeout mechanism. This field is required for all devices that support the Completion Timeout Disable Capability. Software is permitted to set or clear this bit at any time. When set, the Completion Timeout detection mechanism is disabled. If there are outstanding requests when the bit is cleared, it is permitted but not required for hardware to apply the completion timeout mechanism to the outstanding requests. If this is done, it is permitted to base the start time for each request on either the time this bit was cleared or the time each request was issued.
3:0	0h RW	**Completion Timeout Value (CTV):** In Devices that support Completion Timeout programmability, this field allows system software to modify the Completion Timeout value. This field is applicable to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of requests issued on PCI Express. For all other devices this field is reserved and must be hardwired to 0000b. A Device that does not support this optional capability must hardwire this field to 0000b and is required to implement a timeout value in the range 50us to 50ms. Devices that support Completion Timeout programmability must support the values given below corresponding to the programmability ranges indicated in the Completion Timeout Values Supported field. The root port targeted configurable ranges are listed below, along with the range allowed by the PCI Express 2.0 specification. Defined encodings: 0000b Default range: 40-50ms (spec range 50us to 50ms) Values available if Range A (50us to 10 ms) programmability range is supported: 0001b 90-100us (spec range is 50 us to 100 us) 0010b 9-10ms (spec range is 1ms to 10 ms) Values available if Range B (10ms to 250ms) programmability range is supported: 0101b 40-50ms (spec range is 16ms to 55ms) 0110b 160-170ms (spec range is 65ms to 210ms) Values available if Range C (250ms to 4s) programmability range is supported: 1001b 400-500ms (spec range is 260ms to 900ms) 1010b 1.6-1.7s (spec range is 1s to 3.5s) Values not defined above are Reserved. Software is permitted to change the value in this field at any time. For requests already pending when the Completion Timeout Value is changed, hardware is permitted to use either the new or the old value for the outstanding requests, and is permitted to base the start time for each request either on when this value was changed or on when each request was issued.

20.1.24 Link Capabilities 2 (LCAP2)—Offset 6Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22:16	0h RO	**Lower SKP OS Reception Supported Speeds Vector (LSOSRSS):** Lower SKP OS Reception Supported Speeds Vector(LSOSRSS): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
15:9	0h RO	**Lower SKP OS Generation Supported Speeds Vector (LSOSGSSV):** Lower SKP OS Generation Supported Speeds Vector(LSOSGSSV): If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Behavior is undefined if a bit is set in this field and the corresponding bit is not set in the Supported Link Speeds Vector.
8	0h RO	**Crosslink Supported (CS):** Crosslink Supported (CS): No support for Crosslink. Register Attribute: Static.
7:1	0h RO/V	**Supported Link Speeds Vector (SLSV):** Supported Link Speeds Vector (SLSV): This field indicates the supported Link speed of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported; otherwise, the Link speed is not supported. Bit definitions within this field for PCI Express are: Bit 0: 2.5 GT/s. Bit 1: 5.0 GT/s. Bit 2: 8.0 GT/s. Bits 6:3: Reserved.
0	0h RO	Reserved.

20.1.25 Link Control 2 And Link Status 2 (LCTL2_LSTS2)—Offset 70h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RW/1C/V/P	**Link Equalization Request (LER):** Link Equalization Request (LER): This bit is set by hardware to request the Link equalization process to be performed on the Link. Register Attribute: Dynamic.
20	0h RO/V/P	**Equalization Phase 3 Successful (EQP3S):** Equalization Phase 3 Successful (EQP3S): When set to 1, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
19	0h RO/V/P	**Equalization Phase 2 Successful (EQP2S):** Equalization Phase 2 Successful (EQP2S): When set to 1, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
18	0h RO/V/P	**Equalization Phase 1 Successful (EQP1S):** Equalization Phase 1 Successful (EQP1S): When set to 1, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
17	0h RO/V/P	**Equalization Complete (EQC):** Equalization Complete (EC): When set to 1, this bit indicates that the Transmitter Equalization procedure has completed
16	0h RO/V	**Current De-emphasis Level (CDL):** When the Link is operating at 5.0 GT/s speed, this bit reflects the level of de-emphasis. Encodings: 1b -3.5 dB 0b -6 dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed.
15:12	0h RW/P	**Compliance Preset/De-emphasis (CD):** For 8.0 GT/s Data Rate: This field sets the Transmitter Preset in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Results are undefined if a reserved preset encoding is used when entering Polling.Compliance in this way. For 5.0 GT/s Data Rate: This bit sets the de-emphasis level in Polling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. Encodings: 0001b -3.5 dB 0000b -6 dB When the Link is not operating at 2.5 GT/s speed, the setting of this bit has no effect. The default value of this field is 0000b. This bit is intended for debug, compliance testing purposes. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this field is set to the default value.
11	0h RW/P	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send SKP Ordered Sets periodically in between the (modified) compliance patterns. The default value of this bit is 0b. This bit is applicable when the Link is operating at 2.5 GT/s or 5.0 GT/s data rates only. Register Attribute: Static.
10	0h RW/P	**Enter Modified Compliance (EMC):** When this bit is set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. Default value of this bit is 0b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.

Bit Range	Default & Access	Field Name (ID): Description
9:7	0h RW/P	**Transmit Margin (TM):** This field controls the value of the nondeemphasized voltage level at the Transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate (see PCI Express Chapter 4 for details of how the Transmitter voltage level is determined in various states). Encodings: 000b Normal operating range 001b 800-1200 mV for full swing and 400-700 mV for half-swing 010b - (n-1) Values must be monotonic with a non-zero slope. The value of n must be greater than 3 and less than 7. At least two of these must be below the normal operating range of n : 200-400 mV for full-swing and 100-200 mV for half-swing n - 111b reserved For a Multi-Function device associated with an Upstream Port, the field in Function 0 is of type RWS, and only Function 0 controls the component's Link behavior. In all other Functions of that device, this field is of type RsvdP. Default value of this field is 000b. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 000b. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0h RW/P	**Selectable De-emphasis (SD):** When the Link is operating at 5.0 GT/s speed, this bit selects the level of de-emphasis for an Upstream component. Encodings: 1b -3.5 dB 0b -6 dB When the Link is not operating at 5.0 GT/s speed, the setting of this bit has no effect. When the Link is operating at 2.5 GT/s speed, the setting of this bit has no effect.
5	0h RO	**Hardware Autonomous Speed Disable (HASD):** Reserved. This port cannot autonomously change speeds.
4	0h RW/P	**Enter Compliance (EC):** Software is permitted to force a Link to enter Compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a Link and then initiating a hot reset on the Link. Default value of this bit following Fundamental Reset is 0b. This bit is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this bit only during debug or compliance testing. In all other cases, the system must ensure that this bit is set to the default value. Register Attribute: Static.
3:0	1h RW/V/P	**Target Link Speed (TLS):** Target Link Speed (TLS): This field sets an upper limit on Link operational speed by restricting the values advertised by the upstream component in its training sequences. The encoded value specifies a bit location in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the current Link speed. Defined encodings are: 0001b: Supported 2.5 GT/s. 0010b: Supported 5 GT/s. 0011b: Supported 8 GT/s. All other encodings are reserved. If a value is written to this field that does not correspond to a supported speed, the result is undefined. The default value of this field is GEN1. Note: This register field could be used by REUT software to limit the link speed to 2.5 GT/s, 5 GT/s, or 8 GT/s data rate.

20.1.26 Message Signaled Interrupt Identifiers And Message Signaled Interrupt Message Control (MID_MC)—Offset 80h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 9005h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
22:20	0h RW	**Multiple Message Enable (MME):** These bits are RW for software compatibility, but only one message is ever sent by the root port.
19:17	0h RO	**Multiple Message Capable (MMC):** Only one message is required.
16	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. CMD.BME must be set for an MSI to be generated. If CMD.BME is cleared, and this bit is set, no interrupts (not even pin based) are generated.
15:8	90h RW/O	**Next Pointer (NEXT):** Indicates the location of the next capability in the list. The default value of this register is 90h which points to the Subsystem Vendor capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

20.1.27 Message Signaled Interrupt Message Address (MA)—Offset 84h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0h RO	Reserved.

20.1.28 Message Signaled Interrupt Message Data (MD)—Offset 88h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD[lb]15:0[rb]) during the data phase of the MSI memory write transaction.

20.1.29 Subsystem Vendor Capability (SVCAP)—Offset 90h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: A00Dh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	A0h RW/O	**Next Capability (NEXT):** Indicates the location of the next capability in the list. The default value of this register is A0h which points to the PCI Power Management capability structure. BIOS can determine which capabilities will be exposed by including or removing them from the capability linked list. As this register is RWO, BIOS must write a value to this register, even if it is to re-write the default value.
7:0	Dh RO	**Capability Identifier (CID):** Value of 0Dh indicates this is a PCI bridge subsystem vendor capability.

20.1.30 Subsystem Vendor IDs (SVID)—Offset 94h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem Identifier (SID):** Indicates the subsystem as identified by the vendor. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).
15:0	0h RW/O	**Subsystem Vendor Identifier (SVID):** Indicates the manufacturer of the subsystem. This field is write once and is locked down until a bridge reset occurs (not the PCI bus reset).

20.1.31 Power Management Capability And PCI Power Management Capabilities (PMCAP_PMC)—Offset A0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: C8030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	19h RO	**PME Support (PMES):** Indicates PME# is supported for states D0, D3HOT and D3COLD. The root port does not generate PME#, but reporting that it does is necessary for legacy operating systems to enable PME# in devices connected behind this root port.
26	0h RO	**D2_Support (D2S):** The D2 state is not supported.
25	0h RO	**D1_Support (D1S):** The D1 state is not supported.
24:22	0h RO	**Aux_Current (AC):** Reports 375mA maximum suspend well current required when in the D3COLD state.
21	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
20	0h RO	Reserved.
19	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
18:16	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.
15:8	0h RO	**Next Capability (NEXT):** Indicates this is the last item in the list.
7:0	1h RO	**Capability Identifier (CID):** Value of 01h indicates this is a PCI power management capability.

20.1.32 PCI Power Management Control And Status (PMCS)—Offset A4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Data (DTA):** Reserved

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**Bus Power / Clock Control Enable (BPCE):** Reserved per PCI Express specification
22	0h RO	**B2/B3 Support (B23S):** Reserved per PCI Express specification.
21:16	0h RO	Reserved.
15	0h RO	**PME Status (PMES):** Indicates a PME was received on the downstream link.
14:13	0h RO	**Data Scale (DSC):** Reserved
12:9	0h RO	**Data Select (DSEL):** Reserved
8	0h RW/P	**PME Enable (PMEE):** Indicates PME is enabled. The root port takes no action on this bit, but it must be RW for legacy operating systems to enable PME# on devices connected to this root port.
7:4	0h RO	Reserved.
3	1h RW/O	**No Soft Reset (NSR):** When set to 1 this bit indicates that devices transitioning from D3hot to D0 because of Power State commands do not perform an internal reset. Configuration context is preserved. Upon transition from D3hot to D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. When clear, devices do perform an internal reset upon transitioning from D3hot to D0 via software control of the Power State bits. Configuration Context is lost when performing the soft reset. Upon transition from D3hot to D0 state, full reinitialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	Reserved.
1:0	0h RW	**Power State (PS):** This field is used both to determine the current power state of the root port and to set a new power state. The values are: 00 - D0 state 11 - D3HOT state When in the D3HOT state, the controller's configuration space is available, but the I/O and memory spaces are not. Type 1 configuration cycles are also not accepted. Interrupts are not required to be blocked as software will disable interrupts prior to placing the port into D3HOT. If software attempts to write a '10' or '01' to these bits, the write will be ignored.

20.1.33 Additional Configuration 1 (CCFG)—Offset D0h

BIOS may program this register.

20.1.34 Advanced Error Extended Reporting Capability Header (AECH)—Offset 100h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Set to 000h as this is the last capability in the list. Point to the next capability.
19:16	0h RW/O	**Capability Version (CV):** For systems that support AER, BIOS should write a 1h to this register else it should write 0
15:0	0h RW/O	**Capability ID (CID):** For systems that support AER, BIOS should write a 0001h to this register else it should write 0

20.1.35 Uncorrectable Error Status (UES)—Offset 104h

This register must maintain its state through a platform reset. It loses its state upon loss of core power.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RW/1C/V/P	**ACS Violation Status (AVS):** Indicates an ACS Violation is logged
20	0h RW/1C/V/P	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0h RO	**ECRC Error Status (EE):** ECRC is not supported.
18	0h RW/1C/V/P	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0h RW/1C/V/P	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0h RW/1C/V/P	**Unexpected Completion Status (UC):** Indicates an unexpected completion was received.
15	0h RW/1C/V/P	**Completor Abort Status (CA):** Indicates a completer abort was received
14	0h RW/1C/V/P	**Completion Timeout Status (CT):** Indicates a completion timed out. This is signaled if Completion Timeout is enabled and a completion fails to return within the amount of time specified by the Completion Timeout Value
13	0h RO	**Flow Control Protocol Error Status (FCPE):** Not supported.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW/1C/V/P	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:6	0h RO	Reserved.
5	0h RO	**Surprise Down Error Status (SDE):** Surprise Down is not supported.
4	0h RW/1C/V/P	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:1	0h RO	Reserved.
0	0h RO	**Training Error Status (TE):** Not supported.

20.1.36 Uncorrectable Error Mask (UEM)—Offset 108h

When set, the corresponding error in the UES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RW/P	**ACS Violation Mask (AVM):** Mask for ACS Violation errors
20	0h RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors.
19	0h RO	**ECRC Error Mask (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Mask (MT):** Mask for malformed TLPs
17	0h RW/P	**Receiver Overflow Mask (RO):** Mask for receiver overflows.
16	0h RW/P	**Unexpected Completion Mask (UC):** Mask for unexpected completions.
15	0h RW/P	**Completor Abort Mask (CM):** Mask for completer abort.
14	0h RW/P	**Completion Timeout Mask (CT):** Mask for completion timeouts.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RO	**Flow Control Protocol Error Mask (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Mask (PT):** Mask for poisoned TLPs.
11:6	0h RO	Reserved.
5	0h RO	**Surprise Down Error Mask (SDE):** Surprise Down is not supported.
4	0h RW/P	**Data Link Protocol Error Mask (DLPE):** Mask for data link protocol errors.
3:1	0h RO	Reserved.
0	0h RO	**Training Error Mask (TE):** Not supported.

20.1.37 Uncorrectable Error Severity (UEV)—Offset 10Ch

This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal if the bit is cleared. This register is only reset by a loss of core power.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 60011h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RW/P	**ACS Violation Severity (AVS):** Severity for ACS violation.
20	0h RW/P	**Unsupported Request Error Severity (URE):** Severity for unsupported request reception.
19	0h RO	**ECRC Error Severity (EE):** ECRC is not supported.
18	1h RW/P	**Malformed TLP Severity (MT):** Severity for malformed TLP reception.
17	1h RW/P	**Receiver Overflow Severity (RO):** Severity for receiver overflow occurrences.
16	0h RW/P	**Unexpected Completion Severity (UC):** Severity for unexpected completion reception.
15	0h RW/P	**Completor Abort Severity (CA):** Severity for completer abort.
14	0h RW/P	**Completion Timeout Severity (CT):** Severity for completion timeout.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RO	**Flow Control Protocol Error Severity (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Severity (PT):** Severity for poisoned TLP reception.
11:6	0h RO	Reserved.
5	0h RO	**Surprise Down Error Severity (SDE):** Surprise Down is not supported.
4	1h RW/P	**Data Link Protocol Error Severity (DLPE):** Severity for data link protocol errors.
3:1	0h RO	Reserved.
0	1h RO	**Training Error Severity (TE):** TE not supported. This bit is left as RO='1' for ease of implementation..

20.1.38 Correctable Error Status (CES)—Offset 110h

This register is only reset by a loss of core power

Access Method

Type: CFG Register (Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13	0h RW/1C/V/P	**Advisory Non-Fatal Error Status (ANFES):** When set, indicates that an Advisory Non-Fatal Error occurred.
12	0h RW/1C/V/P	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.
11:9	0h RO	Reserved.
8	0h RW/1C/V/P	**Replay Number Rollover Status (RNR):** Indicates the replay number rolled over.
7	0h RW/1C/V/P	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.
6	0h RW/1C/V/P	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW/1C/V/P	**Receiver Error Status (RE):** Indicates a receiver error occurred.

20.1.39 Correctable Error Mask (CEM)—Offset 114h

When set, the corresponding error in the CES register is masked, and the logged error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 28
Function:

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13	1h RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0h RW/P	**Replay Timer Timeout Mask (RTT):** Mask for replay timer timeout.
11:9	0h RO	Reserved.
8	0h RW/P	**Replay Number Rollover Mask (RNR):** Mask for replay number rollover.
7	0h RW/P	**Bad DLLP Mask (BD):** Mask for bad DLLP reception.
6	0h RW/P	**Bad TLP Mask (BT):** Mask for bad TLP reception.
5:1	0h RO	Reserved.
0	0h RW/P	**Receiver Error Mask (RE):** Mask for receiver errors.

20.1.40 Advanced Error Capabilities And Control (AECC)—Offset 118h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	Reserved.
12	0h RO	**Completion Timeout Prefix/Header Log Capable (CTPHLC):** If set, this bit indicates that port records the prefix/header of Request TLPs that experience a Completion Timeout error. Note: BIOS should program this bit before enable the Completion Timeout mechanism. Register Attribute: Static.
11:9	0h RO	Reserved.
8	0h RO	**ECRC Check Enable (ECE):** ECRC is not supported.
7	0h RO	**ECRC Check Capable (ECC):** ECRC is not supported.
6	0h RO	**ECRC Generation Enable (EGE):** ECRC is not supported.
5	0h RO	**ECRC Generation Capabile (EGC):** ECRC is not supported.
4:0	0h RO/V/P	**First Error Pointer (FEP):** Identifies the bit position of the first error reported in the Uncorrectable Error Status Register.

20.1.41 Root Error Command (REC)—Offset 12Ch

This register allows errors to generate interrupts.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RO	Reserved.
2	0h RW	**Fatal Error Reporting Enable (FERE):** When set, the root port will generate an interrupt when a fatal error is reported by the attached device.
1	0h RW	**Non-fatal Error Reporting Enable (NERE):** When set, the root port will generate an interrupt when a non-fatal error is reported by the attached device.
0	0h RW	**Correctable Error Reporting Enable (CERE):** When set, the root port will generate an interrupt when a correctable error is reported by the attached device.

20.1.42 Root Error Status (RES)—Offset 130h

This register can track more than one error and set the multiple bits if a second or subsequent error occurs and the first has not been serviced. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Advanced Error Interrupt Message Number (AEMN):** Reserved. There is only one error interrupt allocated.
26:7	0h RO	Reserved.
6	0h RW/1C/V/P	**Fatal Error Message Received (FEMR):** Set when one or more Fatal Uncorrectable Error Messages have been received.
5	0h RW/1C/V/P	**Non-Fatal Error Messages Received (NFEMR):** Set when one or more Non-Fatal Uncorrectable error messages have been received
4	0h RW/1C/V/P	**First Uncorrectable Fatal (FUF):** Set when the first Uncorrectable Error message received is for a fatal error.
3	0h RW/1C/V/P	**Multiple ERR_FATAL/NONFATAL Received (MENR):** Set when either a fatal or a non-fatal error is received and the ENR bit is already set.
2	0h RW/1C/V/P	**ERR_FATAL/NONFATAL Received (ENR):** Set when either a fatal or a non-fatal error message is received.
1	0h RW/1C/V/P	**Multiple ERR_COR Received (MCR):** Set when a correctable error message is received and the CR bit is already set.
0	0h RW/1C/V/P	**ERR_COR Received (CR):** Set when a correctable error message is received.

20.1.43 Error Source Identification (ESID)—Offset 134h

Size:32 bits
Identifies the source (Requester ID) of the first correctable and uncorrectable (Non-Fatal / Fatal) errors reported in the Root Error Status register. This register is only reset by a loss of core power.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V/P	**ERR_FATAL/NONFATAL Source Identification (EFNFSID):** Loaded with the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message with the ERR_FATAL/NONFATAL Received register is not already set.
15:0	0h RO/V/P	**ERR_COR Source Identification (ECSID):** Loaded with the Requester ID indicated in the received ERR_COR Message with the ERR_COR Received register is not already set.

20.1.44 L1 Sub-States Extended Capability Header (L1SECH)—Offset 200h

Size: 32 bits
Note: When operating in Mobile Express mode, this capability should not be enabled.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** This field contains the offset to the next PCI Express Capability structure or 000h if no other items exist in the linked list of Capabilities. For Extended Capabilities implemented in Configuration Space, this offset is relative to the beginning of PCI compatible Configuration Space and thus must always be either 000h (for terminating list of Capabilities) or greater than 0FFh. The bottom 2 bits of this offset are Reserved and must be implemented as 00b and software must mask them to allow for future uses of these bits.
19:16	0h RW/O	**Capability Version (CV):** This field is a PCI-SIG defined version number that indicates the version of the Capability structure present. Must be 1h for this version of the specification. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 1h
15:0	0h RW/O	**PCI Express Extended Capability ID (PCIEEC):** This field is a PCI-SIG defined ID number that indicates the nature and format of the Extended Capability. For systems that support L1 Sub-State Extended Capability, BIOS should set this field to 001Eh.

20.1.45 L1 Sub-States Capabilities (L1SCAP)—Offset 204h

This is L1 Sub-States Capabilities register. Refer to register field for more details

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 28281Fh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:19	5h RW/O	**Port Tpower_on Value (PTV):** Along with the Port T_POWER_ON Scale Field in the L1 Substates Capabilities register sets theTime (in us) that this Port requires the port on the opposite side of Link to wait in L1.OFF_EXIT after sampling CLKREQ# asserted before actively driving the interface. Port Tpower_on is calculated by multiplying the value in this field by the value in the Port Tpower_on scale field in the L1 Sub-States Capabilities 2 register. Required for all Ports that support L1.OFF.
18	0h RO	Reserved.
17:16	0h RW/O	**Port Tpower_on Scale (PTPOS):** Specifies the scale used for Tpower_on value field in the L1 Substates Capabilities register. 00b: 2us 01b: 10us 10b: 100us 11b: Reserved Required for all Ports that support L1.OFF.
15:8	28h RW/O	**Port Common Mode Restore Time (PCMRT):** This is the time (in us) required for this Port to re-establish common mode. Required for all ports that support L1.OFF.
7	0h RO	Reserved.
6	0h RW/1C/V	**L1-Substate Exit Interrupt Status (L1SSEIS):** CLKREQ# Acceleration Interrupt Status - For a Downstream Port that has both the CLKREQ# Acceleration Supported and CLKREQ# Acceleration Interrupt Enable bits Set, when set this bit indicates that the Port has completed the CLKREQ# Acceleration Link Activation process, and that the Link has reached L0. Software must then clear this bit by writing a 1b to this bit. Must be hardwired to 0b for Upstream Ports. Default value is 0b.
5	0h RW/O	**L1-Substate Exit Supported (L1SSES):** CLKREQ# Acceleration Supported - When set this bit indicates that this Port supports CLKREQ# Accelration (see [lt]Ref to Ch6 sect to be written!!![gt])
4	1h RW/O	**L1 PM Substates Supported (L1PSS):** When Set this bit indicates that this Port supports L1 PM Substates. For compatibility with possible future extensions, software must not enable L1 PM Substates unless this bit is set. This RWO field must be programmed prior to enabling ASPM. Required for both Upstream and Downstream Ports.
3	1h RW/O	**ASPM L1.1 Substates Supported (AL11S):** When set, this bit indicates that this port supports L1 substates for ASPM L1.SNOOZ is supported. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
2	1h RW/O	**ASPM L1.2 Supported (AL12S):** When set, this bit indicates that ASPM_L1.OFF is supported. Required for both Upstream and Downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
1	1h RW/O	**PCI-PM L1.1 Supported (PPL11S):** When set, this bit indicates that L1.SNOOZ sub-state is supported and this bit must be set by all ports implementing L1 Sub-States. A port that supports L1.OFF must support L1.SNOOZ. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static
0	1h RW/O	**PCI-PM L1.2 Supported (PPL12S):** When set, this bit indicates that PCI-PM L1.OFF power management feature is supported. Required for both upstream and downstream ports. This RWO field must be programmed prior to enabling ASPM. Register Attribute: Static

20.1.46 L1 Sub-States Control 1 (L1SCTL1)—Offset 208h

This is L1 Sub-States Control 1 register. Refer to register field for more details

Access Method

Type: CFG Register (Size: 32 bits)
Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RW	**L1.2 LTR Threshold Latency ScaleValue (L12LTRTLSV):** This field contains the L1.OFF LTR Threshold Latency Scale Value for this particular PCIe Root Port. The value in this field, together with L12LTRTLV is compared against both the snoop and non-snoop LTR values of the device. 000: L12LTRSTLV times 1 ns 001: L12LTRSTLV times 32 ns 010: L12LTRSTLV times 1024 ns 011: L12LTRSTLV times 32768 ns 100: L12LTRSTLV times 1048576 ns 101: L12LTRSTLV times 33554432 ns Others: Not Permitted. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
28:26	0h RO	Reserved.
25:16	0h RW	**L1.2 LTR Threshold Latency Value (L12OFFLTRTLV):** This field contains the L1.2 LTR Threshold Latency Value for this particular PCIe Root Port. The value in this field, together with L12LTRTLSV is compared against both the snoop and non-snoop LTR values of the device. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
15:8	0h RW	**Common Mode Restore Time (CMRT):** This is the Tcommon_mode time (in us) the PCIe Root Port needs to continue sending TS1 and refrain from sending TS2 in Recovery state to allow the TX common mode to be established prior to sending TS2. The timer starts from the time when the first TS1 has been sent and the receiver has detected un-squelch. The value in this field defines the time in micro-seconds. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
7:4	0h RO	Reserved.
3	0h RW	**ASPM L1.1 Enabled (AL11E):** When set, this bit indicates that ASPM L1.SNOOZ substates are enabled for ASPM. Required for both upstream and downstream ports. Register Attribute: Dynamic
2	0h RW	**ASPM L1.2 Enable (AL12E):** When set, this bit indicates that ASPM L1.OFF substates are enabled for PCI-PM. Required for both upstream and downstream ports. Register Attribute: Dynamic.
1	0h RW	**PCI-PM L1.SNOOZ Enable (PPL11E):** When set, this bit indicates that PCI-PM L1.SNOOZ power management feature is enabled. If L1.OFF is enabled, L1.SNOOZ must also be enabled. This field must be programmed prior to enabling ASPM L1. Register Attribute: Dynamic

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**PCI-PM L1.2 Enabled (PPL12E):** When set, this bit indicates that PCI-PM L1.OFF power management feature is enabled. L1.OFF can only be enabled if the platform supports bi-directional CLKREQPLUS#. This field must be programmed prior to enabling ASPM L1. Ports that support L1.OFF shall support Latency Tolerance Reporting. Register Attribute: Dynamic

20.1.47 L1 Sub-States Control 2 (L1SCTL2)—Offset 20Ch

This is L1 Sub-States Control 2 register. Refer to register field for more details

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 28h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:3	5h RW	**Power On Wait Time (POWT):** Along with the Tpower_on Scale sets the minimum amount of time (in us) that the Port must wait in L1.OFF EXIT after sampling CLKREQPLUS# asserted before actively driving the interface. The timer starts counting when CLKREQPLUS# is sampled asserts in L1.OFF state. Tpower_on value is calculated by multiplying the value in this field by the value in the TPOS field. This field must be programmed prior to enabling L1.OFF. Register Attribute: Static
2	0h RO	Reserved.
1:0	0h RW	**Tpower_on Scale (TPOS):** Specifies the scale used for Tpower_on value. 00b: 2 us 01b: 10 us 10b: 100us 11b: Reserved. Required for all Ports that support L1.OFF. Register Attribute: Static

20.1.48 ACS Extended Capability Header (ACSECH)—Offset 220h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 28
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RW/O	**Next Capability Offset (NCO):** Next Capability Offset (NCO): Points to the next capability.
19:16	0h RW/O	**Capability Version (CV):** Capability Version (CV): For systems that support ACS Extended Capability, BIOS should write a 1h to this register else it should write 0.
15:0	0h RW/O	**Capability ID (CID):** Capability ID (CID): For systems that support ACS Extended Capability, BIOS should write a 000Dh to this register else it should write 0.

20.1.49 ACS Capability Register And ACS Control Register (ACSCAPR_ACSCTLR)—Offset 224h

This is ACS Capability Register and ACS Control register. Refer to register field for more details

Access Method

Type: CFG Register (Size: 32 bits)

Device: 28

Function:

Default: 1Fh

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22	0h RO	**ACS Direct Translated P2P Enable (TE):** ACS Direct Translated P2P Enable (T): ACS Direct Translated P2P is not supported.
21	0h RO	**ACS P2P Egress Control Enable (EE):** ACS P2P Egress Control Enable (E): ACS P2P Egress Control is not supported.
20	0h RW	**ACS Upstream Forwarding Enable (UE):** When set, the component forwards upstream any Request or Completion TLPs it receives that were redirected upstream by a component lower in the hierarchy. Note that the U bit only applies to upstream TLPs arriving at a Downstream Port, and whose normal routing targets the same Downstream Port. Upstream I/O, Configuration, VDM Message, Message are never affected by ACS Upstream Forwarding Enable. Register Attribute: Static
19	0h RW	**ACS P2P Completion Redirect Enable (CE):** ACS P2P Completion Redirect (C): Determines when the component redirects peer-to-peer Completions upstream; applicable only to Read Completions whose Relaxed Ordering Attribute is clear. Requests are never affected by ACS P2P Completion Redirect. Default value of this field is 0b. Register Attribute: Static.
18	0h RW	**ACS P2P Request Redirect Enable (RE):** ACS P2P Request Redirect Enable (R): Determines when the component redirects peer-to-peer memory Requests targeting another peer port upstream. I/O, Configuration, VDM Messages and Completions are never affected by ACS P2P Request Redirect. Default value of this field is 0b. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**ACS Translation Blocking Enable (BE):** ACS Translation Blocking Enable (B): When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value. I/O, Configuration, Completions and Messages are never affected by ACS Translation Blocking. Default value of this field is 0b. Register Attribute: Static.
16	0h RW	**ACS Source Validation Enable (VE):** ACS Source Validation Enable (V): When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers. I/O, Configuration and Completions are never affected by ACS Source Validation. Default value of this field is 0b. Register Attribute: Static.
15:7	0h RO	Reserved.
6	0h RO	**ACS Direct Translated P2P (T):** ACS Direct Translated P2P (T): ACS Direct Translated P2P is not supported.
5	0h RO	**ACS P2P Egress Control (E):** ACS P2P Egress Control (E): ACS P2P Egress Control is not supported.
4	1h RW/O	**ACS Upstream Forwarding (U):** Required for Root Ports if the RC supports Redirected Request Validation: required for Switch Downstream Ports: must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Upstream Forwarding Register Attribute: Static
3	1h RW/O	**ACS P2P Completion Redirect (C):** ACS P2P Completion Redirect (C): Required for all Functions that support ACS P2P Request Redirect; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Completion Redirect. Register Attribute: Static.
2	1h RW/O	**ACS P2P Request Redirect (R):** ACS P2P Request Redirect (R): Required for Root Ports that support peer-to-peer traffic with other Root Ports; required for Switch Downstream Ports; required for multi-function device Functions that support peer-to-peer traffic with other Functions; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS P2P Request Redirect. Register Attribute: Static.
1	1h RW/O	**ACS Translation Blocking (B):** ACS Translation Blocking (B): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Translation Blocking. Register Attribute: Static.
0	1h RW/O	**ACS Source Validation (V):** ACS Source Validation (V): Required for Root Ports and Switch Downstream Ports; must be hardwired to 0b otherwise. If 1b, indicates that the component implements ACS Source Validation. Register Attribute: Static.

21 I2C Interface (D25: F0-F1, D21:F0-F3)

21.1 I2C PCI Configuration Registers

Table 21-1. Summary of I2C PCI Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Device ID and Vendor ID (DEVVENDID)—Offset 0h	XXXX8086h
4h	7h	Status and Command (STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	Revision ID and Class Code (REVCLASSCODE)—Offset 8h	C8000XXh
Ch	Fh	Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch	800000h
10h	13h	Base Address (BAR)—Offset 10h	4h
14h	17h	Base Address Register High (BAR_HIGH)—Offset 14h	0h
18h	1Bh	Base Address 1 (BAR1)—Offset 18h	4h
1Ch	1Fh	Base Address 1 High (BAR1_HIGH)—Offset 1Ch	0h
2Ch	2Fh	Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch	0h
34h	37h	Capabilities Pointer (CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	Interrupt Register (INTERRUPTREG)—Offset 3Ch	0h
80h	83h	Power Management Capability ID (POWERCAPID)—Offset 80h	39001h
84h	87h	Power Management Control and Status (PMECTRLSTATUS)—Offset 84h	8h
90h	93h	PCI Device Idle Capability Record (PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
98h	9Bh	SW LTR update MMIO Location (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	2101h
9Ch	9Fh	Device IDLE Pointer (DEVICE_IDLE_POINTER_REG)—Offset 9Ch	24C1h
A0h	A3h	Device PG Config (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	F0800h
B0h	B3h	General Purpose Read Write 1 (GEN_REGRW1)—Offset B0h	0h
B4h	B7h	General Purpose PCI Read Write 2 (GEN_REGRW2)—Offset B4h	0h
B8h	BBh	General Purpose PCI Read Write 3 (GEN_REGRW3)—Offset B8h	0h
BCh	BFh	General Purpose PCI Read Write 4 (GEN_REGRW4)—Offset BCh	0h
C0h	C3h	General Purpose Input (GEN_INPUT_REG)—Offset C0h	0h

21.1.1 Device ID and Vendor ID (DEVVENDID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: XXXX8086h

Bit Range	Default and Access	Field Name (ID): Description
31:16	-- RO/P	**Device ID Field (DEVICEID):** This is a 16-bit value assigned to the controller. Refer the Device and Revision ID Table in Volume 1 for the default value.
15:0	8086h RO	**Vendor ID Field (VENDORID):** Identifies the manufacturer of the device. 8086h = Intel.

21.1.2 Status and Command (STATUSCOMMAND)—Offset 4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 100000h

Bit Range	Default and Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	0h RW/1C	**RMA Field (RMA):** S/W writes a '1' to this bit to clear it.
28	0h RW/1C	**RTA Field (RTA):** S/W writes a '1' to this bit to clear it.
27:21	0h RO	Reserved.
20	1h RO	**Cap List Field (CAPLIST):** Indicates that the controller contains a capabilities pointer list.
19	0h RO	**Intrerrupt Status Field (INTR_STATUS):** This bit reflects state of interrupt in the device. Only when the Interrupt Disable bit is a 0 and this Interrupt Status bit is a 1, will the device's/function's interrupt message be sent. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable Field (INTR_DISABLE):** Setting this bit disables INTx assertion. The interrupt disabled is legacy INTx# interrupt. This bit has no connection with interrupt status bit.
9	0h RO	Reserved.
8	0h RW	**SERR Enable Field (SERR_ENABLE):** Not implemented.
7:3	0h RO	Reserved.
2	0h RW	**BME Field (BME):** If this bit is 0, the controller does not generate any new upstream transaction as a Initiator.
1	0h RW	**MSE Field (MSE):** 0 = Disables memory mapped Configuration space. 1 = Enables memory mapped Configuration space.

Bit Range	Default and Access	Field Name (ID): Description
0	0h RO	Reserved.

21.1.3 Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: C8000XXh

Bit Range	Default and Access	Field Name (ID): Description
31:8	C8000h RO	**Class Code (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	-- RO/P	**Revision ID (RID):** Indicates stepping of the host controller. Refer to Device and Revision ID table in Vol1 for specific value.

21.1.4 Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 800000h

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23	1h RO	**MultiFunction Device Field (MULFNDEV):** 0 = Single Function Device 1 = Multi Function device
22:16	0h RO	**Header Type Field (HEADERTYPE):** Implements Type 0 Configuration header.
15:8	0h RO	**Latency Timer Field (LATTIMER):** Hardwired to 0.
7:0	0h RW/P	**Cache Line Size Field (CACHELINE_SIZE)**

21.1.5 Base Address (BAR)—Offset 10h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 4h

Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RW	**Base Address Field (BASEADDR):** Provides system memory base address for the controller.
11:4	0h RO	**Size Field (SIZEINDICATOR):** Always returns 0. The size of this register depends on the size of the memory space.
3	0h RO	**Prefetchable Field (PREFETCHABLE):** 0 indicates that this BAR is not prefetchable.
2:1	2h RO	**Type Field (TYPE):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE):** 0 indicates this BAR is present in the memory space.

21.1.6 Base Address Register High (BAR_HIGH)—Offset 14h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Base Address High Field (BASEADDR_HIGH)**

21.1.7 Base Address 1 (BAR1)—Offset 18h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 4h

Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RW	**Base Address Field (BASEADDR1):** This field is present if BAR1 is enabled.
11:4	0h RO	**Size Field (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**Prefetchable Field (PREFETCHABLE1):** 0 indicates that this BAR is not prefetchable.
2:1	2h RO	**Type Field (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Message Space Field (MESSAGE_SPACE1):** 0 Indicates this BAR is present in the memory space.

21.1.8 Base Address 1 High (BAR1_HIGH)—Offset 1Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Base Address High Field (BASEADDR1_HIGH)**

21.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/O/P	**Subsystem ID Field (SUBSYSTEMID):** The register, in combination with the Subsystem Vendor ID register make it possible for the operating environment to distinguish one subsystem from the other. This register is a Read Write Once type register.
15:0	0h RW/O/P	**Subsystem Vendor Field (SUBSYSTEMVENDORID):** The register, in combination with the Subsystem ID register, enables the operating environment to distinguish one subsystem from the other. This register is a Read Write Once register.

21.1.10 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Capabilities Pointer register indicates what the next capability is

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 0

Default: 80h

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	80h RO	**Capabilities Pointer Field (CAPPTR_POWER):** Indicates what the next capability is.

21.1.11 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**Max Latency Field (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**Min Gnt Field (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma
15:12	0h RO	Reserved.
11:8	0h RO	**Interrupt Pin Field (INTPIN)**
7:0	0h RW/P	**Int Line Field (INTLINE):** It is used to communicate to software, the interrupt line to which the interrupt pin is connected.

21.1.12 Power Management Capability ID (POWERCAPID)—Offset 80h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 21
Function: 0

Default: 39001h

Bit Range	Default and Access	Field Name (ID): Description
31:27	0h RO	**PME Support Field (PMESUPPORT):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for for a bit indicates that the function is not capable of asserting the PME# signal while in that power state. Bit 27 = 1: PME# can be asserted from D0. Bit 30 = 1: PME# can be asserted from D3 hot. Other bits are not used.
26:19	0h RO	Reserved.
18:16	3h RO	**Version Field (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	90h RO	**Next Cap Field (NXTCAP):** Points to the next capability structure.
7:0	1h RO	**Power Capability ID Field (POWER_CAP):** Indicates power management capability.

21.1.13 Power Management Control and Status (PMECTRLSTATUS)—Offset 84h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 8h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW/1C/P	**PME Status Field (PMESTATUS)**
14:9	0h RO	Reserved.
8	0h RW/P	**PME Enable Field (PMEENABLE):** 0 = PME message is disabled 1 = PME message is enabled.
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset Field (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	Reserved.
1:0	0h RW	**Power State Field (POWERSTATE):** This field is used both to determine the current power state and to set a new power state. The values are: 00 = D0 state 11 = D3HOT state Others = Reserved Notes: If software attempts to write a value of 01b or 10b in to this field,the data is discarded and no state change occurs. When in the D3HOT states, interrupts are blocked.

21.1.14 PCI Device Idle Capability Record (PCIDEVIDLE_CAP_RECORD)—Offset 90h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: F0140009h

Bit Range	Default and Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision IDField (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	0h RO	**Next Capability Field (NEXT_CAP):** Points to the next capability structure. This points to NULL.
7:0	9h RO	**Capability ID Field (CAPID)**

21.1.15 SW LTR update MMIO Location (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

Software location pointer in MMIO space as an offset specified by BAR

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 2101h

Bit Range	Default and Access	Field Name (ID): Description
31:4	210h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR BAR Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	1h RO	**SW LTR Valid Field (SW_LAT_VALID)**

21.1.16 Device IDLE Pointer (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register giving details on Device MMIO offset location BAR NUM and D0i3 Valid Strap

Access Method

Type: CFG Register (Size: 32 bits)

Device: 21
Function: 0

Default: 24C1h

Bit Range	Default and Access	Field Name (ID): Description
31:4	24Ch RO	**D0i3 Dword Offset Field (DWORD_OFFSET):** contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR NUM Field (BAR_NUM):** Indicates that the D0i3 MMIO location is always at BAR0.
0	1h RO	**D0i3 Valid Field (VALID):** 0 = Not valid 1 = Valid

21.1.17 Device PG Config (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

Access Method

Type: CFG Register (Size: 32 bits)

Device: 21
Function: 0

Default: F0800h

Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19	1h RW/P	**Sleep Enable Field (SLEEP_EN)**
18	1h RW/P	**D3 Hen Field (PGE):** If clear, the controller will never request a PG. If 1, then the function will power gate when idle and the DevIdle bit is set.
17	1h RW/P	**Device Idle En Field (I3_ENABLE):** If 1, then function will power gate when idle and the POWERSTATE bits in the function = 11 (D3).
16	1h RW/P	**PMC Request Enable Field (PMCRE):** If this bit is set to '1', the function will power gate when idle.
15:13	0h RO	Reserved.
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** This value is written by BIOS to communicate to the Driver.

Bit Range	Default and Access	Field Name (ID): Description
9:0	0h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** This value is written by BIOS to communicate to the Driver.

21.1.18 General Purpose Read Write 1 (GEN_REGRW1)—Offset B0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**General Purpose Read Write Field (GEN_REG_RW1):** General purpose read write PCI register.

21.1.19 General Purpose PCI Read Write 2 (GEN_REGRW2)—Offset B4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**General Purpose Read Write Field (GEN_REG_RW2):** General purpose read write PCI register.

21.1.20 General Purpose PCI Read Write 3 (GEN_REGRW3)—Offset B8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**General Purpose Read Write Field (GEN_REG_RW3):** General purpose read write PCI register.

21.1.21 General Purpose PCI Read Write 4 (GEN_REGRW4)—Offset BCh

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**General Purpose Read Write Field (GEN_REG_RW4):** General purpose read write PCI register.

21.1.22 General Purpose Input (GEN_INPUT_REG)—Offset C0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 21
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO	**General Purpose Input Field (GEN_REG_INPUT_RW):** General purpose input register.

21.2 I2C Memory Mapped Registers

The registers in this section are memory-mapped registers based on the BAR defined in PCH Configuration space.

Table 21-2. Summary of I2C Memory Mapped Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	I2C Control (IC_CON)—Offset 0h	77h
4h	7h	I2C Target Address (IC_TAR)—Offset 4h	1055h
Ch	Fh	I2C High Speed Initiator Mode Code Address (IC_HS_MADDR)—Offset Ch	1h
10h	13h	Rx/Tx Data Buffer and Command (IC_DATA_CMD)—Offset 10h	0h

Table 21-2. Summary of I2C Memory Mapped Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
14h	17h	Standard Speed I2C Clock SCL High Count (IC_SS_SCL_HCNT)—Offset 14h	1F4h
18h	1Bh	Standard Speed I2C Clock SCL Low Count (IC_SS_SCL_LCNT)—Offset 18h	24Ch
1Ch	1Fh	Fast Speed I2C Clock SCL High Count (IC_FS_SCL_HCNT)—Offset 1Ch	4Bh
20h	23h	Fast Speed I2C Clock SCL Low Count (IC_FS_SCL_LCNT)—Offset 20h	A3h
24h	27h	High Speed I2C Clock SCL High Count (IC_HS_SCL_HCNT)—Offset 24h	8h
28h	2Bh	High Speed I2C Clock SCL Low Count (IC_HS_SCL_LCNT)—Offset 28h	14h
2Ch	2Fh	I2C Interrupt Status Register (IC_INTR_STAT)—Offset 2Ch	0h
30h	33h	Interrupt Mask Register (IC_INTR_MASK)—Offset 30h	8FFh
34h	37h	Raw Interrupt Status (IC_RAW_INTR_STAT)—Offset 34h	0h
38h	3Bh	Receive FIFO Threshold (IC_RX_TL)—Offset 38h	0h
3Ch	3Fh	Transmit FIFO Threshold (IC_TX_TL)—Offset 3Ch	0h
40h	43h	Clear Combined and Individual Interrupt (IC_CLR_INTR)—Offset 40h	0h
44h	47h	Clear RX_UNDER Interrupt (IC_CLR_RX_UNDER)—Offset 44h	0h
48h	4Bh	Clear RX_OVER Interrupt (IC_CLR_RX_OVER)—Offset 48h	0h
4Ch	4Fh	Clear TX_OVER Interrupt (IC_CLR_TX_OVER)—Offset 4Ch	0h
50h	53h	Clear RD_REQ Interrupt (IC_CLR_RD_REQ)—Offset 50h	0h
54h	57h	Clear TX_ABRT Interrupt (IC_CLR_TX_ABRT)—Offset 54h	0h
58h	5Bh	Clear RX_DONE Interrupt (IC_CLR_RX_DONE)—Offset 58h	0h
5Ch	5Fh	Clear ACTIVITY Interrupt (IC_CLR_ACTIVITY)—Offset 5Ch	0h
60h	63h	Clear STOP_DET Interrupt (IC_CLR_STOP_DET)—Offset 60h	0h
64h	67h	Clear START_DET Interrupt (IC_CLR_START_DET)—Offset 64h	0h
68h	6Bh	Clear GEN_CALL Interrupt (IC_CLR_GEN_CALL)—Offset 68h	0h
6Ch	6Fh	I2C Enable (IC_ENABLE)—Offset 6Ch	0h
70h	73h	I2C Status (IC_STATUS)—Offset 70h	6h
74h	77h	I2C Transmit FIFO Level (IC_TXFLR)—Offset 74h	0h
78h	7Bh	Receive FIFO Level (IC_RXFLR)—Offset 78h	0h
7Ch	7Fh	SDA Hold Time Length (IC_SDA_HOLD)—Offset 7Ch	1h
80h	83h	Transmit Abort Source (IC_TX_ABRT_SOURCE)—Offset 80h	0h
88h	8Bh	DMA Control (IC_DMA_CR)—Offset 88h	0h
8Ch	8Fh	DMA Transmit Data Level (IC_DMA_TDLR)—Offset 8Ch	0h
90h	93h	Receive Data Level (IC_DMA_RDLR)—Offset 90h	0h
98h	9Bh	ACK General Call (IC_ACK_GENERAL_CALL)—Offset 98h	1h
9Ch	9Fh	I2C Enable Status (IC_ENABLE_STATUS)—Offset 9Ch	0h
A0h	A3h	SS and FS Spike Suppression Limit (IC_FS_SPKLEN)—Offset A0h	7h

21.2.1 I2C Control (IC_CON)—Offset 0h

I2C Control Register

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 77h

Bit Range	Default and Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h RW	**TX_EMPTY_CTRL (TX_EMPTY_CTRL):** This bit controls the generation of the TX_EMPTY interrupt, as described in the IC_RAW_INTR_STAT register.
7	0h RO	Reserved.
6	1h RW	**IC_Target_DISABLE (IC_Target_DISABLE):** This bit controls whether I2C has its Target disabled. If this bit is set (Target is disabled), the function only works as a Initiator and does not perform any action that requires a Target. 0:Reserved 1: Target is disabled
5	1h RW	**IC_RESTART_EN (IC_RESTART_EN):** Determines whether RESTART conditions may be sent when I2C is acting as a Initiator. 0: Restart disable 1: Restart enable When the RESTART is disabled, the IP is incapable of performing the following functions: • Sending a START BYTE • Performing any high-speed mode operation • Performing direction changes in combined format mode • Performing a read operation with a 10-bit address By replacing RESTART condition followed by a STOP and a subsequent START condition, split operations are broken down into multiple transfers. If the above operations are performed, it will result in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register.
4	1h RO	**IC_10BITADDR_Initiator_rd_only (IC_10BITADDR_Initiator_rd_only):** Identifies if I2C operates in 7 or 10 bit addressing. 0: 7-bit addressing 1: 10-bit addressing
3	0h RO	Reserved.
2:1	3h RW	**SPEED (SPEED):** These bits control at which speed the I2C operates. 01: standard mode (0 to 100 kbit/s) 10: fast mode (<= 400 kbit/s) 11: High Speed Mode (<= 3.4 Mbit/s)
0	1h RW	**Initiator_MODE (Initiator_MODE):** This bit controls whether I2C Initiator is enabled. 0 = Reserved 1 = Initiator Enabled Note: For Initiator Device Configuration Software must ensure that this bit is set to 1, and bit 6 must also be set to 1. Else this will result in configuration error.

21.2.2 I2C Target Address (IC_TAR)—Offset 4h

The register should only be updated when the I2C is not enabled (IC_ENABLE=0) or No Initiator mode operations are active (IC_STATUS[5] = 0 and IC_CON[0] = 1 and IC_STATUS[2] = 1).

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 1055h

Bit Range	Default and Access	Field Name (ID): Description
31:13	0h RO	Reserved.
12	1h RW	**IC_10BITADDR_Initiator (IC_10BITADDR_Initiator):** This bit controls whether the I2C starts its transfers in 7-or 10-bit addressing mode when acting as a Initiator. 0: 7 bit addressing 1: 10-bit addressing
11	0h RW	**SPECIAL (SPECIAL):** This bit indicates whether software performs a General Call or START BYTE command. 0: ignore bit 10 GC_OR_START and use IC_TAR normally. 1: perform special I2C command as specified in GC_OR_START bit.
10	0h RW	**GC_OR_START (GC_OR_START):** If bit 11 (SPECIAL) is set to 1, then this bit indicates whether a General Call or START byte command is to be performed by the I2C. 0: General Call Address – after issuing a General Call, only writes may be performed. Attempting to issue a read command results in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. The I2C remains in General Call mode until the SPECIAL bit value (bit 11) is cleared. 1: START BYTE
9:0	55h RW	**IC_TAR (IC_TAR):** This is the target address for any Initiator transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits.

21.2.3 I2C High Speed Initiator Mode Code Address (IC_HS_MADDR)—Offset Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RO	Reserved.
2:0	1h RW	**IC_HS_MAR (IC_HS_MAR):** This bit field holds the value of the I2C HS mode Initiator code. HS-mode Initiator codes are reserved 8-bit codes (00001xxx) that are not used for Target addressing or other purposes. Each Initiator has its unique Initiator code; up to eight highspeed mode Initiators can be present on the same I2C bus system. Valid values are from 0 to 7. This register goes away and becomes read-only returning 0s if the IC_MAX_SPEED_MODE configuration parameter is set to either Standard (1) or Fast (2).

21.2.4 Rx/Tx Data Buffer and Command (IC_DATA_CMD)—Offset 10h

I2C Data Command Register

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:11	0h RO	Reserved.
10	0h WO	**RESTART (RESTART):** This bit controls whether a RESTART is issued before the byte is sent or received. 1: a RESTART is issued before the data is sent/received (according to the value of CMD), regardless of whether or not the transfer direction is changing from the previous command. 0: a RESTART is issued only if the transfer direction is changing from the previous command.
9	0h WO	**STOP (STOP):** This bit controls whether a STOP is issued after the byte is sent or received. 1: STOP is issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the Initiator immediately tries to start a new transfer by issuing a START and arbitrating for the bus. 0: STOP is not issued after this byte, regardless of whether or not the Tx FIFO is empty. If the Tx FIFO is not empty, the Initiator continues the current transfer by sending/receiving data bytes according to the value of the CMD bit. If the Tx FIFO is empty, the Initiator holds the SCL line low and stalls the bus until a new command is available in the Tx FIFO.
8	0h WO	**CMD (CMD):** This bit controls whether a read or a write is performed. 1 = Read. 0 = Write When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. In Target-receiver mode, this bit is a do not care because writes to this register are not required. In Target-transmitter mode, a 0 indicates that the data in IC_DATA_CMD is to be transmitted. When programming this bit, note the following: attempting to perform a read operation after a General Call command has been sent results in a TX_ABRT interrupt (bit 6 of the IC_RAW_INTR_STAT register), unless bit 11 (SPECIAL) in the IC_TAR register has been cleared. If a "1" is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs.
7:0	0h RW	**DAT (DAT):** This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the I2C. However, when you read this register, these bits return the value of data received on the I2C interface.

21.2.5 Standard Speed I2C Clock SCL High Count (IC_SS_SCL_HCNT)—Offset 14h

This register sets the SCL clock high-period count for standard speed. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The register is only used in Initiator mode.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 1F4h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	1F4h RW	**IC_SS_SCL_HCNT (IC_SS_SCL_HCNT):** This register sets the SCL clock high-period count for standard speed. The value of the registers should be within the range {6, 65525}.

21.2.6 Standard Speed I2C Clock SCL Low Count (IC_SS_SCL_LCNT)—Offset 18h

This register sets the SCL clock low-period countfor standard speed.. This register can be written only when the I2C interface is disabled which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 24Ch

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	24Ch RW	**IC_SS_SCL_LCNT (IC_SS_SCL_LCNT):** Standard Speed I2C Clock SCL Low Count Register. The register value should always be >= 8

21.2.7 Fast Speed I2C Clock SCL High Count (IC_FS_SCL_HCNT)—Offset 1Ch

Fast Speed I2C Clock SCL High Count Register. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 4Bh

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	4Bh RW	**IC_FS_SCL_HCNT (IC_FS_SCL_HCNT):** This register sets the SCL clock high-period count for fast speed. It is used in high-speed mode to send the Initiator Code and START BYTE or General CALL.. The minimum value of this field is 6.

21.2.8 Fast Speed I2C Clock SCL Low Count (IC_FS_SCL_LCNT)—Offset 20h

Fast Speed I2C Clock SCL Low Count Register. This register must be set before any I2C bus transaction can take place to ensure proper I/O timing.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: A3h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	A3h RW	**IC_FS_SCL_LCNT (IC_FS_SCL_LCNT):** This register sets the SCL clock low period count for fast speed. It is used in high-speed mode to send the Initiator Code and START BYTE or General CALL. The register should be programmed with a minimum value of 8.

21.2.9 High Speed I2C Clock SCL High Count (IC_HS_SCL_HCNT)—Offset 24h

High Speed I2C Clock SCL High Count Register. This register must be set before any I2C bus transaction can take place to ensure proper I/O timing.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 8h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	8h RW	**IC_HS_SCL_HCNT (IC_HS_SCL_HCNT):** This register sets the SCL clock high period count for high speed.

21.2.10 High Speed I2C Clock SCL Low Count (IC_HS_SCL_LCNT)—Offset 28h

High Speed I2C Clock SCL Low Count Register. This register must be set before any I2C bus transaction can take place to ensure proper I/O timing.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 14h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	14h RW	**IC_HS_SCL_LCNT (IC_HS_SCL_LCNT):** This register sets the SCL clock low period count for high speed.

21.2.11 I2C Interrupt Status Register (IC_INTR_STAT)—Offset 2Ch

I2C Interrupt Status Register. Each bit in this register has a corresponding mask bit in the IC_INTR_MASK register. These bits are cleared by reading the matching interrupt clear register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13	0h RO	**R_Initiator_ON_HOLD (R_Initiator_ON_HOLD):** Indicates whether a Initiator is holding the bus and the TX FIFO is empty. Enabled only when I2C_DYNAMIC_TAR_UPDATE = 1 and IC_EMPTYFIFO_HOLD_Initiator_EN = 1
12	0h RO	Reserved.
11	0h RO	**R_GEN_CALL (R_GEN_CALL):** Set only when a General Call address is received and it is acknowledged. It stays set until it is cleared either by disabling the controller or when the processor reads bit 0 of the IC_CLR_GEN_CALL register
10	0h RO	**R_START_DET (R_START_DET):** Indicates whether a START or RESTART condition has occurred on the I2C interface.
9	0h RO	**R_STOP_DET (R_STOP_DET):** Indicates whether a STOP condition has occurred on the I2C interface.

Bit Range	Default and Access	Field Name (ID): Description
8	0h RO	**R_ACTIVITY (R_ACTIVITY):** This bit captures the controller activity and stays set until it is cleared. There are four ways to clear it: 1. Disabling the controller, 2. Reading the IC_CLR_ACTIVITY register, 3. Reading the IC_CLR_INTR register, 4. System reset Note: Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the controller is idle, this bit remains set until cleared, indicating that there was activity on the bus.
7	0h RO	Reserved.
6	0h RO	**R_TX_ABRT (R_TX_ABRT):** This bit indicates if the controler, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places. NOTE: The controller flushes/resets/empties the TX FIFO whenever this bit is set. The TX FIFO remains in this flushed state until the register IC_CLR_TX_ABRT is read. Once this read is performed, the TX FIFO is then ready to accept more data bytes.
5	0h RO	Reserved.
4	0h RO	**R_TX_EMPTY (R_TX_EMPTY):** The behavior of the TX_EMPTY interrupt status differs based on the TX_EMPTY_CTRL selection in the IC_CON register. When TX_EMPTY_CTRL = 0: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. When TX_EMPTY_CTRL = 1: This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register and the transmission of the address/data from the internal shift register for the most recently popped command is completed. It is automatically cleared by hardware when the buffer level goes above the threshold. When IC_ENABLE[0] is set to 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the Initiator or Target state machines. When there is no longer any activity, then with ic_en=0, this bit is set to 0.
3	0h RO	**R_TX_OVER (R_TX_OVER):** Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register. When the module is disabled, this bit keeps its level until the Initiator or Target state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.
2	0h RO	**R_RX_FULL (R_RX_FULL):** Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold. If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of the activity that continues.
1	0h RO	**R_RX_OVER (R_RX_OVER):** Set if the receive buffer is completely filled to IC_RX_BUFFER_DEPTH and an additional byte is received from an external I2C device. The controller acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the Initiator goes into idle, and when ic_en goes to 0, this interrupt is cleared.
0	0h RO	**R_RX_UNDER (R_RX_UNDER):** Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the Initiator or Target state machines go into idle, and when ic_en goes to 0, this interrupt is cleared

21.2.12 Interrupt Mask Register (IC_INTR_MASK)—Offset 30h

These bits mask their corresponding interrupt status bits in the IC_INTR_STAT register

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 8FFh

Bit Range	Default and Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13	0h RW	**M_Initiator_ON_HOLD (M_Initiator_ON_HOLD):** This bit masks the R_MST_ON_HOLD interrupt bit in the IC_INTR_STAT register.
12	0h RO	Reserved.
11	1h RW	**M_GEN_CALL (M_GEN_CALL):** M_GEN_CALL_field
10	0h RW	**M_START_DET (M_START_DET):** M_START_DET_field
9	0h RW	**M_STOP_DET (M_STOP_DET):** M_STOP_DET_field
8	0h RW	**M_ACTIVITY (M_ACTIVITY):** M_ACTIVITY_field
7	1h RW	**M_RX_DONE (M_RX_DONE):** M_RX_DONE_field
6	1h RW	**M_TX_ABRT (M_TX_ABRT):** M_TX_ABRT_field
5	1h RW	**M_RD_REQ (M_RD_REQ):** M_RD_REQ_field
4	1h RW	**M_TX_EMPTY (M_TX_EMPTY):** M_TX_EMPTY_field
3	1h RW	**M_TX_OVER (M_TX_OVER):** M_TX_OVER_field
2	1h RW	**M_RX_FULL (M_RX_FULL):** M_RX_FULL_field
1	1h RW	**M_RX_OVER (M_RX_OVER):** M_RX_OVER_field
0	1h RW	**M_RX_UNDER (M_RX_UNDER):** M_RX_UNDER_field

21.2.13 Raw Interrupt Status (IC_RAW_INTR_STAT)—Offset 34h

Unlike the IC_INTR_STAT register, these bits are not masked so they always show the true status of the controller.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13	0h RO	**Initiator_ON_HOLD (Initiator_ON_HOLD):** Same as in reg_IC_INTR_STAT
12	0h RO	Reserved.
11	0h RO	**GEN_CALL (GEN_CALL):** Same as in reg_IC_INTR_STAT
10	0h RO	**START_DET (START_DET):** Same as in reg_IC_INTR_STAT
9	0h RO	**STOP_DET (STOP_DET):** Same as in reg_IC_INTR_STAT
8	0h RO	**RAW_INTR_ACTIVITY (RAW_INTR_ACTIVITY):** Same as in reg_IC_INTR_STAT
7	0h RO	**RX_DONE (RX_DONE):** Same as in reg_IC_INTR_STAT
6	0h RO	**TX_ABRT (TX_ABRT):** Same as in reg_IC_INTR_STAT
5	0h RO	**RD_REQ (RD_REQ):** Same as in reg_IC_INTR_STAT
4	0h RO	**TX_EMPTY (TX_EMPTY):** Same as in reg_IC_INTR_STAT
3	0h RO	**TX_OVER (TX_OVER):** Same as in reg_IC_INTR_STAT
2	0h RO	**RX_FULL (RX_FULL):** Same as in reg_IC_INTR_STAT
1	0h RO	**RX_OVER (RX_OVER):** Same as in reg_IC_INTR_STAT
0	0h RO	**RX_UNDER (RX_UNDER):** Same as in reg_IC_INTR_STAT

21.2.14 Receive FIFO Threshold (IC_RX_TL)—Offset 38h

I2C Receive FIFO Threshold Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**RX_TL (RX_TL):** Receive FIFO Threshold Level. Controls the level of entries (or above) that triggers the RX_FULL interrupt (bit 2 in IC_RAW_INTR_STAT register). The valid range is 0-0x3F. (Values > 0x3F are set to depth of the buffer). A value of 0 sets the threshold for 1 entry, and a value of 63 sets the threshold for 64 entries.

21.2.15 Transmit FIFO Threshold (IC_TX_TL)—Offset 3Ch

I2C Transmit FIFO Threshold Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**TX_TL (TX_TL):** Transmit FIFO Threshold Level Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register). The valid range is 0-255, with the additional restriction that it may not be set to value larger than the depth of the buffer. If an attempt is made to do that, the actual value set will be the maximum depth of the buffer. A value of 0 sets the threshold for 0 entries, and a value of 255 sets the threshold for 255 entries.

21.2.16 Clear Combined and Individual Interrupt (IC_CLR_INTR)—Offset 40h

Clear Combined and Individual Interrupt Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**CLR_INTR (CLR_INTR):** Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABRT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

21.2.17 Clear RX_UNDER Interrupt (IC_CLR_RX_UNDER)—Offset 44h

Clear RX_UNDER Interrupt Register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**CLR_RX_UNDER (CLR_RX_UNDER):** Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.

21.2.18 Clear RX_OVER Interrupt (IC_CLR_RX_OVER)—Offset 48h

Clear RX_OVER Interrupt Register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**CLR_RX_OVER (CLR_RX_OVER):** Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.

21.2.19 Clear TX_OVER Interrupt (IC_CLR_TX_OVER)—Offset 4Ch

Clear TX_OVER Interrupt Register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**CLR_TX_OVER (CLR_TX_OVER):** Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.

21.2.20 Clear RD_REQ Interrupt (IC_CLR_RD_REQ)—Offset 50h

Clear RD_REQ Interrupt Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**CLR_RD_REQ (CLR_RD_REQ):** Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register

21.2.21 Clear TX_ABRT Interrupt (IC_CLR_TX_ABRT)—Offset 54h

Clear TX_ABRT Interrupt Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**CLR_TX_ABRT (CLR_TX_ABRT):** Read this register to clear the TX_ABRT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABRT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO. Refer to Bit 9 of the IC_TX_ABRT_SOURCE register for an exception to clearing IC_TX_ABRT_SOURCE.

21.2.22 Clear RX_DONE Interrupt (IC_CLR_RX_DONE)—Offset 58h

Clear RX_DONE Interrupt Register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**CLR_RX_DONE (CLR_RX_DONE):** Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.

21.2.23 Clear ACTIVITY Interrupt (IC_CLR_ACTIVITY)—Offset 5Ch

Clear ACTIVITY Interrupt Register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**CLR_ACTIVITY (CLR_ACTIVITY):** Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register to get status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register

21.2.24 Clear STOP_DET Interrupt (IC_CLR_STOP_DET)—Offset 60h

Clear STOP_DET Interrupt Register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**CLR_STOP_DET (CLR_STOP_DET):** Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register

21.2.25 Clear START_DET Interrupt (IC_CLR_START_DET)—Offset 64h

Clear START_DET Interrupt Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**CLR_START_DET (CLR_START_DET):** Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.

21.2.26 Clear GEN_CALL Interrupt (IC_CLR_GEN_CALL)—Offset 68h

Clear GEN_CALL Interrupt Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**CLR_GEN_CALL (CLR_GEN_CALL):** Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register

21.2.27 I2C Enable (IC_ENABLE)—Offset 6Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1	0h RW	**ABORT (ABORT):** Software can abort I2C transfer by setting this bit. Hw will clear this ABORT bit once the STOP has been detected
0	0h RW	**ENABLE (ENABLE):** Controls whether the controller is enabled. 0: Disables I2C controller(TX and RX FIFOs are held in an erased state) 1: Enables I2C controller. Software can disable the controller while it is active. However, it is important that care be taken to ensure that the controller is disabled properly. When the controller is disabled, the following occurs: -The TX FIFO and RX FIFO get flushed. -Status bits in the IC_INTR_STAT register are still active until the controller goes into IDLE state. If the module is transmitting, it stops as well as deletes the contents of the transmit buffer after the current transfer is complete. If the module is receiving, the controller stops the current transfer at the end of the current byte and does not acknowledge the transfer.

21.2.28 I2C Status (IC_STATUS)—Offset 70h

I2C Status Register. This is a read-only register used to indicate the current transfer status and FIFO status. The status register may be read at any time. None of the bits in this register request an interrupt. When the I2C is disabled by writing 0 in bit 0 of the IC_ENABLE register: - Bits 1 and 2 are set to 1 - Bits 3 and 4 are set to 0 When the Initiator or Target state machines goes to idle and IC_ENABLE=0: - Bits 5 and 6 are set to 0

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 6h

Bit Range	Default and Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5	0h RO	**MST_ACTIVITY (MST_ACTIVITY):** When the Initiator state machine is not in the IDLE state, this bit is set. 0: Initiator is in IDLE state 1: Initiator is not in IDLE
4	0h RO	**RFF (RFF):** When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared. 0: Receive FIFO is not full 1: Receive FIFO is full
3	0h RO	**RFNE (RFNE):** This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty. 0: Receive FIFO is empty 1: Receive FIFO is not empty
2	1h RO	**TFE (TFE):** When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. 0: Transmit FIFO is not empty 1: Transmit FIFO is empty
1	1h RO	**TFNF (TFNF):** Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. 0: Transmit FIFO is full 1: Transmit FIFO is not full
0	0h RO	**IC_STATUS_ACTIVITY (IC_STATUS_ACTIVITY):** I2C Activity Status

21.2.29 I2C Transmit FIFO Level (IC_TXFLR)—Offset 74h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:7	0h RO	Reserved.
6:0	0h RO	**TXFLR (TXFLR):** Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO

21.2.30 Receive FIFO Level (IC_RXFLR)—Offset 78h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:7	0h RO	Reserved.
6:0	0h RO	**RXFLR (RXFLR):** Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.

21.2.31 SDA Hold Time Length (IC_SDA_HOLD)—Offset 7Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	1h RW	**IC_SDA_TX_HOLD (IC_SDA_TX_HOLD):** Sets the required SDA hold time in units of ic_clk period (133Mhz), when the I2C Host Controller acts as a transmitter.

21.2.32 Transmit Abort Source (IC_TX_ABRT_SOURCE)—Offset 80h

This register has 32 bits that indicate the source of the TX_ABRT bit. Except for Bit 9, this register is cleared whenever the IC_CLR_TX_ABRT register or the IC_CLR_INTR register is read. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; RESTART must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]).
Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, Bit 9 clears for one cycle and is then re-asserted.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:23	0h RO	**TX_FLUSH_CNT (TX_FLUSH_CNT):** This field preserves the TXFLR value prior to the last TX_ABRT event. It is cleared whenever I2C is disabled. Mode Applicable:Initiator-Transmitter
22:17	0h RO	Reserved.
16	0h RO	**ABRT_USER_ABRT (ABRT_USER_ABRT):** This is a Initiator-mode-only bit. Initiator has detected the user initiated transfer abort (IC_ENABLE[1]) Mode Applicable:Initiator-Transmitter
15	0h RO	**ABRT_SLVRD_INTX (ABRT_SLVRD_INTX):** 1: When the processor side responds to a Target mode request for data to be transmitted to a remote Initiator and user writes a 1 in CMD (bit 8) of IC_DATA_CMD register. Mode Applicable: Target Transmitter 14 RO 1'h0
14:13	0h RO	Reserved.
12	0h RO	**ARB_LOST (ARB_LOST):** 1: Initiator has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the Target transmitter has lost arbitration. Mode Applicable: Initiator or Target Transmitter
11	0h RO	**ABRT_Initiator_DIS (ABRT_Initiator_DIS):** 1: User tries to initiate a Initiator operation with the Initiator mode disabled. Mode Applicable: Initiator Transmitter or Receiver
10	0h RO	**ABRT_10B_RD_NORSTRT (ABRT_10B_RD_NORSTRT):** 1: The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the Initiator sends a read command in 10-bit addressing mode. Mode Applicable: Initiator Receiver
9	0h RO	**ABRT_SBYTE_NORSTRT (ABRT_SBYTE_NORSTRT):** 1: The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the user is trying to send a START Byte. To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; restart must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]). Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, bit 9 clears for one cycle and then gets re-asserted.
8	0h RO	**ABRT_HS_NORSTRT (ABRT_HS_NORSTRT):** 1: The restart is disabled (IC_RESTART_EN bit (IC_CON[5]) = 0) and the user is trying to use the Initiator to transfer data in High Speed mode. Mode Applicable: Initiator Transmitter or Receiver
7	0h RO	**ABRT_SBYTE_ACKDET (ABRT_SBYTE_ACKDET):** 1: Initiator has sent a START Byte and the START Byte was acknowledged (wrong behavior). Mode Applicable: Initiator
6	0h RO	**ABRT_HS_ACKDET (ABRT_HS_ACKDET):** 1: Initiator is in High Speed mode and the High Speed Initiator code was acknowledged (wrong behavior). Mode Applicable: Initiator
5	0h RO	**ABRT_GCALL_READ (ABRT_GCALL_READ):** 1: Controller in Initiator mode sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1).
4	0h RO	**ABRT_GCALL_NOACK (ABRT_GCALL_NOACK):** 1: DW_apb_i2c in Initiator mode sent a General Call and no Target on the bus acknowledged the General Call. Mode Applicable: Initiator Transmitter
3	0h RO	**ABRT_TXDATA_NOACK (ABRT_TXDATA_NOACK):** 1: This is a Initiator-mode only bit. Initiator has received an acknowledgment for the address, but when it sent data byte(s) following the address, it did not receive an acknowledge from the remote Target(s). Mode Applicable: Initiator Transmitter
2	0h RO	**ABRT_10ADDR2_NOACK (ABRT_10ADDR2_NOACK):** 1: Initiator is in 10-bit address mode and the second address byte of the 10-bit address was not acknowledged by any Target. Mode Applicable: Initiator Transmitter or Receiver
1	0h RO	**ABRT_10ADDR1_NOACK (ABRT_10ADDR1_NOACK):** 1: Initiator is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any Target. Mode Applicable: Initiator Transmitter or Receiver
0	0h RO	**ABRT_7B_ADDR_NOACK (ABRT_7B_ADDR_NOACK):** 1: Initiator is in 7-bit addressing mode and the address sent was not acknowledged by any Target. Mode Applicable: Initiator Transmitter or Receiver

21.2.33 DMA Control (IC_DMA_CR)—Offset 88h

This register is only valid when the controller is configured with a set of DMA Controller interface signals.
When the controller is not configured for DMA operation, this register does not exist and writing to the register's address has no effect and reading from this register address will return zero.
The register is used to enable the DMA Controller interface operation. There is a separate bit for transmit and receive. This can be programmed regardless of the state of IC_ENABLE.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1	0h RW	**TDMAE (TDMAE):** Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel. 0 = Transmit DMA disabled 1 = Transmit DMA enabled
0	0h RW	**RDMAE (RDMAE):** Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel. 0 = Receive DMA disabled 1 = Receive DMA enabled

21.2.34 DMA Transmit Data Level (IC_DMA_TDLR)—Offset 8Ch

DMA Transmit Data Level Register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5:0	0h RW	**DMATDL (DMATDL):** Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE = 1.

21.2.35 Receive Data Level (IC_DMA_RDLR)—Offset 90h

I2C Receive Data Level Register

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5:0	0h RW	**DMARDL (DMARDL):** Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level = DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1. For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.

21.2.36 ACK General Call (IC_ACK_GENERAL_CALL)—Offset 98h

I2C ACK General Call Register. The register controls whether DW_apb_i2c responds with a ACK or NACK when it receives an I2C General Call address

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	1h RW	**ACK_GEN_CALL (ACK_GEN_CALL):** When set to 1, the controller responds with a ACK when it receives a General Call. When set to 0, the controller does not generate General Call interrupts.

21.2.37 I2C Enable Status (IC_ENABLE_STATUS)—Offset 9Ch

The register is used to report the hardware status when the IC_ENABLE register is set from 1 to 0; that is, when the controller is disabled.
If IC_ENABLE has been set to 1, bits 2:1 are forced to 0, and bit 0 is forced to 1.
If IC_ENABLE has been set to 0, bits 2:1 is only be valid as soon as bit 0 is read as '0'.
When IC_ENABLE has been written with '0,' a delay occurs for bit 0 to be read as '0' because disabling the controller depends on I2C bus activities.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**IC_EN (IC_EN):** When read as 1, the controller is deemed to be in an enabled state. When read as 0, the controller is deemed completely inactive.

21.2.38 SS and FS Spike Suppression Limit (IC_FS_SPKLEN)—Offset A0h

This register is used to store the duration, measured in ic_clk cycles, of the longest spike that is filtered out by the spike suppression logic when the component is operating in SS or FS modes.
The relevant I2C requirement is tSP as detailed in the I2C Bus Specification. This register must be programmed with a minimum value of 1.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 7h

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	7h RW	**IC_FS_SPKLEN (IC_FS_SPKLEN):** This register must be set before any I2C bus transaction can take place to ensure stable operation. This register sets the duration, measured in ic_clk cycles, of the longest spike in the SCL or SDA lines that are filtered out by the spike suppression logic; for more information, refer to Spike Suppression. This register can be written only when the I2C interface is disabled, which corresponds to the IC_ENABLE register being set to 0. Writes at other times have no effect. The minimum valid value is 1; hardware prevents values less than this being written, and if attempted results in 2 being set.

21.3 I2C Additional Registers

The registers in this section are memory-mapped registers based on the BAR defined in PCH Configuration space.

Table 21-3. Summary of I2C Additional Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
204h	207h	Soft Reset (RESETS)—Offset 204h	0h
210h	213h	Active LTR (ACTIVELTR_VALUE)—Offset 210h	800h
214h	217h	Idle LTR (IDLELTR_VALUE)—Offset 214h	800h
218h	21Bh	TX ACK Count (TX_ACK_COUNT)—Offset 218h	0h

Table 21-3. Summary of I2C Additional Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
21Ch	21Fh	RX ACK Count (RX_BYTE_COUNT)—Offset 21Ch	0h
220h	223h	Interrupt Status for Tx Complete (TX_COMPLETE_INTR_STAT)—Offset 220h	0h
224h	227h	Tx Complete Interrupt Clear (TX_COMPLETE_INTR_CLR)—Offset 224h	0h
228h	22Bh	SW Scratch Register 0 (SW_SCRATCH_0)—Offset 228h	0h
22Ch	22Fh	SW Scratch Register 1 (SW_SCRATCH_1)—Offset 22Ch	0h
230h	233h	SW Scratch Register 2 (SW_SCRATCH_2)—Offset 230h	0h
234h	237h	SW Scratch Register 3 (SW_SCRATCH_3)—Offset 234h	0h
238h	23Bh	Clock Gate (CLOCK_GATE)—Offset 238h	0h
240h	243h	Remap Address Low (REMAP_ADDR_LO)—Offset 240h	0h
244h	247h	Remap Address High (REMAP_ADDR_HI)—Offset 244h	0h
24Ch	24Fh	Device Idle Control (DEVIDLE_CONTROL)—Offset 24Ch	8h
2FCh	2FFh	Capabilities (CAPABLITIES)—Offset 2FCh	0h

21.3.1 Soft Reset (RESETS)—Offset 204h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RO	Reserved.
2	0h RW	**reset_dma (reset_dma):** DMA Software Reset Control. 0 = IP is in reset (Reset Asserted) 1 = IP is NOT at reset (Reset Released)
1:0	0h RW	**reset_ip (reset_ip):** Used to reset the I2C Host Controller by SW control. All I2C Configuration State and Operational State will be forced to the Default state. There is no timing requirement (SW can assert and de-assert in back to back transactions). This reset does NOT impact the settings by BIOS, the PCI configuration header information, DMA channel configuration and interrupt assignment/mapping/etc. Driver should re-initialize registers related to Driver context following an I2C host controller reset. 00 = I2C Host Controller is in reset (Reset Asserted) 01 = Reserved 10 = Reserved 11 = I2C Host Controller is NOT at reset (Reset Released)

21.3.2 Active LTR (ACTIVELTR_VALUE)—Offset 210h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 800h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**Snoop Requirement (snoop_requirment):** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10 -bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time
14:13	0h RO	Reserved.
12:10	2h RW	**i2c_sw_ltr_snoop_scale_reg_12_10 (i2c_sw_ltr_snoop_scale_reg_12_10):** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -> 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**Snoop Value (snoop_value):** 10-bit latency value

21.3.3 Idle LTR (IDLELTR_VALUE)—Offset 214h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 800h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW	**snoop_requirement (snoop_requirment):** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10 -bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time
14:13	0h RO	Reserved.
12:10	2h RW	**snoop_latency_scale (snoop_latency_scale):** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -> 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**snoop_value (snoop_value):** 10-bit latency value.

21.3.4 TX ACK Count (TX_ACK_COUNT)—Offset 218h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	**TX Count Overflow (tx_ack_count_overflow):** Count overflow indication. 0= Count valid 1= Count overflow/invalid
30:24	0h RO	Reserved.
23:0	0h RO	**TX Ack Count (tx_ack_count):** Count ACK seen on Write commands, 24-bit up-counter which counts the number of TX ACKs on the I2C bus. The Counter is forced to be cleared by software Read.

21.3.5 RX ACK Count (RX_BYTE_COUNT)—Offset 21Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	**RX ACK Count Overflow (rx_ack_count_overflow):** Rx ACK count overflow 0= count valid 1= count overflow/invalid
30:24	0h RO	Reserved.
23:0	0h RO	**RX ACK Count (rx_ack_count):** Counts ACK seen on Read commands, 24-bit readable (MMIO) up-counter which counts the number of RX bytes received on the I2C bus. The Counter is forced to be cleared by software Read

21.3.6 Interrupt Status for Tx Complete (TX_COMPLETE_INTR_STAT)—Offset 220h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1	0h RW	**TX Completion Interrupt Mask (tx_intr_stat_mask):** 0 = Unmask 1= Mask
0	0h RO	**TX Completion Interrupt (tx_intr_stat):** 0 = Low 1 = High

21.3.7 Tx Complete Interrupt Clear (TX_COMPLETE_INTR_CLR)—Offset 224h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RO	**TX Completion Interrupt Clear (i2c_tx_complete_intr_clr_0):** Read this register to clear the TX_COMPLETE_INTR_STAT register

21.3.8 SW Scratch Register 0 (SW_SCRATCH_0)—Offset 228h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**SW Scratch 0 (SW_Scratch_0):** Scratch Pad Register for SW to generated Local CMD or DATA for DMA.

21.3.9 SW Scratch Register 1 (SW_SCRATCH_1)—Offset 22Ch

Same definition as SW_SCRATCH_0.

21.3.10 SW Scratch Register 2 (SW_SCRATCH_2)—Offset 230h

Same definition as SW_SCRATCH_0.

21.3.11 SW Scratch Register 3 (SW_SCRATCH_3)—Offset 234h

Same definition as SW_SCRATCH_0.

21.3.12 Clock Gate (CLOCK_GATE)—Offset 238h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:2	0h RW	**DMA Clock Control (sw_dma_clk_ctl):** 00 = Dyanamic Clock Gate Enable 01 = Reserved 10 = Force iDMA Clock off 11 = Force iDMA Clock on
1:0	0h RW	**Controller Clock Control (sw_ip_clk_ctl):** 00 = Dynamic Clock Gate Enable 01 = Reserved 10 = Force Clocks off 11 = Force Clocks on

21.3.13 Remap Address Low (REMAP_ADDR_LO)—Offset 240h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Remap Address Low (i2c_remap_addr_lo_reg):** Must be programmed to the same value as low 32 bits (0x 010 BAR Low) Note: Must be programed for all I2C controllers configurations (DMA or PIO only)

21.3.14 Remap Address High (REMAP_ADDR_HI)—Offset 244h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Remap Address High (i2c_remap_addr_hi):** Must be programmed to the same value as low 32 bits (0x 014 BAR High)

21.3.15 Device Idle Control (DEVIDLE_CONTROL)—Offset 24Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 8h

Bit Range	Default and Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4	0h RO	**Interrupt Request Capable (intr_req_capable):** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0.
3	1h RW/1C	**Restore Required (restore_required):** When set (by HW), SW must restore state to the controller. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up. Note: If SW is setting bit 3 together with any other bit of this register, only bit 3 is written; SW is required to do 2 writes in this case : bit 3 first and all other bits second.
2	0h RW	**Device Idle (devidle):** SW sets this bit to 1 to move the function into the DevIdle state. Writing this bit to 0 will return the function to the fully active D0 state.
1	0h RO	Reserved.
0	0h RO	**Command In Progress (cmd_in_progress):** HW sets this bit on a 1->0 or 0->1 transition of DEVIDLE. While set, the other bits in this register are not valid and it is unsupported for SW to write to any bit in this register. HW clears this bit upon completing the DevIdle transition command. When clear, all the other bits in the register are valid and SW may write to any bit. If Interrupt Request (IR) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to the HW. SW writes to this bit have no effect.

21.3.16 Capabilities (CAPABLITIES)—Offset 2FCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9	0h RO	**Serial Clock Frequency (serial_clk_freq):** 1 indicates 133 MHz clock.
8	0h RO	**DMA Present (iDMA_present):** 0= DMA present 1= DMA not present
7:4	0h RO	**Instance Type (instance_type):** 0000 = I2C 0001 = UART 0010 = SPI 0011 – 1111 = Reserved
3:0	0h RO	**instance_number (instance_number):** 0h: I2C0 1h: I2C1 2h: I2C2 ... 5h: I2C5

21.4 I2C DMA Controller Registers

The registers in this section are memory-mapped registers based on the BAR defined in PCH Configuration space.

Table 21-4. Summary of I2C DMA Controller Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
800h	803h	DMA Transfer Source Address Low (SAR_LO0)—Offset 800h	0h
804h	807h	DMA Transfer Source Address High (SAR_HI0)—Offset 804h	0h
808h	80Bh	DMA Transfer Destination Address Low (DAR_LO0)—Offset 808h	0h
80Ch	80Fh	DMA Transfer Destination Address High (DAR_HI0)—Offset 80Ch	0h
810h	813h	Linked List Pointer Low (LLP_LO0)—Offset 810h	0h
814h	817h	Linked List Pointer High (LLP_HI0)—Offset 814h	0h
818h	81Bh	Control Register Low (CTL_LO0)—Offset 818h	0h
81Ch	81Fh	Control Register High (CTL_HI0)—Offset 81Ch	0h
820h	823h	Source Status (SSTAT0)—Offset 820h	0h
828h	82Bh	Destination Status (DSTAT0)—Offset 828h	0h
830h	833h	Source Status Address Low (SSTATAR_LO0)—Offset 830h	0h
834h	837h	Source Status Address High (SSTATAR_HI0)—Offset 834h	0h
838h	83Bh	Destination Status Address Low (DSTATAR_LO0)—Offset 838h	0h
83Ch	83Fh	Destination Status Address High (DSTATAR_HI0)—Offset 83Ch	0h
840h	843h	DMA Transfer Configuration Low (CFG_LO0)—Offset 840h	203h
844h	847h	DMA Transfer Configuration High (CFG_HI0)—Offset 844h	0h
848h	84Bh	Source Gather (SGR0)—Offset 848h	0h
850h	853h	Destination Scatter (DSR0)—Offset 850h	0h
AC0h	AC3h	Raw Interrupt Status (RawTfr)—Offset AC0h	0h

Table 21-4. Summary of I2C DMA Controller Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
AC8h	ACBh	Raw Status for Block Interrupts (RawBlock)—Offset AC8h	0h
AD0h	AD3h	Raw Status for Source Transaction Interrupts (RawSrcTran)—Offset AD0h	0h
AD8h	ADBh	Raw Status for Destination Transaction Interrupts (RawDstTran)—Offset AD8h	0h
AE0h	AE3h	Raw Status for Error Interrupts (RawErr)—Offset AE0h	0h
AE8h	AEBh	Status for Transfer Interrupts (StatusTfr)—Offset AE8h	0h
AF0h	AF3h	Status for Block Interrupts (StatusBlock)—Offset AF0h	0h
AF8h	AFBh	Status for Source Transaction Interrupts (StatusSrcTran)—Offset AF8h	0h
B00h	B03h	Status for Destination Transaction Interrupts (StatusDstTran)—Offset B00h	0h
B08h	B0Bh	Status for Error Interrupts (StatusErr)—Offset B08h	0h
B10h	B13h	Mask for Transfer Interrupts (MaskTfr)—Offset B10h	0h
B18h	B1Bh	Mask for Block Interrupts (MaskBlock)—Offset B18h	0h
B20h	B23h	Mask for Source Transaction Interrupts (MaskSrcTran)—Offset B20h	0h
B28h	B2Bh	Mask for Destination Transaction Interrupts (MaskDstTran)—Offset B28h	0h
B30h	B33h	Mask for Error Interrupts (MaskErr)—Offset B30h	0h
B38h	B3Bh	Clear for Transfer Interrupts (ClearTfr)—Offset B38h	0h
B40h	B43h	Clear for Block Interrupts (ClearBlock)—Offset B40h	0h
B48h	B4Bh	Clear for Source Transaction Interrupts (ClearSrcTran)—Offset B48h	0h
B50h	B53h	Clear for Destination Transaction Interrupts (ClearDstTran)—Offset B50h	0h
B58h	B5Bh	Clear for Error Interrupts (ClearErr)—Offset B58h	0h
B60h	B63h	Combined Status (StatusInt)—Offset B60h	0h
B98h	B9Bh	DMA Configuration (DmaCfgReg)—Offset B98h	0h
BA0h	BA3h	DMA Channel Enable (ChEnReg)—Offset BA0h	0h

21.4.1 DMA Transfer Source Address Low (SAR_LO0)—Offset 800h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer. Source Address Register for lowe 32-bits for Channels 0-1

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**SAR_LO (SAR_LO):** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported.

21.4.2 DMA Transfer Source Address High (SAR_HI0)—Offset 804h

The starting source address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the source address of the current transfer. Source Address Register for upper 32-bits for Channels 0-1

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**SAR_HI (SAR_HI):** Current Source Address of DMA transfer. Updated after each source transfer. The SINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every source transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated source transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Read Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Read address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA read was a burst read (i.e. burst length > 1), the read-back value reflects the first address of the burst read since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA read progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported.

21.4.3 DMA Transfer Destination Address Low (DAR_LO0)—Offset 808h

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer.Destination Address Register for Channels 0-1

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**DAR_LO (DAR_LO):** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported.

21.4.4 DMA Transfer Destination Address High (DAR_HI0)—Offset 80Ch

The starting destination address is programmed by software before the DMA channel is enabled, or by an LLI update before the start of the DMA transfer. While the DMA transfer is in progress, this register is updated to reflect the destination address of the current transfer. Destination Address Register for Upper 32-bits for Channels 0-1

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**DAR_HI (DAR_HI):** Current Destination Address of DMA transfer. Updated after each destination transfer. The DINC field in the CTL_LO[n]: Control Register determines whether the address increments or is left unchanged on every destination transfer throughout the block transfer. When the channel is enabled (i.e. CH_EN is 1), the read back value will reflect the updated destination transfer addresses. However, when the channel is disabled, the original programmed value will be reflected when reading this register. It's important to notice the following: 1. Once the block transfer is in progress (i.e. when channel is enabled), the read-back value correlates with the OCP Write Address that one would see in an OCP tracker. 2. If the read to this register comes during a block transfer, the LAST DMA Write address sent on the OCP before the register read is what's reflected in the read-back value. 3. If the last DMA write was a burst write (i.e. burst length > 1), the read-back value reflects the first address of the burst write since this is what gets sent on the OCP fabric. 4. If the read to the register occurred after the whole block got transferred, then the channel gets disabled and the returned value would be the original programmed value. 5. Since the read-back value is OCP based, only DW aligned addresses will be reflected (i.e. OCP Byte-Enable values would not be reflected) 6. Based on the above remarks, this value should be used as pseudo DMA write progress indicator when the channel is enabled and not an absolute one. Decrementing addresses are not supported.

21.4.5 Linked List Pointer Low (LLP_LO0)—Offset 810h

The register needs to be programmed to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**LOC (LOC):** Starting Address In Memory of next LLI if block chaining is enabled. Note that the two LSBs of the starting address are not stored because the address is assumed to be aligned to a 32-bit boundary. LLI accesses are always 32-bit accesses and cannot be changed or programmed to anything other than 32-bit.
1:0	0h RO	Reserved.

21.4.6 Linked List Pointer High (LLP_HI0)—Offset 814h

The register needs to be programmed to point to the first Linked List Item (LLI) in memory prior to enabling the channel if block chaining is enabled.

21.4.7 Control Register Low (CTL_LO0)—Offset 818h

This register contains fields that control the DMA transfer.The CTL_LO register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28	0h RW	**LLP_SRC_EN (LLP_SRC_EN):** Block chaining is enabled on the source side only if the LLP_SRC_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
27	0h RW	**LLP_DST_EN (LLP_DST_EN):** Block chaining is enabled on the destination side only if the LLP_DST_EN field is high and LLPn.LOC is non-zero and (LLP_EN == 1)
26:22	0h RO	Reserved.
21:20	0h RW	**TT_FC (TT_FC):** The following transfer types are supported. 00: Reserved 01: Memory to Peripheral 10: Peripheral to Memory 11: Reserved Flow Control is always assigned to the DMA.
19	0h RO	Reserved.
18	0h RW	**DST_SCATTER_EN (DST_SCATTER_EN):** 0 = Scatter disabled 1 = Scatter enabled Scatter on the destination side is applicable only when the CTL_LOn.DINC bit indicates an incrementing address control.
17	0h RW	**SRC_GATHER_EN (SRC_GATHER_EN):** 0 = Gather disabled 1 = Gather enabled Gather on the source side is applicable only when the CTL_LOn.SINC bit indicates an incrementing address control.
16:14	0h RW	**SRC_MSIZE (SRC_MSIZE):** Number of data items, each of width CTL_LOn.SRC_TR_WIDTH, to be read from the source. Source BURST SIZE (in DW) = (2 ^ SRC_TR_WIDTH)
13:11	0h RW	**DEST_MSIZE (DEST_MSIZE):** Destination Burst Transaction Length. Number of data items, each of width CTL_LOn.DST_TR_WIDTH, to be written to the destination.
10	0h RW	**SINC (SINC):** Source Address Increment. Indicates whether to increment or decrement the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No Change)
9	0h RO	Reserved.
8	0h RW	**DINC (DINC):** Destination Address Increment. Indicates whether to increment or decrement the destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to No change. 0 = Increment 1 = Fixed (No change)

Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	Reserved.
6:4	0h RW	**SRC_TR_WIDTH (SRC_TR_WIDTH):** BURST_SIZE (IN DW) = (2^ MSIZE) (i.e. 2 to-the-power-of MSIZE) 1.Transferred Bytes Per Burst = BURST_SIZE * (2 ^ TR_WIDTH) Note that encodings 101 (32 DW), 110 (64 DW) and 111 (128 DW) are not supported. 2.For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported.
3:1	0h RW	**DST_TR_WIDTH (DST_TR_WIDTH):** BURST SIZE (in DW) = (2^ MSIZE) (i.e. 2 to-the-power-of MSIZE) Transferred Bytes Per Burst = BURST_SIZE * (2 ^ TR_WIDTH) Since Max Burst Length is limited to 16 DW, encodings 101 (32 DW), 110 (64 DW) and 111 (128 DW) are not supported. For incrementing addresses and (Transfer_Width < 4 Bytes), the MSIZE parameter is ignored since only single transactions are supported.
0	0h RW	**INT_EN (INT_EN):** Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled.

21.4.8 Control Register High (CTL_HI0)—Offset 81Ch

This register contains fields that control the DMA transfer. The CTL_HI register is part of the block descriptor (linked list item - LLI) when block chaining is enabled. It can be varied on a block-by-block basis within a DMA transfer when block chaining is enabled.If status write-back is enabled, CTL_HI is written to then control registers location of the LLI in system memory at the end of the block transfer.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:29	0h RW	**CH_CLASS (CH_CLASS):** Channel Class. A Class of (N_CHNLS-1) is the highest priority, and 0 is the lowest. This field must be programmed within 0 to (N_CHNLS-1). A programmed value outside this range will cause erroneous behavior.
28:18	0h NA	**RESERVED (RESERVED0):** Reserved
17	0h RW	**DONE (DONE):** If status write-back is enabled, the upper word of the control register, CTL_HIn, is written to the control register location of the Linked List Item (LLI) in system memory at the end of the block transfer with the done bit set. Software can poll the LLI CTL_HI.DONE bit to see when a block transfer is complete. The LLI CTL_HI.DONE bit should be cleared when the linked lists are set up in memory prior to enabling the channel. The DMA will not transfer the block if the DONE bit in the LLI is not cleared.
16:0	0h RW	**BLOCK_TS (BLOCK_TS):** Block Transfer Size (in Bytes). Since the DMA is always the flow controller, the user needs to write this field before the channel is enabled in order to indicate the block size. The number programmed into BLOCK_TS indicates the total number of bytes to transfer for every block transfer. Once the transfer starts (i.e. channel is enabled), the read-back value is the total number of bytes for which Read Commands have already been sent to the source. It doesnt mean Bytes that are already in the FIFO. However, when the channel is disabled, the original programmed value will be reflected when reading this register.

21.4.9 Source Status (SSTAT0)—Offset 820h

After each block transfer completes, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register. This status information is then stored in the SSTATx register and written out to the SSTATx register location of the LLI before the start of the next block

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**SSTAT (SSTAT):** Source status information retrieved by hardware from the address pointed to by the contents of the Source Status Address Register. This register is a temporary placeholder for the source status information on its way to the SSTATn register location of the LLI. The source status information should be retrieved by software from the SSTATn register location of the LLI, and not by a read of this register over the DMA Target interface.

21.4.10 Destination Status (DSTAT0)—Offset 828h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register. This status information is then stored in the DSTATx register and written out to the DSTATx register location of the LLI. Note: This register is a temporary placeholder for the destination status information on its way to the DSTATx register location of the LLI. The destination status information should be retrieved by software from the DSTATx register location of the LLI and not by a read of this register over the DMA Target interface.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**DSTAT (DSTAT):** Destination status information retrieved by hardware from the address pointed to by the contents of the Destination Status Address Register. This register is a temporary placeholder for the destination status information on its way to the DSTATn register location of the LLI. The destination status information should be retrieved by software from the DSTATn register location of the LLI and not by a read of this register over the DMA Target interface

21.4.11 Source Status Address Low (SSTATAR_LO0)—Offset 830h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx registe

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**SSTATAR_LO (SSTATAR_LO):** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block

21.4.12 Source Status Address High (SSTATAR_HI0)—Offset 834h

After the completion of each block transfer, hardware can retrieve the source status information from the address pointed to by the contents of the SSTATARx register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**SSTATAR_HI (SSTATAR_HI):** Pointer from where hardware can fetch the source status information, which is registered in the SSTATn register and written out to the SSTATn register location of the LLI before the start of the next block

21.4.13 Destination Status Address Low (DSTATAR_LO0)—Offset 838h

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**DSTATAR_LO (DSTATAR_LO):** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

21.4.14 Destination Status Address High (DSTATAR_HI0)—Offset 83Ch

After the completion of each block transfer, hardware can retrieve the destination status information from the address pointed to by the contents of the DSTATARx register.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**DSTATAR_HI (DSTATAR_HI):** Pointer from where hardware can fetch the destination status information, which is registered in the DSTATn register and written out to the DSTATn register location of the LLI before the start of the next block.

21.4.15 DMA Transfer Configuration Low (CFG_LO0)—Offset 840h

This register contains fields that configure the DMA transfer. The channel configuration register remains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 203h

Bit Range	Default and Access	Field Name (ID): Description
31	0h RW	**RELOAD_DST (RELOAD_DST):** Automatic Destination Reload. The DARn register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated
30	0h RW	**RELOAD_SRC (RELOAD_SRC):** Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated.
29:22	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
21	0h RW	**SRC_OPT_BL (SRC_OPT_BL):** 0 = Writes will use only BL=1 or BL=(2 ^ SRC_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ SRC_MSIZE))
20	0h RW	**DST_OPT_BL (DST_OPT_BL):** 0 = Writes will use only BL=1 or BL=(2 ^ DST_MSIZE) 1 = Writes will use (1 (= BL (= (2 ^ DST_MSIZE))
19	0h RW	**SRC_HS_POL (SRC_HS_POL):** 0 = Active high 1 = Active low
18	0h RW	**DST_HS_POL (DST_HS_POL):** 0 = Active high 1 = Active low
17:11	0h RO	Reserved.
10	0h RW	**CH_DRAIN (CH_DRAIN):** Forces channel FIFO to drain while in suspension. This bit has effect only when CH_SUSPEND ia asserted
9	1h RO	**FIFO_EMPTY (FIFO_EMPTY):** Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1 = Channel FIFO empty 0 = Channel FIFO not empty
8	0h RW	**CH_SUSP (CH_SUSP):** Suspends all DMA data transfers from the source until this bit is cleared. There is no guarantee that the current transaction will complete. Can also be used in conjunction with CFGx.FIFO_EMPTY to cleanly disable a channel without losing any data. 0 = Not suspended. 1 = Suspend DMA transfer from the source.
7	0h RW	**SS_UPD_EN (SS_UPD_EN):** Source Status Update Enable. Source status information is fetched only from the location pointed to by the SSTATARn register, stored in the SSTATn register and written out to the SSTATn location of the LLI if SS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0
6	0h RW	**DS_UPD_EN (DS_UPD_EN):** Destination Status Update Enable. Destination status information is fetched only from the location pointed to by the DSTATARn register, stored in the DSTATn register and written out to the DSTATn location of the LLI if DS_UPD_EN is high. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
5	0h RW	**CTL_HI_UPD_EN (CTL_HI_UPD_EN):** If set, the CTL_HI register is written out to the CTL_HIn location of the LLI. This bit is ignored if (LLP_EN == 0) or (LLP_WB_EN == 0)
4	0h RO	Reserved.
3	0h RW	**HSHAKE_NP_WR (HSHAKE_NP_WR):** 0x1 : Issues Non-Posted writes on HW-Handshake on DMA Write Port. 0x0 : Issues Posted writes on HW-Handshake on DMA Write Port (Except end-ofblock writes which will be Non-Posted)
2	0h RW	**ALL_NP_WR (ALL_NP_WR):** 0x1 : Forces ALL writes to be Non-Posted on DMA Write Port. 0x0 : Non-Posted Writes will only be used at end of block transfers and in HW Handshake (if HW_NP_WR=1); for all other cases, Posted Writes will be used
1	1h RW	**SRC_BURST_ALIGN (SRC_BURST_ALIGN):** 0x1 : SRC Burst Transfers are broken at a Burst Length aligned boundary. 0x0 : SRC Burst Transfers are not broken at a Burst Length aligned boundary.
0	1h RW	**DST_BURST_ALIGN (DST_BURST_ALIGN):** 0x1 : DST Burst Transfers are broken at a Burst Length aligned boundary. 0x0 : DST Burst Transfers are not broken at a Burst Length aligned boundary

21.4.16 DMA Transfer Configuration High (CFG_HI0)—Offset 844h

This register contains fields that configure the DMA transfer. The channel configuration registerremains fixed for all blocks of a multi-block transfer. This Register should be programmed to enabling the channel

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:18	0h RW	**WR_ISSUE_THD (WR_ISSUE_THD):** Write Issue Threshold. Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Write burst size = (2 ^ DST_MSIZE)*TW.
17:8	0h RW	**RD_ISSUE_THD (RD_ISSUE_THD):** Read Issue Threshold. Value ranges from 0 to (2^10-1 = 1023) but should not exceed maximum Read burst size = (2 ^ SRC_MSIZE)*TW.
7:4	0h RW	**DST_PER (DST_PER):** Destination Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the destination of channel n. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface.
3:0	0h RW	**SRC_PER (SRC_PER):** Source Peripheral ID : Assigns a hardware handshaking interface (0 - 15) to the source of channel n. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface.

21.4.17 Source Gather (SGR0)—Offset 848h

The Source Gather register contains two fields: Source gather count field (SGRx.SGC). Specifies the number of contiguous source transfers of CTLx.SRC_TR_WIDTH between successive gather intervals. This is defined as a gather boundary. Source gather interval field (SGRx.SGI). Specifies the source address increment/decrement in multiples of CTLx.SRC_TR_WIDTH on a gather boundary when gather mode is enabled for the source transfer. The CTLx.SINC field controls whether the address increments or decrements. When the CTLx.SINC field indicates a fixed-address control, then the address remains constant throughout the transfer and the SGRx register is ignored.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RW	**SGC (SGC):** Source gather count. Source contiguous transfer count between successive gather boundaries.
19:0	0h RW	**SGI (SGI)**

21.4.18 Destination Scatter (DSR0)—Offset 850h

The Destination Scatter register contains two fields: Destination scatter count field (DSRx.DSC) . Specifies the number of contiguous destination transfers of CTLx.DST_TR_WIDTH between successive scatter boundaries. Destination scatter interval field (DSRx.DSI) . Specifies the destination address increment/decrement in multiples of CTLx.DST_TR_WIDTH on a scatter boundary when scatter mode is enabled for the destination transfer. The CTLx.DINC field controls whether the address increments or decrements. When the CTLx.DINC field indicates a fixed address control, then the address remains constant throughout the transfer and the DSRx register is ignored.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RW	**DSC (DSC):** Destination scatter count. Destination contiguous transfer count between successive scatter boundaries
19:0	0h RW	**DSI (DSI)**

21.4.19 Raw Interrupt Status (RawTfr)—Offset AC0h

Interrupt events are stored in these Raw Interrupt Status registers before masking: RawBlock, RawDstTran, RawErr, RawSrcTran, and RawTfr. Each Raw Interrupt Status register has a bit allocated per channel, for example, RawTfr(2) is the Channel 2 raw transfer complete interrupt. Each bit in these registers is cleared by writing a 1 to the corresponding location in the ClearTfr, ClearBlock, ClearSrcTran, ClearDstTran, ClearErr registers

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h RO	**RAW (RAW):** Bit0 for channel 0 and bit 1 for channel 1.

21.4.20 Raw Status for Block Interrupts (RawBlock)—Offset AC8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h RO	**RAW (RAW):** Bit 0 for channel 0 and bit 1 for channel 1.

21.4.21 Raw Status for Source Transaction Interrupts (RawSrcTran)—Offset AD0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h RO	**RAW (RAW):** Bit 0 for channel 0 and bit 1 for channel 1.

21.4.22 Raw Status for Destination Transaction Interrupts (RawDstTran)—Offset AD8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h RO	**RAW (RAW):** Bit 0 for channel 0 and bit 1 for channel 1.

21.4.23 Raw Status for Error Interrupts (RawErr)—Offset AE0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h RO	**RAW (RAW):** Bit 0 for channel 0 and bit 1 for channel 1.

21.4.24 Status for Transfer Interrupts (StatusTfr)—Offset AE8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h RO	**STATUS (STATUS):** Bit 0 for channel 0 and bit 1 for channel 1.

21.4.25 Status for Block Interrupts (StatusBlock)—Offset AF0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h RO	**STATUS (STATUS):** Bit 0 for channel 0 and bit 1 for channel 1.

21.4.26 Status for Source Transaction Interrupts (StatusSrcTran)—Offset AF8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h RO	**STATUS (STATUS):** Bit 0 for channel 0 and bit 1 for channel 1.

21.4.27 Status for Destination Transaction Interrupts (StatusDstTran)—Offset B00h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h RO	**STATUS (STATUS):** Bit 0 for channel 0 and bit 1 for channel 1.

21.4.28 Status for Error Interrupts (StatusErr)—Offset B08h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h RO	**STATUS (STATUS):** Bit 0 for channel 0 and bit 1 for channel 1.

21.4.29 Mask for Transfer Interrupts (MaskTfr)—Offset B10h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:8	0h WO	**RESERVED (RESERVED0)**
7:2	0h RO	Reserved.
1:0	0h RW	**INT_MASK (INT_MASK):** Interrupt mask per ch1 and ch0 . 0-mask 1-unmask

21.4.30 Mask for Block Interrupts (MaskBlock)—Offset B18h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:8	0h WO	**RESERVED (RESERVED0):** Interrupt Mask Write Enable ch1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	Reserved.
1:0	0h RW	**INT_MASK (INT_MASK):** Interrupt mask ch1 and ch0. 0-mask 1-unmask

21.4.31 Mask for Source Transaction Interrupts (MaskSrcTran)—Offset B20h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:8	0h WO	**RESERVED (RESERVED0):** Interrupt Mask Write Enable ch1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	Reserved.
1:0	0h RW	**INT_MASK (INT_MASK):** Interrupt mask ch1 and ch0. 0-mask 1-unmask

21.4.32 Mask for Destination Transaction Interrupts (MaskDstTran)—Offset B28h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:8	0h WO	**RESERVED (RESERVED0):** Interrupt Mask Write Enable ch1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	Reserved.
1:0	0h RW	**INT_MASK (INT_MASK):** Interrupt mask ch1 and ch0. 0-mask 1-unmask

21.4.33 Mask for Error Interrupts (MaskErr)—Offset B30h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:8	0h WO	**RESERVED (RESERVED0):** Interrupt Mask Write Enable ch1 and ch0. 0 = write disabled 1 = write enabled
7:2	0h RO	Reserved.
1:0	0h RW	**INT_MASK (INT_MASK):** Interrupt mask ch1 and ch0. 0-mask 1-unmask

21.4.34 Clear for Transfer Interrupts (ClearTfr)—Offset B38h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h WO	**CLEAR (CLEAR):** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

21.4.35 Clear for Block Interrupts (ClearBlock)—Offset B40h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h WO	**CLEAR (CLEAR):** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

21.4.36 Clear for Source Transaction Interrupts (ClearSrcTran)—Offset B48h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h WO	**CLEAR (CLEAR):** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

21.4.37 Clear for Destination Transaction Interrupts (ClearDstTran)—Offset B50h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h WO	**CLEAR (CLEAR):** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

21.4.38 Clear for Error Interrupts (ClearErr)—Offset B58h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1:0	0h WO	**CLEAR (CLEAR):** Interrupt clear ch1 and ch0. 0 = no effect 1 = clear interrupt

21.4.39 Combined Status (StatusInt)—Offset B60h

The contents of each of the five Status registers StatusTfr, StatusBlock, StatusSrcTran, StatusDstTran,StatusErr is Ored to produce a single bit for each interrupt type in the Combined Status register (StatusInt). This register is read-only

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4	0h RO	**ERR (ERR):** OR of the contents of StatusErr register.
3	0h RO	**DSTT (DSTT):** OR of the contents of StatusDst register.

Bit Range	Default and Access	Field Name (ID): Description
2	0h RO	**SRCT (SRCT):** OR of the contents of StatusSrcTran register
1	0h RO	**BLOCK (BLOCK):** OR of the contents of StatusBlock register.
0	0h RO	**TFR (TFR):** OR of the contents of StatusTfr register.

21.4.40 DMA Configuration (DmaCfgReg)—Offset B98h

This register is used to enable the DMA, which must be done before any channel activity can begin. If the global channel enable bit is cleared while any channel is still active, then DmaCfgReg.DMA_EN still returns 1 to indicate that there are channels still active until hardware has terminated all activity on all channels, at which point the DmaCfgReg.DMA_EN bit returns 0.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW	**DMA_EN (DMA_EN):** DMA Enable bit. 0 = DMA Disabled 1 = DMA Enabled

21.4.41 DMA Channel Enable (ChEnReg)—Offset BA0h

This is the DMA Channel Enable Register. If software needs to set up a new channel, then it can read this register in order to find out which channels are currently inactive, it can then enable an inactive channel with the required priority. All bits of this register are cleared to 0 when the global DMA channel enable bit, DmaCfgReg(0), is 0. When the global channel enable bit is 0, then a write to the ChEnReg register is ignored and a read will always read back 0. The channel enable bit, ChEnReg.CH_EN, is written only if the corresponding channel write enable bit, ChEnReg.CH_EN_WE, is asserted on the same OCP write transfer.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:8	0h WO	**RESERVED (RESERVED0):** Channel enable write enable.
7:2	0h RO	Reserved.
1:0	0h RW	**CH_EN (CH_EN):** Enables/Disables the channel. Setting this bit enables a channel, clearing this bit disables the channel. 0 = Disable the Channel 1 = Enable the Channel The ChEnReg.CH_EN bit is automatically cleared by hardware to disable the channel after the last OCP transfer of the DMA transfer to the destination has completed. Software can therefore poll this bit to determine when this channel is free for a new DMA transfer.

21.5 I2C PCR Registers

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 21-5. Summary of I2C PCR Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
200h	203h	PCI Configuration Control for I2C0 (PCICFGCTR1)—Offset 200h	0h
204h	207h	PCI Configuration Control for I2C1 (PCICFGCTR2)—Offset 204h	0h
208h	20Bh	PCI Configuration Control for I2C2 (PCICFGCTR3)—Offset 208h	0h
20Ch	20Fh	PCI Configuration Control for I2C3 (PCICFGCTR4)—Offset 20Ch	0h
210h	213h	PCI Configuration Control for I2C4 (PCICFGCTR5)—Offset 210h	0h
214h	217h	PCI Configuration Control for I2C5 (PCICFGCTR6)—Offset 214h	0h
218h	21Bh	PCI Configuration Control for I2C6 (PCICFGCTR7)—Offset 218h	0h
21Ch	21Fh	PCI Configuration Control for I2C7 (PCICFGCTR8)—Offset 21Ch	0h

21.5.1 PCI Configuration Control for I2C0 (PCICFGCTR1)—Offset 200h

Controls the PCI Configuration Space

Access Method

Type: MSG Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:20	0h RW	**PCICFGCTR1 - PCI IRQ Num Field (PCI_IRQ1):** IRQ number to be sent in the message with data field for PCI Assert_IRQ and PCI_Deassert_IRQ message
19:12	0h RW	**PCICFGCTR1 - ACPI IRQ Field (ACPI_IRQ1):** IRQ number to be sent in the message with data field for ACPI Assert_IRQ and ACPI_Deassert_IRQ message
11:8	0h RW	**Interrupt Pin (IPIN1):** This register indicates the values to be used for Global Interrupts. 0 = No interrupt Pin 1 = INTA 2 = INTB 3 = INTC 4 = INTD 5 - FF: Reserved
7	0h RW	**BAR1 Disable (BAR1_DISABLE1):** BAR1_Disable: BAR1 register in the PCOS space becomes Read only when this bit is set.
6:2	0h RW	**PME Support (PME_SUPPORT1):** The value in this register is XOR with the value in the PME_support strap and reflected in the PME_Support register in the PCI configuration space
1	0h RW	**ACPI Interrupt Enable Field (ACPI_INTR_EN1):** When set, ACPI IRQ number field (bits 19:12) will be used for IRQ messages. When 0, PCI IRQ number field (bits 27:20) will be used for IRQ message.
0	0h RW	**PCICFGCTR1 - PCI CFG Disable Field (PCI_CFG_DIS1):** When set, PCI configuration accesses return UR response When 0, PCI configuration accesses are supported

21.5.2 PCI Configuration Control for I2C1 (PCICFGCTR2)—Offset 204h

Same definition as PCICFGCTR1

21.5.3 PCI Configuration Control for I2C2 (PCICFGCTR3)—Offset 208h

Same definition as PCICFGCTR1.

21.5.4 PCI Configuration Control for I2C3 (PCICFGCTR4)—Offset 20Ch

Same definition as PCICFGCTR1.

21.5.5 PCI Configuration Control for I2C4 (PCICFGCTR5)—Offset 210h

Same definition as PCICFGCTR1.

21.5.6 PCI Configuration Control for I2C5 (PCICFGCTR6)—Offset 214h

Same definition as PCICFGCTR1.

21.5.7 PCI Configuration Control for I2C6 (PCICFGCTR7)—Offset 218h

Same definition as PCICFGCTR1.

21.5.8 PCI Configuration Control for I2C7 (PCICFGCTR8)—Offset 21Ch

Same definition as PCICFGCTR1.

§ §

22 SATA Interface (D23: F0)

22.1 SATA Configuration Registers

Table 22-1. Summary of SATA Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Identifiers (ID)—Offset 0h	XXXX8086h
4h	5h	Command (CMD)—Offset 4h	0h
6h	7h	Device Status (STS)—Offset 6h	210h
8h	8h	Revision ID (RID)—Offset 8h	XXh
9h	9h	Programming Interface (PI)—Offset 9h	1h
Ah	Bh	Class Code (CC)—Offset Ah	106h
Ch	Ch	Cache Line Size (CLS)—Offset Ch	0h
Dh	Dh	Initiator Latency Timer (MLT)—Offset Dh	0h
Eh	Eh	Header Type (HTYPE)—Offset Eh	0h
10h	13h	MSI-X Table Base Address (MXTBA)—Offset 10h	0h
14h	17h	MSI-X Pending Bit Array Base Address (MXPBA)—Offset 14h	0h
20h	23h	AHCI Index Data Pair Base Address (AIDPBA)—Offset 20h	1h
24h	27h	AHCI Base Address (ABAR)—Offset 24h	0h
2Ch	2Fh	Sub System Identifiers (SS)—Offset 2Ch	0h
34h	34h	Capabilities Pointer (CAP)—Offset 34h	80h
3Ch	3Dh	Interrupt Information (INTR)—Offset 3Ch	100h
70h	71h	PCI Power Management Capability ID (PID)—Offset 70h	A801h
72h	73h	PCI Power Management Capability ID (PID)—Offset 70h	4003h
74h	75h	PCI Power Management Control And Status (PMCS)—Offset 74h	8h
80h	81h	Message Signalled Interrupt Identifier (MID)—Offset 80h	7005h
82h	83h	Message Signalled Interrupt Message Control (MC)—Offset 82h	0h
84h	87h	Message Signalled Interrupt Message Address (MA)—Offset 84h	0h
88h	89h	Message Signalled Interrupt Message Data (MD)—Offset 88h	0h
90h	93h	Port Mapping Register (MAP)—Offset 90h	0h
94h	97h	Port Control And Status (PCS)—Offset 94h	0h
9Ch	9Fh	SATA General Configuration (SATAGC)—Offset 9Ch	0h
A0h	A0h	SATA Initialization Register Index (SIRI)—Offset A0h	0h
A4h	A7h	SATA Initialization Register Data (SIRD)—Offset A4h	0h
A8h	ABh	Serial ATA Capability Register 0 (SATACR0)—Offset A8h	100012h
ACh	AFh	Serial ATA Capability Register 1 (SATACR1)—Offset ACh	48h
C0h	C3h	Scratch Pad (SP)—Offset C0h	0h
D0h	D1h	MSI-X Identifiers (MXID)—Offset D0h	11h
D2h	D3h	MSI-X Message Control (MXC)—Offset D2h	0h
D4h	D7h	MSI-X Table Offset And Table BIR (MXT)—Offset D4h	0h

Table 22-1. Summary of SATA Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
D8h	DBh	MSI-X PBA Offset And PBA BIR (MXP)—Offset D8h	1h
E0h	E3h	BIST FIS Control/Status (BFCS)—Offset E0h	0h
E4h	E7h	BIST FIS Transmit Data 1 (BFTD1)—Offset E4h	0h
E8h	EBh	BIST FIS Transmit Data 2 (BFTD2)—Offset E8h	0h

22.1.1 Identifiers (ID)—Offset 0h

When the MMIO RUN.RUNE=1, read access to this double-word is return with UR.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: XXXX8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	-- RO	**Device ID (DID):** Indicates the Device ID of the SATA controller. Refer to the Device and Revision ID Table in Volume 1 for default value.
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates the company vendor as Intel.

22.1.2 Command (CMD)—Offset 4h

Command

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts. This bit has no effect on MSI operation. 0 = Internal INTx# messages are generated if there is an interrupt and MSI is not enabled. 1 = Internal INTx# messages will not be generated.
9	0h RO	Reserved.
8	0h RW	**SERR# Enable (SEE):** 0 = SERR# messages will not be generated. 1 = SERR# messages are generated if STS.DPD register is set or bit 8 of the SATAGC.URD register is set.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	Reserved.
6	0h RW	**Parity Error Response Enable (PEE):** 0 = Disabled. SATA controller will not generate PERR# when a data parity error is detected. 1 = Enabled. SATA controller will generate PERR# when a data parity error is detected.
5:3	0h RO	Reserved.
2	0h RW	**Bus Initiator Enable (BME):** Controls the SATA Controller's ability to act as a Initiator for data transfers. This bit does not impact the generation of completions for split transaction commands.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the SATA Controller's target memory space (for AHCI).
0	0h RW	**I/O Space Enable (IOSE):** Controls access to the SATA Controller's target I/O space.

22.1.3 Device Status (STS)—Offset 6h

Device Status

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 210h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**Detected Parity Error (DPE):** 0 = No parity error detected by SATA controller. 1 = SATA controller detects a parity error on its interface.
14	0h RW/1C/V	**Signalled System Error (SSE):** 0 = No SERR# detected by SATA controller. 1 = SATA controller detects a SERR# on its interface.
13	0h RW/1C/V	**Received Initiator-Abort Status (RMA):** 0 = Initiator abort not generated. 1 = SATA controller received a Initiator abort.
12	0h RW/1C/V	**Received Target-Abort Status (RTA):** 0 = Target abort not generated. 1 = SATA controller received a target abort.
11	0h RW/1C/V	**Signalled Target-Abort Status (STA):** This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target-Abort do not need to implement this bit.
10:9	1h RO	**DEVSEL# Timing Status (DEVT):** 01 = Hardwired; Controls the device select time for the SATA controller's PCI interface.
8	0h RW/1C/V	**Initiator Data Parity Error Detected (DPD):** For PCH, this bit can only be set on read completions received from the bus when there is a parity error. 0 = No data parity error received. 1 = SATA controller, as a Initiator, either detects a parity error or sees the parity error line asserted, and the parity error response bit (bit 6 of the command register) is set.
7:5	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list. The minimum requirement for the capabilities list must be PCI power management for the SATA Controller.
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of INTx# messages, IRQ14 or IRQ15. 0 = Interrupt is cleared (independent of the state of CMD.ID). 1 = Interrupt is to be asserted
2:0	0h RO	Reserved.

22.1.4 Revision ID (RID)—Offset 8h

Revision ID

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 23
Function: 0

Default: XXh

Bit Range	Default & Access	Field Name (ID): Description
7:0	-- RO	**Revision ID (RID):** Indicates stepping of the host controller hardware. Refer to Device ID and Revision Table in Vol1 for specific value.

22.1.5 Programming Interface (PI)—Offset 9h

Programming Interface

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 23
Function: 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
7:0	1h RO	**Interface (IF):** If CC.SCC=06h (AHCI mode), it indicates that this is an AHCI HBA that has a major revision of 1. If CC.SCC=04h (RAID mode), it indicates that there is no programming interface (IF=00h).

22.1.6 Class Code (CC)—Offset Ah

Class Code

Access Method

Type: CFG Register (Size: 16 bits)
Device: 23
Function: 0

Default: 106h

Bit Range	Default & Access	Field Name (ID): Description
15:8	1h RO	**Base Class Code (BCC):** Indicates that this is a mass storage device.
7:0	6h RO	**Sub Class Code (SCC):** This field specifies the sub-class code of the controller, per the table below: MAP.SMS SCC Register Value 0b 06h (AHCI Controller) 1b 04h (RAID Controller)

22.1.7 Cache Line Size (CLS)—Offset Ch

Cache Line Size

Access Method

Type: CFG Register (Size: 8 bits)
Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Cache Line Size (CLS):** This register has no meaning for the SATA controller.

22.1.8 Initiator Latency Timer (MLT)—Offset Dh

Initiator Latency Timer

Access Method

Type: CFG Register (Size: 8 bits)
Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Initiator Latency Timer (MLT):** This register has no meaning for the SATA controller.

22.1.9 Header Type (HTYPE)—Offset Eh

Header Type

Access Method

Type: CFG Register (Size: 8 bits)	**Device:** 23 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**Multi-function Device (MFD):** 1: indicates this controller is part of a multi-function device. 0: indicates this controller is a single function device.
6:0	0h RO	**Header Layout (HL):** Indicates that the controller uses a target device layout.

22.1.10 MSI-X Table Base Address (MXTBA)—Offset 10h

This BAR is used to allocate 32K, 16K or 8K Memory space for the MSI-X Table. The Memory space size is determined by BIOS by making bit-14 and bit-13 Read-Only '1' or Read-Write '0' based on SATAGC.MSS[1:0].

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 23 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RW	**Base Address (BA):** Base address of memory space.
14	0h RW	**Base Address Bit 14 (BAB14):** When SATAGC.MSS[1:0]=00, this bit is Read Only '0' else it's Read Write '0'.
13	0h RW	**Base Address Bit 13 (BAB13):** When SATAGC.MSS[1:0]=00 or 01, this bit is Read Only '0' else it's Read Write '0'.
12:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for Memory space.

22.1.11 MSI-X Pending Bit Array Base Address (MXPBA)—Offset 14h

This BAR is used to allocate 256-byte Memory space for the MSI-X PBA.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RW	**Base Address (BA):** Base address of memory space (aligned to 256B).
7:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for Memory space.

22.1.12 AHCI Index Data Pair Base Address (AIDPBA)—Offset 20h

This BAR is used to allocate I/O space for the AHCI index/data pair mechanism.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 23
Function: 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:5	0h RW	**Base Address (BA):** Base address of the I/O space.
4:1	0h RO	Reserved.
0	1h RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

22.1.13 AHCI Base Address (ABAR)—Offset 24h

This register represents a memory BAR allocating space for the AHCI memory registers. Note that Bit[31:16] of this register must be programmed to a value greater than 0 to ensure the memory is mapped to an address of 1 MBytes and greater (i.e. ABAR must be 00010000h or greater). Otherwise, memory cycle targeting the ABAR range may not be accepted. The Memory space size is determined by BIOS by making bit 15:11 Read-Only 1 or Read-Write 0 based on SATAGC.ASSEL[1:0].

Access Method

Type: CFG Register (Size: 32 bits)
Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RW	**Base Address (BA):** Base address of register memory space.
18	0h RW	**Base Address Bit 18 (BAB18):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 256K, this bit is Read Only '0' else it's Read Write '0'.
17	0h RW	**Base Address Bit 17 (BAB17):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 128K, this bit is Read Only '0' else it's Read Write '0'.
16	0h RW	**Base Address Bit 16 (BAB16):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 64K, this bit is Read Only '0' else it's Read Write '0'.
15	0h RW	**Base Address Bit 15 (BAB15):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 32K, this bit is Read Only '0' else it's Read Write '0'.
14	0h RW	**Base Address Bit 14 (BAB14):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 16K, this bit is Read Only '0' else it's Read Write '0'.
13:11	0h RW	**Base Address Bit 13-11 (BAB1311):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 2K, this bit is Read Only '0' else it's Read Write '0'.
10:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable
2:1	0h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

22.1.14 Sub System Identifiers (SS)—Offset 2Ch

This register is initialized to logic 0 by the assertion of PLTRST#. This register can be written only once after PLTRST# de-assertion.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

22.1.15 Capabilities Pointer (CAP)—Offset 34h

Capabilities Pointer

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 23
Function: 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Capability Pointer (CP):** Indicates that the first capability pointer offset is 80h. Note: Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.

22.1.16 Interrupt Information (INTR)—Offset 3Ch

Interrupt Information

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
15:8	1h RW/O	**Interrupt Pin (IPIN):** This register tells which interrupt pin the device function uses. A value of 1 corresponds to INTA#. A value of 2 corresponds to INTB#. A value of 3 corresponds to INTC#. A value of 4 corresponds to INTD#. This register is not reset by FLR.
7:0	0h RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register. Interrupt Line register is not reset by FLR.

22.1.17 PCI Power Management Capability ID (PID)—Offset 70h

PCI Power Management Capability ID

Access Method

Type: CFG Register (Size: 16 bits)
Device: 23
Function: 0

Default: A801h

Bit Range	Default & Access	Field Name (ID): Description
15:8	A8h RW/L	**Next Capability (NEXT):** A8h is the location of the Serial ATA capability structure. Note: Refer to the SGC.REGLOCK description in order to lock the register to become RO.
7:0	1h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management capability.

22.1.18 PCI Power Management Capabilities (PC)—Offset 72h

PCI Power Management Capabilities

Access Method

Type: CFG Register (Size: 16 bits)
Device: 23
Function: 0

Default: 4003h

Bit Range	Default & Access	Field Name (ID): Description
15:11	8h RO	**PME_Support (PME_SUPPORT):** The default value 01000 which indicates PME# can be generated from the D3HOT state in the SATA controller.
10	0h RO	**D2_Support (D2_SUPPORT):** The D2 state is not supported.
9	0h RO	**D1_Support (D1_SUPPORT):** The D1 state is not supported.
8:6	0h RO	**Aux_Current (AUX_CURRENT):** PME# from D3COLD state is not supported, therefore this field is 000b.
5	0h RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
4	0h RO	Reserved.
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

22.1.19 PCI Power Management Control And Status (PMCS)—Offset 74h

PCI Power Management Control And Status

Access Method

Type: CFG Register (Size: 16 bits)
Device: 23
Function: 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C/V	**PME Status (PMES):** Bit is set when a PME event is to be requested, and if this bit and PMEE is set, a PME# will be generated from the SATA controller.
14:9	0h RO	Reserved.
8	0h RW	**PME Enable (PMEE):** When set, the SATA controller asserts PME# when exiting D3HOT on a wake event. Note: Software is advised to clear PMEE and PMES together prior to changing CC.SCC through MAP.SMS.
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSFRST):** These bits are used to indicate whether devices transitioning from D3HOT state to D0 state will perform an internal reset. 0 = Device transitioning from D3HOT state to D0 state perform an internal reset. 1 = Device transitioning from D3HOT state to D0 state do not perform an internal reset. Configuration content is preserved. Upon transition from the D3HOT state to D0 state initialized state, no additional operating system intervention is required to preserve configuration context beyond writing to the PowerState bits. Regardless of this bit, the controller transition from D3HOT state to D0 state by a system or bus segment reset will return to the state D0 uninitialized with only PME context preserved if PME is supported and enabled.
2	0h RO	Reserved.
1:0	0h RW	**Power State (PS):** These bits are used both to determine the current power state of the SATA controller and to set a new power state. 00 = D0 state 11 = D3HOT state When in the D3HOTstate, the controller's configuration space is available, but the I/O and memory spaces are not. Additionally, interrupts are blocked.

22.1.20 Message Signalled Interrupt Identifier (MID)—Offset 80h

Message Signalled Interrupt Identifier

Access Method

Type: CFG Register (Size: 16 bits)
Device: 23
Function: 0

Default: 7005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	70h RW/L	**Next Pointer (NEXT):** Indicates the next item in the list is the PCI power management pointer. BIOS may program this field to A8h indicating that the next item is Serial ATA Capability Structure. Note: Refer the SGC.REGLOCK description in order to lock the register to become RO.
7:0	5h RO	**Capability ID (CID):** Capabilities ID indicates MSI.

22.1.21 Message Signalled Interrupt Message Control (MC)—Offset 82h

Message Signalled Interrupt Message Control

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h RO	**64-Bit Address Capable (C64):** Capable of generating a 32-bit message only.
6:4	0h RO	**Multiple Message Enable (MME):** When this field is cleared to 000 (and MSIE is set), only a single MSI message will be generated for all SATA ports, and bits [15:0] of the message vector will be driven from MD[15:0].
3:1	0h RO	**Multiple Message Capable (MMC):** Not supported.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. Note that CMD.ID bit has not effect on MSI. Software must clear this bit to 0 to disable MSI first before changing the number of messages allocated in the MMC field.

22.1.22 Message Signalled Interrupt Message Address (MA)—Offset 84h

Message Signalled Interrupt Message Address

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DWORD aligned.
1:0	0h RO	Reserved.

22.1.23 Message Signalled Interrupt Message Data (MD)—Offset 88h

Message Signalled Interrupt Message Data

Access Method

Type: CFG Register (Size: 16 bits)	**Device:** 23 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word of the data bus of the MSI memory write transaction.

22.1.24 Port Mapping Register (MAP)—Offset 90h

Port Mapping Register

Access Method

Type: CFG Register (Size: 32 bits)	**Device:** 23 **Function:** 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW/O	**SATA Port 1 Disable (SPD1):** Similar to SPD0 but for port 1. This bit is only applicable to project(s) that has port 1 physically.
16	0h RW/O	**SATA Port 0 Disable (SPD0):** A 1 prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1. In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPDx. And only then BIOS configures the PCS.PxE. This bit is only applicable to project(s) that has port 0 physically.
15:8	0h RO	Reserved.
7:0	0h RW	**Port Clock Disable (PCD):** When any of these bits is set to 1, the clock driven to the associated port logic is gated and will not toggle. When this bit is cleared to 0, all clocks to the associated port logic will operate normally. Assignment of the bits is: Bit 0: Port 0 Bit 1: Port 1 ... Bit 7: Port 7 NOTE: if a port is not available, the bit is not applicable and reserved.

22.1.25 Port Control And Status (PCS)—Offset 94h

By default, the SATA ports are set (by hardware) to the disabled state (e.g. bits[5:0] == '0') as a result of an initial power on reset. When enabled by software, the ports can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. Note: This register is not reset by FLR. Note: AHCI specific notes: If an AHCI-aware or RAID enabled operating system is being booted then system BIOS shall insure that all

supported SATA ports are enabled prior to passing control to the OS. Once the AHCI aware OS is booted it becomes the enabling/disabling policy owner for the individual SATA ports. This is accomplished by manipulating a port's PxSCTL.DET and PxCMD.SUD fields. Because an AHCI or RAID aware OS will typically not have knowledge of the PxE bits and because the PxE bits act as Initiator on/off switches for the ports, pre-boot software must insure that these bits are set to '1' prior to booting the OS, regardless as to whether or not a device is currently on the port.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RO/V	**Port 1 Present (P1P):** This bit is set when COMINIT is received as a response to COMRESET. 0 = No device detected. 1 = The presence of a device on Port 1 has been detected. The status of this bit may change at any time. This bit is cleared when the port is disabled using P1E. This bit is not cleared upon surprise removal of a device.
16	0h RO/V	**Port 0 Present (P0P):** This bit is set when COMINIT is received as a response to COMRESET. 0 = No device detected. 1 = The presence of a device on Port 0 has been detected. The status of this bit may change at any time. This bit is cleared when the port is disabled using P0E. This bit is not cleared upon surprise removal of a device.
15:2	0h RO	Reserved.
1	0h RW/V	**Port 1 Enabled (P1E):** 0 = Disabled. The port is in the 'off' state and cannot detect any devices. 1 = Enabled. The port can transition between the on, partial, and slumber states and can detect devices. Note: This bit takes precedence over P1CMD.SUD (offset ABAR+198h:bit 1). When MAP.SPD[1] is 1, this is reserved and is read-only 0.
0	0h RW/V	**Port 0 Enabled (P0E):** 0 = Disabled. The port is in the 'off' state and cannot detect any devices. 1 = Enabled. The port can transition between the on, partial, and slumber states and can detect devices. Note: This bit takes precedence over P0CMD.SUD (offset ABAR+118h:bit 1). When MAP.SPD[0] is 1, this is reserved and is read-only 0.

22.1.26 SATA General Configuration (SATAGC)—Offset 9Ch

SATA General Configuration

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/O	**Register Lock (REGLOCK):** 0 = Will not lock CAP.CP, PID.NEXT, MID.NEXT, or SATACR0.NEXT 1 = Setting this bit will lock CAP.CP, PID.NEXT, MID.NEXT, and SATACR0.NEXT. Once locked, these register bits will become RO. BIOS is requested to program this field to '1' prior to OS handoff. Note: This field is not reset by FLR.
30:16	0h RO	Reserved.
15	0h RW	**Data Phase Parity Error Enable (DPPEE):** When '1', IOSF data phase parity error handling is enabled. When '0', the data phase parity error handling is disabled. Note: This field is not reset by FLR.
14:12	0h RW	**Write Request_Size Select/Max_Payload_Size (WRRSELMPS):** These two bits select the max write request size that SATA host controller will initiate for DMA write to memory. SATA host controller will internally break up larger write request based on these bits. The request is address-aligned to the selected size. Defined encodings for this field are: 000b = 128 address aligned bytes max payload size 111b = 64 address aligned bytes max payload size. All other values are reserved for SATA host controller. Note: This field is not reset by FLR (not supported).
11	0h RW	**Command Parity Error Enable (CPEE):** When '1', command parity error handing is enable. When '0' the command parity error handling is disabled. Note: This field is not reset by FLR.
10	0h RW	**SATA Controller Function Disable (SCFD):** BIOS program this bit to 1 to disable the SATA Controller function. When 0, SATA Controller function is enabled. When disable, SATA Host Controller will not claimed the register access targeting its Configuration Space. In IOSF primary Fabric Decode scheme, it's expected BIOS also program the corresponding bit used by the Fabric Decoder accordingly hence both SATA SIP and Fabric Decoder are in sync, and BIOS need to program this bit before programming the one in Fabric Decoder. Once this bit is set, BIOS isnot able to revert it back to Function Enable until next round of platform reset. This register field is not reset by FLR.
9	0h RW	**Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error. If both URRE and PCI configuration SERR# Enable registers are set to a 1, then the agent must set the Signaled System Error bit in the PCI Status register and send a DO_SERR message in IOSF-SB interface.
8	0h RW/1C/V	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW. URD bit is only set based on IOSF primary bus interface activity. Its not set based on IOSF sideband bus interface activity.
7	0h RW/O	**Alternate ID Enable (AIE):** 0 = Clearing this bit when in RAID mode, the SATA Controller located at Device 23: Function 0 will report its Device ID as 2822h for Desktop SKUs or 282Ah for Mobile SKUs of the PCH. Clearing this bit is required for the Intel® Rapid Storage Technology driver (including the Windows* Vista operating system and later in-box version of the driver) to load on the platform. Intel® Smart Response Technology also requires that the bit be cleared in order to be enabled on the platform. 1 = Setting this bit when in RAID mode, the SATA Controller located at Device 23: Function 0 will report its Device ID as A107h for Desktop SKUs or 9D07h for Mobile SKUs of the Chipset. This setting will prevent the Intel® Rapid Storage Technology driver (including the Windows* operating system in-box version of the driver) from loading on the platform. During the Windows* OS installation, the user will be required to "load" (formerly done by pressing the F6 button on the keyboard) the appropriate RAID storage driver that is enabled by this setting. Note: BIOS is recommended to program this bit prior to programming the MAP.SMS field to reflect RAID. This field is reset by PLTRST# and BIOS is required to reprogram the value (either 0 or 1) after resuming from S3, S4 or S5. This insures that the value is properly and cannot be changed during runtime. Note: This field is not reset by FLR (not supported).
6	0h RW/O/V	**AIE0 DevID Selection (DEVIDSEL):** This register allows BIOS to select Device ID when AIE=0. This bit only has effect in Desktop SKU. In Mobile SKU this bit has no effect at all. Refer to config register offset 09h PI for usage. 0 : 2822h 1 : 2826h Note: This field is not reset by FLR.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW/O	**FLR Capability Selection (FLRCSSEL):** This allows the FLR Capability to be bypassed. Refer to config offset B0h. BIOS is required to program this bit to 1 and config offset A8h SATACR0.NEXT to 00h. Note: This field is not reset by FLR.
4:3	0h RW/O	**MXTBA Size Select (MSS):** These 2 bits select the size of the Memory space for the MSI-X Table defined in BAR 0 (Configuration space offset 10h). MSS[1:0] MSI-X Table Memory space size 00 32K 01 16K 10 8K 11 Reserved Note: This field is not reset by FLR (not supported).
2:0	0h RW/O	**ABAR Size Select (ASSEL):** These 3 bits select the size of the Memory space for the ABAR in BAR 5 (Configuration space offset 24h). ASSEL[2:0] ABAR Memory space size 000 2K 001 16K 010 32K 011 64K 100 128K 101 256K 110 512K 111 Reserved Note: This field is not reset by FLR (not supported).

22.1.27 SATA Initialization Register Index (SIRI)—Offset A0h

SATA Initialization Register Index

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0h RW	**Index (IDX):** 6-bit index pointer into the 256-byte space. Data is written into the SIRD (DFTD) register and read from the SIRD register. This point to a DWord register. The byte enables on the SIRD register affect what will be written.
1:0	0h RO	Reserved.

22.1.28 SATA Initialization Register Data (SIRD)—Offset A4h

SATA Initialization Register Data

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V	**Data (DTA):** 32-bit data value that is written to the register pointed to by SIRI, or read from the register pointed to by SIRI.

22.1.29 Serial ATA Capability Register 0 (SATACR0)—Offset A8h

The SATACR0.NEXT is not changed from RO to become RWO because there is an existing method (SATAGC.FLRCSSEL bit) to bypass the FLR Capability structure, and since the FLR Capability ID.NEXT is already indicating end of capability structure, it does not need change to be RWO.

Access Method

Type: CFG Register (Size: 32 bits)
Device: 23
Function: 0

Default: 100012h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:20	1h RO	**Major Revision (MAJREV):** Major revision number of the SATA Capability Pointer implemented.
19:16	0h RO	**Minor Revision (MINREV):** Minor revision number of the SATA Capability Pointer implemented.
15:8	0h RW/L	**Next Capability Pointer (NEXT):** 00h indicating the final item in the Capability List. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	12h RO	**Capability ID (CAP):** The value of 12h has been assigned by the PCI SIG to designate the SATA Capability pointer.

22.1.30 Serial ATA Capability Register 1 (SATACR1)—Offset ACh

Serial ATA Capability Register 1

Access Method

Type: CFG Register (Size: 32 bits)
Device: 23
Function: 0

Default: 48h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:4	4h RO	**BAR Offset (BAROFST):** Indicates the offset into the BAR where the Index/Data pair are located (in DWord granularity). The Index and Data I/O registers are located at offset 10h within the I/O space defined by LBAR. A value of 004h indicates offset 10h. 000h = 0h offset 001h = 4h offset 002h = 8h offset 003h = Bh offset 004h = 10h offset ... FFFh = 3FFFh offset (maximum 16KB)
3:0	8h RO	**BAR Location (BARLOC):** Indicates the absolute PCI Configuration register address of the BAR containing the Index/Data pair (in DWord granularity). The Index and Data I/O registers reside within the space defined by LBAR in the SATA controller. A value of 8h indicates offset 20h, which is LBAR. 0000 - 0011b = reserved 0100b = 10h => BAR0 0101b = 14h => BAR1 0110b = 18h => BAR2 0111b = 1Ch => BAR3 1000b = 20h => LBAR 1001b = 24h => BAR5 1010–1110b = reserved 1111b = Index/Data pair in PCI Configuration space. This is not supported in the PCH.

22.1.31 Scratch Pad (SP)—Offset C0h

Scratch Pad

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data (DT):** This is a read/write register that is available for software to use. No hardware action is taken on this register.

22.1.32 MSI-X Identifiers (MXID)—Offset D0h

MSI-X Identifiers

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 11h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW/L	**Next Pointer (NEXT):** Indicates the next item in the list. This may be other capability pointers or it may be the last item in the list.The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	11h RO	**Capability ID (CID):** Capabilities ID indicates this is an MSI-X capability.

22.1.33 MSI-X Message Control (MXC)—Offset D2h

MSI-X Message Control

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**MSI-X Enable (MXE):** If set to '1' and the MSI Enable bit in the MSI Message Control register is cleared to '0', the function is permitted to use MSI-X to request service and is prohibited from using its INTx# pin (if implemented). If cleared to '0', the function is prohibited from using MSI-X to request service.
14	0h RW	**Function Mask (FM):** If set to '1', all of the vectors associated with the function are masked, regardless of their per vector Mask bit states. If cleared to '0', each vector's Mask bit determines whether the vector is masked or not. Setting or clearing the MSI-X Function Mask bit has no effect on the state of the per vector Mask bits.
13:11	0h RO	Reserved.
10:0	0h RO	**Table Size (TS):** This value indicates the size of the MSI-X Table as the value n, which is encoded as n - 1. For example, a returned value of 3h corresponds to a table size of 4..

22.1.34 MSI-X Table Offset And Table BIR (MXT)—Offset D4h

MSI-X Table Offset And Table BIR

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RW/O	**Table Offset (TO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X Table. The lower three Table BIR bits are masked off (cleared to 000b) by system software to form a 32-bit Qword-aligned offset.
2:0	0h RO	**Table BIR (TBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X Table into system memory. A read-only value of '0' means 10h.

22.1.35 MSI-X PBA Offset And PBA BIR (MXP)—Offset D8h

MSI-X PBA Offset And PBA BIR

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RW/O	**PBA Offset (PBAO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X PBA. The lower three PBA BIR bits are masked off (cleared to 000b) by software to form a 32-bit Qword-aligned offset.
2:0	1h RO	**PBA BIR (PBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X PBA into system memory. A read-only value of '1' means 14h.

22.1.36 BIST FIS Control/Status (BFCS)—Offset E0h

BIST FIS Control/Status

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	Reserved.
12	0h RW	**Port 2 BIST FIS Initiate (P2BFI):** When a rising edge is detected on this bit field, the PCH initiates a BIST FIS to the device on Port 2,using the parameters specified in this register and the data specified in BFTD1 and BFTD2. The BIST FIS will only be initiated if a device on Port 2 is present and ready (not partial/slumber state). After a BIST FIS is successfully completed, software must disable and re-enable the port using the PCS.P2E prior to attempting additional BIST FISes or to return the PCH to a normal operational mode. If the BIST FIS fails to complete, as indicated by the BFF bit in the register, then software can clear then set the P2BFI bit to initiate another BIST FIS. This can be retried until the BIST FIS eventually completes successfully. Note: Bit may be Reserved depending on if port is available in the given SKU.
11	0h RW/1C/V	**BIST FIS Successful (BFS):** 0 = Software clears this bit by writing a 1 to it. 1 = This bit is set any time a BIST FIS transmitted by PCH receives an R_OK completion status from the device. Note: This bit must be cleared by software prior to initiating a BIST FIS.
10	0h RW/1C/V	**BIST FIS Failed (BFF):** 0 = Software clears this bit by writing a 1 to it. 1 = This bit is set any time a BIST FIS transmitted by PCH receives an R_ERR completion status from the device. Note: This bit must be cleared by software prior to initiating a BIST FIS.
9	0h RW	**Port 1 BIST FIS Initiate (P1BFI):** When a rising edge is detected on this bit field, the PCH initiates a BIST FIS to the device on Port 1,using the parameters specified in this register and the data specified in BFTD1 and BFTD2. The BIST FIS will only be initiated if a device on Port 1 is present and ready (not partial/slumber state). After a BIST FIS is successfully completed, software must disable and re-enable the port using the PCS.P1E prior to attempting additional BIST FISes or to return the PCH to a normal operational mode. If the BIST FIS fails to complete, as indicated by the BFF bit in the register, then software can clear then set the P1BFI bit to initiate another BIST FIS. This can be retried until the BIST FIS eventually completes successfully.
8	0h RW	**Port 0 BIST FIS Initiate (P0BFI):** When a rising edge is detected on this bit field, the PCH initiates a BIST FIS to the device on Port 0,using the parameters specified in this register and the data specified in BFTD1 and BFTD2. The BIST FIS will only be initiated if a device on Port 0 is present and ready (not partial/slumber state). After a BIST FIS is successfully completed, software must disable and re-enable the port using the PCS.P0E prior to attempting additional BIST FISes or to return the PCH to a normal operational mode. If the BIST FIS fails to complete, as indicated by the BFF bit in the register, then software can clear then set the P0BFI bit to initiate another BIST FIS. This can be retried until the BIST FIS eventually completes successfully.
7:2	0h RW	**BIST FIS Parameters (BFP):** These 6 bits form the contents of the upper 6 bits of the BIST FIS Pattern Definition in any BIST FIS transmitted by the PCH. This field is not port specific—its contents will be used for any BIST FIS initiated on port 0, port 1, port 2, or port 3. The specific bit definitions are: Bit 7: T – Far End Transmit mode Bit 6: A – Align Bypass mode Bit 5: S – Bypass Scrambling Bit 4: L – Far End Retimed Loopback Bit 3: F – Far End Analog Loopback Bit 2: P – Primitive bit for use with Transmit mode
1:0	0h RO	Reserved.

22.1.37 BIST FIS Transmit Data 1 (BFTD1)—Offset E4h

BIST FIS Transmit Data 1

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** The data programmed into this register will form the contents of the second DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 2nd DW regardless of whether or not the T bit is indicated in the BFCS register.

22.1.38 BIST FIS Transmit Data 2 (BFTD2)—Offset E8h

BIST FIS Transmit Data 2

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** The data programmed into this register will form the contents of the third DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 3rd DW regardless of whether or not the T bit is set in the BFCS register.

22.2 SATA ABAR Registers

Table 22-2. Summary of SATA ABAR Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	HBA Capabilities (GHC_CAP)—Offset 0h	FF36FF07h
4h	7h	Global HBA Control (GHC)—Offset 4h	80000000h
8h	Bh	Interrupt Status Register (IS)—Offset 8h	0h
Ch	Fh	Ports Implemented (GHC_PI)—Offset Ch	0h
10h	13h	AHCI Version (VS)—Offset 10h	10301h
1Ch	1Fh	Enclosure Management Location (EM_LOC)—Offset 1Ch	1600002h
20h	23h	Enclosure Management Control (EM_CTL)—Offset 20h	7010000h
24h	27h	HBA Capabilities Extended (GHC_CAP2)—Offset 24h	3Ch
A0h	A3h	Vendor Specific (VSP)—Offset A0h	48h
A4h	A7h	Vendor Specific Capabilities Register (VS_CAP)—Offset A4h	1002DEh
C0h	C3h	RAID Platform ID (RPID)—Offset C0h	311C02h
C4h	C5h	Premium Feature Block (PFB)—Offset C4h	0h
C8h	C9h	SW Feature Mask (SFM)—Offset C8h	3Fh
100h	103h	Port 0 Command List Base Address (P0CLB)—Offset 100h	0h
104h	107h	Port 0 Command List Base Address Upper 32-bits (P0CLBU)—Offset 104h	0h

Table 22-2. Summary of SATA ABAR Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
108h	10Bh	Port 0 FIS Base Address (P0FB)—Offset 108h	0h
10Ch	10Fh	Port 0 FIS Base Address Upper 32-bits (P0FBU)—Offset 10Ch	0h
110h	113h	Port 0 Interrupt Status (P0IS)—Offset 110h	0h
114h	117h	Port 0 Interrupt Enable (P0IE)—Offset 114h	0h
118h	11Bh	Port 0 Command (P0CMD)—Offset 118h	4h
120h	123h	Port 0 Task File Data (P0TFD)—Offset 120h	9h
124h	127h	Port 0 Signature (P0SIG)—Offset 124h	FFFFFFFFh
128h	12Bh	Port 0 Serial ATA Status (P0SSTS)—Offset 128h	0h
12Ch	12Fh	Port 0 Serial ATA Control (P0SCTL)—Offset 12Ch	0h
130h	133h	Port 0 Serial ATA Error (P0SERR)—Offset 130h	0h
134h	137h	Port 0 Serial ATA Active (P0SACT)—Offset 134h	0h
138h	13Bh	Port 0 Command Issue (P0CI)—Offset 138h	0h
144h	147h	Port 0 Device Sleep (P0DEVSLP)—Offset 144h	1E022852h
180h	183h	Port 1 Command List Base Address (P1CLB)—Offset 180h	0h
184h	187h	Port 1 Command List Base Address Upper 32-bits (P1CLBU)—Offset 184h	0h
188h	18Bh	Port 1 FIS Base Address (P1FB)—Offset 188h	0h
18Ch	18Fh	Port 1 FIS Base Address Upper 32-bits (P1FBU)—Offset 18Ch	0h
190h	193h	Port 1 Interrupt Status (P1IS)—Offset 190h	0h
194h	197h	Port 1 Interrupt Enable (P1IE)—Offset 194h	0h
198h	19Bh	Port 1 Command (P1CMD)—Offset 198h	0h
1A0h	1A3h	Port 1 Task File Data (P1TFD)—Offset 1A0h	0h
1A4h	1A7h	Port 1 Signature (P1SIG)—Offset 1A4h	0h
1A8h	1ABh	Port 1 Serial ATA Status (P1SSTS)—Offset 1A8h	0h
1ACh	1AFh	Port 1 Serial ATA Control (P1SCTL)—Offset 1ACh	0h
1B0h	1B3h	Port 1 Serial ATA Error (P1SERR)—Offset 1B0h	0h
1B4h	1B7h	Port 1 Serial ATA Active (P1SACT)—Offset 1B4h	0h
1B8h	1BBh	Port 1 Command Issue (P1CI)—Offset 1B8h	0h
1C4h	1C7h	Port 1 Device Sleep (P1DEVSLP)—Offset 1C4h	0h

22.2.1 HBA Capabilities (GHC_CAP)—Offset 0h

HBA Capabilities. This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

Access Method

Type: MEM Register (Size: 32 bits)

Device: 23
Function: 0

Default: FF36FF07h

Bit Range	Default and Access	Field Name (ID): Description
31	1h RW/O	**Supports 64-bit Addressing (S64A):** Indicates that the SATA controller can access 64-bit data structures. The 32-bit upper bits of the port DMA Descriptor, the PRD Base, and each PRD entry are read/write.
30	1h RW/O	**Supports Native Command Queuing Acceleration (SCQA):** When set to 1, indicates that the SATA controller supports SATA command queuing using the DMA Setup FIS. The PCH handles DMA Setup FISes natively, and can handle auto-activate optimization through that FIS.
29	1h RW/O	**Supports SNotification Register (SSNTF):** When set to 1, indicates the SATA controller supports the PxSNTF (SNotification) register and its associated functionality. When cleared to 0, the SATA controller does not support the PxSNTF (SNotification) register and its associated functionality.
28	1h RW/O	**Supports Mechanical Presence Switch (SMPS):** When set to 1, indicates whether the SATA controller supports mechanical presence switches on its ports for use in hot-plug operations. This value is loaded by platform BIOS prior to operating system initialization. If this bit is set, BIOS must also map the SATAGP pins to the SATA controller through GPIO space.
27	1h RW/O	**Supports Staggered Spin-up (SSS):** Indicates whether the SATA controller supports staggered spin-up on its ports, for use in balancing power spikes. This value is loaded by platform BIOS prior to OS initialization. 0 = Staggered spin-up not supported. 1 = Staggered spin-up supported.
26	1h RW/O	**Supports Aggressive Link Power Management (SALP):** 0 = Software shall treat the PxCMD.ALPEand PxCMD.ASP bits as reserved. 1 = The SATA controller supports auto-generating link requests to the partial or slumber states when there are no commands to process.
25	1h RW/O	**Supports Activity LED (SAL):** Indicates the SATA controller supports a single output pin (SATALED#) which indicates activity.
24	1h RW/O	**Supports Command List Override (SCLO):** When set to 1, indicates that the HBA supports the PxCMD.CLO bit and it's associated function. When cleared to 0., The HBA is not capable of clearing the BSY and DRQ bits in the Status register in order to issue a software reset if these bits are still set from a previous operation.
23:20	3h RW/O	**Interface Speed Support (ISS):** Indicates the maximum speed the SATA controller can support on its ports. 1h = 1.5Gb/s 2h = 3Gb/s 3h = 6Gb/s The default of this field is dependent upon the PCH SKU. If at least one PCH SATA port supports 6Gb/s, the default will be 3h. If no PCH SATA ports support 6Gb/s, then the default will be 2h and writes of 3h will be ignored by the PCH. Refer to Volume 1, Chapter 1 for details on 6Gb/s port availability.
19	0h RO	Reserved.
18	1h RO	**Supports AHCI mode only (SAM):** The SATA controller may optionally support AHCI access mechanism only. 0 = SATA controller supports both IDE and AHCI Modes 1 = SATA controller supports AHCI Mode Only Note: BIOS should program this field as “1” since IDE mode is not supported.
17	1h RO	**Supports Port Multiplier (SMP):** Not supported.
16	0h RO	Reserved.
15	1h RO	**PIO Multiple DRQ Block (PMD):** Hardwired to 1. The SATA controller supports PIO Multiple DRQ Command Block.
14	1h RW/O	**Slumber State Capable (SSC):** When set to 1, the SATA controller supports the slumber state.
13	1h RW/O	**Partial State Capable (PSC):** When set to 1, the SATA controller supports the partial state.
12:8	1Fh RO	**Number of Command Slots (NCS):** Hardwired to 1Fh to indicate support for 32 slots.

Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	**Command Completion Coalescing Supported (CCCS):** 0 = Command Completion Coalescing Not Supported 1 = Command Completion Coalescing Supported
6	0h RO	**Enclosure Management Supported (EMS):** 0 = Enclosure Management Not Supported 1 = Enclosure Management Supported
5	0h RW/O	**Supports External SATA (SXS):** 0 = External SATA is not supported on any ports 1 = External SATA is supported on one or more ports When set, software can examine each SATA port's Command register (PxCMD.ESP) to determine which port is routed externally.
4:0	7h RO	**Number of Ports (NP):** Indicates number of supported ports. The number of ports indicated in this field may be more than the number of ports indicated in the PI (ABAR + 0Ch) register. Field value dependent on number of ports available in a given SKU.

22.2.2 Global HBA Control (GHC)—Offset 4h

Global HBA Control. This register controls various global actions of the HBA.

Access Method

Type: MEM Register (Size: 32 bits)

Device: 23

Function: 0

Default: 80000000h

Bit Range	Default and Access	Field Name (ID): Description
31	1h RO	**AHCI Enable (AE):** When set, indicates that an AHCI driver is loaded and communication to the HBA shall be via AHCI mechanisms. This can be used by an HBA that supports both legacy mechanisms (such as SFF-8038i) and AHCI to know when the HBA is running under an AHCI driver. 0 = Software will only communicate with the HBA using legacy mechanisms. 1 = Software shall only talk to the HBA using AHCI. The HBA will not have to allow command processing via both AHCI and legacy mechanisms. Note: Software shall set this bit to 1 before accessing other AHCI registers. Note: The implementation of this bit is dependent upon the value of the CAP.SAM bit. If CAP.SAM is '0', then GHC.AE should be RW and shall have a reset value of '0'. If CAP.SAM is '1', then GHC.AE shall be read only and shall have a reset value of '1'.
30:3	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
2	0h RO	**MSI Revert to Single Message (MRSM):** When set to 1 by hardware, indicates that the HBA requested more than one MSI vector but has reverted to using the first vector only. When this bit is cleared to 0, the HBA has not reverted to single MSI mode (i.e. hardware is already in single MSI mode, software has allocated the number of messages requested, or hardware is sharing interrupt vectors if MC.MME < MC.MMC). The HBA may revert to single MSI mode when the number of vectors allocated by the host is less than the number requested. This bit shall only be set to 1 when the following conditions hold: MC.MSIE = 1 (MSI is enabled) MC.MMC > 0 (multiple messages requested) MC.MME > 0 (more than one message allocated) MC.MME != MC.MMC (messages allocated not equal to number requested) When this bit is set to 1, single MSI mode operation is in use and software is responsible for clearing bits in the IS register to clear interrupts. This bit shall be cleared to 0 by hardware when any of the four conditions stated is false. This bit is also cleared to 0 when MC.MSIE = 1 and MC.MME = 0h. In this case, the hardware has been programmed to use single MSI mode, and is not reverting to that mode. For PCH, the HBA shall always revert to single MSI mode when the number of vectors allocated by the host is leass than the number requested. Value of MRSM is a don't care when GHC.HR=1.
1	0h RW	**Interrupt Enable (IE):** This global bit enables interrupts from the PCH. 0 = All interrupt sources from all ports are disabled. 1 = Interrupts are allowed from the AHCI controller.
0	0h RW/1S	**HBA Reset (HR):** Resets the PCH AHCI controller. 0 = No effect. 1 = When set by software, this bit causes an internal reset of the PCH AHCI controller. All state machines that relate to data transfers and native command queuing will return to an idle condition, and all ports are re-initialized using COMRESET.

22.2.3 Interrupt Status Register (IS)—Offset 8h

Interrupt Status Register. This register indicates which of the ports within the controller have an interrupt pending and require service.

Access Method

Type: MEM Register (Size: 32 bits)

Device: 23

Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RO	Reserved.
2	0h RW/1C	**Interrupt Pending Status Port 2 (IPS2):** This bit is only applicable to system that has Port 2 physically. 0 = No interrupt pending. 1 = Port 2 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt
1	0h RW/1C	**Interrupt Pending Status Port 1 (IPS1):** This bit is only applicable to system that has Port 1 physically. 0 = No interrupt pending. 1 = Port 1 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt.
0	0h RW/1C	**Interrupt Pending Status Port 0 (IPS0):** This bit is only applicable to system that has Port 0 physically. 0 = No interrupt pending. 1 = Port 0 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt.

22.2.4 Ports Implemented (GHC_PI)—Offset Ch

Ports Implemented. This register indicates which ports are exposed to the HBA. It is loaded by platform BIOS. It indicates which ports that the device supports are available for software to use. Any available port may not be implemented. This register is not reset by FLR. There is BIOS programming requirement on the PI register.

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RO	Reserved.
2	0h RW/O	**Port 2 Implemented (PI2):** 0 = The port is not implemented. 1 = The port is implemented. Note: This bit may be Reserved and is RO '0' depending on if port is available in the given SKU. Refer to Volume 1, Chapter 1 for details if port is available.
1	0h RW/O	**Port 1 Implemented (PI1):** 0 = The port is not implemented. 1 = The port is implemented.
0	0h RW/O	**Port 0 Implemented (PI0):** 0 = The port is not implemented. 1 = The port is implemented.

22.2.5 AHCI Version (VS)—Offset 10h

AHCI Version. This register indicates the major and minor version of the AHCI specification. It is BCD encoded. The upper two bytes represent the major version number, and the lower two bytes represent the minor version number. Example: Version 3.12 would be represented as 00030102h.

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: 10301h

Bit Range	Default and Access	Field Name (ID): Description
31:16	1h RO	**Major Version Number (MJR):** Indicates the major version is 1
15:0	301h RO	**Minor Version Number (MNR):** Indicates the minor version is 30

22.2.6 Enclosure Management Location (EM_LOC)—Offset 1Ch

Enclosure Management Location. The enclosure management location register identifies the location and size of the enclosure management message buffer. This register is not implemented if enclosure management is not supported (i.e. CAP.EMS = 0).

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: 1600002h

Bit Range	Default and Access	Field Name (ID): Description
31:16	160h RO	**Offset (OFST):** The offset of the message buffer in Dwords from the beginning of the ABAR.
15:0	2h RO	**Buffer Size (SZ):** Specifies the size of the transmit message buffer area in Dwords. If both transmit and receive buffers are supported, then the transmit buffer begins at ABAR[EM_LOC.OFST*4] and the receive buffer directly follows it. If both transmit and receive buffers are supported, both buffers are of the size indicated in the Buffer Size field. A value of 0 is invalid. Note that SATA controller only supports transmit buffer.

22.2.7 Enclosure Management Control (EM_CTL)—Offset 20h

Enclosure Management Control. This register is used to control and obtain status for the enclosure management interface. The register incluldes information on the attributes of the implementation, enclosure management messages supported, the status of the interface, whether any messages are pending, and is used to initiate sending messages. This register is not implemented if enclosure management is not supported (i.e. CAP.EMS = 0).

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: 7010000h

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27	0h RO	**Port Multiplier Support (ATTR_PM):** The HBA does not support enclosure management messages for devices attached via a Port Multiplier. Software should use the Serial ATA enclosure management bridge that is built into many Port Multipliers for enclosure services with these devices. For more information on Serial ATA enclosure management bridges, refer to the Serial ATA II: Extensions to Serial ATA 1.0a revision 1.2 specification.
26	1h RW/O	**Activity LED Hardware Driven (ATTR_ALHD):** If set to 1, the HBA drives the activity LED for the LED message type in hardware and does not utilize software settings for this LED. The HBA does not begin transmitting the hardware based activity signal until after software has written CTL.TM=1 after a reset condition.
25	1h RO	**Transmit Only (ATTR_XMT):** If set to 1, the HBA only supports transmitting messages and does not support receiving messages. If cleared to 0, the HBA supports transmitting and receiving messages.

Bit Range	Default and Access	Field Name (ID): Description
24	1h RO	**Single Message Buffer (ATTR_SMB):** If set to 1, the HBA has one message buffer that is shared for messages to transmit and messages received. In this case, unsolicited receive messages are not supported and it is software's responsibility to manage access to this buffer. If cleared to 0, there are separate receive and transmit buffers such that unsolicited messages could be supported.
23:20	0h RO	Reserved.
19	0h RO	**SGPIO Enclosure Management Messages (SUPP_SGPIO):** If set to 1, the HBA supports the SGPIO register interface message type.
18	0h RO	**SES-2 Enclosure Management Messages (SUPP_SES2):** If set to 1, the HBA supports the SES-2 message type.
17	0h RO	**SAF-TE Enclosure Management Messages (SUPP_SAFTE):** If set to 1, the HBA supports the SAF-TE message type.
16	1h RO	**LED Message Types (SUPP_LED):** If set to 1, the HBA supports the LED message type defined in LED Message Type.
15:10	0h RO	Reserved.
9	0h RW/1S	**Reset (RST):** When set to 1 by software, the HBA shall reset all enclosure management message logic and take all appropriate reset actions to ensure messages can be transmitted/received after the reset. After the HBA completes the reset operation, the HBA shall set the value to 0. A write of 0 by software to this field shall have no effect.
8	0h RW/1S	**Transmit Message (CTL_TM):** When set to 1 by software, the HBA shall transmit the message contained in the message buffer. When the message is completely sent, the HBA shall clear this bit to 0. A write of 0 to this bit by software shall have no effect. Software shall not change the contents of the message buffer while CTL.TM is set to 1.
7:1	0h RO	Reserved.
0	0h RO	**Message Received (STS_MR):** Message received is not supported.

22.2.8 HBA Capabilities Extended (GHC_CAP2)—Offset 24h

HBA Capabilities Extended. This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

Access Method

Type: MEM Register (Size: 32 bits)

Device: 23
Function: 0

Default: 3Ch

Bit Range	Default and Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5	1h RW/O	**DEVSLP Entrance from Slumber Only (DESO):** This bit specifies that the HBA shall only assert DEVSLP if the interface is in Slumber. 0 = The host may enter DEVSLP from any link state (active, Partial, or Slumber). 1 = The host shall ignore software directed entrance to DEVSLP by means of PxCMD.ICC bit unless PxSSTS.IPM = 6h.
4	1h RW/O	**Supports Aggressive DEVSLP Management (SADM):** 0 = Aggressive DEVSLP Management is not supported and software shall treat the PxDEVSLP.ADSE field as reserved. 1 = The host supports hardware assertion of the DEVSLP signal after the idle timeout expires.
3	1h RW/O	**Supports DEVSLP (SDS):** 0 = DEVSLP is not supported. 1 = Supports the DEVSLP feature.
2	1h RW/O	**Automatic Partial to Slumber Transitions (APST):** 0 = Automatic Partial to Slumber Transition is not supported. 1 = Supports Automatic Partial to Slumber Transitions.
1	0h RO	Reserved.
0	0h RO	**BIOS/OS Handoff (BOH):** Not supported.

22.2.9 Vendor Specific (VSP)—Offset A0h

Vendor Specific

Access Method

Type: MEM Register (Size: 32 bits)

Device: 23
Function: 0

Default: 48h

Bit Range	Default and Access	Field Name (ID): Description
31:7	0h RO	Reserved.
6	1h RO	**Software Feature Mask Supported (SFMS):** Set to 1 if the platform is enabled for premium storage features mask (SFM) as described in VS MMIO space at offset ABAR[RPID.(OFST*4)+4].
5	0h RO	**Premium Features Supported (PFS):** Set to 1 if the platform is enabled for premium storage features (PFB) as described in VS MMIO space at offset ABAR[RPID.OFST*4]. Set to 0 if the platform is not enabled for premium storage features.
4	0h RO	**Platform Type (PT):** Set to 1 if mobile platform. Clear (0) if desktop.
3	1h RO	**Supports RAID Platform ID Reporting (SRPIR):** If set to 1, then indicates that the RAID Platform ID is reported via ABAR + C0h. Set to 0 if this ID is not reported via MMIO space.
2:0	0h RO	Reserved.

22.2.10 Vendor Specific Capabilities Register (VS_CAP)—Offset A4h

Vendor Specific Capabilities Register

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: 1002DEh

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:16	10h RW/O	**NVM Remapped Register Offset (NRMO):** Specifies the offset (in 128B unit) within ABAR as to where the PCIe NAND memory BAR register space is remapped. For example, NRMO=1 means ABAR + 128B. This allows the remapped offset to shift between ABAR + 0B, and ABAR + 512KK - 128B, with 128B step. The remapped offset into the AHCI memory space must not overlap with the memory space used for SATA. The remapped offset into the AHCI memory space and the remapped size must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = 1. The reset default of this field is 10h, this places the start of the PCIe NAND memory BAR register space at ABAR + 2K. This field is not reset by FLR.
15:13	0h RO	Reserved.
12:1	16Fh RW/O	**Memory Space Limit. (MSL):** This field specifies the size (in 128B unit) of the remapped memory space for the PCIe NAND device. It is a 0-based field. For example, MSL=1 means 256B. This allows the remapped size to shift between 128B and 512K with the step of 128B.Memory BAR offset from 0 to MSL of the PCIe NAND device are remapped under the integrated AHCI controller memory space.The remapped offset into the AHCI memory space and the value programmed in this field must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = 1. The reset default of this field is 16Fh which specifies the size of the remapped memory space as 34k.This field is not reset by FLR.
0	0h RW/O	**PCIe NAND Memory BAR Remapped Enable (NRMBE):** Set to 1 if a PCIe NAND device is present and remapping of its memory BAR register space is enabled. Cleared to 0 if there is no PCIe NAND device present or the remapping of its memory BAR register space is disabled. This bit is not reset by FLR.

22.2.11 RAID Platform ID (RPID)—Offset C0h

RAID Platform ID. This register is used by the Intel Matrix Storage Manager OROM to match the features supported by the OROM with the platform on which the OROM is executing. This prevents the use of an OROM designed for newer chipsets from being use on older chipsets as this could reduce up-sell potential.

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: 311C02h

Bit Range	Default and Access	Field Name (ID): Description
31:16	31h RO	**Offset (OFST):** The offset of the Premium Feature Block (PFB) in DWords from the beginning of the ABAR. SFM follows directly after PFB.
15:0	1C02h RO	**RAID Platform ID (RPID):** Specifies the DID value that has been assigned to the platform. This is the same DID that is reported by the SATA controller when SATAGC.AIE is set to 1 except that the DID is always reported through this register, regardless if the programming of SATAGC.AIE.

22.2.12 Premium Feature Block (PFB)—Offset C4h

Access Method

Type: MEM Register (Size: 16 bits)
Device: 23
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
15:5	0h RO	Reserved.
4	0h RO	**Reserved (Reserved):** Read value is the same as VSP.PFS.
3	0h RO	**Reserved (Reserved):** Read value is the same as VSP.PFS.
2	0h RO	**Reserved (Reserved):** Read value is the same as VSP.PFS.
1	0h RO	**Supports Email Alert (SEA):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.
0	0h RO	**Supports OEM IOCTL (SOI):** Read value is the same as VSP.PFS. If set to 1, then this feature is supported as part of the premium feature set.

22.2.13 SW Feature Mask (SFM)—Offset C8h

SW Feature Mask. The following will be programmed by the BIOS when VS_CAP.SFMS == 1. The feature mask is used by SW to determine which non-premium features shall be supported by SW. These register bits are not reset by FLR since they are programmed by BIOS.

Access Method

Type: MEM Register (Size: 16 bits)
Device: 23
Function: 0

Default: 3Fh

Bit Range	Default and Access	Field Name (ID): Description
15:12	0h RO	Reserved.
11:10	0h RW/O	**OROM UI Normal Delay. (OROM_UI_Normal_Delay):** Values of these bits specify the delay of the OROM UI Splash Screen in a normal status. 00 = 2 secs (default and previous value); 01 = 4 secs; 10 = 6 secs; 11 = 8 secs. If bit 5 == 0, then these values are disregarded.
9	0h RW/O	**Smart Response Technology. (Smart_Response_Technology):** If set to '1', then Smart Response Technology is enabled. If cleared to '0', the feature is disabled.
8	0h RW/O	**RRT Only on ESATA (IRRT_Only_on_ESATA):** If set to 1, then only RRT volumes can span internal and external SATA ports (e.g. eSATA). If cleared to 0, then any RAID volume can span internal and external SATA ports (e.g. eSATA).
7	0h RW/O	**LED Locate (LED_Locate):** If set to 1, then LED/SGPIO hardware is attached and the ping to locate feature is enabled in the OS.
6	0h RW/O	**HDDUNLOCK (HDDUNLOCK):** If set to 1, then HDD password unlock is enabled in the OS.
5	1h RW/O	**OROM UI and BANNER (OROM_UI_and_BANNER):** If set to 1, then the OROM UI is displayed. When cleared to 0, the OROM UI and BANNER are not displayed if all disks and volumes have a normal status.
4	1h RW/O	**RRT (IRRT):** If set to 1, then Rapid Recovery Technology is enabled.
3	1h RW/O	**R5 (R5):** If set to 1, then RAID5 is enabled
2	1h RW/O	**R10 (R10):** If set to 1, then RAID10 is enabled
1	1h RW/O	**R1 (R1):** If set to 1, then RAID1 is enabled
0	1h RW/O	**R0 (R0):** If set to 1, then RAID0 is enabled

22.2.14 Port 0 Command List Base Address (P0CLB)—Offset 100h

Port 0 Command List Base Address

Access Method

Type: MEM Register (Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:10	0h RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. Note that these bits are not reset on a HBA reset.
9:0	0h RO	Reserved.

22.2.15 Port 0 Command List Base Address Upper 32-bits (P0CLBU)—Offset 104h

Port 0 Command List Base Address Upper 32-bits

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset.

22.2.16 Port 0 FIS Base Address (P0FB)—Offset 108h

Port 0 FIS Base Address

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. Note that these bits are not reset on a HBA reset.
7:0	0h RO	Reserved.

22.2.17 Port 0 FIS Base Address Upper 32-bits (P0FBU)—Offset 10Ch

Port 0 FIS Base Address Upper 32-bits

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. Note that these bits are not reset on a HBA reset.

22.2.18 Port 0 Interrupt Status (P0IS)—Offset 110h

Port 0 Interrupt Status

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW/1C	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0h RW/1C	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or Initiator abort.
28	0h RW/1C	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0h RW/1C	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0h RW/1C	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0h RO	Reserved.
24	0h RW/1C	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0h RW/1C	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during emuneration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.
22	0h RO	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0h RO	Reserved.
7	0h RW/1C	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0h RO	**Port Connect Change Status (PCS):** This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared. 1 = Change in Current Connect Status. 0 = No change in Current Connect Status.
5	0h RW/1C	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.

Bit Range	Default and Access	Field Name (ID): Description
4	0h RO	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0h RW/1C	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0h RW/1C	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0h RW/1C	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0h RW/1C	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

22.2.19 Port 0 Interrupt Enable (P0IE)—Offset 114h

Port 0 Interrupt Enable

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31	0h RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0h RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0h RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0h RW	**Host Bus Data Error Enable (HBDE):** When set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0h RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0h RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0h RO	Reserved.
24	0h RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interupt.
23	0h RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0h RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.

Bit Range	Default and Access	Field Name (ID): Description
21:8	0h RO	Reserved.
7	0h RW	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0h RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0h RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0h RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0h RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0h RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0h RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0h RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

22.2.20 Port 0 Command (P0CMD)—Offset 118h

Port 0 Command

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 4h

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. Writes to this field will cause actions on the interface, either as primitives or an OOB sequence, and the resulting status of the interface will be reported in the PxSSTS register. Value Definition Fh–9h Reserved 8h DEVSLP: This will cause the PCH to assert the DEVSLP signal associated with the port. The PCH will ignore the DEVSLP idle timeout value that is specified by PxDEVSLP.DITO. Software will only request DEVSLP when the interface is in an idle state (that is, PxCI is cleared to 0h and PxSACT is cleared to 0h). If the interface is not idle at the time this register is written, then the PCH will take no action and the interface will remain in its current state. If PxCAP2.DESO is set to '1' and PxSSTS.IPM is not set to '6h', then the host will take no action on the interface and will remain in its current state. Additionally, the HBA shall not assert the DEVSLP signal until PHYRDY has been achieved (after a previous de-assertion). 7h Reserved 6h Slumber: This will cause the PCH to request a transition of the interface to the slumber state. The SATA device may reject the request and the interface will remain in its current state. 5h–3h Reserved 2h Partial: This will cause the PCH to request a transition of the interface to the partial state. The SATA device may reject the request and the interface will remain in its current state. 1h Active: This will cause the PCH to request a transition of the interface into the active state. If the requested transition is from the DEVSLP state, then the host controller shall wait until PxDEVSLP.DMAT has expired before deasserting the DEVSLP Signal. 0h No-Op/Idle: When software reads this value, it indicates the PCH is not in the process of changing the interface state or sending a device reset, and a new link command may be issued. When system software writes a non-reserved value other than No-Op (0h), the HBA shall perform the action and update this field back to Idle (0h). If software writes to this field to change the state to a state the link is already in (i.e. interface is in the active state and a request is made to go to the active state), the HBA shall take no action and return this field to Idle. If the interface is in a low power state and the software wants to transition to a different low power state, software must first bring the link to active and then initiate the transition to the desired low power state (with the exception of DEVSLP). The transition to DEVSLP may occur from any other state if CAP2.DESO is cleared to '0'. If CAP2.DESO is set to '1', then DEVSLP may only be transitioned to if the link is in Slumber.
27	0h RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleard to 0., software shall treat this bit as reserved.
26	0h RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommeded to program this field to 1.
25	0h RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0.. This bit is set by software
24	0h RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0h RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** 0 = This port will not perform Automatic Partial to Slumber Transitions. 1 = The HBA may perform Automatic Partial to Slumber Transitions. Note: Software shall only set this bit to '1' if CAP2.APST is set to '1'; if CAP2.APST is cleared to '0' software shall treat this bit as reserved.
22	0h RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0h RW/O	**External SATA Port (ESP):** 0 = This port supports internal SATA devices only. 1 = This port will be used with an external SATA device and hot-plug is supported. When set, CAP.SXS must also be set. This bit is not reset by Function Level Reset.

Bit Range	Default and Access	Field Name (ID): Description
20	0h RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0h RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0h RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user. 0 = Port is not capable of hot-plug. 1 = Port is hot-plug capable. The HBA takes no action on the state of this bit – it is for system software only. For example, if this bit is cleared, and a hot plug event occurs, the HBA shall still treat it as a proper hot plug event. Note: This bit is not reset on a HBA reset. This field is not reset by FLR.
17	0h RO	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1.. Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.
16	0h RO	Reserved.
15	0h RO	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0h RO	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0h RO	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	0h RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7	0h RO	Reserved.
6	0h RO	**PHYSLP Present (PSP):** If set to '1', the platform supports PHYSLP on this port. If cleared to '0', the platform does not support PHYSLP on this port. This bit may only be set to '1' if CAP2.SPS is set to '1'.
5	0h RO	Reserved.
4	0h RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0h RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.

Bit Range	Default and Access	Field Name (ID): Description
2	1h RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0h RW	**Spin-Up Device (SUD):** This bit is read/write and default to 0 for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1 for HBAs that do not support staggered spin-up. 0 = No Action 1 = On an edge detect from 0 to 1, the PCH shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to 0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0 and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0h RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 ot a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

22.2.21 Port 0 Task File Data (P0TFD)—Offset 120h

Port 0 Task File Data

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: 9h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	0h RO	**Error (ERR):** Contains the latest copy of the task file error register.
7	0h RO	**Status Busy (STS_BSY):** Status - Indicates the interface is busy.
6:4	0h RO	Reserved.
3	1h RO	**Status Drq (STS_DRQ):** Status - Indicates a data transfer is requested.
2:1	0h RO	Reserved.
0	1h RO	**Status Err (STS_ERR):** Status - Indicates an error during the transfer.

22.2.22 Port 0 Signature (P0SIG)—Offset 124h

Port 0 Signature

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: FFFFFFFFh

Bit Range	Default and Access	Field Name (ID): Description
31:0	FFFFFFFFh RO	**Signature (SIG):** Contains the signature received from a device on the first D2H Register FIS. The bit order is as follows: Bit Field 31:24 LBA High Register 23:16 LBA Mid Register 15:8 LBA Low Register 7:0 Sector Count Register

22.2.23 Port 0 Serial ATA Status (P0SSTS)—Offset 128h

Port 0 Serial ATA Status

Access Method

Type: MEM Register (Size: 32 bits)

Device: 23

Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RO	Reserved.
11:8	0h RO	**Interface Power Management (IPM):** Indicates the current interface state. Value Description 0h Device not present or communication not established 1h Interface in active state 2h Interface in PARTIAL power management state 6h Interface in SLUMBER power management state 8h DEVSLP asserted All other values reserved. This field reflects the interface power management state for both device and host initiated power management. Note: If an Automatic Partial to Slumber Transition occurs, PxSSTS.IPM shall reflect that the host has entered Slumber (PxSSTS.IPM = '6h').
7:4	0h RO	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed. Value Description 0h Device not present or communication not established 1h Generation 1 communication rate negotiated 2h Generation 2 communication rate negotiated 3h Generation 3 communication rate negotiated All other values reserved.
3:0	0h RO	**Device Detection (DET):** Indicates the interface device detection and Phy state. Value Description 0h No device detected and Phy communication not established 1h Device presence detected but Phy communication not established 3h Device presence detected and Phy communication established 4h Phy in offline mode as a result of the interface being disabled or running in a BIST loopback mode All other values reserved. Note: While the true reset default value of this register is 0h, the value read from this register depends on drive presence and the point in time within the initialization process when the register is read. Note: The means by which the implementation determines device presence may be vendor specific. However, device presence shall always be indicated anytime a COMINIT signal is received.

22.2.24 Port 0 Serial ATA Control (P0SCTL)—Offset 12Ch

Port 0 Serial ATA Control

Access Method

Type: MEM Register
(Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19:16	0h RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0h RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0h RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKp any request from the device to enter that state. Value Description 0h No interface restrictions 1h Transitions to the PARTIAL state disabled 2h Transitions to the SLUMBER state disabled 3h Transitions to both PARTIAL and SLUMBER states disabled 4h Transitions to the DEVSLP power management state are disabled 5h Transitions to the Partial and DEVSLP power management states are disabled 6h Transitions to the Slumber and DEVSLP power management states are disabled 7h Transitions to the Partial, Slumber and DEVSLP power management states are disabled All other values reserved.
7:4	0h RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface. Value Description 0h No speed negotiation restrictions 1h Limit speed negotiation to Generation 1 communication rate 2h Limit speed negotiation to a rate not greater than Generation 2 communication rate 3h Limit speed negotiation to a rate not greater than Generation 3 communication rate All other values reserved Note: If software changes SPD after port has been enabled, software is required to perform a port reset via DET=1h.
3:0	0h RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization. Value Description 0h No device detection or initialization action requested. 1h Perform interface communication initialization sequence to establish communication. This is functionally equivalent to a hard reset and results in the interface being reset and communications reinitialized. While this field is 1h, COMRESET is continuously transmitted on the interface. Software should leave the DET field set to 1h for a minimum of 1 millisecond to ensure that a COMRESET is sent on the interface. 4h Disable the Serial ATA interface and put Phy in offline mode. All other values reserved. This field may only be changed when PxCMD.ST is '0'. Changing this field while the HBA is running results in undefined behavior. When PxCMD.ST is set to '1', this field should have a value of 0h. Note: It is permissible to implement any of the Serial ATA defined behaviors for transmission of COMRESET when PxSCTL.DET = 1h.

22.2.25 Port 0 Serial ATA Error (P0SERR)—Offset 130h

Port 0 Serial ATA Error

Access Method

Type: MEM Register (Size: 32 bits)

Device: 23
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/1C	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. Bit Field 31:27 Reserved 26 Exchanged (X): When set to one this bit indicates that a change in device presence has been detected since the last time this bit was cleared. The means by which the implementation determines that the device presence has changed is vendor specific. This bit shall always be set to one anytime a COMINIT signal is received. This bit is reflected in the P0IS.PCS bit. 25 Unrecognized FIS Type (F): Indicates that one or more FISs were received by the Transport layer with good CRC, but had a type field that was not recognized/known. 24 Transport state transition error (T): Indicates that an error has occurred in the transition from one state to another within the Transport layer since the last time this bit was cleared. 23 Link Sequence Error (S): Indicates that one or more Link state machine error conditions were encountered. The Link Layer state machine defines the conditions under which the link layer detects an erroneous transition. 22 Handshake Error (H): Indicates that one or more R_ERR handshake response was received in response to frame transmission. Such errors may be the result of a CRC error detected by the recipient, a disparity or 8b/10b decoding error, or other error condition leading to a negative handshake on a transmitted frame. 21 CRC Error (C): Indicates that one or more CRC errors occurred with the Link Layer. 20 Disparity Error (D): This field is not used by AHCI. 19 10B to 8B Decode Error (B): Indicates that one or more 10B to 8B decoding errors occurred. 18 Comm Wake (W): Indicates that a Comm Wake signal was detected by the Phy. 17 Phy Internal Error (I): Indicates that the Phy detected some internal error. 16 PhyRdy Change (N): When set to 1 this bit indicates that the internal PhyRdy signal changed state since the last time this bit was cleared. The state of this bit is reflected in the PxIS.PRCS interrupt status bit and an interrupt will be generated if enabled.
15:0	0h RW/1C	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. Bit Field 15:12 Reserved 11 Internal Error (E): The SATA controller failed due to a Initiator or target abort when attempting to access system memory. 10 Protocol Error (P): A violation of the Serial ATA protocol was detected. 9 Persistent Communication or Data Integrity Error (C): A communication error that was not recovered occurred that is expected to be persistent. Persistent communications errors may arise from faulty interconnect with the device, from a device that has been removed or has failed, or a number of other causes. 8 Transient Data Integrity Error (T): A data integrity error occurred that was not recovered by the interface. 7:2 Reserved 1 Recovered Communications Error (M): Communications between the device and host was temporarily lost but was re-established. This can arise from a device temporarily being removed, from a temporary loss of Phy synchronization, or from other causes and may be derived from the PhyNRdy signal between the Phy and Link layers. 0 Recovered Data Integrity Error (I): A data integrity error occurred that was recovered by the interface through a retry operation or other recovery action.

22.2.26 Port 0 Serial ATA Active (P0SACT)—Offset 134h

Port 0 Serial ATA Active

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/1S	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS. This field is also cleared when PxCMD.ST is cleared by software. Note that this field is not cleared by COMRESET or SRST.

22.2.27 Port 0 Command Issue (P0CI)—Offset 138h

Port 0 Commands Issued

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to '1' by software when PxCMD.ST is set to '1'. This field is also cleared when PxCMD.ST is written from a '1' to a '0' by software.

22.2.28 Port 0 Device Sleep (P0DEVSLP)—Offset 144h

Port 0 Device Sleep

Access Method

Type: MEM Register (Size: 32 bits)
Device: 23
Function: 0

Default: 1E022852h

Bit Range	Default and Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:25	Fh RW/O	**DITO Multiplier (DM):** DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. The HBA computes the total idle timeout as a product of DM and DITO (i.e. DITO actual = DITO * (DM+1)). Note: These bits are not reset by controller reset.
24:15	4h RW	**DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal. Hardware reloads its port specific DEVSLP timer with this value each time the port transitions out of DEVSLP state. For example: from DEVSLP to active or PxDEVSLP.ADSE transitions from 0 to a 1. If CAP2.SDS or CAP2.SADM or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0 and PxDEVSLP.ADSE is cleared to 0. Note: These bits are not reset by controller reset.
14:10	Ah RW	**DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granulatity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The norminal value is 10ms and the minimum is 1ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h. Note: These bits are not reset by controller reset.
9:2	14h RW	**DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The norminal value is 20ms while the max value is 255ms depending on device identification information. If CAP2.SDS is cleared to 0 or PxDEVSLP.DSP is cleared to 0 then these bits are read-only 0h and software shall treat these bits as reserved. Software shall only set this value when PxCMD.ST is cleared to 0, PxDEVSLP.ADSE is cleared to 0, and prior to setting PxCMD.ICC to 8h. Note: These bits are not reset by controller reset.
1	1h RW/O	**DEVSLP Present (DSP):** If set to '1', the platform supports DEVSLP on this port. If cleared to '0', the platform does not support DEVSLP on this port. This bit may only be set to '1' if CAP2.SDS is set to '1'. DSP is mutually exclusive with the PxCMD.HPCP bit and PxCMD.ESP bit. BIOS is required to program this field to ‘1’ if the system supports the DEVSLP feature. Note: These bits are not reset by controller reset.
0	0h RW	**Aggressive DEVSLP Enable (ADSE):** This bit is read/write for HBAs that support aggressive DEVSLP management (CAP2. SADM = '1'). When this bit is set to '1', the HBA shall assert the DEVSLP signal after the port has been idle (PxCI = 0h and PxSACT = 0h) for the amount of time specified by the PxDEVSLP.DITO register and the interface is in Slumber (PxSSTS.IPM = 6h). When this bit is cleared to '0', the HBA does not enter DEVSLP unless software directed via PxCMD.ICC. This bit shall only be set to '1' if PxDEVSLP.DSP is set to '1'. If this bit is set to '1' and software clears the bit to '0', then the HBA shall de-assert the DEVSLP signal if asserted. Note that these bits are not reset on a HBA reset. BIOS is recommended to program this field to '1' if the platform support the DEVSLP feature. If CAP2.SDS is cleared to '0' or CAP2.SADM is cleared to '0', or if PxDEVSLP.DSP is cleared to '0' then these bits are read-only 0h and software shall treat these bits as reserved.

22.2.29 Port 1 Command List Base Address (P1CLB)—Offset 180h

Same bit definition as P0CLB.

22.2.30 Port 1 Command List Base Address Upper 32-bits (P1CLBU)—Offset 184h

Same bit definition as P0CLBU.

22.2.31 Port 1 FIS Base Address (P1FB)—Offset 188h

Same bit definition as P0FB.

22.2.32 Port 1 FIS Base Address Upper 32-bits (P1FBU)—Offset 18Ch

Same bit definition as P0FBU.

22.2.33 Port 1 Interrupt Status (P1IS)—Offset 190h

Same bit definition as P0IS.

22.2.34 Port 1 Interrupt Enable (P1IE)—Offset 194h

Same bit definition as P0IE.

22.2.35 Port 1 Command (P1CMD)—Offset 198h

Same bit definition as P0CMD.

22.2.36 Port 1 Task File Data (P1TFD)—Offset 1A0h

Same bit definition as P0TFD.

22.2.37 Port 1 Signature (P1SIG)—Offset 1A4h

Same bit definition as P0SIG.

22.2.38 Port 1 Serial ATA Status (P1SSTS)—Offset 1A8h

Same bit definition as P0SSTS.

22.2.39 Port 1 Serial ATA Control (P1SCTL)—Offset 1ACh

Same bit definition as P0SCTL.

22.2.40 Port 1 Serial ATA Error (P1SERR)—Offset 1B0h

Same bit definition as P0SERR.

22.2.41 Port 1 Serial ATA Active (P1SACT)—Offset 1B4h

Same bit definition as P0SACT.

22.2.42 Port 1 Command Issue (P1CI)—Offset 1B8h

Same bit definition as P0CI.

22.2.43 Port 1 Device Sleep (P1DEVSLP)—Offset 1C4h

Same bit definition as P0DEVSLP.

22.3 SATA AIDP Registers

SATA AHCI IO INDEX + DATA Registers

Table 22-3. Summary of SATA AIDP Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
10h	13h	AHCI Index Register (INDEX)—Offset 10h	0h
14h	17h	AHCI Data Register (DATA)—Offset 14h	0h

22.3.1 AHCI Index Register (INDEX)—Offset 10h

This registers are only available if CC.SCC is not 01h to index into all memory registers defined in Memory Registers and the message buffer used for enclosure management. If CC.SCC is 01h, these AHCI Index Data Pair registers are not accessible and SINDEX/SDATA register pair shall be used to index into a subset of the memory registers.(See Memory Registers for more information on which registers could be indexed).

Access Method

Type: IO Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:19	0h RO	Reserved.
18:2	0h RW	**Index (INDEX):** This Index register is used to select the Dword offset of the Memory Mapped AHCI register to be accessed. A Dword, Word or Byte access is specified by the active byte enables of the I/O access to the Data register.
1:0	0h RO	Reserved.

22.3.2 AHCI Data Register (DATA)—Offset 14h

This registers are index into all memory registers defined in Memory Registers and the message buffer used for enclosure management.

Access Method

Type: IO Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Data (DATA):** This Data register is a window through which data is read or written to the memory mapped register pointed to by the Index register. Note that a physical register is not actually implemented as the data is actually stored in the memory mapped registers. Since this is not a physical register, the default value is the same as the default value of the register pointed to by Index.

22.4 SATA MXPBA Registers

SATA MSI-X Pending Bit Array Registers

Table 22-4. Summary of SATA MXPBA Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	MSI-X Pending Bit Array QW 0 (MXPQW0_DW0)—Offset 0h	0h

22.4.1 MSI-X Pending Bit Array QW 0 (MXPQW0_DW0)—Offset 0h

MSI-X Pending Bit Array QW 0

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RO/V	**MSI-X vector Pending (MXVP):** For each Pending Bit that is set, the function has a pending message for the associated MSI-X Table entry. Pending bits that have no associated MSI-X Table entry are reserved. After reset, the state of reserved Pending bits must be 0. Software should never write, and should only read Pending Bits. If software writes to Pending Bits, the result is undefined. Each Pending Bit's state after reset is 0 (no message pending).

22.5 SATA MXTBA Registers

SATA MSI-X Table Entry Registers

Table 22-5. Summary of SATA MXTBA Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	MSI-X Table Entries 0 Message Lower Address (MXTE0MLA)—Offset 0h	0h
4h	7h	MSI-X Table Entries 0 Message Upper Address (MXTE0MUA)—Offset 4h	0h
8h	Bh	MSI-X Table Entries 0 Message Data (MXTE0MD)—Offset 8h	0h
Ch	Fh	MSI-X Table Entries 0 Vector Control (MXTE0VC)—Offset Ch	1h
10h	13h	MSI-X Table Entries 1 Message Lower Address (MXTE1MLA)—Offset 10h	0h
14h	17h	MSI-X Table Entries 1 Message Upper Address (MXTE1MUA)—Offset 14h	0h
18h	1Bh	MSI-X Table Entries 1 Message Data (MXTE1MD)—Offset 18h	0h
1Ch	1Fh	MSI-X Table Entries 1 Vector Control (MXTE1VC)—Offset 1Ch	1h
20h	23h	MSI-X Table Entries 2 Message Lower Address (MXTE2MLA)—Offset 20h	0h
24h	27h	MSI-X Table Entries 2 Message Upper Address (MXTE2MUA)—Offset 24h	0h
28h	2Bh	MSI-X Table Entries 2 Message Data (MXTE2MD)—Offset 28h	0h
2Ch	2Fh	MSI-X Table Entries 2 Vector Control (MXTE2VC)—Offset 2Ch	1h
30h	33h	MSI-X Table Entries 3 Message Lower Address (MXTE3MLA)—Offset 30h	0h
34h	37h	MSI-X Table Entries 3 Message Upper Address (MXTE3MUA)—Offset 34h	0h
38h	3Bh	MSI-X Table Entries 3 Message Data (MXTE3MD)—Offset 38h	0h
3Ch	3Fh	MSI-X Table Entries 3 Vector Control (MXTE3VC)—Offset 3Ch	1h
40h	43h	MSI-X Table Entries 4 Message Lower Address (MXTE4MLA)—Offset 40h	0h
44h	47h	MSI-X Table Entries 4 Message Upper Address (MXTE4MUA)—Offset 44h	0h
48h	4Bh	MSI-X Table Entries 4 Message Data (MXTE4MD)—Offset 48h	0h
4Ch	4Fh	MSI-X Table Entries 4 Vector Control (MXTE4VC)—Offset 4Ch	1h
50h	53h	MSI-X Table Entries 5 Message Lower Address (MXTE5MLA)—Offset 50h	0h
54h	57h	MSI-X Table Entries 5 Message Upper Address (MXTE5MUA)—Offset 54h	0h
58h	5Bh	MSI-X Table Entries 5 Message Data (MXTE5MD)—Offset 58h	0h
5Ch	5Fh	MSI-X Table Entries 5 Vector Control (MXTE5VC)—Offset 5Ch	1h
60h	63h	MSI-X Table Entries 6 Message Lower Address (MXTE6MLA)—Offset 60h	0h
64h	67h	MSI-X Table Entries 6 Message Upper Address (MXTE6MUA)—Offset 64h	0h
68h	6Bh	MSI-X Table Entries 6 Message Data (MXTE6MD)—Offset 68h	0h
6Ch	6Fh	MSI-X Table Entries 6 Vector Control (MXTE6VC)—Offset 6Ch	1h
70h	73h	MSI-X Table Entries 7 Message Lower Address (MXTE7MLA)—Offset 70h	0h
74h	77h	MSI-X Table Entries 7 Message Upper Address (MXTE7MUA)—Offset 74h	0h
78h	7Bh	MSI-X Table Entries 7 Message Data (MXTE7MD)—Offset 78h	0h
7Ch	7Fh	MSI-X Table Entries 7 Vector Control (MXTE7VC)—Offset 7Ch	1h

22.5.1 MSI-X Table Entries 0 Message Lower Address (MXTE0MLA)—Offset 0h

MSI-X Table Entries 0 Message Lower Address

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**MSI-X message lower address (MXMLA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.
1:0	0h RO	Reserved.

22.5.2 MSI-X Table Entries 0 Message Upper Address (MXTE0MUA)—Offset 4h

MSI-X Table Entries 0 Message Upper Address

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message upper 32-bit address (MXMUA):** Specifies the upper 32-bit of the MSI-X Message.

22.5.3 MSI-X Table Entries 0 Message Data (MXTE0MD)—Offset 8h

MSI-X Table Entries 0 Message Data

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message Data (MXMD):** Specifies the 32-bit Data of the MSI-X Message.

22.5.4 MSI-X Table Entries 0 Vector Control (MXTE0VC)—Offset Ch

MSI-X Table Entries 0 Vector Control

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	1h RW	**MSI-X vector Mask (MXVM):** When this bit is set, the function is prohibited from sending a message using this MSI-X Table entry. However, any other MSI-X Table entries programmed with the same vector will still be capable of sending an equivalent message unless they are also masked. This bit's state after reset is 1 (entry is masked).

22.5.5 MSI-X Table Entries 1 Message Lower Address (MXTE1MLA)—Offset 10h

MSI-X Table Entries 1 Message Lower Address

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**MSI-X message lower address (MXMLA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.
1:0	0h RO	Reserved.

22.5.6 MSI-X Table Entries 1 Message Upper Address (MXTE1MUA)—Offset 14h

MSI-X Table Entries 1 Message Upper Address

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message upper 32-bit address (MXMUA):** Specifies the upper 32-bit of the MSI-X Message

22.5.7 MSI-X Table Entries 1 Message Data (MXTE1MD)—Offset 18h

MSI-X Table Entries 1 Message Data

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message Data (MXMD):** Specifies the 32-bit Data of the MSI-X Message.

22.5.8 MSI-X Table Entries 1 Vector Control (MXTE1VC)—Offset 1Ch

MSI-X Table Entries 1 Vector Control

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	1h RW	**MSI-X vector Mask (MXVM):** When this bit is set, the function is prohibited from sending a message using this MSI-X Table entry. However, any other MSI-X Table entries programmed with the same vector will still be capable of sending an equivalent message unless they are also masked. This bit's state after reset is 1 (entry is masked).

22.5.9 MSI-X Table Entries 2 Message Lower Address (MXTE2MLA)—Offset 20h

MSI-X Table Entries 2 Message Lower Address

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**MSI-X message lower address (MXMLA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.
1:0	0h RO	Reserved.

22.5.10 MSI-X Table Entries 2 Message Upper Address (MXTE2MUA)—Offset 24h

MSI-X Table Entries 2 Message Upper Address

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message upper 32-bit address (MXMUA):** Specifies the upper 32-bit of the MSI-X Message

22.5.11 MSI-X Table Entries 2 Message Data (MXTE2MD)—Offset 28h

MSI-X Table Entries 2 Message Data

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message Data (MXMD):** Specifies the 32-bit Data of the MSI-X Message.

22.5.12 MSI-X Table Entries 2 Vector Control (MXTE2VC)—Offset 2Ch

MSI-X Table Entries 2 Vector Control

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	1h RW	**MSI-X vector Mask (MXVM):** When this bit is set, the function is prohibited from sending a message using this MSI-X Table entry. However, any other MSI-X Table entries programmed with the same vector will still be capable of sending an equivalent message unless they are also masked. This bit's state after reset is 1 (entry is masked).

22.5.13 MSI-X Table Entries 3 Message Lower Address (MXTE3MLA)—Offset 30h

MSI-X Table Entries 3 Message Lower Address

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**MSI-X message lower address (MXMLA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.
1:0	0h RO	Reserved.

22.5.14 MSI-X Table Entries 3 Message Upper Address (MXTE3MUA)—Offset 34h

MSI-X Table Entries 3 Message Upper Address

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message upper 32-bit address (MXMUA):** Specifies the upper 32-bit of the MSI-X Message

22.5.15 MSI-X Table Entries 3 Message Data (MXTE3MD)—Offset 38h

MSI-X Table Entries 3 Message Data

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message Data (MXMD):** Specifies the 32-bit Data of the MSI-X Message.

22.5.16 MSI-X Table Entries 3 Vector Control (MXTE3VC)—Offset 3Ch

MSI-X Table Entries 3 Vector Control

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	1h RW	**MSI-X vector Mask (MXVM):** When this bit is set, the function is prohibited from sending a message using this MSI-X Table entry. However, any other MSI-X Table entries programmed with the same vector will still be capable of sending an equivalent message unless they are also masked. This bit's state after reset is 1 (entry is masked).

22.5.17 MSI-X Table Entries 4 Message Lower Address (MXTE4MLA)—Offset 40h

MSI-X Table Entries 4 Message Lower Address

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**MSI-X message lower address (MXMLA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.
1:0	0h RO	Reserved.

22.5.18 MSI-X Table Entries 4 Message Upper Address (MXTE4MUA)—Offset 44h

MSI-X Table Entries 4 Message Upper Address

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message upper 32-bit address (MXMUA):** Specifies the upper 32-bit of the MSI-X Message

22.5.19 MSI-X Table Entries 4 Message Data (MXTE4MD)—Offset 48h

MSI-X Table Entries 4 Message Data

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message Data (MXMD):** Specifies the 32-bit Data of the MSI-X Message.

22.5.20 MSI-X Table Entries 4 Vector Control (MXTE4VC)—Offset 4Ch

MSI-X Table Entries 4 Vector Control

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	1h RW	**MSI-X vector Mask (MXVM):** When this bit is set, the function is prohibited from sending a message using this MSI-X Table entry. However, any other MSI-X Table entries programmed with the same vector will still be capable of sending an equivalent message unless they are also masked. This bit's state after reset is 1 (entry is masked).

22.5.21 MSI-X Table Entries 5 Message Lower Address (MXTE5MLA)—Offset 50h

MSI-X Table Entries 5 Message Lower Address

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**MSI-X message lower address (MXMLA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.
1:0	0h RO	Reserved.

22.5.22 MSI-X Table Entries 5 Message Upper Address (MXTE5MUA)—Offset 54h

MSI-X Table Entries 5 Message Upper Address

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message upper 32-bit address (MXMUA):** Specifies the upper 32-bit of the MSI-X Message

22.5.23 MSI-X Table Entries 5 Message Data (MXTE5MD)—Offset 58h

MSI-X Table Entries 5 Message Data

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message Data (MXMD):** Specifies the 32-bit Data of the MSI-X Message.

22.5.24 MSI-X Table Entries 5 Vector Control (MXTE5VC)—Offset 5Ch

MSI-X Table Entries 5 Vector Control

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	1h RW	**MSI-X vector Mask (MXVM):** When this bit is set, the function is prohibited from sending a message using this MSI-X Table entry. However, any other MSI-X Table entries programmed with the same vector will still be capable of sending an equivalent message unless they are also masked. This bit's state after reset is 1 (entry is masked).

22.5.25 MSI-X Table Entries 6 Message Lower Address (MXTE6MLA)—Offset 60h

MSI-X Table Entries 6 Message Lower Address

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**MSI-X message lower address (MXMLA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.
1:0	0h RO	Reserved.

22.5.26 MSI-X Table Entries 6 Message Upper Address (MXTE6MUA)—Offset 64h

MSI-X Table Entries 6 Message Upper Address

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message upper 32-bit address (MXMUA):** Specifies the upper 32-bit of the MSI-X Message

22.5.27 MSI-X Table Entries 6 Message Data (MXTE6MD)—Offset 68h

MSI-X Table Entries 6 Message Data

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message Data (MXMD):** Specifies the 32-bit Data of the MSI-X Message.

22.5.28 MSI-X Table Entries 6 Vector Control (MXTE6VC)—Offset 6Ch

MSI-X Table Entries 6 Vector Control

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	1h RW	**MSI-X vector Mask (MXVM):** When this bit is set, the function is prohibited from sending a message using this MSI-X Table entry. However, any other MSI-X Table entries programmed with the same vector will still be capable of sending an equivalent message unless they are also masked. This bit's state after reset is 1 (entry is masked).

22.5.29 MSI-X Table Entries 7 Message Lower Address (MXTE7MLA)—Offset 70h

MSI-X Table Entries 7 Message Lower Address

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**MSI-X message lower address (MXMLA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.
1:0	0h RO	Reserved.

22.5.30 MSI-X Table Entries 7 Message Upper Address (MXTE7MUA)—Offset 74h

MSI-X Table Entries 7 Message Upper Address

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message upper 32-bit address (MXMUA):** Specifies the upper 32-bit of the MSI-X Message

22.5.31 MSI-X Table Entries 7 Message Data (MXTE7MD)—Offset 78h

MSI-X Table Entries 7 Message Data

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**MSI-X message Data (MXMD):** Specifies the 32-bit Data of the MSI-X Message.

22.5.32 MSI-X Table Entries 7 Vector Control (MXTE7VC)—Offset 7Ch

MSI-X Table Entries 7 Vector Control

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1h

Bit Range	Default and Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	1h RW	**MSI-X vector Mask (MXVM):** When this bit is set, the function is prohibited from sending a message using this MSI-X Table entry. However, any other MSI-X Table entries programmed with the same vector will still be capable of sending an equivalent message unless they are also masked. This bit's state after reset is 1 (entry is masked).

23 Intel® CSE: HECI Interface (D22:F0/F1/F4/F5)

23.1 Intel® CSE:HECI PCI Configuration Registers

Table 23-1. Summary of Intel® CSE:HECI PCI Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	HECI ID (HECI1_ID)—Offset 0h	XXXX8086h
4h	5h	HECI Command (HECI1_CMD)—Offset 4h	0h
6h	7h	HECI Status (HECI1_STS)—Offset 6h	10h
8h	Bh	Revision ID And Class Code (HECI1_RID_CC)—Offset 8h	78000XXh
Ch	Ch	Cache Line Size (HECI1_CLS)—Offset Ch	0h
Dh	Dh	Initiator Latency Timer (HECI1_MLT)—Offset Dh	0h
Eh	Eh	Header Type (HECI1_HTYPE)—Offset Eh	80h
Fh	Fh	Built In Self-Test (HECI1_BIST)—Offset Fh	0h
10h	13h	HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h	4h
14h	17h	HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h	0h
2Ch	2Fh	Sub System Identifiers (HECI1_SS)—Offset 2Ch	0h
34h	37h	Capabilities Pointer (HECI1_CAP)—Offset 34h	50h
3Fh	3Fh	Maximum Latency (HECI1_MLAT)—Offset 3Fh	0h
40h	43h	Host Firmware Status (HECI1_HFS)—Offset 40h	0h
44h	47h	Miscellaneous Shadow (HECI1_MISC_SHDW)—Offset 44h	80000000h
48h	4Bh	General Status Shadow 1 (HECI1_GS_SHDW1)—Offset 48h	0h
4Ch	4Fh	Host General Status (HECI1_H_GS1)—Offset 4Ch	0h
50h	51h	PCI Power Management Capability ID (HECI1_PID)—Offset 50h	8C01h
52h	53h	PCI Power Management Capabilities (HECI1_PC)—Offset 52h	4003h
64h	67h	General Status Shadow 3 (HECI1_GS_SHDW3)—Offset 64h	0h
68h	6Bh	General Status Shadow 4 (HECI1_GS_SHDW4)—Offset 68h	0h
6Ch	6Fh	General Status Shadow 5 (HECI1_GS_SHDW5)—Offset 6Ch	0h
70h	73h	Host General Status 2 (HECI1_H_GS2)—Offset 70h	0h
74h	77h	Host General Status 3 (HECI1_H_GS3)—Offset 74h	0h
8Ch	8Dh	Message Signaled Interrupt Identifiers (HECI1_MID)—Offset 8Ch	A405h
8Eh	8Fh	Message Signaled Interrupt Message Control (HECI1_MC)—Offset 8Eh	80h
90h	93h	Message Signaled Interrupt Message Address (HECI1_MA)—Offset 90h	0h
94h	97h	Message Signaled Interrupt Upper Address (HECI1_MUA)—Offset 94h	0h
98h	99h	Message Signaled Interrupt Message Data (HECI1_MD)—Offset 98h	0h
A0h	A0h	HECI Interrupt Delivery Mode (HECI1_HIDM)—Offset A0h	0h
ACh	AFh	SW LTR Pointer Register (HECI1_SWLTRPTR)—Offset ACh	0h
B0h	B3h	Device Idle Pointer Register (HECI1_DEVIDLEPTR)—Offset B0h	8001h

Table 23-1. Summary of Intel® CSE:HECI PCI Configuration Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
B6h	B7h	DevIdle Power Control Enabled Register (HECI1_PWRCTRLEN)—Offset B6h	Eh
CCh	CFh	Host Extend Register DW4 (HECI1_HER4)—Offset CCh	0h
D4h	D7h	Host Extend Register DW6 (HECI1_HER6)—Offset D4h	0h
D8h	DBh	Host Extend Register DW7 (HECI1_HER7)—Offset D8h	0h
DCh	DFh	Host Extend Register DW8 (HECI1_HER8)—Offset DCh	0h

23.1.1 HECI ID (HECI1_ID)—Offset 0h

Identification

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: XXXX8086h

Bit Range	Default and Access	Field Name (ID): Description
31:16	-- RO/V	**Device ID (DID):** Indicates what device number assigned by Intel. Refer to the Device and Revision ID Table in Volume 1 for default value.
15:0	8086h RO	**Vendor ID (VID):** 16-bit field which indicates Intel is the vendor.

23.1.2 HECI Command (HECI1_CMD)—Offset 4h

Command

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts. This bit does not have any effect on MSI operation.
9	0h RO	**Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0.

Bit Range	Default and Access	Field Name (ID): Description
8	0h RO	**SERR# Enable (SEE):** Not implemented, hardwired to 0.
7	0h RO	**Wait Cycle Enable (WCC):** Not implemented, hardwired to 0.
6	0h RO	**Parity Error Response Enable (PEE):** Not implemented, hardwired to 0.
5	0h RO	**VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0
4	0h RO	**Memory Write And Invalidate Enable (MWIE):** Not implemented, hardwired to 0.
3	0h RO	**Special Cycle Enable (SCE):** Not implemented, hardwired to 0.
2	0h RW	**Bus Initiator Enable (BME):** Controls the HECI host controller's abiity to act as a system memory Initiator for data transfers. When this bit is cleared, HECI bus Initiator activity stops and any active DMA engines return to an idle condition. This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA. When this bit is '0', HECI is blocked from generating MSI to the host CPU. Note that this bit does not block HECI accesses to CSE-UMA.
1	0h RW	**Memory Space Enable (MSE):** Controls access to the HECI host controller's memory mapped register space.
0	0h RO	**I/O Space Enable (IOSE):** Not implemented, hardwired to 0.

23.1.3 HECI Status (HECI1_STS)—Offset 6h

Status

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 10h

Bit Range	Default and Access	Field Name (ID): Description
15	0h RO	**Detected Parity Error (DPE):** Not implemented, hardwired to 0.
14	0h RO	**Signaled System Error (SSE):** Not implemented, hardwired to 0.
13	0h RO	**Received Initiator-Abort (RMA):** Not implemented, hardwired to 0.
12	0h RO	**Received Target Abort (RTA):** Not implemented, hardwired to 0.
11	0h RO	**Signaled Target-Abort (STA):** Not implemented, hardwired to 0.
10:9	0h RO	**DEVSEL# Timing (DEVT):** These bits are hardwired to 00.

Bit Range	Default and Access	Field Name (ID): Description
8	0h RO	**Initiator Data Pariy Error Detected (DPD):** Not implemented, hardwired to 0.
7	0h RO	**Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0.
6	0h RO	Reserved.
5	0h RO	**66 MHz Capable (C66):** Not implemented, hardwired to 0.
4	1h RO	**Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1.
3	0h RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). Note that this bit is not set by an MSI.
2:0	0h RO	Reserved.

23.1.4 Revision ID And Class Code (HECI1_RID_CC)—Offset 8h

Revision ID And Class Code

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 78000XXh

Bit Range	Default and Access	Field Name (ID): Description
31:24	7h RO	**Base Class Code (BCC):** Indicates the base class code of the HECI host controller device.
23:16	80h RO	**Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device.
15:8	0h RO	**Programming Interface (PI):** Indicates the programming interface of the HECI host controller device.
7:0	-- RO/V	**Revision ID (RID):** Indicates stepping of the host controller. Refer to Device and Revision ID table in Vol1 for specific value.

23.1.5 Cache Line Size (HECI1_CLS)—Offset Ch

Cache Line Size

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Cache Line Size (CLS):** Not implemented, hardwired to 0.

23.1.6 Initiator Latency Timer (HECI1_MLT)—Offset Dh

Initiator Latency Timer

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Initiator Latency Timer (MLT):** Not implemented, hardwired to 0.

23.1.7 Header Type (HECI1_HTYPE)—Offset Eh

Header Type

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 22
Function: 0

Default: 80h

Bit Range	Default and Access	Field Name (ID): Description
7	1h RO	**Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi-function device.
6:0	0h RO	**Header Layout (HL):** Indicates that the HECI host controller uses a target device layout.

23.1.8 Built In Self-Test (HECI1_BIST)—Offset Fh

Built In Self-Test

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	**BIST Capable (BC):** Not implemented, hardwired to 0.
6:0	0h RO	Reserved.

23.1.9 HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h

HECI MMIO Base Address Low

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 4h

Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RW	**Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space.
11:4	0h RO	**Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space.
3	0h RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	2h RO	**Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space.
0	0h RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

23.1.10 HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h

HECI MMIO Base Address High

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Base Address High (BA_HI):** Upper 32 bits of base address of register memory space.

23.1.11 Sub System Identifiers (HECI1_SS)—Offset 2Ch

Sub System Identifiers

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** Indicates the subsystem identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** Indicates the subsystem vendor identifier. This field should be programmed by BIOS during boot- up. Once written, this register becomes Read Only.

23.1.12 Capabilities Pointer (HECI1_CAP)—Offset 34h

Capabilities Pointer

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 50h

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	50h RO	**Capability Pointer (CP):** Indicates the first capability pointer offset. It points to the PCI power management capability offset.

23.1.13 Maximum Latency (HECI1_MLAT)—Offset 3Fh

Maximum Latency

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RO	**Latency (LAT):** Not implemented, hardwired to 0.

23.1.14 Host Firmware Status (HECI1_HFS)—Offset 40h

Host Firmware Status

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Firmware Status Host Access (FS_HA):** Indicates current status of the firmware for the HECI controller. This field is the host's read only access to the FS field in the CSE Firmware Status register.

23.1.15 Miscellaneous Shadow (HECI1_MISC_SHDW)—Offset 44h

Miscellaneous Shadow

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 80000000h

Bit Range	Default and Access	Field Name (ID): Description
31	1h RO	**Miscellaneous Shadow Valid (MSVLD):** This bit is hardwired to 1 to indicate that this HECI device implements the Miscellaneous Shadow register. This bit can be used by host software that is bus/dev/function number agnostic (such as HECI operating system driver) to discover whether the Miscellaneous Shadow register is implemented or not.
30:17	0h RO	Reserved.
16	0h RO/V	**CSE UMA Size Valid (CUSZV):** This bit indicates that FW has written the CUSZ field. This field reflects the value of CSE CUBA.CUSZV.
15:12	0h RO	Reserved.
11:0	0h RO/V	**CSE UMA Size (CUSZ):** These bits reflect firmware's desired size of CSEUMA memory region at 1MB granularity, 1-based. It is configured by firmware prior to bring up core power and allowing BIOS to initialize memory. Example: 000h (0MB, no CSEUMA) 003h (3MB) 040h (64MB) FFFh (4GB) This field reflects the value of CSE CUBA.CUSZ.

23.1.16 General Status Shadow 1 (HECI1_GS_SHDW1)—Offset 48h

General Status Shadow 1

Access Method

Type: CFG Register (Size: 32 bits)
Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 1 (GSS1):** This field is host side shadow of CSE General Status 1 (CSE_GS1).

23.1.17 Host General Status (HECI1_H_GS1)—Offset 4Ch

Host General Status

Access Method

Type: CFG Register (Size: 32 bits)
Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Host General Status (H_GS1):** General status of Host. This field is not used by hardware.

23.1.18 PCI Power Management Capability ID (HECI1_PID)—Offset 50h

PCI Power Management Capability ID

Access Method

Type: CFG Register (Size: 16 bits)
Device: 22
Function: 0

Default: 8C01h

Bit Range	Default and Access	Field Name (ID): Description
15:8	8Ch RO	**Next Capability (NEXT):** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability.
7:0	1h RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management.

23.1.19 PCI Power Management Capabilities (HECI1_PC)—Offset 52h

PCI Power Management Capabilities

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 4003h

Bit Range	Default and Access	Field Name (ID): Description
15:11	8h RO	**PME Support (PSUP):** Indicates the states that can generate PME#. HECI can assert PME# from D3hot only.
10	0h RO	**D2 Support (D2S):** The D2 state is not supported for the HECI host controller.
9	0h RO	**D1 Support (D1S):** The D1 state is not supported for the HECI host controller.
8:6	0h RO	**Aux Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported.
5	0h RO	**Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required.
4	0h RO	Reserved.
3	0h RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	3h RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

23.1.20 General Status Shadow 3 (HECI1_GS_SHDW3)—Offset 64h

General Status Shadow 3

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3).

23.1.21 General Status Shadow 4 (HECI1_GS_SHDW4)—Offset 68h

General Status Shadow 4

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4).

23.1.22 General Status Shadow 5 (HECI1_GS_SHDW5)—Offset 6Ch

General Status Shadow 5

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5).

23.1.23 Host General Status 2 (HECI1_H_GS2)—Offset 70h

Host General Status 2

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware.

23.1.24 Host General Status 3 (HECI1_H_GS3)—Offset 74h

Host General Status 3

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Host General Status 3 (H_GS3):** General status of Host. This field is not used by hardware.

23.1.25 Message Signaled Interrupt Identifiers (HECI1_MID)—Offset 8Ch

Message Signaled Interrupt Identifiers

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: A405h

Bit Range	Default and Access	Field Name (ID): Description
15:8	A4h RO	**Next Pointer (NEXT):** Indicates the location of the next capability item in the list. This is the DevIdle conventional PCI vendor specific capability.
7:0	5h RO	**Capability ID (CID):** Indicates MSI.

23.1.26 Message Signaled Interrupt Message Control (HECI1_MC)—Offset 8Eh

Message Signaled Interrupt Message Control

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 80h

Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	1h RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages.
6:4	0h RO	**Multiple Message Enable (MME):** Not implemented, hardwired to 0.
3:1	0h RO	**Multiple Message Capable (MMC):** Not implemented, hardwired to 0.
0	0h RW	**MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts.

23.1.27 Message Signaled Interrupt Message Address (HECI1_MA)—Offset 90h

Message Signaled Interrupt Message Address

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0h RO	Reserved.

23.1.28 Message Signaled Interrupt Upper Address (HECI1_MUA)—Offset 94h

Message Signaled Interrupt Upper Address

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Upper Address (UADDR):** Upper 32 bits of the system specified message address. This register is optional and only implemented if MC.C64=1.

23.1.29 Message Signaled Interrupt Message Data (HECI1_MD)—Offset 98h

Message Signaled Interrupt Message Data

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
15:0	0h RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the FSB during the data phase of the MSI memory write transaction.

23.1.30 HECI Interrupt Delivery Mode (HECI1_HIDM)—Offset A0h

HECI Interrupt Delivery Mode

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h RW/1S/V	**HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field.
1:0	0h RW/L	**HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit. They are interpreted as follows: 00 - Generate Legacy or MSI interrupt; 01 - Generate SCI; 10 - Generate SMI; This field may be locked by writing 1 to HIDM_L bit.

23.1.31 SW LTR Pointer Register (HECI1_SWLTRPTR)—Offset ACh

Software Latency Tolerance Reporting (LTR) Pointer Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Update MMIO Offset Location (SWLTRLOC):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is not valid, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is not valid, if the Valid bit is not set.
0	0h RO	**Valid (Valid):** Set to 1'b1 to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to 1'b0 to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.

23.1.32 Device Idle Pointer Register (HECI1_DEVIDLEPTR)—Offset B0h

Device Idle Pointer Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 8001h

Bit Range	Default and Access	Field Name (ID): Description
31:4	800h RO	**Device Idle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is not valid, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0's based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is not valid, if the Valid bit is not set.
0	1h RO	**Valid (Valid):** Set to 1'b1 to indicate that the function has implemented a SW LTR register as specified DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to 1'b0 to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of device idle.

23.1.33 DevIdle Power Control Enabled Register (HECI1_PWRCTRLEN)—Offset B6h

DevIdle Power Control Enabled Register

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 22
Function: 0

Default: Eh

Bit Range	Default and Access	Field Name (ID): Description
15:6	0h RO	Reserved.
5	0h RO	**Hardware Autonomous Enable (HAE):** CSE does not support autonomous power gating on idle.
4	0h RO	Reserved.
3	1h RO	**Sleep Enable (SE):** CSE always asserts the sleep signal during power gating.
2	1h RO	**D3-Hot Enable (D3HEN):** CSE could power gate when idle and the PMCSR[1:0] register in the function =2'b11 (D3).
1	1h RO	**DEVIDLE Enable (DEVIDLEN):** CSE could power gate when idle and the DevIdle register (DevIdleC[2] = 1'b1) is set.
0	0h RO	**PMC Request Enable (PMCRE):** CSE will not power gate due to pmc_ip_sw_pg_req_b = LOW.

23.1.34 Host Extend Register DW4 (HECI1_HER4)—Offset CCh

Host Extend Register DW4

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW4 (ERDW4):** Host Extend Register DW4.

23.1.35 Host Extend Register DW6 (HECI1_HER6)—Offset D4h

Host Extend Register DW6

Access Method

Type: CFG Register (Size: 32 bits)
Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW6 (ERDW6):** Host Extend Register DW6.

23.1.36 Host Extend Register DW7 (HECI1_HER7)—Offset D8h

Host Extend Register DW7

Access Method

Type: CFG Register (Size: 32 bits)
Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW7 (ERDW7):** Host Extend Register DW7.

23.1.37 Host Extend Register DW8 (HECI1_HER8)—Offset DCh

Host Extend Register DW8

Access Method

Type: CFG Register (Size: 32 bits)
Device: 22
Function: 0

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Host Extend Register DW8 (ERDW8):** Host Extend Register DW8.

23.2 Intel® CSE:HECI MMIO Registers

Table 23-2. Summary of Intel® CSE:HECI MMIO Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
800h	803h	DEVIDLE Control (HECI1_DEVIDLEC)—Offset 800h	0h
CBCh	CBFh	Host Enhanced Extend Register Status (HECI1_ENH_HERS)—Offset CBCh	0h

23.2.1 DEVIDLE Control (HECI1_DEVIDLEC)—Offset 800h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	0h RO	**Restore Required (RR)**
2	0h RW	**DevIdle (DEVIDLE):** SW sets this bit to 1'b1 to move the function into the DevIdle state. Writing this bit to 1'b0 will return the function to the fully active D0 state (D0i0).
1	0h RW	**Interrupt Request (IR):** SW sets this bit to 1'b1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RO/V	**Command-in-Progress (CIP):** HW sets this bit on a 1'b1->1'b0 or 1'b0->1'b1 transition of DEVIDLE. While set, the other bits in this register are not valid and it is unsupported for SW to write to any bit in this register. HW clears this bit when CSE FW clears its own DevIdle interrupt status bit indicating completion of the DevIdle transition command. When clear, all the other bits in the register are valid and SW may write to any bit. If Interrupt Request (IR) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to the HW. SW writes to this bit have no effect.

23.2.2 Host Enhanced Extend Register Status (HECI1_ENH_HERS)—Offset CBCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:31	0h	**Extend Register Valid (ERV)**
30	0h RO	Reserved.
29:30	0h	**Extend Feature Present (EFP)**
29	0h RO	Reserved.
28:29	0h	**Extend Complete (ERC)**
28:0	0h RO	Reserved.
-1:0	0h	**Extend Register Algorithm (ERA)**

§ §

24 USB 3.2 Gen 2x1 (10 Gb/s) xHCI HC (D20: F0)

24.1 xHCI Configuration Registers

Table 24-1. Summary of xHCI Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	Vendor ID (VID)—Offset 0h	8086h
2h	3h	Device ID (DID)—Offset 2h	34EDh
4h	5h	Command Reg (CMD)—Offset 4h	0h
6h	7h	Device Status (STS)—Offset 6h	290h
8h	8h	Revision ID (RID)—Offset 8h	0h
9h	9h	Programming Interface (PI)—Offset 9h	30h
Ah	Ah	Sub Class Code (SCC)—Offset Ah	3h
Bh	Bh	Base Class Code (BCC)—Offset Bh	Ch
Dh	Dh	Initiator Latency Timer (MLT)—Offset Dh	0h
Eh	Eh	Header Type (HT)—Offset Eh	80h
10h	17h	Memory Base Address (MBAR)—Offset 10h	4h
2Ch	2Dh	USB Subsystem Vendor ID (SSVID)—Offset 2Ch	0h
2Eh	2Fh	USB Subsystem ID (SSID)—Offset 2Eh	0h
34h	34h	Capabilities Pointer (CAP_PTR)—Offset 34h	70h
3Ch	3Ch	Interrupt Line (ILINE)—Offset 3Ch	0h
3Dh	3Dh	Interrupt Pin (IPIN)—Offset 3Dh	0h
40h	43h	XHC System Bus Configuration 1 (XHCC1)—Offset 40h	3401FDh

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
88h	8Bh	Message Signaled Interrupt Upper Address (MSI_MUAD)—Offset 88h	0h
8Ch	8Dh	Message Signaled Interrupt Message Data (MSI_MD)—Offset 8Ch	0h
A4h	A7h	High Speed Configuration 2 (HSCFG2)—Offset A4h	3800h
A8h	ABh	Super Speed Configuration 1 (SSCFG1)—Offset A8h	24000h

24.1.1 Vendor ID (VID)—Offset 0h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	8086h RO	**Vendor ID (VID)**

24.1.2 Device ID (DID)—Offset 2h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 34EDh

Bit Range	Default & Access	Field Name (ID): Description
15:0	34EDh RO/V	**Device ID (DID):** See the Device and Version ID Table in Volume 1 for the default value.

24.1.3 Command Reg (CMD)—Offset 4h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (INTR_DIS)**
9	0h RO	**Fast Back to Back Enable (FBE)**
8	0h RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#.
7	0h RO	**Wait Cycle Control (WCC)**
6	0h RW	**Parity Error Response (PER)**
5	0h RO	**VGA Palette Snoop (VPS)**
4	0h RO	**Memory Write Invalidate (MWI)**
3	0h RO	**Special Cycle Enable (SCE)**
2	0h RW	**Bus Initiator Enable (BME)**
1	0h RW	**Memory Space Enable (MSE)**
0	0h RO	**I/O Space Enable (IOSE)**

24.1.4 Device Status (STS)—Offset 6h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 290h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**Detected Parity Error (DPE)**
14	0h RW/1C	**Signaled System Error (SSE):** This bit is set by the PCH whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set.Software clears this bit by writing a 1 to this bit location.
13	0h RW/1C	**Received Initiator-Abort Status (RMA)**
12	0h RW/1C	**Received Target Abort Status (RTA)**
11	0h RW/1C	**Signaled Target-Abort Status (STA)**

Bit Range	Default & Access	Field Name (ID): Description
10:9	1h RO	**DEVSEL# Timing Status (DEVT)**
8	0h RW/1C	**Initiator Data Parity Error Detected (MDPED)**
7	1h RO	**Fast Back-to-Back Capable (FBBC)**
6	0h RO	**User Definable Features (UDF)**
5	0h RO	**66 MHz Capable (MC)**
4	1h RO	**Capabilities List (CL)**
3	0h RO/V	**Interrupt Status (INTR_STS)**
2:0	0h RO	Reserved.

24.1.5 Revision ID (RID)—Offset 8h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO/V	**Revision ID (RID):** Indicates stepping of the host controller. Refer to Device and Revision ID table in Vol1 for specific value.

24.1.6 Programming Interface (PI)—Offset 9h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	30h RO	**Programming Interface (PI)**

24.1.7 Sub Class Code (SCC)—Offset Ah

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 3h

Bit Range	Default & Access	Field Name (ID): Description
7:0	3h RO	**Sub Class Code (SCC)**

24.1.8 Base Class Code (BCC)—Offset Bh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: Ch

Bit Range	Default & Access	Field Name (ID): Description
7:0	Ch RO	**Base Class Code (BCC)**

24.1.9 Initiator Latency Timer (MLT)—Offset Dh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RO	**Initiator Latency Timer (MLT)**

24.1.10 Header Type (HT)—Offset Eh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RO	**Multi-Function Bit (MFB)**
6:0	0h RO	**Configuration layout (CL)**

24.1.11 Memory Base Address (MBAR)—Offset 10h

Access Method

Type: CFG Register
(Size: 64 bits)

Device: 20
Function: 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:16	0h RW	**Base Address (BA)**
15:4	0h RO	Reserved.
3	0h RO	**Prefetchable (PREFETCHABLE)**
2:1	2h RO	**Type (MBAR_TYPE)**
0	0h RO	**Resource Type Indicator (RTE)**

24.1.12 USB Subsystem Vendor ID (SSVID)—Offset 2Ch

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others.

24.1.13 USB Subsystem ID (SSID)—Offset 2Eh

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW/L	**USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s).

24.1.14 Capabilities Pointer (CAP_PTR)—Offset 34h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 70h

Bit Range	Default & Access	Field Name (ID): Description
7:0	70h RO	**Capabilities Pointer (CAP_PTR)**

24.1.15 Interrupt Line (ILINE)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Line (ILINE)**

24.1.16 Interrupt Pin (IPIN)—Offset 3Dh

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h RW/L	**Interrupt pin (IPIN)**

24.1.17 XHC System Bus Configuration 1 (XHCC1)—Offset 40h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 3401FDh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1L	**Access Control (ACCTRL):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset.
30:25	0h RO	Reserved.
24	0h RW	**Initiator/Target Abort SERR (RMTASERR)**
23	0h RW/1C	**Unsupported Request Detected (URD)**
22	0h RW	**Unsupported Request Report Enable (URRE)**
21:19	6h RW	**Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk
18	1h RW	**XHC Initiated L1 Enable (XHCIL1E)**
17	0h RW	**D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power managment to be enables.[BR
16:12	0h RO	Reserved.
11	0h RW	**SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register) SW: SW could write 0 to clear this bit.n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller.n HW: HW, under policy control, will clear this bit when HW exits Idle state.

Bit Range	Default & Access	Field Name (ID): Description
10:8	1h RW	**L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk
7:6	3h RW	**Upstream Type Arbiter Grant Count Posted (UTAGCP)**
5:4	3h RW	**Upstream Type Arbiter Grant Count Non Posted (UDAGCNP)**
3:2	3h RW	**Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP)**
1:0	1h RW	**Upstream Device Arbiter Grant Count (UDAGC) (UDAGC)**

24.1.18 XHC System Bus Configuration 2 (XHCC2)—Offset 44h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 3FC688h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**OC Configuration Done (OCCFGDONE)**
30	0h RW	**Enable Relaxed Ordering (RO_EN)**
29:28	0h RW	**MMIO Back to Back Rd/Wr Delay Count (RW_DLY_CNT)**
27:26	0h RO	Reserved.
25	0h RW	**DMA Request Boundary Crossing Control (DREQBCC):** This bit controls the boundary crossing limit of each Read/Write Request. 0: 4KB 1: 64B
24:22	0h RW	**IDMA Write Request Size Control (WRREQSZCTRL):** This bit controls the maximum size of each Write Request. 000: 128B 001: 256B 011 - 110: Reserved 111: 64B
21	1h RW	**XHC Upstream Read Relaxed Ordering Enable (XHCUPRDROE):** This policy controls the Relaxed Ordering attribute for upstream reads. 0 - xHC will clear RO for all upstream read requests. 1 - xHC will set RO for all upstream read requests.

Bit Range	Default & Access	Field Name (ID): Description
20:14	7Fh RW	**Upstream Non-Posted Pre-Allocation (UNPPA):** This field reserves data sizes, in 64 byte chunks, of the downstream completion resource. This value is zero based. 000000 - 111111: Pre-allocate 64 bytes - 4096 bytes If set greater than the default allows over-allocation If set less than default allows under-allocation Only allowed to be programmed when BME = 0 and no outstanding downstream completion
13:12	0h RW	**SW Assisted xHC Idle Policy (SWAXHCIP):** Note: Irrespective of the setting of this field, SW write of 0 to SWAXHCI will clear the bit. 00b (default): xHC HW clears SWAXHCI bit upon MMIO access to Host Controller OR xHC HW exits Idle state 01b: xHC HW does not autonomously clear SWAXHCI bit. The bit could be cleared only by SW. 10b: xHC HW clears SWAXHCI upon MMIO acces to Host Controller. xHC HW exit from Idle state will not clear SWAXHCI. 11b: Reserved
11	0h RW	**MMIO Read After MMIO Write Delay Disable (RAWDD):** This field controls delay on MMIO Read after MMIO Write. 0b (Default): Delay MMIO Read after MMIO Write 1b: Do not delay MMIO Read after MMIO Write Note that this delay applies after the second of the two DW writes in the case where the IOSF Gasket splits a QW write into two single DW writes to the IP.
10	1h RW	**MMIO Write After MMIO Write Delay Enable (WAWDE):** This field controls delay on MMIO Write after previous MMIO Write. 0b (Default): Do not delay MMIO Write after previous MMIO Write 1b: Delay MMIO Write after previous MMIO Write Note that the delay count does not apply on the second of the two DW writes that are generated by IOSF Gasket when it splits a QW write into two. In other words, the second of the two DW writes could happen without any delay with respect to the first DW write.The delay count, in this case, will apply after the second of the two DW writes.
9:8	2h RW	**SW Assisted Cx Inhibit (SWACXIHB):** This field controls how the DMI L1 inhibit signal from USB 3.1 to PMC will behave. 00: Never inhibit Cx 01: Inhibit Cx when Isochronous Endpoint is active (PPT Behavior) 10: Inhibit Cx when Periodic Active as defined in 40.4.3.2. 111: Always inhibit Cx
7:6	2h RW	**SW Assisted DMI L1 Inhibit (SWADMIL1IHB)**
5:3	1h RW	**L1 Force P2 Clock Gating Wait Count (L1FP2CGWC)**
2:0	0h RW	**Read Request Size Control (RDREQSZCTRL)**

24.1.19 Clock Gating (XHCLKGTEN)—Offset 50h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: FDF6D3Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Enable Frame Clk Gating When Active Periodic EPs On Scheduler (PRDCEP_FRCLK_GATEEN)**
30	0h RW	**Extend EU3S To U2 (EXTD_EU3S_TO_U2)**
29	0h RO	Reserved.
28	0h RW	**Nak'ing USB2.0 EPs for Backbone Clock Gating and PLL Shutdown (NUEFBCGPS):** This field controls whether Naking USB2.0 EPs, once in Naking low priority schedule, should be considered as active for the considerations for backbone clock gating and PLL shutdown or not. 0: Naking USB2.0 EPs are not considered to be active for Backbone Clock Gating and PLL Shutdown evaluation. 1: Naking USB2.0 EPs are considered to be active for Backbone clock gating and PLL shutdown evaluation.
27	1h RW	**SRAM Power Gate Enable (SRAMPGTEN):** This register enables the SRAM Power Gating when PLL shutdown conditions for all clock domains have been met 0 - Disallow SRAM Power Gating. 1 - Allow SRAM Power Gating
26	1h RW	**SS Link PLL Shutdown Enable (SSLSE):** This register enables the SS P3 state to be exposed to PXP PLL Shutdown conditions on behalf of all USB SS Ports ontop of trunk clock gating. 0 - P3 state NOT allowed to result in PXP PLL shutdown. 1- P3 state allowed to result in PXP PLL shutdown
25	1h RW	**USB2 PLL Shutdown Enable (USB2PLLSE):** When set, this bit allows USB2 PLL to be shutdown when HS Link trunk clock is gated, and xHC can tolerate PLL spin up time for subsequent clock request.
24	1h RW	**IOSF Sideband Trunk Clock Gating Enable (IOSFSTCGE):** When set, this bit allows the IOSF sideband clock trunk to be gated when idle conditions are met.
23:20	Dh RW	**HS Backbone PXP Trunk Clock Gate Enable (HSTCGE):** This register determines the HS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) NA (no support for U1) (2) ==) U2 (L1) or deeper (3) ==) U3 (L2) or deeper
19:16	Fh RW	**SS Backbone PXP Trunk Clock Gate Enable (SSTCGE):** This register determines the SS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==> U0 or deeper (1) ==> U1 or deeper (2) ==> U2 or deeper (3) ==> U3 or deeper
15	0h RW	**XHC Ignore_EU3S (XHCIGEU3S):** This register determines if the xHC will use the EU3S as a condition to allow for Frame timer gating. 0 - xHC may allow frame timer to be gated when EU3S is set and all ports are in the required state. 1 - xHC may allow frame timer to be gated regardless of EU3S.
14	1h RW	**XHC Frame Timer Clock Shutdown Enable (XHCFTCLKSE):** This register determines if the xHC will allow the frame timer clock to be gated. 0 - xHC will not allow ICC PLL 96MHz output to be shutdown thus keeping the frame timer running. 1 - xHC will allow ICC PLL 96MHz output to be shutdown under specific conditions.
13	1h RW	**XHC Backbone PXP Trunk Clock Gate In Presence of ISOCH EP (XHCBBTCGIPISO):** This register controls the policy on allowing Backbone PXP trunk clock gate in the presence of IDLE ISOCH EP s with active DB. Allows the periodic active to be used in enabling Backbone PXP trunk clock gating of core clock. 0 - Trunk gate of core clock is not allowed when ISOCH EP DB is set and ISOCH EP s are idle. 1 - Allow trunk gate of core clock when ISOCH EP DB is set and ISOCH EP s are idle.

Bit Range	Default & Access	Field Name (ID): Description
12	0h RW	**XHC HS Backbone PXP Trunk Clock Gate U2 non RWE (XHCHSTCGU2NRWE):** This register controls the policy on allowing Backbone PXP trunk gating of core clock when there is atleast 1 non Remote Wake Enabled HS Port in U2. 0 - Prevent trunk gate of core clock when a non RWE HS Port is in U2. 1 - Allow trunk gate of core clock when a non RWE HS Port is in U2.
11:10	3h RW	**XHC USB2 PLL Shutdown Lx Enable (XHCUSB2PLLSDLE):** This register determines the HS Link state(s) which will be exposed to USB2 PLL Shutdown conditions on behalf of all USB2 HS Ports. Ly is a state allowed to result in USB2 PLL Shutdown when en(x) is asserted. (0) ==> L1 or deeper (1) ==> L2 or deeper
9:8	1h RW	**HS Backbone PXP PLL Shutdown Ux Enable (HSUXDMIPLLSE):** This register determines the Ux state(s) which will be exposed to PXP PLL Shutdown conditions. PLL Shutdown is allowed in: 00b Disabled (Link states shall be disabled for DMI PLL shutdown) 01b U0 or conditions for 10b setting. 10b U2 or conditions for 11b setting. 10b U3, Disconnected, Disabled or Powered-Off.
7:5	1h RW	**SS Backbone PXP PLL Shutdown Ux Enable (SSPLLSUE):** This register determines the Ux state(s) which will be exposed to DMI PLL Shutdown conditions. PLL Shutdown is allowed in: 000b Disabled (Link states shall be ignored for DMI PLL shutdown). 001b U0 or conditions for 010b setting. 010b U1 or conditions for 011b setting. 011b U2 or conditions for 100b setting. 100b U3, Disconnected, Disabled or Powered-Off
4	1h RW	**XHC Backbone Local Clock Gating Enable (XHCBLCGE):** When set, this bit allows XHCI Controller IP backbone clock to be locally gated when idle conditions are met.
3	1h RW	**HS Link Trunk Clock Gating Enable (HSLTCGE):** When set, this bit allows High Speed Link control's 480 MHz and its 48/60 MHz link clock trunk to be gated when idle conditions are met.
2	1h RW	**SS Link Trunk Clock Gating Enable (SSLTCGE):** When set, this bit allows the SuperSpeed Link control's 250 MHz and its divided 125 MHz link clock trunk to ge gated when idle conditions are met.
1	1h RW	**IOSF Backbone Trunk Clock Gating Enable (IOSFBTCGE)**
0	1h RW	**IOSF Gasket Backbone Local Clock Gating Enable (IOSFBLCGE):** When set, this bit allows the IOSF Gasket backbone clock to be locally gated when idle conditions are met.

24.1.20 Audio Time Synchronization (AUDSYNC)—Offset 58h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:16	0h RO/V	**Captured Frame List Current Index/Frame Number (CMFI)**
15:13	0h RO	Reserved.
12:0	0h RO/V	**Captured Micro-frame BLIF (CMFB)**

24.1.21 Serial Bus Release Number (SBRN)—Offset 60h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 31h

Bit Range	Default & Access	Field Name (ID): Description
7:0	31h RO	**Serial Bus Release Number (SBRN)**

24.1.22 Frame Length Adjustment (FLADJ)—Offset 61h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 60h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	Reserved.
6	1h RO	**No Frame Length Timing Capability (NO_FRAME_LENGTH_TIMING_CAP)**
5:0	20h RO	**Frame Length Timing Value (FLTV):** SOF (micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h) ... 59984 31 (1Fh) 60000 32 (20h) ... 60480 62 (3Eh) 60496 63 (3Fh) Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value

24.1.23 Best Effort Service Latency (BESL)—Offset 62h

Access Method

Type: CFG Register (Size: 8 bits)
Device: 20
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RW/L	**Default Best Effort Service Latency Deep (DBESLD):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters.
3:0	0h RW/L	**Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters.

24.1.24 PCI Power Management Capability ID (PM_CID)—Offset 70h

Access Method

Type: CFG Register (Size: 8 bits)
Device: 20
Function: 0

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
7:0	1h RO	**PCI Power Management Capability ID (PM_CID)**

24.1.25 Next Item Pointer 1 (PM_NEXT)—Offset 71h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Next Item Pointer 1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any Initiator-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed.

24.1.26 Power Management Capabilities (PM_CAP)—Offset 72h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: C1C2h

Bit Range	Default & Access	Field Name (ID): Description
15:11	18h RW/L	**PME_Support (PME_SUPPORT):** This 5-bit field indicates the power states in which the function may assert PME#. The PCH XHC does not support the D1 or D2 states. For all other states, the PCH XHC is capable of generating PME#. Software should never need to modify this field.
10	0h RW/L	**D2_Support (D2_SUPPORT)**
9	0h RW/L	**D1_Support (D1_SUPPORT)**
8:6	7h RW/L	**Aux_Current (AUX_CURRENT)**
5	0h RW/L	**DSI (DSI)**
4	0h RO	Reserved.
3	0h RW/L	**PME Clock (PMECLOCK)**
2:0	2h RW/L	**Version (VERSION)**

24.1.27 Power Management Control/Status (PM_CS)—Offset 74h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW/1C	**PME_Status (PME_STATUS)**
14:13	0h RO	**Data_Scale (DATA_SCALE)**
12:9	0h RO	**Data_Select (DATA_SELECT)**
8	0h RW	**PME_En (PME_EN)**
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSR)**
2	0h RO	Reserved.
1:0	0h RW	**PowerState (POWERSTATE)**

24.1.28 Message Signaled Interrupt CID (MSI_CID)—Offset 80h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 5h

Bit Range	Default & Access	Field Name (ID): Description
7:0	5h RO	**Capability ID (CID)**

24.1.29 Next Item Pointer (MSI_NEXT)—Offset 81h

Access Method

Type: CFG Register
(Size: 8 bits)

Device: 20
Function: 0

Default: 90h

Bit Range	Default & Access	Field Name (ID): Description
7:0	90h RW/L	**Next Pointer (NEXT_POINTER)**

24.1.30 Message Signaled Interrupt Message Control (MSI_MCTL)—Offset 82h

Access Method

Type: CFG Register
(Size: 16 bits)

Device: 20
Function: 0

Default: 86h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0h RO	Reserved.
8	0h RO	**Per-Vector Masking Capable (PVM)**
7	1h RO	**64 Bit Address Capable (C64)**
6:4	0h RW	**Multiple Message Enable (MME)**
3:1	3h RO	**Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert.This field must be set by HW to reflect the number of Interrupters supported. Encoding number of Vectors requested (number of Interrupters) 000 1 001 2 010 4 011 8 100 16 101 32 110-111 Reserved
0	0h RW	**MSI Enable (MSIE)**

24.1.31 Message Signaled Interrupt Message Address (MSI_MAD)—Offset 84h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description

24.2.1 Capability Registers Length (CAPLENGTH)—Offset 0h

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	80h RW/L	**Capability Registers Length (CAPLENGTH):** This register is used as an offset to add to the Memory Base Register to find the beginning of the Operational Register Space.

24.2.2 Host Controller Interface Version Number (HCIVERSION)—Offset 2h

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 110h

Bit Range	Default & Access	Field Name (ID): Description
15:0	110h RW/L	**Host Controller Interface Version Number (HCIVERSION):** This is a two-byte register containing a BCD encoding of the version number of interface that this host controller interface conforms.

24.2.3 Structural Parameters 1 (HCSPARAMS1)—Offset 4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 10000840h

Bit Range	Default & Access	Field Name (ID): Description
31:24	10h RW/L	**Number of Ports (MAXPORTS):** This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Default value = 0Eh
23:19	0h RO	Reserved.
18:8	8h RW/L	**Number of Interrupters (MAXINTRS):** This field specifies the number of interrupters implemented on this host controller. Each interrupter is allocated to a vector of MSI and controls its generation and moderation.
7:0	40h RW/L	**Number of Device Slots (MAXSLOTS):** This field specifies the number of Device Context Structures and Doorbell Array entries this host controller can support. Valid values are in the range of 1 to 255.

24.2.4 Structural Parameters 2 (HCSPARAMS2)—Offset 8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 14200054h

Bit Range	Default & Access	Field Name (ID): Description
31:27	2h RW/L	**Max Scratchpad Buffers LO (MAXSCRATCHPADBUFS):** Indicates the number of Scratchpad Buffers system software shall reserve for the xHC.
26	1h RW/L	**Scratchpad Restore (SPR):** 0 = Indicates the Scratchpad buffer space may be freed and reallocated between power events. 1 = Indicates that the xHC requires the integrity of the Scratchpad buffer space to be maintained across power events.
25:21	1h RW/L	**Max Scratchpad Buffers HI (MAXSCRATCHPADBUFS_HI)**
20:8	0h RO	Reserved.
7:4	5h RW/L	**Event Ring Segment Table Max (ERSTMAX):** This field determines the maximum value supported by the Event Ring Segment Table Base Size registers.
3:0	4h RW/L	**Isochronous Scheduling Threshold (IST):** This field indicates to system software the minimum distance (in time) that it is required to stay ahead of the xHC while adding TRBs, in order to have the xHC process them at the correct time. The value is specified in the number if frames/ microframes. If bit [3] of IST is cleared to 0b, software can add a TRB no later than IST [2:0] microframes before that TRB is scheduled to be executed. If bit [3] of IST is set to 1b, software can add a TRB no later than IST[2:0] frames before that TRB is scheduled to be executed.

24.2.5 Structural Parameters 3 (HCSPARAMS3)—Offset Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: A0000Ah

Bit Range	Default & Access	Field Name (ID): Description
31:16	A0h RW/L	**U2 Device Exit Latency (U2DEL):** Indicates the worst case latency to transition from U2 to U0. Applies to all root hub ports. The following are permissible values: Value Description 00h Zero 01h Less than 1 µs 02h Less than 2 µs ... 0Bh-FFh Reserved
15:8	0h RO	Reserved.
7:0	Ah RW/L	**U1 Device Exit Latency (U1DEL):** Worst case latency to transition a root hub Port Link State (PLS) from U1 to U0. Applies to all root hub ports. The following are permissible values: Value Description 00h Zero 01h Less than 1 µs 02h Less than 2 µs ... 0800h-FFFFh Reserved

24.2.6 Capability Parameters (HCCPARAMS)—Offset 10h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 20007FC1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	2000h RW/L	**xHCI Extended Capabilities Pointer (XECP):** This field indicates the existence of a capabilities list. The value of this field indicates a relative offset, in 32-bit words, from Base to the beginning of the first extended capability.
15:12	7h RW/L	**Maximum Primary Stream Array Size (MAXPSASIZE):** RW/L. This fields identifies the maximum size Primary Stream Array that the xHC supports. The Primary Stream Array size = 2MaxPSASize+1. Valid MaxPSASize values are 1 to 15.
11	1h RW/L	**Contiguous Frame ID Capability (CFC)**
10	1h RW/L	**Stopped EDLTA Capabilty (SEC):** This flag indicates that the host controller implementation Stream Context support a Stopped EDLTA field.
9	1h RW/L	**Stopped - Short Packet Capability (SPC):** This flag indicates that the host controller implementation is capable of generating a Stopped-Short Packet Completion Code.
8	1h RW/L	**Parst All Event Data (PAE)**
7	1h RW/L	**No Secondary SID Support (NSS):** Hardwired to '0' indicating Secondary Stream ID decoding is supported.
6	1h RW/L	**Latency Tolerance Messaging Capability (LTC):** 0 = Latency Tolerance Messaging is not supported. 1 = Latency Tolerance Messaging is supported
5	0h RW/L	**Light HC Reset Capability (LHRC):** 0 = Light Host Controller Reset is not supported. 1 = Light Host Controller Reset is supported
4	0h RW/L	**Port Indicators (PIND):** This bit indicates whether the xHC root hub ports support port indicator control. When this bit is a '1', the port status and control registers include a read/writeable field for controlling the state of the port indicator.
3	0h RW/L	**Port Power Control (PPC):** This bit indicates whether the host controller implementation includes port power control. A '1' in this bit indicates the ports have port power switches. A '0' in this bit indicates the port do not have port power switches.
2	0h RW/L	**Context Size (CSZ):** If this bit is set to '1', then the xHC uses 64 byte Context data structures. If this bit is cleared to '0', then the xHC uses 32 byte Context data structures.
1	0h RW/L	**BW Negotiation Capability (BNC):** 0 = Not capable of BW Negotiation. 1 = Capable of BW Negotiation.
0	1h RW/L	**64-bit Addressing Capability (AC64):** This bit documents the addressing range capability of the xHC. The value of this flag determines whether the xHC has implemented the high order 32- bits of 64-bit register and data structure pointer fields. Values for this flag have the following interpretation: 0 = Supports 32-bit address memory pointers 1 = Supports 64-bit address memory pointers If 32-bit address memory pointers are implemented, the xHC shall ignore the high order 32- bits of 64-bit data structure pointer fields, and system software shall ignore the high order 32- bits of 64- bit xHC registers.

24.2.7 Doorbell Offset (DBOFF)—Offset 14h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 3000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	C00h RO	**Doorbell Array Offset (DBAO):** This field defines the DWord offset of the Doorbell Array base address from the Base (for example, the base address of the xHCI Capability register address space).
1:0	0h RO	Reserved.

24.2.8 Runtime Register Space Offset (RTSOFF)—Offset 18h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	100h RO	**Runtime Register Space Offset (RTRSO):** This field defines the 32-byte offset of the xHCI Runtime Registers from the Base. That is, Runtime Register Base Address = Base + Runtime Register Set Offset.
4:0	0h RO	Reserved.

24.2.9 USB Command (USBCMD)—Offset 80h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	Reserved.
11	0h RW	**Enable U3 MFINDEX Stop (EU3S):** When set to 1b, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the U3, Disconnected, Disabled, or Powered-off state. When cleared to 0b, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the Disconnected, Disabled, or Powered-off state.
10	0h RW	**Enable Wrap Event (EWE):** When set to 1b, the xHC shall generate a MFINDEX Wrap Event every time the MFINDEX register transitions from 03FFFh to 0. When cleared to 0b, no MFINDEX Wrap Events are generated.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Controller Restore State (CRS):** When set to 1b, MEM_BASE+80h:bit 0= 0b, and MEM_BASE+80h:bit 8 = 1b, the xHC shall perform a Restore State operation and restore its internal state. When set to 1b and MEM_BASE+80h:bit 0= 1b or MEM_BASE+80h:bit 8 = 0b, or when cleared to '0', no Restore State operation shall be performed.
8	0h RW	**Controller Save State (CSS):** When written by software with 1b and MEM_BASE+80h:bit 0=0b, the xHC shall save any internal state that will be restored by a subsequent Restore State operation. When written by software with 1b and MEM_BASE+80h:bit 0= 1b, or written with '0', no Save State operation shall be performed.
7	0h RW	**Light Host Controller Reset (LHCRST):** If the Light HC Reset Capability (LHRC) bit (MEM_BASE=10h:bit 5) is 1b, then setting this bit to 1b allows the driver to reset the xHC without affecting the state of the ports. A system software read of this bit as 0b indicates the Light Host Controller Reset has completed and it is safe for software to re-initialize the xHC. A software read of this bit as a 1b indicates the Light Host Controller Reset has not yet completed.
6:4	0h RO	Reserved.
3	0h RW	**Host System Error Enable (HSEE):** When this bit is set to 1b, and the HSE bit (MEM_BASE+84h:bit 2) is set to 1b, the xHC shall assert out-of-band error signaling to the host. The signaling is acknowledged by software clearing the HSE bit.
2	0h RW	**Interrupter Enable (INTE):** This control bit is used by software to reset the host controller. When software sets this bit to 1b, the Host Controller resets its internal pipelines, timers, counters, state machines, and so forth, to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values.
1	0h RW	**Host Controller Reset (HCRST):** This control bit is used by software to reset the host controller. When software sets this bit to 1b, the Host Controller resets its internal pipelines, timers, counters, state machines, and so forth, to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values.
0	0h RW	**Run/Stop (RS):** When set to 1b, the xHC proceeds with execution of the schedule. The xHC continues execution as long as this bit is set to 1b. When this bit is cleared to 0b, the xHC completes the current and any actively pipelined transactions on the USB and then halts. The xHC shall halt within 16 microframes after software clears the Run/ Stop bit. The HCHalted (HCH) bit (MEM_BASE+84h:bit 0) indicates when the xHC has finished its pending pipelined transactions and has entered the stopped state. Software shall not write a '1' to this flag unless the xHC is in the Halted state (that is, HCH in the USBSTS register is '1'); doing so will yield undefined results.

24.2.10 USB Status (USBSTS)—Offset 84h

This register indicates pending interrupts and various states of the Host controller. The status resulting from a transaction on the serial bus is not indicated in this register. See the Interrupts description in section 4 of the xHCI specification for additional information concerning interrupt conditions.
Note: For the writable bits, software must write a 1 to clear bits that are set. Writing a 0 has no effect.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	Reserved.
12	0h RO	**Host Controller Error (HCE):** This flag shall be set to indicate that an internal error condition has been detected which requires software to reset and re-initialize the xHC. 0 = No internal xHC error conditions exist. 1 = Internal xHC error condition exists.
11	0h RO	**Controller Not Ready (CNR):** 0 = Ready 1 = Not Ready Software shall not write any Doorbell or Operational register of the xHC, other than the USBSTS register, until CNR = 0b. This flag is set by the xHC after a Hardware Reset and cleared when the xHC is ready to begin accepting register writes. This flag shall remain cleared (0b) until the next Chip Hardware Reset.
10	0h RW/1C	**Save/Restore Error (SRE):** If an error occurs during a Save or Restore operation this bit shall be set to 1b. This bit shall be cleared to 0b when a Save or Restore operation is initiated or when written with 1b.
9	0h RO	**Restore State Status (RSS):** When the Controller Restore State (CRS) flag in the USB_CMDregister is written with 1b this bit shall be set to 1b and remain set while the xHC restores its internalstate. Note: When the Restore State operation is complete, this bit shall be cleared to 0b.
8	0h RO	**Save State Status (SSS)**
7:5	0h RO	Reserved.
4	0h RW/1C	**Port Change Detect (PCD):** This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the xHC, this bit is loaded with the OR of all of the PORTSC change bits (including: Force port resume, overcurrent change, enable/ disable change and connect status change). Regardless of the implementation, when this bit is readable (that is, in the D0 state), it must provide a valid view of the Port Status registers. 0 = No change bit transition from a 0 to 1 or No Force Port Resume bit transition from 0 to 1 as a result of a J-K transition detected on a suspended port. 1 = The Host controller sets this bit to 1 when any port for which the Port Owner bit is set to 0 has a change bit transition from a 0 to 1 or a Force Port Resume bit transition from 0 to 1 as a result of a J-K transition detected on a suspended port.
3	0h RW/1C	**Event Interrupt (EINT):** The xHC sets this bit to 1b when the Interrupt Pending (IP) bit of any Interrupter is transitions from 0b to 1b. Software that uses EINT shall clear it prior to clearing any IP flags. A race condition will occur if software clears the IP flags then clears the EINT flag, and between the operations another IP '0' to '1' transition occurs. In this case the new IP transition will be lost.
2	0h RW/1C	**Host System Error (HSE):** The xHC sets this bit to 1b when a serious error is detected, either internal to the xHC or during a host system access involving the xHC module. Conditions that set this bit to '1' include PCI Parity error, PCI Initiator Abort, and PCI Target Abort. When this error occurs, the xHC clears the Run/Stop (R/S) bit in the USB_CMD register to prevent further execution of the scheduled TDs. If the HSEE bit in the USB_CMD register is 1b, the xHC shall also assert out-ofband error signaling to the host.
1	0h RO	Reserved.
0	1h RO	**HCHalted (HCH):** This bit is a '0' whenever the Run/Stop (R/S) bit is set to 1b. The xHC sets this bit to 1b after it has stopped executing as a result of the Run/Stop (R/S) bit being cleared to 0b, either by software or by the xHC hardware (for example, internal error). If this bit is set to1b, then SOFs, microSOFs, or Isochronous Timestamp Packets (ITP) shall not be generated by the xHC.

24.2.11 Page Size (PAGESIZE)—Offset 88h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	1h RO	**Page Size (PAGESIZE):** Hardwired to 1h to indicate support for 4 Kbyte page sizes.

24.2.12 Device Notification Control (DNCTRL)—Offset 94h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**Notification Enable (N0_N15):** When a Notification Enable bit is set, a Device Notification Event will be generated when a Device Notification Transaction Packet is received with the matching value in the Notification Type field. For example, setting N1 to '1' enables Device Notification Event generation if a Device Notification TP is received with its Notification Type field set to '1' (FUNCTION_WAKE), and so on

24.2.13 Command Ring Low (CRCR_LO)—Offset 98h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h WO	**Command Ring Pointer (CRP):** This field defines low order bits of the initial value of the 64-bitCommand Ring Dequeue Pointer. Notes: 1. Writes to this field are ignored when Command Ring Running bit (CRR) = 1b. 2. If the CRCR register is written while the Command Ring is stopped (CRR = 0b), the value ofthis field shall be used to fetch the first Command TRB the next time the Host ControllerDoorbell register is written with the DB Reason field set to Host Controller Command. 3. If the CRCR register is not written while the Command Ring is stopped (CRR = 0b), then theCommand Ring shall begin fetching Command TRBs at the current value of the internal xHCCommand Ring Dequeue Pointer. 4. Reading this field always returns 0b.
5:4	0h RO	Reserved.
3	0h RO	**Command Ring Running (CRR):** This bit is set to 1b if the Run/Stop (R/S) bit is 1b and theHost Controller Doorbell register is written with the DB Reason field set to Host ControllerCommand. It is cleared to 0b when the Command Ring is stopped after writing a 1b to theCommand Stop (CS) or Command Abort (CA) bits, or if the R/S bit is cleared to 0b.
2	0h WO	**Command Abort (CA):** Writing a 1b to this bit shall immediately terminate the currentlyexecuting command, stop the Command Ring, and generate a Command Completion Event with theCompletion Code set to Command Ring Stopped. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Commandshall restart the Command Ring operation. Notes: 1. Writes to this flag are ignored by the xHC if Command Ring Running (CRR) = 0b. 2. Reading this bit always returns 0b.
1	0h WO	**Command Stop (CS):** Writing a 1b to this bit shall stop the operation of the Command Ringafter the completion of the currently executing command, and generate a Command CompletionEvent with the Completion Code set to Command Ring Stopped and the Command TRB Pointer setto the current value of the Command Ring Dequeue Pointer. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Commandshall restart the Command Ring operation. Notes: 1. Writes to this flag are ignored by the xHC if Command Ring Running (CRR) bit = 0b. 2. Reading this bit always returns 0b.
0	0h WO	**Ring Cycle State (RCS):** This bit identifies the value of the xHC Consumer Cycle State (CCS)flag for the TRB referenced by the Command Ring Pointer. Notes: 1. Writes to this bit are ignored when the Command Ring Running (CRR) bit = 1b. 2. If the CRCR register is written while the Command Ring is stopped (CCR = 0b), then the valueof this flag shall be used to fetch the first Command TRB the next time the Host ControllerDoorbell register is written with the DB Reason field set to Host Controller Command. 3. If the CRCR register is not written while the Command Ring is stopped (CCR = 0b), then theCommand Ring will begin fetching Command TRBs using the current value of the internalCommand Ring CCS flag. 4. Reading this flag always returns 0b.

24.2.14 Command Ring High (CRCR_HI)—Offset 9Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h WO	**Command Ring Pointer (CRP):** Command Ring Pointer—R/W. This field defines high order bits of the initial value of the 64-bitCommand Ring Dequeue Pointer. Notes: 1. Writes to this field are ignored when Command Ring Running bit (CRR) = 1b. 2. If the CRCR register is written while the Command Ring is stopped (CRR = 0b), the value ofthis field shall be used to fetch the first Command TRB the next time the Host ControllerDoorbell register is written with the DB Reason field set to Host Controller Command. 3. If the CRCR register is not written while the Command Ring is stopped (CRR = 0b), then theCommand Ring shall begin fetching Command TRBs at the current value of the internal xHCCommand Ring Dequeue Pointer. 4. Reading this field always returns 0b.

24.2.15 Device Context Base Address Array Pointer Low (DCBAAP_LO)—Offset B0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Device Context Base Address Array Pointer (DCBAAP):** This field defines low order bits of the 64-bitbase address of the Device Context Pointer Array table (a table of address pointers that referenceDevice Context structures for the devices attached to the host.
5:0	0h RO	Reserved.

24.2.16 Device Context Base Address Array Pointer High (DCBAAP_HI)—Offset B4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Device Context Base Address Array Pointer (DCBAAP):** This field defines high order bits of the 64-bitbase address of the Device Context Pointer Array table (a table of address pointers that referenceDevice Context structures for the devices attached to the host.)

24.2.17 Port N Status and Control USB2 (PORTSCN)—Offset 480h

Note that this USB2 Port Status and Control register is available at the following offsets for all applicable USB2 ports:

USB2 Port 1: 480h
USB2 Port 2: 490h
USB2 Port 3: 4A0h
.....
USB2 Port 9: 500h
USB2 Port 10: 510h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR):** When software sets this bit to 1b, the Warm Reset sequence is enabled
30	0h RW/L	**Device Removable (DR):** This bit indicates if this port has a removable device. 0 = Device is removable. 1 = Device is non-removable.
29:28	0h RO	Reserved.
27	0h RW/P	**Wake on Over-current Enable (WOE):** 0 = Disable. (Default) 1 = Enable. Writing this bit to a 1b enables the port to be sensitive to overcurrent conditions as system wake-up events.
26	0h RW/P	**Wake on Disconnect Enable (WDE):** 0 = Disable. (Default) 1 = Enable. Writing this bit to a 1b enables the port to be sensitive to device disconnects as system wake-up events.
25	0h RW/P	**Wake on Connect Enable (WCE):** 0 = Disable. (Default) 1 = Enable. Writing this bit to a 1b enables the port to be sensitive to device connects as system wake-up events.
24	0h RO	**Cold Attach Status (CAS):** This bit indicates that far-end terminations were detected in the Disconnected state and the Root Hub Port State Machine was unable to advance to the Enabled state. Software shall clear this bit by writing a 1b to the WPR bit or the xHC shall clear this bit if the CSS bit transitions to 1.
23	0h RW/1C	**Port Config Error Change (CEC)**
22	0h RW/1C	**Port Link State Change (PLC):** 0 = No change 1 = Link Status Change This flag is set to ‘1’ due to the following Port Link State (PLS) transitions:
21	0h RW/1C	**Port Reset Change (PRC):** This flag is set to ‘1’ due a '1' to '0' transition of Port Reset (PR), for example, when any reset processing on this port is complete. 0 = No change 1 = Reset Complete

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW/1C	**Over-current Change (OCC):** The functionality of this bit is not dependent upon the port owner. Software clears this bit by writing a 1 to it. 0 = No change. (Default) 1 = There is a change to Overcurrent Active.
19	0h RW/1C	**Warm Port Reset Change (WRC):** This bit is set when Warm Reset processing on this port completes. 0 = No change. (Default) 1 = Warm reset complete
18	0h RW/1C	**Port Enabled Disabled Change (PEC):** 0 = No change. (Default) 1 = There is a change to PED bit.
17	0h RW/1C	**Connect Status Change (CSC):** R/WC. This flag indicates a change has occurred in the port's Current Connect Status (CCS) or Cold Attach Status (CAS) bits. 0 = No change. (Default) 1 = There is a change to the CCS or CAS bit. The xHC sets this bit to 1b for all changes to the port device connect status, even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, root hub hardware will be "setting" an already-set bit (that is, the bit will remain 1b).
16	0h RW	**Port Link State Write Strobe (LWS):** 0 = When 0b, write data in PLS field is ignored. (Default) 1 = When this bit is set to 1b on a write reference to this register, this flag enables writes to the PLS field. Reads to this bit return '0'.
15:14	0h RW/P	**Port Indicator Control (PIC)**
13:10	0h RO	**Port Speed (PORTSPEED):** A device attached to this port operates at a speed defined by the following codes: Value Speed 0001b Full-speed 0010b Low speed 0011b Highspeed All other values reserved. Refer to the eXtensible Host Controller Interface for Universal Serial Bus Specification for additional details.
9	1h RW/P	**Port Power (PP):** Default value of 1. 0 = This port is in the powered-off state 1 = This port is in the powered-on state. This indicates that the port does have power.

Bit Range	Default & Access	Field Name (ID): Description
8:5	5h RW/P	**Port Link State (PLS):** This field is used to power manage the port and reflects its currentlink state.When the port is in the Enabled state, system software may set the link U-state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port. Write Value and Description 0: The link shall transition to a U0 state from any of the U-states. 2: USB 2.0 ports only. The link should transition to the U2 State. 3: The link shall transition to a U3 state from any of the U-states. This action selectively suspends the device connected to this port. While the Port LinkState = U3, the hub does not propagate downstream-directed traffic to this port, but the hub will respond to resume signaling from the port. 5: USB 3.0 ports only. If the port is in the Disabled state (PLS = Disabled, PP= 1), then the link shall transition to a RxDetect state and the port shall transition to the Disconnected state, else ignored. 15: USB 2.0 ports only. If the port is in the U3 state (PLS = U3), then the link shall remain in the U3 state and the port shall transition to the U3Exit substate, else ignored. All other values are ignored Read Value and Definition 0: Link is in the U0 State 1: Link is in the U1 State 2: Link is in the U2 State 3: Link is in the U3 State (Device Suspended) 4: Link is in the Disabled State 5:Link is in the RxDetect State 6:Link is in the Inactive State 7: Link is in the Polling State 8:Link is in the Recovery State 9: Link is in the Hot Reset State 10: Link is in the Compliance Mode State 11: Link is in the Test Mode State 12–14: Reserved 15: Link is in the Resume State
4	0h RW/1S	**Port Reset (PR):** When software writes a 1 to this bit (from a 0), the bus reset sequence as 1=port in reset 0=port not in reset
3	0h RW	**Over-current Active (OCA):** 0 = This port does not have an overcurrent condition. (Default) 1 = This port currently has an overcurrent condition. This bit will automatically transition from 1 to 0 when the overcurrent condition is removed. The PCH automatically disables the port when the overcurrent active bit is 1.
2	0h RO	Reserved.
1	0h RW/1C	**Port Enabled Disabled (PED):** Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a 1 to this bit. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by host software. The bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events. 0=disable 1=enable(default)
0	0h RW	**Current Connect Status (CCS):** This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. 0=no device is present 1=device is present on port.

24.2.18 Port Power Management Status Aand Control USB2 (PORTPMSCN)—Offset 484h

Note that this USB2 Port Power Management Status and Control register is available at the following offsets for all applicable USB2 ports:

USB2 Port 1: 484h
USB2 Port 2: 494h
USB2 Port 3: 4A4h
.....
USB2 Port 9: 504h
USB2 Port 10: 514h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RW/P	**Port Test Control (PTC):** When this field is '0', the port is not operating in a test mode. (Default) A non-zero value indicates that the port is operating in test mode and the specific test mode is indicated by the specific value. A non-zero Port Test Control value is only valid to a port that is in the Disabled state. If the port is not in this state, the xHC shall respond with the Port Test Control field set to Port Test Control Error. The encoding of the Test Mode bits for a USB 2.0 port are: Value Test Mode 0h Test mode not enabled 1h Test J_STATE 2h Test K_STATE 3h Test SE0_NAK 4h Test Packet 5h Test FORCE_ENABLE 6h–14h Reserved. 15 Port Test Control Error
27:17	0h RO	Reserved.
16	0h RW	**Hardware LPM Enable (HLE):** 0=disable 1=Enable. When this bit is a 1, hardware controlled LPM shall be enabled for this port.
15:8	0h RO	Reserved.
7:4	0h RW/P	**Host Initiated Resume Duration (HIRD)**
3	0h RW/P	**Remote Wake Enable (RWE):** The host system sets this flag to enable or disable the device for remote wake from L1. 0=disable 1=enable The value of this flag will temporarily (while in L1) override the current setting of the Remote Wake feature set by the standard Set/ClearFeature() commands defined in Universal Serial Bus Specification, revision 2.0, Chapter 9.
2:0	0h RW	**L1 Status (L1S)**

24.2.19 Port N Hardware LPM Control Register (PORTHLPMCN)—Offset 48Ch

Note that this Port Hardware Control register is available at the following offsets for all applicable USB ports:

USB2 Port 1: 48Ch
USB2 Port 2: 49Ch
USB2 Port 3: 4ACh
.....
USB2 Port 9: 50Ch
USB2 Port 10: 51Ch

This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST).The definition for the fields depend on the protocol supported.
For USB3 this register is reserved and shall be treated by software as RsvdP.
For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13:10	0h RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us...Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.
9:2	0h RW/P	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us....FFh: 65,280us
1:0	0h RW/P	**Host Initiated Resume Duration Mode (HIRDM)**

24.2.20 Port Status And Control USB3 (PORTSCXUSB3)—Offset 540h

The USB3 Port Status and Control registers are available at the following offsets forapplicable USB3 ports:
USB3 Port 1: 540h
USB3 port 2: 550h
USB3 port 3: 560h

USB3 port 4: 570h
USB3 port 5: 580h
USB3 port 6: 590h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2A0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S	**Warm Port Reset (WPR):** When software sets this bit to 1b, the Warm Reset sequence is enabled
30	0h RW/L	**Device Removable (DR):** This bit indicates if this port has a removable device. 0 = Device is removable. 1 = Device is non-removable.
29:28	0h RO	Reserved.
27	0h RW/P	**Wake on Over-current Enable (WOE):** 0 = Disable. (Default) 1 = Enable. Writing this bit to a 1b enables the port to be sensitive to overcurrent conditions as system wake-up events.
26	0h RW/P	**Wake on Disconnect Enable (WDE):** 0 = Disable. (Default) 1 = Enable. Writing this bit to a 1b enables the port to be sensitive to device disconnects as system wake-up events.
25	0h RW/P	**Wake on Connect Enable (WCE):** 0 = Disable. (Default) 1 = Enable. Writing this bit to a 1b enables the port to be sensitive to device connects as system wake-up events.
24	0h RO	**Cold Attach Status (CAS):** This bit indicates that far-end terminations were detected in the Disconnected state and the Root Hub Port State Machine was unable to advance to the Enabled state. Software shall clear this bit by writing a 1b to the WPR bit or the xHC shall clear this bit if the CSS bit transitions to 1.
23	0h RW/1C	**Port Config Error Change (CEC)**
22	0h RW/1C	**Port Link State Change (PLC):** 0 = No change 1 = Link Status Change This flag is set to '1' due to the following Port Link State (PLS) transitions:
21	0h RW/1C	**Port Reset Change (PRC):** This flag is set to '1' due a '1' to '0' transition of Port Reset (PR), for example, when any reset processing on this port is complete. 0 = No change 1 = Reset Complete
20	0h RW/1C	**Over-current Change (OCC):** The functionality of this bit is not dependent upon the port owner. Software clears this bit by writing a 1 to it. 0 = No change. (Default) 1 = There is a change to Overcurrent Active.
19	0h RW/1C	**Warm Port Reset Change (WRC):** This bit is set when Warm Reset processing on this port completes. 0 = No change. (Default) 1 = Warm reset complete
18	0h RW/1C	**Port Enabled Disabled Change (PEC):** 0 = No change. (Default) 1 = There is a change to PED bit.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW/1C	**Connect Status Change (CSC):** R/WC. This flag indicates a change has occurred in the port's Current Connect Status (CCS) or Cold Attach Status (CAS) bits. 0 = No change. (Default) 1 = There is a change to the CCS or CAS bit. The xHC sets this bit to 1b for all changes to the port device connect status, even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, root hub hardware will be "setting" an already-set bit (that is, the bit will remain 1b).
16	0h RW	**Port Link State Write Strobe (LWS):** 0 = When 0b, write data in PLS field is ignored. (Default) 1 = When this bit is set to 1b on a write reference to this register, this flag enables writes to the PLS field. Reads to this bit return '0'.
15:14	0h RW/P	**Port Indicator Control (PIC)**
13:10	0h RO	**Port Speed (PORTSPEED):** A device attached to this portoperates at a speed defined by the following codes: Value Speed 0100b SuperSpeed (5Gb/s) 0101b SuperSpeedPlus (10Gb/s) All other values reserved.
9	1h RW/P	**Port Power (PP):** Default value of 1. 0 = This port is in the powered-off state 1 = This port is in the powered-on state. This indicates that the port does have power.
8:5	5h RW/P	**Port Link State (PLS):** This field is used to power manage the port and reflects its current link state.When the port is in the Enabled state, system software may setthe link U-state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port. Write Value and Description: 0: The link shall transition to a U0 state from any of the U-states. 2: USB 2.0 ports only. The link should transition to the U2 State. 3: The link shall transition to a U3 state from any of the U-states.This action selectively suspends the device connected to this port.While the Port Link State = U3, the hub does not propagatedownstream-directed traffic to this port, but the hub will respondto resume signaling from the port. 5: USB 3.0 ports only. If the port is in the Disabled state (PLS =Disabled, PP = 1), then the link shall transition to a RxDetect stateand the port shall transition to the Disconnected state, elseignored. 15: USB 2.0 ports only. If the port is in the U3 state (PLS = U3),then the link shall remain in the U3 state and the port shalltransition to the U3Exit substate, else ignored.All other values IgnoredNote: The Port Link State Write Strobe (LWS) shall be set to 1b towrite this field. Read Value and Definition: 0: Link is in the U0 State 1: Link is in the U1 State 2: Link is in the U2 State 3: Link is in the U3 State (Device Suspended) 4: Link is in the Disabled State 5: Link is in the RxDetect State 6: Link is in the Inactive State 7: Link is in the Polling State 8: Link is in the Recovery State 9: Link is in the Hot Reset State 10: Link is in the Compliance Mode State 11: Link is in the Test Mode State 12–14: Reserved 15: Link is in the Resume State

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/1S	**Port Reset (PR):** When software writes a1 to this bit (from a 0), the bus reset sequence as defined in the USB Specification, Revision 2.0 is started. Software writes a 0 tothis bit to terminate the bus reset sequence. Software must keep this bit at a 1 long enough to ensure the reset sequence completes as specified in the USB Specification, Revision 2.0. USB 3.0 portsshall execute the Hot Reset sequence as defined in the USB 3.0 Specification. PR remains set until reset signaling is completed by the root hub. 1 = Port is in Reset. 0 = Port is not in Reset.
3	0h RW	**Over-current Active (OCA):** 0 = This port does not have an overcurrent condition. (Default) 1 = This port currently has an overcurrent condition. This bit will automatically transition from 1 to 0 when the overcurrent condition is removed. The PCH automatically disables the port when the overcurrent active bit is 1.
2	0h RO	Reserved.
1	0h RW/1C	**Port Enabled Disabled (PED):** Ports can only be enabled by the host controller as a part of thereset and enable. Software cannot enable a port by writing a 1 to this bit. Ports can be disabled byeither a fault condition (disconnect event or other fault condition)or by host software. The bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events. 0 = Disable. 1 = Enable. (Default)
0	0h RW	**Current Connect Status (CCS):** This value reflects the currentstate of the port, and may not correspond directly to the eventthat caused the Connect Status Change bit (Bit 1) to be set. 0 = No device is present. (Default) 1 = Device is present on port.

24.2.21 Port Power Management Status And Control USB3 (PORTPMSCX)—Offset 544h

The USB3 Port Status and Control registers are available at the following offsets forapplicable USB3 ports:
USB3 Port 1: 544h
USB3 port 2: 554h
USB3 port 3: 564h
USB3 port 4: 574h
USB3 port 5: 584h
USB3 port 6: 594h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	Reserved.
16	0h RW	**Force Link PM Accept (FLA):** Force Link PM Accept (FLA):
15:8	0h RW/P	**U2 Timeout (U2T):** U2 Timeout (U2T):
7:0	0h RW/P	**U1 Timeout (U1T):** U1 Timeout (U1T):

24.2.22 USB3 Port X Link Info (PORTLIX)—Offset 548h

Note that this USB3 Port Link Info register is available at the following offsets for allapplicable USB3 ports:
USB3 Port 1: 548h
USB3 port 2: 558h
USB3 port 3: 568h
USB3 port 4: 578h
USB3 port 5: 588h
USB3 port 6: 598h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**Link Error Count (LEC):** Displays the Link Error Count for the USB 3 port.

24.2.23 Microframe Index (RTMFINDEX)—Offset 2000h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13:0	0h RO	**Microframe Index (IMAN0)**

24.2.24 Interrupter x Management (IMANx)—Offset 2020h

Note that there are a total of 8 IMAN registers at the following offsets:
IMAN0: at offset 2020h
IMAN1: at offset 2040h
IMAN2: at offset 2060h
.....
IMAN6: at offset 20E0h
IMAN7; at offset 2100h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	Reserved.
1	0h RW	**Interrupt Enable (IE):** This flag specifies whether the Interrupter is capable of generating an interrupt.0 = The Interrupter is prohibited from generating interrupts.1 = When this bit and the IP bit are set (1b), the Interrupter shall generate an interrupt when the Interrupter Moderation Counter reaches '0'.
0	0h RW/1C	**Interrupt Pending (IP):** 0 = No interrupt is pending for the Interrupter.1 = An interrupt is pending for this Interrupter.This bit is set to 1b when IE = 1, the IMODI Interrupt Moderation Counter field = 0b, the Event Ring associated with the Interrupter is not empty (or for the Primary Interrupter when the HCE flag is set to 1b), and EHB = 0. If MSI interrupts are enabled, this flag shall be cleared automatically when the PCI DWord write generated by the Interrupt assertion is complete. If PCI Pin Interrupts are enabled, this flag shall be cleared by software.

24.2.25 Interrupter x Moderation (IMODx)—Offset 2024h

Note that there are a total of 8 IMOD registers at the following offsets:
IMOD0 : at offset 2024h
IMOD1: at offset 2044h
IMOD2: at offset 2064h
.....
IMOD6: at offset 20E4h
IMOD7; at offset 2104h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: FA0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Interrupt Moderation Counter (IMODC):** Down counter. Loaded with Interval Moderation value—value of bits 15:0, whenever the IP bit is cleared to 0b, counts down to '0', and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP bits = 1, and EHB = 0.This counter may be directly written by software at any time to alter the interrupt rate
15:0	FA0h RW	**Interrupt Moderation Interval (IMODI):** Minimum inter-interrupt interval. The interval is specified in 250 ns increments. A value of '0' disables interrupt throttling logic and interrupts shall be generated immediately if IP = 0, EHB = 0, and the Event Ring is not empty.

24.2.26 Event Ring Segment Table Size x (ERSTSZx)—Offset 2028h

There are 8 ERSTSZ registers available at the following address offsets:
ERSTSZ0: at offset 2028h
ERSTSZ1: at offset 2048h
ERSTSZ2: at offset 2068h
ERSTSZ3: at offset 2088h
ERSTSZ4: at offset 20A8h
ERSTSZ5: at offset 20C8h
ERSTSZ6: at offset 20E8h
ERSTSZ7: at offset 2108h
Address Offset: 2028-202Bh, 2048-204Bh, ..., 2028+(MaxInts-1)*20h-202B+(MaxInts-1)*20h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register.

24.2.27 Event Ring Segment Table Base Address Low x (ERSTBA_LOx)—Offset 2030h

There are 8 ERSTBA_LO registers available at the following address offsets:
ERSTBA_LO0: at offset 2030h
ERSTBA_LO1: at offset 2050h
ERSTBA_LO2: at offset 2070h

ERSTBA_LO3: at offset 2090h
ERSTBA_LO4: at offset 20B0h
ERSTBA_LO5: at offset 20D0h
ERSTBA_LO6: at offset 20F0h
ERSTBA_LO7: at offset 2110h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0h RW	**Event Ring Segment Table Base Address Register (ERSTBA):** This field defines the low order bits of the start address of the Event Ring Segment Table. This field shall not be modified if HCHalted (HCH) = 0.
5:0	0h RO	Reserved.

24.2.28 Event Ring Segment Table Base Address High x (ERSTBA_HIx)—Offset 2034h

There are 8 ERSTBA_HI registers available at the following address offsets:
ERSTBA_HI0: at offset 2034h
ERSTBA_HI1: at offset 2054h
ERSTBA_HI2: at offset 2074h
ERSTBA_HI3: at offset 2094h
ERSTBA_HI4: at offset 20B4h
ERSTBA_HI5: at offset 20D4h
ERSTBA_HI6: at offset 20F4h
ERSTBA_HI7: at offset 2114h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Segment Table Base Address (ERSTBA):** This field defines the low order bits of the start address of the Event Ring Segment Table. This field shall not be modified if HCHalted (HCH) = 0.

24.2.29 Event Ring Dequeue Pointer Low x (ERDP_LOx)—Offset 2038h

There are 8 ERDP_LO registers available at the following address offsets:
ERDP_LO0: at offset 2038h
ERDP_LO1: at offset 2058h
ERDP_LO2: at offset 2078h
ERDP_LO3: at offset 2098h
ERDP_LO4: at offset 20B8h
ERDP_LO5: at offset 20D8h
ERDP_LO6: at offset 20F8h
ERDP_LO7: at offset 2118h

Access Method

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RW	**Event Ring Dequeue Pointer (ERDP):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that Event Ring Dequeue Pointer resides in.
3	0h RW/1C	**Event Handler Busy (EHB):** This flag shall be set to '1' when the IP bit is set to '1' and cleared to '0' by software when the Dequeue Pointer register is written.
2:0	0h RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that Event Ring Dequeue Pointer resides in.

24.2.30 Event Ring Dequeue Pointer High x (ERDP_HIx)—Offset 203Ch

There are 8 ERDP_LO registers available at the following address offsets:
ERDP_HI0: at offset 203Ch
ERDP_HI1: at offset 205Ch
ERDP_HI2: at offset 207Ch
ERDP_HI3: at offset 209Ch
ERDP_HI4: at offset 20BCh
ERDP_HI5: at offset 20DCh
ERDP_HI6: at offset 20FCh
ERDP_HI7: at offset 211Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Event Ring Dequeue Pointer (ERDP):** This field defines the low order bits of the 64- bit address of the current Event Ring Dequeue Pointer.

24.2.31 Door Bell x (DBx)—Offset 3000h

Door Bell registers are an array of 32 registers.
The door bell registers are at the following offset:

Door Bell 0: 3000-3003h
Door Bell 1: 3004-3007h
.....
Door Bell 30: 3078-307Bh
Door Bell 31: 307C-307Fh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**DB Stream ID (DSI)**
15:8	0h RO	Reserved.
7:0	0h RW	**DB Target (DT):** This field defines the target of the doorbell reference. The table below defines the xHC notification that is generated by ringing the doorbell. Doorbell Register 0 is dedicated to Command Ring and decodes this field differently than the other Doorbell Registers. Refer to the xHCI Specification for definitions of the values.

24.2.32 XECP SUPP USB2_0 (XECP_SUPP_USB2_0)—Offset 8000h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2000802h

Bit Range	Default & Access	Field Name (ID): Description
31:24	2h RO	**USB Major Revision: 2.0 (USB2_MAJ_REV):** Major Specification Release Number in Binary-Coded Decimal (i.e., version 3.x is 03h). This field identifies the major release number component of the specification with which the xHC is compliant.
23:16	0h RO	**USB Minor Revision (USB_MIN_REV):** Minor Specification Release Number in Binary-Coded Decimal (i.e., version x.10 is 10h). This field identifies the minor release number component of the specification with which the xHC is compliant.
15:8	8h RO	**Next Capability Pointer (NCP):** This field indicates the location of the next capability with respect to the effective address of this capability.
7:0	2h RO	**Supported Protocol ID (SPID):** This field identifies the xHCI Extended capability. Refer to Table 146 for a list of the valid xHCI extended capabilities.

24.2.33 XECP SUPP USB2_1 (XECP_SUPP_USB2_1)—Offset 8004h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 20425355h

Bit Range	Default & Access	Field Name (ID): Description
31:0	20425355h RO	**XECP_SUPP_USB2_1 (XECP_SUPP_USB2_1):** This field is a mnemonic name string that references the specification with which the xHC is compliant. Four ASCII characters may be defined. Allowed characters are: alphanumeric, space, and underscore. Alpha characters are case sensitive.

24.2.34 XECP SUPP USB2_2 (XECP_SUPP_USB2_2)—Offset 8008h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 30180C01h

Bit Range	Default & Access	Field Name (ID): Description
31:28	3h RO	**Protocol Speed ID Count (PROT_SPD_ID_CNT)**
27:21	0h RO	Reserved.
20	1h RW/L	**BESL LPM Capability (BLC)**
19	1h RW/L	**Protocol Defined - Hardware LMP Capability (HLC)**
18	0h RO	**Protocol Defined - Integrated Hub Implementation (IHI)**

Bit Range	Default & Access	Field Name (ID): Description
17	0h RO	**Protocol Defined - High SPeed Only (HSO):** This field indicates the number of Protocol Speed ID (PSI) Dwords that the xHCI Supported Protocol Capability data structure contains.If this field is non-zero, then all speeds supported by the protocol shall be defined using PSI Dwords, i.e. no implied Speed ID mappings apply.
16	0h RO	Reserved.
15:8	Ch RO	**Compatible Port Count (CPC):** This field identifies the number of consecutive Root Hub Ports (starting at the Compatible Port Offset) that support this protocol. Valid values are 1 to MaxPorts.
7:0	1h RO	**Compatible Port Offset (CPO):** This field specifies the starting Port Number of Root Hub Ports that support this protocol. Valid values are '1' to MaxPorts.

24.2.35 XECP SUPP USB3_3 (XECP_SUPP_USB2_3)—Offset 800Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4:0	0h RO	**XECP_SUPP_USB3_3 (PROTOCOL_SLOT_TYPE)**

24.2.36 XECP SUPP USB2_4 Full Speed (XECP_SUPP_USB2_4)—Offset 8010h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: C0021h

Bit Range	Default & Access	Field Name (ID): Description
31:16	Ch RO	**Protocol Speed ID Mantissa (PSIM):** This field defines the mantissa that shall be applied to the PSIE when calculating the maximum bit rate represented by this PSI Dword
15:14	0h RO	**Link Protocol (LP):** Link Protocol (LP): 0: SuperSpeed 1: SuperSpeedPlus 3-2: Reserved
13:9	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RO	**PSI Full Duplex (PFD):** If this bit is '1' the link is full-duplex (dual-simplex), and if '0' the link is half-duplex (simplex).
7:6	0h RO	**PSI Type (PLT):** This field identifies whether the PSI Dword defines a symmetric or asymmetric bit rate, and if asymmetric, then this field also indicates if this Dword defines the receive or transmit bit rate. Note that the Asymmetric PSI Dwords shall be paired, i.e. an Rx immediately followed by a Tx, and both Dwords shall define the same value for the PSIV.PLT Value Bit Rate Note 0 Symmetric Single PSI Dword 1 Reserved 2 Asymmetric Rx Paired with Asymmetric Tx PSI Dword 3 Asymmetric Tx Immediately follows Rx Asymmetric PSI Dword
5:4	2h RO	**Protocol Speed ID Exponent (PSIE):** This field defines the base 10 exponent times 3, that shall be applied to the Protocol Speed ID Mantissa when calculating the maximum bit rate represented by this PSI Dword.PSIE Value Bit Rate 0 Bits per second 1 Kb/s 2 Mb/s 3 Gb/s
3:0	1h RO	**Protocol Speed ID Value (PSIV):** If a device is attached that operates at the bit rate defined by this PSI Dword, then the value of this field shall be reported in the Port Speed field of PORTSC register (5.4.8) of a compatible port. Note, the PSIV value of '0' is reserved and shall not be defined by a PSI.

24.2.37 XECP_SUPP USB2_5 Low Speed (XECP_SUPP_USB2_5)—Offset 8014h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 5DC0012h

Bit Range	Default & Access	Field Name (ID): Description
31:16	5DCh RO	**Protocol Speed ID Mantissa (PSIM)**
15:14	0h RO	**Link Protocol (LP):** Link Protocol (LP): 0: SuperSpeed 1: SuperSpeedPlus 3-2: Reserved
13:9	0h RO	Reserved.
8	0h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	1h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	2h RO	**Protocol Speed ID Value (PSIV)**

24.2.38 XECP SUPP USB2_6 High Speed (XECP_SUPP_USB2_6)—Offset 8018h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1E00023h

Bit Range	Default & Access	Field Name (ID): Description
31:16	1E0h RO	**Protocol Speed ID Mantissa (PSIM)**
15:14	0h RO	**Link Protocol (LP):** Link Protocol (LP): 0: SuperSpeed 1: SuperSpeedPlus 3-2: Reserved
13:9	0h RO	Reserved.
8	0h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	2h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	3h RO	**Protocol Speed ID Value (PSIV)**

24.2.39 XECP SUPP USB3_0 (XECP_SUPP_USB3_0)—Offset 8020h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 3101402h

Bit Range	Default & Access	Field Name (ID): Description
31:24	3h RO	**USB Major Revision: 3.0 (USB3_MAJ_REV)**
23:16	10h RO	**USB Minor Revision (USB3_MIN_REV)**
15:8	14h RO	**Next Capability Pointer (NCP)**
7:0	2h RO	**Supported Protocol ID (SPID)**

24.2.40 XECP SUPP USB3_1 (XECP_SUPP_USB3_1)—Offset 8024h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 20425355h

Bit Range	Default & Access	Field Name (ID): Description
31:0	20425355h RO	**XECP_SUPP_USB3_1 (XECP_SUPP_USB3_1)**

24.2.41 XECP SUPP USB3_2 (XECP_SUPP_USB3_2)—Offset 8028h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 8000040Dh

Bit Range	Default & Access	Field Name (ID): Description
31:28	8h RO	**Protocol Speed ID Count (PROT_SPD_ID_CNT)**
27:16	0h RO	Reserved.
15:8	4h RO	**Compatible Port Count (CPC)**
7:0	Dh RO	**Compatible Port Offset (CPO)**

24.2.42 XECP SUPP USB3_3 (XECP_SUPP_USB3_3)—Offset 802Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4:0	0h RO	**XECP_SUPP_USB3_3 (PROTOCOL_SLOT_TYPE)**

24.2.43 XECP SUPP USB3_4 (XECP_SUPP_USB3_4 (USB 3.2 Gen 1x1))—Offset 8030h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 50134h

Bit Range	Default & Access	Field Name (ID): Description
31:4	5013h RO	Reserved.
3:0	4h RO	**Protocol Speed ID Value (PSIV)**

24.2.44 XECP SUPP USB3_5 (XECP_SUPP_USB3_5 (USB 3.2 Gen 2x1))—Offset 8034h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: A4135h

Bit Range	Default & Access	Field Name (ID): Description
31:16	Ah RO	**Protocol Speed ID Mantissa (PSIM)**
15:14	1h	**link Protocol (LP):** Link Protocol (LP): 0: SuperSpeed 1: SuperSpeedPlus 3-2: Reserved
13:9	0h RO	Reserved.
8	1h RO	**PSI Full Duplex (PFD)**

Bit Range	Default & Access	Field Name (ID): Description
7:6	0h RO	**PSI Type (PLT)**
5:4	3h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	5h RO	**Protocol Speed ID Value (PSIV)**

24.2.45 XECP SUPP USB3_6 (XECP_SUPP_USB3_6)—Offset 8038h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 4E00126h

Bit Range	Default & Access	Field Name (ID): Description
31:16	4E0h RO	**Protocol Speed ID Mantissa (PSIM)**
15:14	0h RO	**Link Protocol (LP):** Link Protocol (LP): 0: SuperSpeed 1: SuperSpeedPlus 3-2: Reserved
13:9	0h RO	Reserved.
8	1h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	2h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	6h RO	**Protocol Speed ID Value (PSIV)**

24.2.46 XECP SUPP USB3_7 (XECP_SUPP_USB3_7)—Offset 803Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 9C00127h

Bit Range	Default & Access	Field Name (ID): Description
31:16	9C0h RO	**Protocol Speed ID Mantissa (PSIM)**
15:14	0h RO	**Link Protocol (LP):** Link Protocol (LP): 0: SuperSpeed 1: SuperSpeedPlus 3-2: Reserved
13:9	0h RO	Reserved.
8	1h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	2h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	7h RO	**Protocol Speed ID Value (PSIV)**

24.2.47 XECP SUPP USB3_8 (XECP_SUPP_USB3_8)—Offset 8040h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 13800128h

Bit Range	Default & Access	Field Name (ID): Description
31:16	1380h RO	**Protocol Speed ID Mantissa (PSIM)**
15:14	0h RO	**Link Protocol (LP):** Link Protocol (LP): 0: SuperSpeed 1: SuperSpeedPlus 3-2: Reserved
13:9	0h RO	Reserved.
8	1h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	2h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	8h RO	**Protocol Speed ID Value (PSIV)**

24.2.48 XECP SUPP USB3_9 (XECP_SUPP_USB3_9)—Offset 8044h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 5B10129h

Bit Range	Default & Access	Field Name (ID): Description
31:16	5B1h RO	**Protocol Speed ID Mantissa (PSIM)**
15:9	0h RO	Reserved.
8	1h RO	**PSI Full Duplex (PFD)**
7:6	0h RO	**PSI Type (PLT)**
5:4	2h RO	**Protocol Speed ID Exponent (PSIE)**
3:0	9h RO	**Protocol Speed ID Value (PSIV)**

24.2.49 Host Control Scheduler (HOST_CTRL_SCH_REG)—Offset 8094h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 140h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	Reserved.
12:11	0h RW	**Cache Size Control Reg (CACHE_SZ_CTRL):** 0: 64 1: 32 2,3: 16
10:9	0h RO	Reserved.
8	1h RW	**Turn on scratch_pad_en (TO_SCRATCH_PAD_EN)**
7	0h RW	**Scheduler Host Control Reg (STOP_SCH_UNCON)**
6	1h RW	**disable 1 pack scheduling limit when ISO pending in present microframe (DIS_SCH_LIMIT)**
5:4	0h RW	**scheduler sort pattern (SCH_SORT_PATTERN)**
3	0h RW	**enable TTE overlap prevention on interrupt OUT EPs (at cost of possible service interval slip (EN_TTE_OVERLAP_PREV_OUT)**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**enable TTE overlap prevention on interrupt IN EPs (at cost of possible service interval slip (EN_TTE_OVERLAP_PREV_IN)**
1	0h RW	**Disable TRM active IN EP valid check function (DIS_TRM_ACT_IN_VALID)**
0	0h RW	**Disable poll delay function (DIS_POLL_DELAY)**

24.2.50 Power Management Control (PMCTRL_REG)—Offset 80A4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 492D5094h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Async PME Source Enable (ASYNC_PME_SRC_EN)**
30	1h RW	**Legacy PME Source Enable (LEGACY_PME_SRC_EN)**
29	0h RW	**Reset Warn Power Gate Trigger Disable (RESET_WARN_PWR_GATE_TRIGGER_DISABLE):** This field controls the actions taken for due to reset warn. 0 - Reset Warn will trigger a HW autonomous Power Gate 1 - Reset Warn will not trigger a HW autonomous Power Gate
28	0h RW	**CLR_PME_FLAG_PULSE_AUX_CCLK (CLR_PME_FLAG_PULSE_AUX_CCLK):** Internal PME flag Clear This Write-Only bit can be used to clear the internal PME flag. SW write to '1' will clear the PME flag. SW write to '0' will have no effect and be ignored by the controller.
27	1h RW	**Disable RTD3 power gating when in D3 (DIS_D3_PG)**
26	0h RW	**XLFPSCOUNTSRC (XLFPSCOUNTSRC):** XLFPSCOUNTSRC (Source for LFPS OFF Counter) 0: Central RTC Counter for LFPS detection 1: Local Counter for LFPS detection
25	0h RW	**XELFPSRTC (XELFPSRTC)**
24	1h RW	**XMPHYSPGDD0I2 (XMPHYSPGDD0I2)**
23	0h RW	**XMPHYSPGDD0I3 (XMPHYSPGDD0I3)**
22	0h RW	**XMPHYSPGDRTD3 (XMPHYSPGDRTD3)**
21:18	Bh RW	**XD3RTCPTTM (XD3RTCPTTM):** XD3RTCPTTM (D3 RTC Port Timer Tick Multiplier) This register will be the multiplication factor for determining Wake Detection Frequency and RXDET based on the XD3RTCPTTC value. If XD3RTCPTTC is 9h and this register is Bh, frequency for RXDET H8EXIT detection while MODPHY SUS Power gating is enabled would be 99ms.

Bit Range	Default & Access	Field Name (ID): Description
17	0h RW	**U3 LFPS Periodic Sampling ON Time Control (U3_LFPS_PRDC_SAMPLING_ON_TIME_CTRL):** This field controls the ON time for the LFPS periodic sampling for USB3 ports. 0 ON time is 2 rtc clocks 1 ON time is 3 rtc clocks Note: This field is ignored if USB3 PHY SUS Well Power Gating is enabled.
16	1h RW	**AON LFPS Detector Enable Mode (AON_LFPS_DETECTOR_EN_MODE)**
15:8	50h RW	**SS U3 LFPS Detection Threshold (SS_U3_LFPS_DETECTION_THRESHOLD)**
7:4	9h RW	**SS_U3_LFPS_PRDC_SAMPLING_OFFTIME_CTRL (SS_U3_LFPS_PRDC_SAMPLING_OFFTIME_CTRL)**
3	0h RW	**PS3 LFPS Source Select (PS3_LFPS_SRC_SEL)**
2	1h RW	**XHCI Engine Autonomous Power Gate Exit Reset Policy (XHC_AUTO_PWRGATE_EXITRST_POLICY)**
1	0h RW	**USB2 Port Wake Unit Coupling Policy (USB2_PORT_WAKE_COUPLING_POLICY)**
0	0h RW	**USB3 Port Wake Unit Coupling Policy (USB3_PORT_WAKE_COUPLING_POLICY)**

24.2.51 Host Controller Misc Reg (HOST_CTRL_MISC_REG)—Offset 80B0h

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 37Fh

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**USB2_LTRUPDT_DIS (USB2_LTRUPDT_DIS):** This controls the inclusion of the USB2 LTR based on link state. Setting this bit will disable USB2 LTR and will expose a NO Requirement from USB2 thus not impacting the aggregated LTR vaule for the controller.
30	0h RW	**USB2 Line State Debounce During Port Reset Policy (USB2_LINE_STATE_DEBOUNCE_DURING_PORT_RESET_POLICY)**
29	0h RW	**TTE PEXE Credit Fix Disable (TTE_PEXE_CREDIT_FIX_DISABLE)**
28	0h RW	**TTE Scheduling policy (TTE_SCHEDULING_POLICY)**
27	0h RW	**USB3 ITP Delta Timer Source Select (USB3_ITP_DELTA_TIMER_SOURCE_SELECT)**
26	0h RW	**Frame Timer Source Select (FRAME_TIMER_SOURCE_SELECT)**
25	0h RW	**uFrame Masking Enable (UFRAME_MASKING_ENABLE)**
24	0h RW	**Late FID Check Disable (LATE_FID_CHECK_DISABLE)**

Bit Range	Default & Access	Field Name (ID): Description
23:20	0h RO	Reserved.
19	0h RW	**USB2 Resume Cx Inhibit Disable (USB2_RESUME_CX_INHIBIT_DISABLE)**
18	0h RW	**LATE_FID_TTE_DIS**
17	0h RW	**Late FID uframe Check Disable (LATE_FID_UFRAME_CHK_DIS)**
16	0h RW	**Late FID Extra Interval (LATE_FID_EXTRA_INTER)**
15:0	37Fh RW	**Valid Isoch Scheduling Range (VALID_ISOCH_SCHEDULING_RANGE)**

24.2.52 Host Controller Misc Reg2 (HOST_CTRL_MISC_REG2)—Offset 80B4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	Reserved.
25	0h RW	**ltm_belt_valid_clr (LTM_BELT_VALID_CLR)**
24	0h RW	**cfg_trm_drop_sch_req_dis (CFG_TRM_DROP_SCH_REQ_DIS)**
23	0h RW	**cfg_trm_drop_tte_req_dis (CFG_TRM_DROP_TTE_REQ_DIS)**
22	0h RW	**cfg_trm_edtla_clr_dis (CFG_TRM_EDTLA_CLR_DIS)**
21	0h RW	**cfg_xfer_is_serve_chk_en (CFG_XFER_IS_SERVE_CHK_EN)**
20	0h RW	**cfg_cpl_npkt0_fc_dis (CFG_CPL_NPKT0_FC_DIS)**
19:18	0h RO	Reserved.
17	0h RW	**Disable IDT credit leak fix (CFG_DIS_ODMA_IDT_CRD_LEAK_FIX)**
16	0h RW	**cfg_idma_ttype_chk_dis (CFG_IDMA_TTYPE_CHK_DIS)**

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**HC Reset Controller Isolation Disable (HCRST_CTRL_ISOL_DISABLE)**
14	0h RW	**cfg_dis_idma_perf_fix (DISABLE_IDMA_PERF_FIX)**
13:0	0h RO	Reserved.

24.2.53 Super Speed Port Enable (SSPE_REG)—Offset 80B8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RW	**SSPE_REG (SSPE_REG)**

24.2.54 AUX Power Management Control (AUX_CTRL_REG1)—Offset 80E0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 8080BCE0h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RW	**D3 Hot function enable register (D3_HOT_FXN_EN)**
30	0h RW	**Allow L1 Core Clock Gating (ALL_L1_CORE_CG)**
29	0h RW	**Allow Engine PHY Status Extension (AL_EP_SEXT)**
28	0h RW	**Allow Engine PCIe Rate Change Passing (ALL_EP_RCP)**
27	0h RW	**Allow Engine PERST Fundamental Reset (AL_PERST_FRST)**

Bit Range	Default & Access	Field Name (ID): Description
26	0h RW	**Overwrite PCIe P2 to P1 (OVR_PCIE_P2_P1)**
25	0h RW	**Set Internal SSV 1 (SET_ISSV_1)**
24	0h RW	**Clear Internal SSV 0 (CLR_ISSV_0)**
23	1h RW	**Enable save_restore_enable SW Loading (EN_SRE_SW_LD)**
22	0h RO	Reserved.
21	0h RW	**Force save_restore 1 (FORCE_SR1)**
20	0h RO	Reserved.
19	0h RW	**cfg iob drivestrength[1] (CIDS1)**
18	0h RW	**cfg iob drivestrength[0] (CIDS0)**
17	0h RW	**cfg_dis_arc_RXDP3 (CFG_DIS_ARC_RXDP3)**
16	0h RW	**cfg clk gate dis (CCGD)**
15	1h RW	**Enable CFG RXDET P3 (EN_CFG_RDP3)**
14	0h RW	**Enable CFG PIPE Reset (EN_CFG_PIPE_RST)**
13	1h RW	**Enable Filter TX Idle (EN_FILT_TX_IDLE)**
12	1h RW	**Enable Host Engine Generate PME (EN_HE_GEN_PME)**
11	1h RW	**Enable Isolation (EN_ISOL)**
10	1h RW	**Enable L1 Caused P2 Overwrite (EN_L1_P2_OVR)**
9	0h RW	**Enable Core Clock Gating (EN_CORE_CG)**
8	0h RW	**Enable PHY Status Timeout (EN_PHY_STS_TO)**
7	1h RW	**Ignore aux_pm_en PCIe Core (IGN_APE_PC)**
6	1h RW	**Enable P2 Overwrite P1 (EN_P2_OVR_P1)**
5	1h RW	**Enable P2 Remote Wake (EN_P2_REM_WAKE)**
4:1	0h RW	**Forced PM State (FORCED_PM_STATE)**
0	0h RW	**Initiate Force PM State (INIT_FPMS)**

24.2.55 SuperSpeed Port Link Control (HOST_CTRL_PORT_LINK_REG)—Offset 80ECh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 18000C00h

Bit Range	Default & Access	Field Name (ID): Description
31:27	3h RW	**Force LTSSM State (FORCE_LTSSM_ST)**
26	0h RW	**Direct Link LTSSM State (DL_LTSSM_ST)**
25	0h RW	**Direct Link To U0 (DL_U0)**
24:21	0h RW	**Forced Compliance Pattern (FORCED_CMP_PAT)**
20:17	0h RO	Reserved.
16:15	0h RW	**PHY Low Power Latency (PHY_LP_LAT)**
14:12	0h RW	**Link Recovery Minimum Time (LR_MIN_TM)**
11:9	6h RW	**Link Polling Minimum Time (LP_MIN_TM)**
8	0h RW	**Force Link Accept PM Command (FORCE_LA_PMC)**
7	0h RW	**Direct Link Recovery U0 (DL_REC_U0)**
6	0h RW	**Link Fast Training Mode (LINK_FTM)**
5	0h RW	**Disable Link Scrambler (DIS_LINK_SCRAM)**
4	0h RW	**Direct Link U3 From U0 (DL_U3_U0)**
3	0h RW	**Direct Link U3 From U0 (DL_U2_U0)**
2	0h RW	**Direct Link U3 From U0 (DL_U1_U0)**
1	0h RW	**Enable Link Loopback Initiator Mode (EN_LINK_LB_MAST)**
0	0h RW	**Disable Link Compliance Mode (DIS_LINK_CM):** 0: Enable link compliance mode 1: Disable link compliance mode

24.2.56 USB2 Port Link Control 1 (USB2_LINK_MGR_CTRL_REG1)—Offset 80F0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 314803A0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	31h RW	**FS/LS Mode SE0 Disconnect Delay[7:0] (FSLS_SE0_DIS_DEL_7_0)**
23	0h RW	**EN_SNPS_PHY_FIX (EN_SNPS_PHY_FIX)**
22	1h RW	**EN_L1_DISC_IN_L0 (EN_L1_DISC_IN_L0)**
21	0h RW	**DIS_PURGE_ON_SETUP_FIX (DIS_PURGE_ON_SETUP_FIX)**
20	0h RW	**L1_EXIT_RECOVERY_MODE (L1_EXIT_RECOVERY_MODE)**
19	1h RW	**L1_TO_INCR_MODE (L1_TO_INCR_MODE)**
18	0h RO	Reserved.
17	0h RW	**EN_DETECT_NOMINAL_PKT_EOP (EN_DETECT_NOMINAL_PKT_EOP)**
16	0h RW	**Disable Chirp Response (DIS_CHIRP_RESPONSE)**
15	0h RW	**Disable 192 Byte Limit Check (DIS_192B_LIM)**
14	0h RW	**External Provided FS/LS Disconnect (EXT_FSLS_DIS)**
13:12	0h RW	**UTMI Reset Source Select (UTMI_RST_SEL)**
11	0h RW	**Disable HS Disconnect Window (DIS_HS_DIS_WIN)**
10	0h RW	**Disable Port Error Detection (DIS_PERR_DET)**
9	1h RW	**Disable Peek Function for ISO-OUT (DIS_PF_IOUT)**
8	1h RW	**Drive Resume-K FS/LS Serial Interface (DRV_RESK_FSLS_SER)**
7	1h RW	**Enable USB2 Drop-Ping (EN_U2_DROP_PING)**
6	0h RW	**Enable USB2 Force-Ping (EN_U2_FORCE_PING)**

Bit Range	Default & Access	Field Name (ID): Description
5	1h RW	**Enable USB2 Auto-Ping (EN_U2_AUTO_PING)**
4	0h RW	**Disable PHY SuspendM (DIS_PHY_SUSM)**
3	0h RW	**UTMI Internal Clock Gate Disable (UTMI_INT_CG_DIS)**
2	0h RW	**Disable PHY SuspendM in Disconnect State (DIS_PSUSM_DS)**
1	0h RW	**Force PHY Reset (FORCE_PHY_RST)**
0	0h RW	**USB2 Accelerated Simulation Timing (U2_ACC_SIM_TIM)**

24.2.57 USB2 Port Link Control 4 (USB2_LINK_MGR_CTRL_REG4)—Offset 80FCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 8003h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21:9	40h RW	**U2 Detect Remote Wake Delay (U2D_RWAKE_DEL)**
8:0	3h RW	**U2 Entry Ignore Linestate Changes Duration[12:4] (U2_IGN_LS_DUR_12_4)**

24.2.58 Power Scheduler Control-0 (PWR_SCHED_CTRL0)—Offset 8140h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: FF01903Ch

Bit Range	Default & Access	Field Name (ID): Description
31:24	FFh RW	**Engine Idle Hysteresis (EIH)**
23:12	19h RW	**Backbone PLL Shutdown Advance Wake (BPSAW)**
11:0	03Ch RW	**Backbone PLL Shutdown Min. Idle Duration (BPSMID)**

24.2.59 Power Scheduler Control-1 (PWR_SCHED_CTRL2)—Offset 8144h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 23Fh

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9	1h RW	**HS Interrupt-OUT Alarm (HS_INT_OUT_ALRM)**
8	0h RW	**HS Interrupt-IN Alarm (HS_INT_IN_ALRM):** HS Interrupt IN Alarm (HSII):Note: This is required to be set to enable the functionality behind the PCICFG.HSCFG2.HSIIPAPC method of tracking HS Intr IN EPs for Periodic Active.
7	0h RW	**SS Interrupt-OUT FC Alarm (SS_INT_OUT_FC_ALRM)**
6	0h RW	**SS Interrupt-IN Alarm (SS_INT_IN_FC_ALRM)**
5	1h RW	**SS Interrupt-OUT & not in FC Alarm (SS_INT_OUT_ALRM)**
4	1h RW	**SS Interrupt-IN & not in FC Alarm (SS_INT_IN_ALRM)**
3	1h RW	**HS ISO-OUT Alarm (HS_ISO_OUT_ALRM)**
2	1h RW	**HS ISO-IN Alarm (HS_ISO_IN_ALRM)**
1	1h RW	**SS ISO-OUT Alarm (SS_ISO_OUT_ALRM)**
0	1h RW	**SS ISO-IN Alarm (SS_ISO_IN_ALRM)**

24.2.60 AUX Power Management Control (AUX_CTRL_REG2)—Offset 8154h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1192206h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30	0h RW	**CFG_FAST_TRAINING (CFG_FAST_TRAINING)**
29	0h RW	**snps_phystatus_done_l1_dis (SNPS_PHYSTATUS_DONE_L1_DIS)**
28	0h RO	Reserved.
27	0h RW	**batt_charge_d3_en (BATT_CHARGE_D3_EN)**
26	0h RW	**cfg_debounce_en (CFG_DEBOUNCE_EN)**
25	0h RO	Reserved.
24	1h RW	**Enable L1 exit notification to SNPS PCIe core (EN_L1_EXIT_NOTIF_PCIE)**
23	0h RW	**DISABLE PLC ON DISCONNECT (DIS_PLC_ON_DISCONNECT)**
22	0h RW	**TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2 (TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2)**
21	0h RW	**Disable p2 overwrite due to the D3HOT where PCIe core enters the L1 (DIS_P2_OVERWRITE_DUE2_D3HOT)**
20	1h RW	**Enable the port to enter U3 automatically when in U1/U2 (ENABLE_AUTO_U3_ENTRY_FROM_U2_U3)**
19	1h RW	**No linkdown reset is issue during low power state (DIS_LINKDOWN_RST_DURING_LOW_POWER)**
18	0h RW	**EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0 (EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0)**
17	0h RW	**U2_EXIT_LFPS_TIMER_VALUE (U2_EXIT_LFPS_TIMER_VALUE)**
16	1h RW	**EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP (EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP)**
15:14	0h RW	**P3_ENTRY_TIMEOUT (P3_ENTRY_TIMEOUT)**
13	1h RW	**Enable U2 P3 Mode (EN_U2_P3)**
12:11	0h RW	**Fine Debug Mode Select (FINE_DM_SEL)**
10	0h RW	**Enable Low Power State Based Core Clock Gating (EN_LP_CORE_CG)**
9	1h RW	**Disable USB3 Port Status Changed Event (DIS_U3_PORT_SCE)**

Bit Range	Default & Access	Field Name (ID): Description
8:4	0h RW	**Debug Mode Select Register (DEB_MODE_SEL)**
3	0h RW	**Enable Auto Wakeup Non-IDLE (EN_AWAK_NIDLE)**
2	1h RW	**Enable PM Control P1 Exit P2 (EN_PMC_P1_EXIT_P2)**
1	1h RW	**Enable PCIe PIPE CLK Isolation (EN_PP_CLK_ISOL)**
0	0h RW	**Enable P2 Overwrite P1 Allowed Detect (EN_P2OVRP1_ADET)**

24.2.61 USB2 PHY Power Management Control (USB2_PHY_PMC)—Offset 8164h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: FCh

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7	1h RW	**EN_CMDM_TXRXB (EN_CMDM_TXRXB)**
6	1h RW	**EN_TTE_TXRXB (EN_TTE_TXRXB)**
5	1h RW	**EN_IDMA_TXRXB (EN_IDMA_TXRXB)**
4	1h RW	**EN_ODMA_TXRXB (EN_ODMA_TXRXB)**
3	1h RW	**EN_TRM_TXRXB (EN_TRM_TXRXB)**
2	1h RW	**EN_SCH_TXRXB (EN_SCH_TXRXB)**
1	0h RW	**Enable Rx Bias ckt disable (EN_RXB_CD)**
0	0h RW	**Enable Tx Bias ckt disable (EN_TXB_CD)**

24.2.62 XHCI Aux Clock Control Register (XHCI_AUX_CCR)—Offset 816Ch

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: F403Ch

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	Reserved.
19	1h RW	**USB3 Partition Engine/Link trunk gating Enable (PARUSB3_ENG_GEN)**
18	1h RW	**USB3 Partition Frame Timer trunk gating Enable (PARUSB3_LINK_GEN)**
17	1h RW	**USB2 link partition clock gating enable (PARUSB2_CLK_GEN)**
16	1h RW	**USB2/USHIP 12.5 MHz partition clock gating enable (USHIP_PCGEN)**
15	0h RO	Reserved.
14	1h RW	**USB3 Port Aux/Core clock gating enable (USB3_AC_CGE):** When set, allows the aux_cclk clock into the USB3 port to be gated when conditions are met.
13:12	0h RW	**Rx Detect Timer when port Aux Clock is Gated (RX_DT_ACG)**
11:8	0h RO	Reserved.
7	0h RW	**Frame Timer Clock Gating Ports in U2 Enable (FTCGPU2E)**
6	0h RW	**USB2 port clock throttle enable (USB2_PC_TE)**
5	1h RW	**XHCI Engine Aux clock gating enable (XHCI_AC_GE)**
4	1h RW	**XHCI Aux PM block clock gating enable (XHCI_APMB_CGE):** When set, allows the aux clock into the Aux PM block to be gated when idle.
3	1h RW	**USB3 Aux Clock Trunk Gating Enable (USB3_AC_TGE):** When set, allows Aux Clock Trunk feeding to USB3.0 ports to be gated when port Aux clock is gated at all USB3.0 ports and all USB3.0 modPHY instances.
2	1h RO	Reserved.
1	0h RW	**ModPHY port Aux clock gating enable in U2 (MPP_AC_GEU2):** When set, allows the aux clock into the ModPhy to be gated when Link is in U2 and pipe has been in PS3 for at least the time defined by U2 Residency Before ModPHY Clock Gating field.
0	0h RW	**ModPHY port Aux clock gating enable in Disconnected, U3 or Disabled (MPP_AC_GE_DDU3):** When set, allows the aux clock into the ModPHY to be gated when Link is in Disconnected, U3 or Disabled state.

24.2.63 XHC Latency Tolerance Parameters LTV Control (XLTP_LTV1)—Offset 8174h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1400C01h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Disable scheduler direct transition from IDLE to NO requirement (DIS_SDT_IDL_NR)**
30:26	0h RO	Reserved.
25	0h	**USB2 async active policy (EN_USB2_LTV_U0_PORT_ASYNC_ACTIVE)**
24	1h RW	**XHCI LTR Enable (XLTRE)**
23:12	400h RW	**Periodic Active LTV (PA_LTV)**
11:0	C01h RW	**USB2 Port L0 LTV (USB2_PL0_LTV)**

24.2.64 XHC Latency Tolerance Parameters High Idle Time Control (XLTP_HITC)—Offset 817Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 50002h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:16	5h RW	**Minimum High Idle Time (MHIT)**
15:13	0h RO	Reserved.
12:0	2h RW	**High Idle Wake Latency (HIWL)**

24.2.65 XHC Latency Tolerance Parameters Medium Idle Time Control (XLTP_MITC)—Offset 8180h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 50002h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:16	5h RW	**Minimum Medium Idle Time (MMIT)**
15:13	0h RO	Reserved.
12:0	2h RW	**Medium Idle Wake Latency (MIWL)**

24.2.66 XHC Latency Tolerance Parameters Low Idle Time Control (XLTP_LITC)—Offset 8184h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 50002h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:16	5h RW	**Minimum Low Idle Time (MLIT)**
15:13	0h RO	Reserved.
12:0	2h RW	**Low Idle Wake Latency (LIWL)**

24.2.67 LFPS On Count (LFPSONCOUNT_REG)—Offset 81B8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 20C8h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:16	0h RW	**U2P3 LFPS Periodic Sampling Control (XU2P3LPSC):** This field controls the OFF time for the LFPS periodic sampling for SS ports in U2P3. If LFPSPM for a port is 1, it will override the OFF time and LFPS receiver will remain OFF permanently. For Fast Sim mode, 500us will be equivalent to 5us. 0x0 Polling Disable. (RXDET Polling will become 100ms.) 0x1 500us OFF Time 0x2 1ms OFF Time 0x3 1.5ms OFF Time
15:10	8h RW	**XLFPSONCNTSSIC (XLFPSONCNTSSIC):** This time would describe the number of clocks LFPS will remain ON. LFPS detection operation may be carried out on using RTC clock or Oscillator clock. The value of this register should be adjusted accordingly. For RTC recommended value is 2. For Oscillator clock, recommended value is 8.
9:0	C8h RW	**XLFPSONCNTSS (XLFPSONCNTSS)**

24.2.68 USB2 PM Control (USB2PMCTRL_REG)—Offset 81C4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 908h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13	0h RW	**Bypass Suspend SM (BYPSUSSM)**
12	0h RO	Reserved.
11	1h RW	**USB2 PHY SUS Power Gate PORTSC Block Policy (U2PSPGPSCBP):** This controls the policy for blocking PORTSC Updates while the USB2 PHY SUS Well is power gated. When set, the controller will block any updates to the PORTSC caused by port status change if the USB2 PHY SUS is power gated.
10:8	1h RW	**USB2 PHY SUS Well Power Gate Entry Hysteresis Count (U2PSPGEHC)**
7:4	0h RW	**USB2 PHY SUS Power Gate PORTSC Block Policy (U2CLPGLAT)**
3:2	2h RW	**USB2 PHY SUS Well Power Gate Policy (U2PSUSPGP)**
1:0	0h RO	Reserved.

24.2.69 USB Legacy Support Capability (USBLEGSUP)—Offset 846Ch

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 2201h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RW	**HC OS Owned Semaphore (HCOSOS):** Default = '0'. System software sets this bit to request ownership of the xHC. Ownership is obtained when this bit reads as '1' and the HC BIOS Owned Semaphore bit reads as '0'.
23:17	0h RO	Reserved.
16	0h RW	**HC BIOS Owned Semaphore (HCBIOSOS):** Default = '0'. The BIOS sets this bit to establish ownership of the xHC. System BIOS will set this bit to a '0' in response to a request for ownership of the xHC by system software.
15:8	22h RW/L	**Next Capability Pointer (NEXTCP):** This field indicates the location of the next capability with respect to the effective address of this capability. Refer to Table 145 for more information on this field.
7:0	1h RW/L	**Capability ID (CID):** This field identifies the extended capability. Refer to Table 146 for the value that identifies the capability as Legacy Support.This extended capability requires one additional 32-bit register for control/status information (USBLEGCTLSTS), and this register is located at offset xECP+04h.

24.2.70 Port Disable Override Capability Register (PDO_CAPABILITY)—Offset 84F4h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 3C6h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	3h RO	**Next Capability Pointer (NCP)**
7:0	C6h RO	**Capability ID (CID)**

24.2.71 USB2 Port Disable Override (USB2PDO)—Offset 84F8h

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	Reserved.
11:0	0h RW/O	**USB2PDO (USB2PDO):** A '1' in a bit position prevents the corresponding USB2 port from reporting a Device Connection to the XHC.This applies across all USB2 protocol ports 0 = Allows corresponding USB port to report a device connection to the xHC. 1 = Prevents the corresponding USB port from reporting a device Connection to the xHC. Port to bit mapping is in one-hot encoding, that is bit 0 controls port 1 and so on. Bit 0 = USB 2.0 port 0 ... Bit N = USB 2.0 port N

24.2.72 USB3 Port Disable Override (USB3PDO)—Offset 84FCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RW/O	**USB3 Port Disable Override (USB3PDO):** 0 = Allows corresponding USB port to report a Device Connection to the xHC. 1 = Prevents the corresponding USB port from reporting a Device Connection to the xHC. Bit 0 = USB 3.1 Port 1 ... Bit N = USB 3.1 Port N

24.2.73 Debug Capability ID Register (DCID)—Offset 8700h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 5100Ah

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	Reserved.
20:16	5h RW/L	**Debug Capability Event Ring Segment Table Max (DCERSTM)**
15:8	10h RW/L	**Next Capability Pointer (NCP)**
7:0	Ah RW/L	**Capability ID (CID)**

24.2.74 Global Time Sync Capability (GLOBAL_TIME_SYNC_CAP_REG)—Offset 8E10h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 12C9h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	12h RO	**Next Capability pointer (NCP)**
7:0	C9h RO	**Capability ID (CID)**

24.2.75 Global Time Sync Control (GLOBAL_TIME_SYNC_CTRL_REG)—Offset 8E14h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW/1S	**Time Stamp Counter Capture Initiate (TIME_STAMP_CNTR_CAPTURE_INITIATE)**

24.2.76 Microframe Time (Local Time) (MICROFRAME_TIME_REG)—Offset 8E18h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29:16	0h RO	**Captured Frame List Current Index/Frame Number (CMFI)**
15:13	0h RO	Reserved.
12:0	0h RO	**Captured Micro-frame BLIF (CMFB)**

24.2.77 Always Running Time (ART) Low (ALWAYS_RUNNING_TIME_LOW)—Offset 8E20h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GLOBAL_TIME_LOW_REG (GLOBAL_TIME_LOW)**

24.2.78 Always Running Time (ART) High (ALWAYS_RUNNING_TIME_HIGH)—Offset 8E24h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**GLOBAL_TIME_HI_REG (GLOBAL_TIME_HI)**

24.2.79 XHCI USB2 Overcurrent Pin Mapping (U2OCM1)—Offset 90A4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:0	0h RW/L	**OC Mapping (OCM)**

24.2.80 XHCI USB2 Overcurrent Pin Mapping (U2OCM2)—Offset 90A8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:0	0h RW/L	**OC Mapping (OCM)**

24.2.81 XHCI USB2 Overcurrent Pin Mapping (U2OCM3)—Offset 90ACh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:0	0h RW/L	**OC Mapping (OCM)**

24.2.82 XHCI USB2 Overcurrent Pin Mapping (U2OCM4)—Offset 90B0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:0	0h RW/L	**OC Mapping (OCM)**

24.2.83 XHCI USB2 Overcurrent Pin Mapping (U2OCM5)—Offset 90B4h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:0	0h RW/L	**OC Mapping (OCM)**

24.2.84 XHCI USB2 Overcurrent Pin Mapping (U2OCM6)—Offset 90B8h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:0	0h RW/L	**OC Mapping (OCM)**

24.2.85 XHCI USB2 Overcurrent Pin Mapping (U2OCM7)—Offset 90BCh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:0	0h RW/L	**OC Mapping (OCM)**

24.2.86 XHCI USB2 Overcurrent Pin Mapping (U2OCM8)—Offset 90C0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9:0	0h RW/L	**OC Mapping (OCM)**

24.2.87 XHCI USB3 Overcurrent Pin Mapping (U3OCM1)—Offset 9124h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RW/L	**OC Mapping (OCM)**

24.2.88 XHCI USB3 Overcurrent Pin Mapping (U3OCM2)—Offset 9128h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RW/L	**OC Mapping (OCM)**

24.2.89 XHCI USB3 Overcurrent Pin Mapping (U3OCM3)—Offset 912Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RW/L	**OC Mapping (OCM)**

24.2.90 XHCI USB3 Overcurrent Pin Mapping (U3OCM4)—Offset 9130h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RW/L	**OC Mapping (OCM)**

24.2.91 XHCI USB3 Overcurrent Pin Mapping (U3OCM5)—Offset 9134h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RW/L	**OC Mapping (OCM)**

24.2.92 XHCI USB3 Overcurrent Pin Mapping (U3OCM6)—Offset 9138h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RW/L	**OC Mapping (OCM)**

24.2.93 XHCI USB3 Overcurrent Pin Mapping (U3OCM7)—Offset 913Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RW/L	**OC Mapping (OCM)**

24.2.94 XHCI USB3 Overcurrent Pin Mapping (U3OCM8)—Offset 9140h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RW/L	**OC Mapping (OCM)**

24.3 USB Configuration Registers

The USB Configuration Registers are distributed within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface using the following Target Port (Destination Port) Identification:

Target Port (Destination Port) Identification = 0xCA

For complete details on how to use the PCH Sideband Interface to access these PCH Private Configuration Registers reference the latest Platform Controller Hub BIOS Specification.

24.3.1 USB2 PER PORT 1 Electrical Control Register (USB2PP1)

Access Method

Type: IOBP Index: Port 0: CA004100h Port 1: CA004200h Port n: CA004n00h (Size: 32 bits)	Device: Function:

Default: See Below

Bit Range	Default and Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14	0h RW	Per Port Half Bit Pre-emphasis (PERPORTTXPEHALF) Configuration bit (per port) to select between half-bit or full-bit implementation 1 = select half-bit pre-emphasis 0 = select full-bit pre-emphasis Note: This bit is do not care when **Per Port HS TX Emphasis** is configured to "11"
13:11	0h RW	Per Port HS Pre-emphasis bias (PERPORTPETXISET)
10:8	0h RW	Per Port HS TX Bias (PERPORTTXISET)
7:0	0h RO	Reserved.

24.3.2 USB2 PER PORT 2 Electrical Control Register (USB2PP2)

Access Method

Type: IOBP Index: Port 0: CA004126h Port 1: CA004226h Port n: CA004n26h (Size: 32 bits)	**Device:** **Function:**

Default: See Below

Bit Range	Default and Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24:23	0h RW	Per Port HS TX Emphasis (IUSBTXEMPHASISEN) Enables the HS TX Emphasis for the respective port
22:0	0h RW	Reserved.

24.3.3 Global ADP VBUS COMP REG (GLB ADP VBUS COMP REG)

Access Method

Type: IOBP Index: CA00402Bh (Size: 32 bits)	Device: Function:

Default: See Below

Bit Range	Default and Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22	1h RW	Differential Disconnect Enable 0: Reserved. 1: Differential Disconnect - enabled
21:0	0h RW	Reserved.

24.3.4 USB2 COMPBG (USB2_COMPBG)

Access Method

Type: IOBP Index: CA007F04h (Size: 32 bits)	Device: Function:

Default: See Below

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	1h RW	USB2 Disconnect Reference Select (UDRS) Selects the reference voltage disconnect detector. 0: Reserved. 1: Differential Disconnect circuit.
14:13	0h RW	USB2 AFE Squelch Reference Positive Voltage Programming (UASQRPVP) These bits specify the programming options for USB2 AFE Squelch reference Positive voltage. 3h: 350mV 2h: 325mV 1h: 300mV 0h: 312.5mV
12:11	0h RW	USB2 AFE Squelch Reference Negative Voltage Programming (UASQRNVP) These bits specify the programming options for USB2 AFE Squelch reference Negative voltage. 3h: 250mV 2h: 225mV 1h: 175mV 0h: 200mV
10:7	0h RW	Differential Disconnect Reference Voltage Programming Bit Value Vref (mV) 0000: Reserved 0001: Reserved 0010: Reserved 0011: Reserved 0100: 562.5 0101: 687.5 0110: 437.5 0111: 312.5 1000: 625 1001: 750 1010: 500 1011: 375 1100: 687.5 1101: 812.5 1110: 562.5 1111: 437.5
7:0	0h RO	Reserved.

§ §

25 USB 3.2 Gen 1x1 (5 Gb/s) Device Controller- xDCI (D20:F1)

25.1 xDCI PCI Configuration Registers

Table 25-1. Summary of xDCI PCI Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Device ID and Vendor ID (DEVVENDID)—Offset 0h	AAA8086h
4h	7h	Status and Command (STATUSCOMMAND)—Offset 4h	100000h
10h	17h	Base Address Register (BAR)—Offset 10h	4h
18h	1Fh	Base Address Register1 (BAR1)—Offset 18h	4h
2Ch	2Fh	Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch	0h
34h	37h	Capabilities Pointer (CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	Interrupt Register (INTERRUPTREG)—Offset 3Ch	100h
80h	83h	PowerManagement Capability ID (POWERCAPID)—Offset 80h	48039001h
84h	87h	Power Management Control and Status (PMECTRLSTATUS)—Offset 84h	8h
90h	93h	PCI Device Idle Capability Record (PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
94h	97h	Device ID and Vendor Specific Register (DEVID_VEND_SPECIFIC_REG)—Offset 94h	1400010h
98h	9Bh	SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	0h
9Ch	9Fh	Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch	10F8301h
A0h	A3h	(D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	80800h

25.1.1 Device ID and Vendor ID (DEVVENDID)—Offset 0h

Access Method

Type: CFG Register (Size: 32 bits)

Device: 20
Function: 1

Default: AAA8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	AAAh RO	**DEVICEID:** Device ID identifies the particular PCI device. Refer to the Device and Revision ID Table in Volume 1 for default value.
15:0	8086h RO	**Vendor Identification (VENDORID):** Vendor ID is a unique ID identifying the manufacturer of the device. 8086h = Intel

25.1.2 Status and Command (STATUSCOMMAND)—Offset 4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 1

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	0h RW/1C	**Received Initiator Abort (RMA):** If the completion status received from IOSF is UR, the Bridge sets this bit. Thesoftware writes a 1 to this bit to clear it.
28	0h RW/1C	**Received Target Abort (RTA):** If the completion status received from IOSF is CA, the Bridge sets this bit. Thesoftware writes a 1 to this bit to clear it.
27:21	0h RO	Reserved.
20	1h RO	**Capabilities List (CAPLIST):** Indicates that the controller contains a capabilities pointer list. The firstitem is pointed to by looking at the configuration offset 34h.
19	0h RO	**Interrupt Status (INTR_STATUS):** This bit reflects state of interrupt in the device Only when theInterrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a1, is the device/function interrupt message sent. Setting the Interrupt Disable bit to a1 has no effect on the state of this bit. This bit reflects Legacy interrupt status.
18:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (INTR_DISABLE):** Interrupt Disable: Setting this bit disables INTx assertion fromBridge. The interrupt disabled is legacy INTx# interrupt, which is the Bridge does notsend Interrupt Assert message through the IOSF Sideband Channel. Reset value ofthis bit is 0. This bit has no connection with the interrupt status bit.
9	0h RO	Reserved.
8	0h RW	**SERR Enable (SERR_ENABLE):** Not implemented
7:3	0h RO	Reserved.
2	0h RW	**Bus Initiator Enable (BME):** Bus Initiator Enable: If this bit is 0,the Bridge does not generate any newupstream transaction on IOSF as a Initiator. Reset value of this bit is 0.
1	0h RW	**Memory Space Enable (MSE):** Memory Space Enable: This bit controls Bridge response to downstreammemory accesses. When set, accesses to memory space of the device is enabled.Reset value of this bit is 0.
0	0h RO	Reserved.

25.1.3 Base Address Register (BAR)—Offset 10h

Access Method

Type: CFG Register
(Size: 64 bits)

Device: 20
Function: 1

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:21	0h RW	**Base Address Register Low (BASEADDR)**
20:12	0h RO	Reserved.
11:4	0h RO	**Size Indicator (SIZEINDICATOR):** Always returns 0. The size of this register depends on the size of the memory space.
3	0h RO	**Prefetchable (PREFETCHABLE):** Indicates that this BAR is not prefetchable
2:1	2h RO	**Type (TYPE):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range, If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE):** 0 indicates this BAR is present in the memory space.

25.1.4 Base Address Register1 (BAR1)—Offset 18h

Memory accesses to BAR1 region are aliased to the PCI configuration space. The BAR1region is always 4K. Software access through BAR1 can only access the regular PCIconfiguration space. BAR1 memory accesses, which do not access a defined PCIconfiguration register, are treated as access to reserved register. If this register isdisabled then this is RO and always returns 0.

Access Method

Type: CFG Register
(Size: 64 bits)

Device: 20
Function: 1

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
63:32	0h RW	**Base Address high (BASEADDR1_HIGH)**
31:12	0h RW	**BASEADDR1:** This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**Size Indicator (SIZEINDICATOR1):** Always is 0 as minimum size is 4K

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**Prefetchable (PREFETCHABLE1):** Indicates that this BAR is not prefetchable.
2:1	2h RO	**Type (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE1):** 0 Indicates this BAR is present in the memory space.

25.1.5 Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SUBSYSTEMID):** This register is implemented for any function thatcan be instantiated more than once in a given system. The SID register, incombination with the Subsystem Vendor ID register make it possible for theoperating environment to distinguish one subsystem from the other. This register is aRead Write Once type register.
15:0	0h RW/O	**Subsystem Vendor ID (SUBSYSTEMVENDORID):** This register must be implemented for any function thatcan be instantiated more than once in a given system. The SVID register, incombination with the Subsystem ID register, enables the operating environment todistinguish one subsystem from the other. This register is a Read Write Once register

25.1.6 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 1

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	80h RO	**Capabilities Pointer (CAPPTR_POWER):** Indicates what the next capability is.

25.1.7 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: CFG Register (Size: 32 bits)
Device: 20
Function: 1

Default: 100h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Max Latency (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**Min Latency (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	Reserved.
11:8	1h RO	**Interrupt Pin (INTPIN):** Interrupt Pin Value in this register is reflected from the IPIN value in theprivate configuration space. For a single function device, this ideally is INTA.
7:0	0h RW	**Interrupt Line (INTLINE):** PCH does not use this field directly. It is used to communicate tosoftware, the interrupt line to which the interrupt pin is connected.

25.1.8 PowerManagement Capability ID (POWERCAPID)—Offset 80h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 20
Function: 1

Default: 48039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**PMESUPPORT:**
26:19	0h RO	Reserved.
18:16	3h RO	**Version (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	90h RO	**Next Capability (NXTCAP):** Points to the next capability structure.
7:0	1h RO	**Power Management Capability (POWER_CAP):** Indicates this is power management capability.

25.1.9 Power Management Control and Status (PMECTRLSTATUS)—Offset 84h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 20
Function: 1

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW/1C	**PME Status (PMESTATUS):** 0 Software clears the bit by writing a 1 to it. 1 This bit is set when the PME# signal is asserted independent of the state of the PMEEnable bit (bit 8 in this register)
14:9	0h RO	Reserved.
8	0h RW	**PME Enable (PMEENABLE):** 1 Enables the function to assert PME#. 0 PME# message on Sideband is disabled
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	Reserved.
1:0	0h RW	**Power State (POWERSTATE):** This field is used both to determine the current power state and toset a new power state.The values are: 00 D0 state 11 D3HOT state Others Reserved

25.1.10 PCI Device Idle Capability Record (PCIDEVIDLE_CAP_RECORD)—Offset 90h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 1

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** Vendor Specific Capability ID
27:24	0h RO	**REVID:** Revision ID of capability structure
23:16	14h RO	**CAP_LENGTH:** Vendor Specific Capability Length
15:8	0h RO	**NEXT_CAP:** Next Capability
7:0	9h RO	**CAPID:** Capability ID

25.1.11 Device ID and Vendor Specific Register (DEVID_VEND_SPECIFIC_REG)—Offset 94h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 20
Function: 1

Default: 1400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	14h RO	**VSEC_LENGTH:** Vendor Specific Extended Capability Length
19:16	0h RO	**VSEC_REV:** Vendor specific Extended Capability revision
15:0	10h RO	**VSECID:** Vendor Specific Extended Capability ID

25.1.12 SW LTR Update MMIO Location Register (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 20
Function: 1

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET:** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW_LAT_BAR_NUM:** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**Valid (SW_LAT_VALID)**

25.1.13 Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Access Method

Type: CFG Register (Size: 32 bits)
Device: 20
Function: 1

Default: 10F8301h

Bit Range	Default & Access	Field Name (ID): Description
31:4	10F830h RO	**DWORD_OFFSET:** Contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR
3:1	0h RO	**BAR Number (BAR_NUM):** Indicates that the D0i3 MMIO location is always at BAR0
0	1h RO	**Valid (VALID)**

25.1.14 (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 20
Function: 1

Default: 80800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RW	**HAE:** Hardware Autonomous Enable
20	0h RO	Reserved.
19	1h RW	**SLEEP_EN:** Sleep Enable
18	0h RW	**D3HEN:** D3-Hot Enable (D3HEN): If 1, then the function will power gate when idle and the PMCSR[1:0] register in the function D3.
17	0h RW	**DEVIDLEN:** If 1, then the function will power gate when idle and the DevIdle register (DevIdleC[2]=1) is set.
16	0h RW	**D3_ENABLE:** D3-Hot Enable (D3HEN): If set to 1, then function will power gate when idle and the PMCSR[1:0] register in the function = 11 (D3).
15:13	0h RO	Reserved.
12:10	2h RW/O	**POW_LAT_SCALE:** Power On Latency Scale
9:0	0h RW/O	**POW_LAT_VALUE:** Power On Latency value

25.2 xDCI MMIO Device Registers

Table 25-2. Summary of xDCI MMIO Device Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
C700h	C703h	Device Configuration Register (DCFG)—Offset C700h	80004h
C704h	C707h	Device Control Register (DCTL)—Offset C704h	F00000h

Table 25-2. Summary of xDCI MMIO Device Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
C708h	C70Bh	Device Event Enable Register (DEVTEN)—Offset C708h	0h
C70Ch	C70Fh	Device Status Register (DSTS)—Offset C70Ch	520004h
C710h	C713h	Device Generic Command Parameter (DGCMDPAR)—Offset C710h	0h
C714h	C717h	Device Generic Command (DGCMD)—Offset C714h	0h
C720h	C723h	Device Active USB Endpoint Enable (DALEPENA)—Offset C720h	0h
C800h	C803h	Device Physical Endpoint-n Command Parameter 2 (DEPCMDPAR2)—Offset C800h	0h
C804h	C807h	Device Physical Endpoint-n Command Parameter 1 (DEPCMDPAR1)—Offset C804h	0h
C808h	C80Bh	Device Physical Endpoint-n Command Parameter 0 (DEPCMDPAR0)—Offset C808h	0h
C80Ch	C80Fh	Device Physical Endpoint-n Command (DEPCMD)—Offset C80Ch	0h

25.2.1 Device Configuration Register (DCFG)—Offset C700h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 80004h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0h RO	Reserved.
22	0h RW	**LPM Capable (LPMCAP):** The application uses this bit to control the LPM capabilities: 1'b0: LPM capability is not enabled. 1'b1: LPM capability is enabled.
21:17	4h RW	**Number of Receive Buffers (NUMP):** This bit indicates the number of receive buffers to be reported in the ACK TP.
16:12	0h RW	**Interrupt Number (INTRNUM):** Indicates interrupt number on which non-endpoint-specific device-related interrupts are generated.
11:10	0h RO	Reserved.
9:3	0h RW	**Device Address (DEVADDR)**
2:0	4h RW	**Device Speed (DEVSPD):** Indicates the speed at which the application requires the core to connect, or the maximum speed the application can support: 3’b100: SuperSpeed 3’b000: High-speed 3’b001: Full-speed

25.2.2 Device Control Register (DCTL)—Offset C704h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: F00000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**Run/Stop (RUN_STOP):** The software writes 1 to this bit to start the device controller operation.To stop the device controller operation, the software must remove any active transfers and write 0 to this bit. When the controller is stopped, it sets the DSTS.DevCtrlHlt bit when the core is idle and the lower layer finishes the disconnect process. The Run/Stop bit must be used in following cases as specified: 1.After power-on reset and CSR initialization, the software must write 1 to this bit to start the device controller. The controller does not signal connect to the host until this bit is set. 2.The software uses this bit to control the device controller to perform a soft disconnect. When the software writes 0 to this bit, the host does not see that the device is connected. The device controller stays in the disconnected state until the software writes 1 to this bit. The minimum duration of keeping this bit cleared: SS: 30ms HS/FS/LS: 10ms If the software attempts a connect after the soft disconnect or detects adisconnect event, it must set DCTL[8:5] to 5 before reasserting the Run/ Stopbit. 3.When the USB or Link is in a lower power state and the Two Power Rails configuration is selected, software writes 0 to this bit to indicate that it is going to turn off the Core Power Rail. After the software turns on the Core Power Rail again and re-initializes the device controller, it must set this bit to start the device controller.
30	0h RW	**Core Soft Reset (CSFTRST):** Resets the all clock domains
29	0h RO	Reserved.
28:24	0h RW	**HIRD Threshold (HIRDTHRES):** The core asserts output signals utmi_l1_suspend_n and utmi_sleep_n on the basis of this signal: The core asserts utmi_l1_suspend_n to put the PHY into Deep Low-Power mode in L1 when both of the following are true: -HIRD value is greater than or equal to the value in DCTL.HIRD_Thres[3:0] -HIRD_Thres[4] is set to 1'b1. The core asserts utmi_sleep_n on L1 when one of the following is true: -If the HIRD value is less than HIRD_Thres[3:0] or -HIRD_Thres[4] is set to 1'b0. Note: This field must be set to '0' during SuperSpeed mode of operation.
23:20	Fh RW	**LPM NYET Response Threshold (LPM_NYET_thres):** Handshake response to LPM token specified by device application
19	0h RW	**Keep Connect (KeepConnect):** When '1', this bit enables the save and restore programming model by preventing the core from disconnecting from the host when DCTL.RunStop is set to '0'. It also enables the Hibernation Request Event to be generated when the link goes to U3 or L2. The device core disconnects from the host when DCTL.RunStop is set to '0'. This bit indicates whether to preserve this behavior ('0'), or if the core should not disconnect when RunStop is set to 0 ('1').This bit also prevents the LTSSM from automatically going to U0/L0 when the host requests resume from U3/L2.
18	0h RW	**L1 Hibernation Enable (L1HibernationEn):** When this bit is set along with KeepConnect, the device core generates a Hibernation Request Event if L1 is enabled and the HIRD value in the LPM token is larger than the threshold programmed in DCTL.HIRD_Thres. The core will not exit the LPM L1 state until software writes Recovery into the DCTL.ULStChngReq field. This prevents corner cases where the device is entering hibernation at the same time the host is attempting to exit L1.
17	0h RW	**Controller Restore State (CRS):** This command initiates the restore process. When software sets this bit to '1', the controller immediately sets DSTS.RSS to '1'. When the controller has finished the restore process, it sets DSTS.RSS to '0'. Note: When read, this field always returns '0'.
16	0h RW	**Controller Save State (CSS):** This command initiates the save process.When software sets this bit to '1', the controller immediately sets DSTS.SSS to '1'. When the controller has finished the save process, it sets DSTS.SSS to '0'. Note: When read, this field always returns '0'.
15:13	0h RO	Reserved.
12	0h RW	**Initiate U2 Enable (INITU2ENA):** 1'b0: May not initiate U2 (default) 1'b1: May initiate U2 On USB reset, hardware clears this bit to "0". Software sets this bit after receiving SetFeature(U2_ENABLE), and clears this bit when ClearFeature(U2_ENABLE) is received.If DCTL[11] (AcceptU2Ena) is 0, the link immediately exits U2 state.
11	0h RW	**Accept U2 Enable (ACCEPTU2ENA):** 1'b0: Reject U2 except when Force_LinkPM_Accept bit is set (default) 1'b1: Core accepts transition to U2 state if nothing is pending on the application side.On USB reset, hardware clears this bit to "0". Software sets this bit after receiving a SetConfiguration command

Bit Range	Default & Access	Field Name (ID): Description
10	0h RW	**Initiate U1 Enable (INITU1ENA):** 1'b0: May not initiate U1 1'b1: May initiate U1 On USB reset, hardware clears this bit to "0". Software sets this bit after receiving SetFeature(U1_ENABLE), and clears this bit when ClearFeature(U1_ENABLE) is received. If DCTL[9] (AcceptU1Ena) is 0, the link immediately exits U1 state.
9	0h RW	**Accept U1 Enable (ACCEPTU1ENA):** 1'b0: Core rejects U1 except when Force_LinkPM_Accept bit is set (default) 1'b1: Core accepts transition to U1 state if nothing is pending on the application side. On USB reset, hardware clears this bit to "0". Software sets this bit after receiving a SetConfiguration command.
8:5	0h WO	**USB / Link State Change Request (ULSTCHNGREQ):** Software writes this field to issue a USB/Link state change request. A change in this field indicates a new request to the core. If software wants to issue the same request back-to-back, it must write a 0 to this field between the two requests. The result of the state change request is reflected in the USB/Link State in DSTS. These bits are self-cleared on the MAC Layer exiting suspended state. If software is updating other fields of the DCTL register and not intending to force any link state change, then it must write a 0 to this field. SS Compliance mode is normally entered and controlled by the remote link partner. Alternatively, the local link can be forced directly into Compliance mode by resetting the SS link with the RUN/STOP bit set to zero. If then '10' is written to the USB/Link State Change field and '1' to RUN/STOP, the Link will go to Compliance. Once in Compliance, 'zero' and '10' may alternately be written to this field to advance the compliance pattern. In SS mode: ValueRequested Link State Transition: 0:No Action 4:SS.Disabled 5:Rx.Detect 6:SS.Inactive 8:Recovery 10:Compliance Others:Reserved In HS/FS/LS mode: ValueRequested USB state transition 8:Remote wakeup request Others:Reserved The Remote wakeup request should be issued 2µs after the device goes into suspend state. Note: After coming out of hibernation, software should write 8 (Recovery) into this field to confirm exit from the suspended state
4:0	0h RO	Reserved.

25.2.3 Device Event Enable Register (DEVTEN)—Offset C708h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	Reserved.
12	0h RW	**Vendor Device Test LMP Received Event (VENDEVTSTRCVDEN)**
11:10	0h RO	Reserved.
9	0h RW	**Erratic Error Event Enable (ERRTICERREVTEN)**
8:7	0h RO	Reserved.
6	0h RW	**U3/L2-L1 Suspend Event Enable (U3L2L1SuspEn)**
5	0h RO	Reserved.
4	0h RW	**Resume/Remote Wakeup Detected Event Enable (WKUPEVTEN)**

Bit Range	Default & Access	Field Name (ID): Description
3	0h RW	**USB/Link State Change Event Enable (ULSTCNGEN)**
2	0h RW	**Connection Done Enable (CONNECTDONEEVTEN)**
1	0h RW	**USB Reset Enable (USBRSTEVTEN)**
0	0h RW	**Disconnect Detected Event Enable (DISSCONNEVTEN)**

25.2.4 Device Status Register (DSTS)—Offset C70Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 520004h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	0h RO	**Device Controller Not Ready (DCNRD):** The bit indicates that the core is in the process of completing the state transitions after exiting from hibernation. To complete the state transitions, it takes 256 bus clock cycles from the time DCTL[31].Run/Stop is set. During hibernation, if the UTMI/ULPI PHY is in suspended state, then the 256-bus clock cycle delay starts after the PHY exited suspended state. Software must set DCTL[31].Run/Stop to '1' and wait for this bit to be de-asserted to zero before processing DSTS.USBLnkSt. This bit is valid only when DWC_USB3_EN_PWROPT is set to two and GCTL[1].GblHibernationEn =1.
28:26	0h RO	Reserved.
25	0h RO	**Restore State Status (RSS):** When the controller has finished the restore process, it will complete the command by setting DSTS.RSS to '0'.
24	0h RO	**Save State Status (SSS):** When the controller has finished the save process, it will complete the command by setting DSTS.SSS to '0'.
23	0h RO	**Core Idle (COREIDLE):** The bit indicates that the core finished transferring all RxFIFO data to system memory, writing out all completed descriptors, and all Event Counts are zero.
22	1h RO	**Device Controller Halted (DEVCTRLHLT):** This bit is set to 0 when the Run/Stop bit in the DCTL register is set to 1. The core sets this bit to 1 when, after SW sets Run/Stop to ‘0’, the core is idle and the lower layer finishes the disconnect process. When Halted =1, the core does not generate Device events.
21:18	4h RO	**USB/Link State (USBLNKST):** In SS mode: 4'h0: U0 4'h1: U1 4'h2: U2 4'h3: U3 4'h4: SS_DIS 4'h5: RX_DET 4'h6: SS_INACT 4'h7: POLL 4'h8: RECOV 4'h9: HRESET 4'ha: CMPLY 4'hb: LPBK 4'hf: Resume/Reset In HS/FS/LS mode: 4’h0: On state 4’h2: Sleep (L1) state 4’h3: Suspend (L2) state 4’h4: Disconnected state 4’h5: Early Suspend state 4'he: Reset 4'hf: Resume

Bit Range	Default & Access	Field Name (ID): Description
17	1h RO	**RxFIFO Empty (RXFIFOEMPTY)**
16:3	0h RO	**Frame/Microframe Number of the Received SOF (SOFFN):** When the core is operating at high-speed: [16:6] indicates the frame number [5:3] indicates the microframe number When the core is operating at full-speed: [16:14] is not used. Software can ignore these 3 bits [13:3] indicates the frame number
2:0	4h RO	**Connected Speed (CONNECTSPD):** Indicates the speed at which the core has come up after speed detection through a chirp sequence: 3'b100: SuperSpeed 3'b000: High-speed 3'b001: Full-speed 3'b010: Low-speed 3'b011: Full-speed

25.2.5 Device Generic Command Parameter (DGCMDPAR)—Offset C710h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Command Parameter (PARAMETER):** This register indicates the device command parameter. This must be programmed before or along with the device command (DGCMD).

25.2.6 Device Generic Command (DGCMD)—Offset C714h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:12	0h RO	**Command Status (CMDSTATUS):** 1: CmdErr – Indicates that the device controller encountered an error while processing the command. 0: Indicates command success
11	0h RO	Reserved.
10	0h NA	**Command Active (CMDACT):** The software sets this bit to 1 to enable the device controller to execute the generic command. The device controller sets this bit to 0 after executing the command.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RO	Reserved.
8	0h RW	**Command Interrupt on Complete (CMDIOC):** When this bit is set, the device controller issues a Generic Command Completion event after executing the command. Note that this interrupt is mapped to DCFG.IntrNum. Note: This field must not set to '1' if the DCTL.RunStop field is '0'.
7:0	0h RW	**Command Type (CMDTYP):** Specifies the type of command the software driver is requesting the core to perform: 02h: Set Periodic Parameters 04h: Set Scratchpad Buffer Array Address Lo 05h: Set Scratchpad Buffer Array Address Hi 07h:Transmit Device Notification 09h: Selected FIFO Flush 0Ah: All FIFO Flush 0Ch: Set Endpoint NRDY 10h: Run SoC Bus LoopBack Test

25.2.7 Device Active USB Endpoint Enable (DALEPENA)—Offset C720h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**USB Active Endpoints (USBACTEP):** This field indicates if a USB endpoint is active in the current configuration and interface. Bit[0]: USB EP0-OUT Bit[1]: USB EP0-IN Bit[2]: USB EP1-OUT Bit[3]: USB EP1-IN

25.2.8 Device Physical Endpoint-n Command Parameter 2 (DEPCMDPAR2)—Offset C800h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER):** This register indicates the physical endpoint command Parameter 2. It must be programmed before issuing the command.

25.2.9 Device Physical Endpoint-n Command Parameter 1 (DEPCMDPAR1)—Offset C804h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER):** This register indicates the physical endpoint command Parameter 1. It must be programmed before issuing the command

25.2.10 Device Physical Endpoint-n Command Parameter 0 (DEPCMDPAR0)—Offset C808h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**PARAMETER (PARAMETER):** This register indicates the physical endpoint command parameter 0. This must be programmed before or along with the command. For commands needing only one 32-bit parameter, this register must be programmed with the command register.

25.2.11 Device Physical Endpoint-n Command (DEPCMD)—Offset C80Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**Command Parameters (COMMANDPARAM):** When this register is written: For Start Transfer command: -[31:16]: StreamID. The USB StreamID assigned to this transfer For Start Transfer command applied to an isochronous endpoint: -[31:16]: StartMicroFramNum: Indicates the (micro)frame number to which the first TRB applies For Update Transfer, End Transfer, and Start New Configuration commands: -[22:16]: Transfer Resource Index (XferRscIdx). The hardware-assigned transfer resource index for the transfer, which was returned in response to the Start Transfer command. The application software-assigned transfer resource index for a Start New Configuration command
15:12	0h RW	**Command Completion Status (CMDSTATUS):** Additional information about the completion of this command is available in this field.
11	0h RW	**HighPriority/ForceRM (HIPRI_FORCERM):** HighPriority: Only valid for Start Transfer command ForceRM: Only valid for End Transfer command ClearPendIN: Only valid for Clear Stall command – Software sets this bit to clear any pending IN transaction (on that endpoint) stuck at the lower layers when a Clear Stall command is issued.
10	0h RW	**Command Active (CMDACT):** Software sets this bit to 1 to enable the device endpoint controller to execute the generic command.The device controller sets this bit to 0 when the CmdStatus field is valid and the endpoint is ready to accept another command. This does not imply that all the effects of the previously-issued command have taken place.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RO	Reserved.
8	0h RW	**Command Interrupt on Complete (CMDIOC):** When this bit is set, the device controller issues a generic Endpoint Command Complete event after executing the command. Note that this interrupt is mapped to DEPCFG.IntrNum. When the DEPCFG command is executed, the command interrupt on completion goes to the interrupt pointed by the DEPCFG.IntrNum in the current command. Note: This field must not set to '1' if the DCTL.RunStop field is '0'.
7:4	0h RO	Reserved.
3:0	0h RW	**Command Type (CMDTYP):** Specifies the type of command the software driver is requesting the core to perform. 00h: Reserved 01h: Set Endpoint Configuration-64 or 96-bit Parameter 02h: Set Endpoint Transfer Resource Configuration-32-bit Parameter 03h: Get Endpoint State-No Parameter Needed 04h: Set Stall-No Parameter Needed 05h: Clear Stall (see Set Stall)-No Parameter Needed 06h: Start Transfer-64-bit Parameter 07h: Update Transfer-No Parameter Needed 08h: End Transfer-No Parameter Needed 09h: Start New Configuration-No Parameter Needed

25.3 xDCI MMIO Global Registers

25.3.1 Global SoC Bus Configuration 0 (GSBUSCFG0)—Offset C100h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 6h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RO	Reserved.
11	0h RW	**Data Access is Big-Endian (DATBIGEND):** This bit controls the endian modefor data accesses. 0: Little-endian (default) 1: Big-endian In big-endian mode, DMAaccess (both read and write) for packet data will utilize a Byte Invariant Big-Endianmode. Note: Since AXI requires byte invariant endianness, settingDescBigend and DatBigEnd to one causes an address invariant transform to be applied, which is not appropriate. Henceforth an AXI Initiator (DWC_USB3_MBUS_TYPE=1), this bit must be set to zero.
10:8	0h RO	Reserved.
7	0h RW	**INCR256 Burst Type Enable (INCR256BRSTENA):** If software set this bit to "1", the Initiator uses INCR to do the 256-beat burst.
6	0h RW	**INCR128 Burst Type Enable (INCR128BRSTENA):** If software set this bit to "1", the Initiator uses INCR to do the 128-beat burst.
5	0h RW	**INCR64 Burst Type Enable (INCR64BRSTENA):** If software set this bit to "1", the Initiator uses INCR to do the 64-beat burst.
4	0h RW	**INCR32 Burst Type Enable (INCR32BRSTENA):** If software set this bit to "1", the Initiator uses INCR to do the 32-beat burst.
3	0h RW	**INCR16 Burst Type Enable (INCR16BRSTENA):** If software set this bit to "1", the Initiator uses INCR to do the 16-beat burst.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RW	**INCR8 Burst Type Enable (INCR8BRSTENA):** if software set this bit to "1", the Initiator uses INCR to do the 8-beat burst
1	1h RW	**INCR4 Burst Type Enable (INCR4BRSTENA):** When this bit is enabled the controller is allowed to do bursts of beat length 1, 2, 3, and 4
0	0h RW	**Undefined Length INCR Burst Type Enable (INCRBrstEna) Input to BUS-GM (INCRBRSTENA):** When enabled, this has higher priority than other burst types. For the AHB configuration. if this bit is set to 1, AHB Initiator tries to do only one INCR burst for each transfer unless it has to break it at a 1Kbyte boundary. If this bit is set to 0, the AHB Initiator may still use INCR burst type at the beginning and end bursts of transfers to align the address. The middle bursts are INCR4/8/16, depending when the type is enabled.

25.3.2 Global SoC Bus Configuration 1 (GSBUSCFG1)—Offset C104h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: F00h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	Reserved.
12	0h RW	**1k Page Boundary Enable (EN1KPAGE):** By default (this bit is disabled) the AXI breaks transfers at the 4k page boundary. When this bit is enabled, the AXI Initiator (DMA data) breaks transfers at the 1k page boundary.
11:8	Fh RW	**AXI Pipelined Transfers Burst Request Limit (PipeTransLimit):** The field controls the number of outstanding pipelined transfers requests the AXI Initiator will push to the AXI Target. Once the AXI Initiator reaches this limit, it will not make more requests on the AXI ARADDR and AWADDR buses until the associated data phases complete. This field is encoded as follows: h0: 1 request h1: 2 requests h2: 3 requests h3: 4 requests ... hF: 16 requests
7:0	0h RO	Reserved.

25.3.3 Global Tx Threshold Control (GTXTHRCFG)—Offset C108h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	0h RO	**USB Transmit Packet Count Enable (USBTxPktCntSel):** This fieldenables/ disables the USB transmission multi-packet thresholding: 0: USB transmissionmulti-packet thresholding is disabled, the core can only start transmission on the USBafter the entire packet has been fetched into the corresponding TXFIFO. 1: USBtransmission multi-packet thresholding is enabled. The core can only start transmissionon the USB after USB Transmit Packet Count amount of packets for the USB transaction(burst) are already in the corresponding TXFIFO This mode is only valid in the hostmode. It is only used for SuperSpeed.
28	0h RO	Reserved.
27:24	0h RO	**USB Transmit Packet Count (USBTxPktCnt):** This field specifies thenumber of packets that must be in the TXFIFO before the core can start transmission forthe corresponding USB transaction (burst). This field is only valid when the USBTransmit Packet Count Enable field is set to one. Valid values are from 1 to 15.
23:16	0h RW	**USB Maximum TX Burst Size (USBMaxTxBurstSize):** When USBTxPktCntSel is one,this field specifies the Maximum Bulk OUT burst the core should do. When the systembus is slower than the USB, TX FIFO can underrun during a long burst. User canprogram a smaller value to this field to limit the TX burst size that the core can do. Itonly applies to SS Bulk, Isochronous, and Interrupt OUT endpoints in the host mode.Valid values are from 1 to 16
15:0	0h RO	Reserved.

25.3.4 Global Rx Threshold Control (GRXTHRCFG)—Offset C10Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 24400000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	1h RW	**USB ReceivePacket Count Enable (USBRxPktCntSel):** This field enables/disables theUSB reception multi-packet thresholding: n 0: The core can only start reception on theUSB when the RX FIFO has space for at least one packet. n 1: The core can only startreception on the USB when the RX FIFO has space for at least USBRxPktCnt amount ofpackets. This mode is only valid in the host mode. It is only used for SuperSpeed.
28	0h RO	Reserved.
27:24	4h RW	**USB Receive Packet Count (USBRxPktCnt):** This field specifies space (in number ofpackets) that must be available in the RX FIFO before the core can start thecorresponding USB RX transaction (burst). This field is only valid when the USB ReceivePacket Count Enable field is set to one. The valid values are from 1 to 15.
23:19	8h RW	**USB Maximum Rx Burst Size (USBMaxRxBurstSize):** This field is only validwhen USBRxPktCntSel is one. This field specifies the Maximum Bulk IN burst the coreshould do. When the system bus is slower than the USB, RX FIFO can overrun during along burst. User can program a smaller value to this field to limit the RX burst size thatthe core can do. It only applies to SS Bulk, Isochronous, and Interrupt IN endpoints inthe host mode. Valid values are from 1 to 16.
18:0	0h RO	Reserved.

25.3.5 Global Core Control (GCTL)—Offset C110h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0h RO	Reserved.
18	0h RW	**Initiator Filter Bypass (InitiatorFILTBYPASS):** When this bit is set to 1'b1, irrespective ofthe parameter DWC_USB3_EN_BUS_FILTERS chosen, all the filters in theDWC_usb3_filter module will be bypassed. The double synchronizers to mac_clkpreceding the filters will also be bypassed. For enabling the filters, this bit should be1'b0.
17	0h RO	Reserved.
16	0h RW	**U2RSTECN (U2RSTECN):** The super speed connection fails during POLL or LMP exchange, thedevice connects at non-SS mode. If this bit is set, then device attempts three moretimes to connect at SS, even if it previously failed to operate in SS mode.
15:14	0h RW	**FRMSCLDWN (FRMSCLDWN):** This field scales down device view of a SOF/USOF/ ITP duration. For SS/HS mode: 2'h3 implements interval to be 15. 625 us 2'h2 implementsinterval to be 31.25 us 2'h1 implements interval to be 62.5 us 2'h0implements interval to be125us For FS mode, the scale-down value is multiplied by 8.
13:12	2h RW	**Port Capability Direction (PRTCAPDIR):** 2’b01: Reserved 2’b10: for Device configurations 2’b11: Reserved
11	0h RW	**Core Soft Reset (CORESOFTRESET):** 1b0 - No soft reset 1b1 - Soft reset
10:4	0h RO	Reserved.
3	0h RW	**Disable Scrambling (DISSCRAMBLE):** Transmit request to Link Partner on next transition to Recovery or Polling.
2	0h RO	Reserved.
1	0h RW	**Global Hibernation Enable (GblHibernationEn):** This bit enables hibernation at the global level. If hibernation is not enabled via this bit, the PMU immediately accepts the D0->D3 and D3->D0 power state change requests, but does not save or restore any core state. In addition, the PMUs will never drive the PHY interfaces and let the core continue to drive the PHY interfaces.
0	0h RW	**Disable Clock Gating (DSBLCLKGTNG):** When this bit is set to 1 and the core is in Low Power mode, internal clock gating is disabled.You can set this bit to 1’b1 after Power On Reset.

25.3.6 GPMSTS (GPMSTS)—Offset C114h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h WO	**PortSel (PortSel)**
27:17	0h RO	Reserved.
16:12	0h RO	**U3Wakeup (U3Wakeup)**
11:10	0h RO	Reserved.
9:0	0h RO	**U2Wakeup (U2Wakeup)**

25.3.7 Global Status (GSTS)—Offset C118h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0h RO	Reserved.
6	0h RO	**Device Interrupt Pending (Device_IP):** This field indicates that there is a pendinginterrupt pertaining to peripheral (device) operation in the Device event queue
5	0h RO	**CSR Timeout (CSRTimeout):** When this bit is 1'b1, it indicates that software performeda write or read to a core register that could not be completed withinbus clock cycles (default: 65535).
4	0h RO	**Bus Error Address Valid (BUSERRADDRVLD):** Indicates that the GBUSERRADDR register is valid and reports the first bus address that encounters a bus error.
3:2	0h RO	Reserved.
1:0	0h RO	**Current Mode of Operation (CURMOD):** Indicates the current mode of operation. 2'b00: Device mode 2'b01: Reserved

25.3.8 Bus Address Low (GBUSERRADDRLO)—Offset C130h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Bus Address Low (BUSERRADDR):** This 64-bit register contains the lower 32 bits of the first bus address that encountered a SoC bus error. It is valid when the GSTS.BusErrAddrVld field is 1.It can only be cleared by resetting the core

25.3.9 Bus Address High (GBUSERRADDRHI)—Offset C134h

25.3.10 GHWPARAMS0 (GHWPARAMS0)—Offset C140h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 40204008h

Bit Range	Default & Access	Field Name (ID): Description
31:24	40h RO	**DWC_USB3_ADWIDTH_31_24 (DWC_USB3_ADWIDTH_31_24)**
23:16	20h RO	**DWC_USB3_SDWIDTH_23_16 (DWC_USB3_SDWIDTH_23_16)**
15:8	40h RO	**DWC_USB3_MDWIDTH_15_8 (DWC_USB3_MDWIDTH_15_8)**
7:6	0h RO	**DWC_USB3_SBUS_TYPE_7_6 (DWC_USB3_SBUS_TYPE_7_6)**
5:3	1h RO	**DWC_USB3_MBUS_TYPE_5_3 (DWC_USB3_MBUS_TYPE_5_3)**
2:0	0h RO	**DWC_USB3_MODE_2_0 (DWC_USB3_MODE_2_0)**

25.3.11 GHWPARAMS1 (GHWPARAMS1)—Offset C144h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 260C93Bh

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	Reserved.
26	0h RO	**DWC_USB3_MAC_PHY_CLKS_SYNC_26 (DWC_USB3_MAC_PHY_CLKS_SYNC_26)**
25:24	2h RO	**DWC_USB3_EN_PWROPT_25_24 (DWC_USB3_EN_PWROPT_25_24)**

Bit Range	Default & Access	Field Name (ID): Description
23	0h RO	**DWC_USB3_SPRAM_TYP_23 (DWC_USB3_SPRAM_TYP_23)**
22:21	3h RO	**DWC_USB3_NUM_RAMS_22_21 (DWC_USB3_NUM_RAMS_22_21)**
20:15	1h RO	**DWC_USB3_DEVICE_NUM_INT_20_15 (DWC_USB3_DEVICE_NUM_INT_20_15)**
14:12	4h RO	**DWC_USB3_ASPACEWIDTH_14_12 (DWC_USB3_ASPACEWIDTH_14_12)**
11:9	4h RO	**DWC_USB3_REQINFOWIDTH_11_9 (DWC_USB3_REQINFOWIDTH_11_9)**
8:6	4h RO	**DWC_USB3_DATAINFOWIDTH_8_6 (DWC_USB3_DATAINFOWIDTH_8_6)**
5:3	7h RO	**DWC_USB3_BURSTWIDTH_5_3 (DWC_USB3_BURSTWIDTH_5_3)**
2:0	3h RO	**DWC_USB3_IDWIDTH_2_0 (DWC_USB3_IDWIDTH_2_0)**

25.3.12 GHWPARAMS2 (GHWPARAMS2)—Offset C148h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 8086A0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	8086A0h RO	**DWC_USB3_USERID_31_0 (DWC_USB3_USERID_31_0)**

25.3.13 GHWPARAMS3 (GHWPARAMS3)—Offset C14Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 10420085h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:23	20h RO	**DWC_USB3_CACHE_TOTAL_XFER_RESOURCES_30_23 (DWC_USB3_CACHE_TOTAL_XFER_RESOURCES_30_23)**
22:18	10h RO	**DWC_USB3_NUM_IN_EPS_22_18 (DWC_USB3_NUM_IN_EPS_22_18)**

Bit Range	Default & Access	Field Name (ID): Description
17:12	20h RO	**DWC_USB3_NUM_EPS_17_12 (DWC_USB3_NUM_EPS_17_12)**
11	0h RO	**DWC_USB3_ULPI_CARKIT_11 (DWC_USB3_ULPI_CARKIT_11)**
10	0h RO	**DWC_USB3_VENDOR_CTL_INTERFACE_10 (DWC_USB3_VENDOR_CTL_INTERFACE_10)**
9:8	0h RO	**ghwparams3_9_8 (ghwparams3_9_8)**
7:6	2h RO	**DWC_USB3_HSPHY_DWIDTH_7_6 (DWC_USB3_HSPHY_DWIDTH_7_6)**
5:4	0h RO	**DWC_USB3_FSPHY_INTERFACE_5_4 (DWC_USB3_FSPHY_INTERFACE_5_4)**
3:2	1h RO	**DWC_USB3_HSPHY_INTERFACE_3_2 (DWC_USB3_HSPHY_INTERFACE_3_2)**
1:0	1h RO	**DWC_USB3_SSPHY_INTERFACE_1_0 (DWC_USB3_SSPHY_INTERFACE_1_0)**

25.3.14 GHWPARAMS4 (GHWPARAMS4)—Offset C150h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 222004h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	1h RO	**DWC_USB3_EXT_BUFF_CONTROL_21 (DWC_USB3_EXT_BUFF_CONTROL_21)**
20:17	1h RO	**DWC_USB3_NUM_SS_USB_INSTANCES_20_17 (DWC_USB3_NUM_SS_USB_INSTANCES_20_17)**
16:13	1h RO	**DWC_USB3_HIBER_SCRATCHBUFS_16_13 (DWC_USB3_HIBER_SCRATCHBUFS_16_13):** Number of external scratchpad buffers the core requires to save its internal state in the device mode. Each buffer is assumed to be 4KB
12	0h RO	**ghwparams4_12 (ghwparams4_12)**
11	0h RO	**ghwparams4_11 (ghwparams4_11)**
10:9	0h RO	**ghwparams4_10_9 (ghwparams4_10_9)**

Bit Range	Default & Access	Field Name (ID): Description
8:7	0h RO	**ghwparams4_8_7 (ghwparams4_8_7)**
6	0h RO	**ghwparams4_6 (ghwparams4_6)**
5:0	4h RO	**DWC_USB3_CACHE_TRBS_PER_TRANSFER_5_0 (DWC_USB3_CACHE_TRBS_PER_TRANSFER_5_0)**

25.3.15 GHWPARAMS5 (GHWPARAMS5)—Offset C154h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 4202088h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:22	10h RO	**DWC_USB3_DFQ_FIFO_DEPTH_27_22 (DWC_USB3_DFQ_FIFO_DEPTH_27_22)**
21:16	20h RO	**DWC_USB3_DWQ_FIFO_DEPTH_21_16 (DWC_USB3_DWQ_FIFO_DEPTH_21_16)**
15:10	8h RO	**DWC_USB3_TXQ_FIFO_DEPTH_15_10 (DWC_USB3_TXQ_FIFO_DEPTH_15_10)**
9:4	8h RO	**DWC_USB3_RXQ_FIFO_DEPTH_9_4 (DWC_USB3_RXQ_FIFO_DEPTH_9_4)**
3:0	8h RO	**DWC_USB3_BMU_BUSGM_DEPTH_3_0 (DWC_USB3_BMU_BUSGM_DEPTH_3_0)**

25.3.16 GHWPARAMS6 (GHWPARAMS6)—Offset C158h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 2F60020h

Bit Range	Default & Access	Field Name (ID): Description
31:16	2F6h RO	**DWC_USB3_RAM0_DEPTH_31_16 (DWC_USB3_RAM0_DEPTH_31_16)**
15	0h RO	**BusFltrsSupport (BusFltrsSupport)**
14	0h RO	**BCSupport (BCSupport)**

Bit Range	Default & Access	Field Name (ID): Description
13	0h RO	**OTG_SS_Support (OTG_SS_Support):** 1'b0: No 3.0 support 1'b1: 3.0 support
12	0h RO	**ADPSupport (ADPSupport)**
11	0h RO	**HNPSupport (HNPSupport)**
10	0h RO	**SRPSupport (SRPSupport):** The application uses this bit to determine the DWC_usb3 core's SRP support. 1'b0: SRP support is not enabled 1'b1: SRP support is enabled
9:6	0h RO	Reserved.
5:0	20h RO	**DWC_USB3_PSQ_FIFO_DEPTH_5_0 (DWC_USB3_PSQ_FIFO_DEPTH_5_0)**

25.3.17 GHWPARAMS7 (GHWPARAMS7)—Offset C15Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 38507E6h

Bit Range	Default & Access	Field Name (ID): Description
31:16	385h RO	**DWC_USB3_RAM2_DEPTH_31_16 (DWC_USB3_RAM2_DEPTH_31_16)**
15:0	7E6h RO	**DWC_USB3_RAM1_DEPTH_15_0 (DWC_USB3_RAM1_DEPTH_15_0)**

25.3.18 GDBGFIFOSPACE (GDBGFIFOSPACE)—Offset C160h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 420000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	42h RO	**SPACE_AVAILABLE (SPACE_AVAILABLE)**
15:9	0h RO	Reserved.
8:0	0h RW	**FIFO_QUEUE_SELECT (FIFO_QUEUE_SELECT):** [8:5] indicates the FIFO/Queue Type [4:0] indicates the FIFO/Queue Number

25.3.19 GDBGLTSSM (GDBGLTSSM)—Offset C164h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 41010440h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30	1h RO	**RxElecidle (RxElecidle)**
29	0h RO	**X3_XS_SWAPPING (X3_XS_SWAPPING)**
28	0h RO	**X3_DS_HOST_SHUTDOWN (X3_DS_HOST_SHUTDOWN)**
27	0h RO	**PRTDIRECTION (PRTDIRECTION):** 1'b0: Upstream 1'b1: Downstream
26	0h RO	**LTDBTIMEOUT (LTDBTIMEOUT)**
25:22	4h RO	**LTDBLINKSTATE (LTDBLINKSTATE)**
21:18	0h RO	**LTDBSUBSTATE (LTDBSUBSTATE)**
17	0h RO	**ELASTICBUFFERMODE (ELASTICBUFFERMODE)**
16	1h RO	**TXELECLDLE (TXELECLDLE)**
15	0h RO	**RXPOLARITY (RXPOLARITY)**
14	0h RO	**TxDetRxLoopback (TxDetRxLoopback)**
13:11	0h RO	**LTDBPhyCmdState (LTDBPhyCmdState):** 000: PHY_IDLE 001: PHY_DET 010: PHY_DET_3 011: PHY_PWR_DLY 100: PHY_PWR_A 101: PHY_PWR_B
10:9	2h RO	**POWERDOWN (POWERDOWN)**
8	0h RO	**RXEQTRAIN (RXEQTRAIN)**
7:6	1h RO	**TXDEEMPHASIS (TXDEEMPHASIS)**
5:3	0h RO	**LTDBClkState (LTDBClkState):** 000: CLK_NORM 001: CLK_TO_P3 010: CLK_WAIT1 011: CLK_P3 100: CLK_TO_P0 101: CLK_WAIT2

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**TXSWING (TXSWING)**
1	0h RO	**RXTERMINATION (RXTERMINATION)**
0	0h RO	**TXONESZEROS (TXONESZEROS)**

25.3.20 GDBGLNMCC (GDBGLNMCC)—Offset C168h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8:0	0h RO	**LNMCC_BERC (LNMCC_BERC)**

25.3.21 GDBGBMU (GDBGBMU)—Offset C16Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**BMU_BCU (BMU_BCU)**
7:4	0h RO	**BMU_DCU (BMU_DCU)**
3:0	0h RO	**BMU_CCU (BMU_CCU)**

25.3.22 GDBGLSP (GDBGLSP)—Offset C174h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**LSPDEBUG (LSPDEBUG)**

25.3.23 GDBGEPINFO0 (GDBGEPINFO0)—Offset C178h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**EPDEBUG (EPDEBUG)**

25.3.24 GDBGEPINFO1 (GDBGEPINFO1)—Offset C17Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 800000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	800000h RO	**EPDEBUG (EPDEBUG)**

25.3.25 Global Transmit FIFO Size Register N (GTXFIFOSIZ0_0)—Offset C300h

FIFO_number: 0<= n <= 15 Offset: C300h + FIFO_number * 04h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 42h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**TXFSTADDR_N (TXFSTADDR_N)**
15:0	42h RW	**TXFDEP_N (TXFDEP_N)**

25.3.26 GRXFIFOSIZ0_0 (GRXFIFOSIZ0_0)—Offset C380h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 385h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW	**RXFSTADDR_N (RXFSTADDR_N)**
15:0	385h RW	**RXFDEP_N (RXFDEP_N)**

25.3.27 GEVNTADRLO_0 (GEVNTADRLO_0)—Offset C400h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EVNTADRLO (EVNTADRLO)**

25.3.28 GEVNTADRHI_0 (GEVNTADRHI_0)—Offset C404h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**EVNTADRHI (EVNTADRHI)**

25.3.29 GEVNTCOUNT_0 (GEVNTCOUNT_0)—Offset C40Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h NA	**EVNTCOUNT (EVNTCOUNT)**

25.3.30 GTXFIFOPRIDEV (GTXFIFOPRIDEV)—Offset C610h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**gtxfifopridev (gtxfifopridev)**

§ §

26 Shared SRAM (D20:F2)

26.1 PMC SSRAM PCI Configuration Space Registers

Table 26-1. Summary of PMC SSRAM PCI Configuration Space Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Device Vendor ID (DEVVENDID)—Offset 0h	8086h
4h	7h	STATUSCOMMAND Status and Command (STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	Revision ID and Class Code (REVCLASSCODE)—Offset 8h	0h
Ch	Fh	Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch	0h
10h	13h	32-bit Base Address Register (BAR)—Offset 10h	4h
14h	17h	BAR HIGH (BAR_HIGH)—Offset 14h	0h
18h	1Bh	32-bit Base Address Register1 (BAR1)—Offset 18h	4h
1Ch	1Fh	BAR1 HIGH (BAR1_HIGH)—Offset 1Ch	0h
2Ch	2Fh	Subsystem Identifiers (SUBSYSTEMID)—Offset 2Ch	0h
34h	37h	Capabilities Pointer (CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	Interrupt Register (INTERRUPTREG)—Offset 3Ch	100h
80h	83h	POWER CAP ID PowerManagement Capability ID (POWERCAPID)—Offset 80h	48030001h
84h	87h	PME Control and Status (PMECTRLSTATUS)—Offset 84h	8h
90h	93h	PCI Device Capability Record (PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
98h	9Bh	D0I3 CONTROL SW LTR MMIO REG (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	0h
9Ch	9Fh	Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch	0h
A0h	A3h	Device PG Config (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	800h
B0h	B3h	General Purpose Read Write Register1 (GEN_REGRW1)—Offset B0h	0h
B4h	B7h	General Purpose Read Write Register2 (GEN_REGRW2)—Offset B4h	0h
B8h	BBh	General Purpose Read Write Register3 (GEN_REGRW3)—Offset B8h	0h
BCh	BFh	General Purpose Read Write Register4 (GEN_REGRW4)—Offset BCh	0h
C0h	C3h	General Purpose Input Register (GEN_INPUT_REG)—Offset C0h	0h

26.1.1 Device Vendor ID (DEVVENDID)—Offset 0h

Device Vendor ID

Access Method

Type: CFG Register (Size: 32 bits)

Device: 20
Function: 2

Default: 8086h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	**Device Identification (DEVICEID):** Indicates the value assigned to the controller. Refer to Vol1 for default value.
15:0	8086h RO	**Vendor Identification (VENDORID):** Indicates Intel

26.1.2 STATUSCOMMAND Status and Command (STATUSCOMMAND)—Offset 4h

Status and Command

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 100000h

Bit Range	Default and Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	0h RW/1C	**RMA (RMA):** Received Initiator Abort
28	0h RW/1C	**RTA (RTA):** Received Target Abort
27:21	0h RO	Reserved.
20	1h RO	**CAPLIST (CAPLIST):** Capabilities List
19	0h RO	**INTR_STATUS (INTR_STATUS):** Interrupt Status
18:11	0h RO	Reserved.
10	0h RW	**INTR_DISABLE (INTR_DISABLE):** Interrupt Disable
9	0h RO	Reserved.
8	0h RW/1C	**SERR_ENABLE (SERR_ENABLE):** System Error Enable
7:3	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
2	0h RW	**BME (BME):** Bus Initiator Enable
1	0h RW	**MSE (MSE):** Memory Space Enable
0	0h RO	Reserved.

26.1.3 Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Revison Class Codes

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	**CLASS_CODES (CLASS_CODES):** The register is read-only and is used to identify the generic function of the device.
7:0	0h RO	**RID (RID):** Indicates stepping of the controller. Refer to Vol1 for specific value.

26.1.4 Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Cache Line Latency Header And BIST

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23	0h RO	**MULFNDEV (MULFNDEV):** 0 = Single Function Device 1 = Multi Function device

Bit Range	Default and Access	Field Name (ID): Description
22:16	0h RO	**HEADERTYPE (HEADERTYPE):** Header Type
15:8	0h RO	**LATTIMER (LATTIMER):** Hard wired to 00h.
7:0	0h RW	**CACHELINE_SIZE (CACHELINE_SIZE):** Cacheline Size

26.1.5 32-bit Base Address Register (BAR)—Offset 10h

Base Address Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 4h

Bit Range	Default and Access	Field Name (ID): Description
31:13	0h RW	**BAR (BASEADDR):** Software programs this register with the base address of the device's memory region
12:4	0h RO	**Size Indicator (SIZEINDICATOR):** Hardwired to 0 to indicate 8KB of memory space
3	0h RO	**Prefetchable (PREFETCHABLE):** Hardwired to 0 to indicate the device's memory space as notprefetchable.
2:1	2h RO	**Type (TYPE):** Hardwired to 10 to indicate that Base register is 64 bits wide and mapping can be done anywhere in the 64-bit Memory Space.
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE):** Hardwired to 0 to identify a Memory BAR.

26.1.6 BAR HIGH (BAR_HIGH)—Offset 14h

BAR -Base Address Register High

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Base Address HIGH (BASEADDR_HIGH):** Base Address

26.1.7 32-bit Base Address Register1 (BAR1)—Offset 18h

Base Address Register1

Access Method

Type: CFG Register (Size: 32 bits)
Device: 20
Function: 2

Default: 4h

Bit Range	Default and Access	Field Name (ID): Description
31:12	0h RW	**BAR1 (BASEADDR1):** Software programs this register with the base address of the device's memory region
11:4	0h RO	**Size Indicator (SIZEINDICATOR1):** Hardwired to 0 to indicate 4KB of memory space
3	0h RO	**Prefetchable (PREFETCHABLE1):** Hardwired to 0 to indicate the device's memory space as notprefetchable.
2:1	2h RO	**Type (TYPE1):** Hardwired to 10 to indicate that Base register is 64 bits wide and mapping can be done anywhere in the 64-bit Memory Space.
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE1):** Hardwired to 0 to identify a Memory BAR.

26.1.8 BAR1 HIGH (BAR1_HIGH)—Offset 1Ch

BAR1 -Base Address Register High

Access Method

Type: CFG Register (Size: 32 bits)
Device: 20
Function: 2

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Base Address HIGH (BASEADDR1_HIGH):** Base Address

26.1.9 Subsystem Identifiers (SUBSYSTEMID)—Offset 2Ch

Subsystem Identifiers

Access Method

Type: CFG Register (Size: 32 bits)
Device: 20
Function: 2

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SUBSYSTEMID):** Written by BIOS. Not used by hardware.
15:0	0h RW/O	**Subsystem Vendor ID (SUBSYSTEMVENDORID):** Written by BIOS.Not used by hardware.

26.1.10 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 80h

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	80h RO	**CAPPTR_POWER (CAPPTR_POWER):** Indicates what the next capability is. This capability points to the PM Capability (0x80) structure.

26.1.11 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Interrupt Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 100h

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	**MAX_LAT (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**MIN_GNT (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers
15:12	0h RO	Reserved.
11:8	1h RO	**INTPIN (INTPIN):** Interrupt Pin
7:0	0h RW	**INTLINE (INTLINE):** Used to communicate to software the interrupt line that the interrupt pin is connected to.

26.1.12 POWER CAP ID PowerManagement Capability ID (POWERCAPID)—Offset 80h

PowerManagement Capability

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 48030001h

Bit Range	Default and Access	Field Name (ID): Description
31:27	9h RO	**PMESUPPORT (PMESUPPORT):** PME Support
26:19	0h RO	Reserved.
18:16	3h RW/1C	**VERSION (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	0h RO	**NXTCAP (NXTCAP):** Points to the next capability structure. This points to NULL.
7:0	1h RO	**POWER_CAP (POWER_CAP):** Indicates power management capability.

26.1.13 PME Control and Status (PMECTRLSTATUS)—Offset 84h

Power Management Control and Status Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 8h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW/1C	**PMESTATUS (PMESTATUS):** PME Status
14:9	0h RO	Reserved.
8	0h RW	**PMEENABLE (PMEENABLE):** PME Enable
7:4	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
3	1h RO	**NO_SOFT_RESET (NO_SOFT_RESET):** When set, this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved.
2	0h RO	Reserved.
1:0	0h RW	**POWERSTATE (POWERSTATE):** This field is used both to determine the current power state and to set a new power state.

26.1.14 PCI Device Capability Record (PCIDEVIDLE_CAP_RECORD)—Offset 90h

PCI DEVICE IDLE CAPABILITY RECORD

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: F0140009h

Bit Range	Default and Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP (VEND_CAP):** Indicates this is Vendor Specific capability.
27:24	0h RO	**REVID (REVID):** Revision ID of capability structure
23:16	14h RO	**CAP_LENGTH (CAP_LENGTH):** Indicates the number of bytes in the capability structure.
15:8	0h RO	**NEXT_CAP (NEXT_CAP):** Points to the next capability structure. This points to NULL.
7:0	9h RO	**CAPID (CAPID):** Capability ID

26.1.15 D0I3 CONTROL SW LTR MMIO REG (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

SW LTR Update MMIO Location Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RO	**SW_LAT_DWORD_OFFSET (SW_LAT_DWORD_OFFSET):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is a do not care, if the Valid bit is not set.
3:1	0h RO	**SW_LAT_BAR_NUM (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0.
0	0h RO	**SW_LAT_VALID (SW_LAT_VALID):** 0= not valid 1= valid

26.1.16 Device IDLE pointer register (DEVICE_IDLE_POINTER_REG)—Offset 9Ch

Device IDLE pointer register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RO	**DWORD_OFFSET (DWORD_OFFSET):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is a do not care, if the Valid bit is not set.
3:1	0h RO	**BAR_NUM (BAR_NUM):** Indicates that the DevIdle update MMIO location is always at BAR0
0	0h RO	**VALID (VALID):** 0= not valid 1= valid

26.1.17 Device PG Config (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

DEVICE PG CONFIG

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 800h

Bit Range	Default and Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RW	**HAE (HAE):** Hardware Autonomous Enable
20	0h RO	Reserved.
19	0h RW	**SLEEP_EN (SLEEP_EN):** Sleep Enable
18	0h RW	**PGE (PGE):** If clear, then the controller will never request a PG. If set, then the controller may request PG when proper conditions are met. Note: This Bit must be set by BIOs for PG to function
17	0h RW	**I3_ENABLE (I3_ENABLE):** If '1', then the function will power gate when idle and the DevIdle register (DevIdleC[2] = '1') is set.
16	0h RW	**PMCRE (PMCRE):** If this bit is set to '1', the function will power gate when idle.
15:13	0h RO	Reserved.
12:10	2h RW/O	**POW_LAT_SCALE (POW_LAT_SCALE):** Power On Latency Scale
9:0	0h RW/O	**POW_LAT_VALUE (POW_LAT_VALUE):** This value is written by BIOS to communicate to the Driver.

26.1.18 General Purpose Read Write Register1 (GEN_REGRW1)—Offset B0h

General Purpose Read Write Register1

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW1 (GEN_REG_RW1):** General Purpose PCI Register

26.1.19 General Purpose Read Write Register2 (GEN_REGRW2)—Offset B4h

General Purpose Read Write Register2

Access Method

Type: CFG Register (Size: 32 bits)
Device: 20
Function: 2

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW2 (GEN_REG_RW2):** General Purpose PCI Register

26.1.20 General Purpose Read Write Register3 (GEN_REGRW3)—Offset B8h

General Purpose Read Write Register3

Access Method

Type: CFG Register (Size: 32 bits)
Device: 20
Function: 2

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW3 (GEN_REG_RW3):** General Purpose PCI Register

26.1.21 General Purpose Read Write Register4 (GEN_REGRW4)—Offset BCh

General Purpose Read Write Register4

Access Method

Type: CFG Register (Size: 32 bits)
Device: 20
Function: 2

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_RW4 (GEN_REG_RW4):** General Purpose PCI Register

26.1.22 General Purpose Input Register (GEN_INPUT_REG)—Offset C0h

General Purpose Input Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 20
Function: 2

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**GEN_REG_INPUT_RW (GEN_REG_INPUT_RW):** General Purpose Input Register

§ §

27 CNVi Registers (D20:F3)

This chapter documents the registers in Bus: 0, Device 20, Function 3.

Note: These registers do not apply to S/H processors.

27.1 CNVi PCI Configuration Register

Table 27-1. Summary of Bus: 0, Device: 20, Function: 3 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	VEN DEV Identification (VEN_DEV_ID)	00008086h
4h	4	PCI COM Status (PCI_COM_STAT)	00100000h
8h	4	PCI CLASS CODE (PCI_CLASS_CODE)	02800000h
10h	4	BAR #0 (BAR0)	00000004h
14h	4	BAR #1 (BAR1)	00000000h
2Ch	4	SUBSYS Identification (SUBSYS_ID)	00008086h
34h	4	CAP PTR (CAP_PTR)	000000C8h
3Ch	4	Interrupt Error UPT (INTERRUPT)	00000100h
40h	4	GIO CAP (GIO_CAP)	00928010h
44h	4	GIO DEV CAP (GIO_DEV_CAP)	10000EC0h
48h	4	GIO DEV (GIO_DEV)	00100C10h
64h	4	GIO DEV CAP #2 (GIO_DEV_CAP_2)	00080812h
68h	4	GIO DEV #2 (GIO_DEV_2)	00000005h
80h	4	MSIX CAP HEAD (MSIX_CAP_HEAD)	000F0011h
84h	4	MSIX TABLE OFFSET (MSIX_TABLE_OFFSET)	00002000h
88h	4	MSIX PBA OFFSET (MSIX_PBA_OFFSET)	00003000h
C8h	4	PMC	C823D001h
CCh	4	PMCSR	0D000008h
D0h	4	MSI Message Control (MSI_MSG_CTRL)	00804005h
D4h	4	MSI LOW ADD (MSI_LOW_ADD)	00000000h
D8h	4	MSI HIGH ADD (MSI_HIGH_ADD)	00000000h
DCh	4	MSI DATA (MSI_DATA)	00000000h
100h	4	LTR EXTND CAP HEAD (LTR_EXTND_CAP_HEAD)	16410018h
104h	4	LTR Maximum SNOOP NOSNOOP LAT (LTR_MAX_SNOOP_NOSNOOP_LAT)	00000000h
10Ch	4	UNCORRECT Error SEV (UNCORRECT_ERR_SEV)	00462031h
110h	4	CORRECT Error Status (CORRECT_ERR_STAT)	00000000h
114h	4	CORRECT Error MASK (CORRECT_ERR_MASK)	00002000h
118h	4	ADVANCED Error CAP (ADVANCED_ERR_CAP)	00000000h
11Ch	4	HEADER LOG #1 (HEADER_LOG1)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
120h	4	HEADER LOG #2 (HEADER_LOG2)	00000000h
124h	4	HEADER LOG #3 (HEADER_LOG3)	00000000h
128h	4	HEADER LOG #4 (HEADER_LOG4)	00000000h

27.1.1 VEN DEV Identification (VEN_DEV_ID) — Offset 0h

identifies the manufacturer of the device(vendor) and type.(Offset 000 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 0h	00008086h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**DEV_ID:** Device ID identifies the particular PCI device
15:0	8086h RO	**VEN_ID:** vendor ID

27.1.2 PCI COM Status (PCI_COM_STAT) — Offset 4h

command and status register .(Offset 004 h)

HARDWIRED --]] HARDWIRED

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 4h	00100000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1C	**DET_PAR_ERR:** Detected Parity Error
30	0h RW/1C	**SIG_SYS_ERR:** Signaled System Error
29	0h RW/1C	**REC_MAS_ABRT:** Received Initiator Abort

Bit Range	Default & Access	Field Name (ID): Description
28	0h RW/1C	**REC_TAR_ABRT:** Received Target Abort
27	0h RW/1C	**SIG_TAR_ABRT:** Signaled Target Abort
26:25	0h RO	**DEVSEL_TIMING:** DEVSEL Timing, does not apply to PCI Express HARDWIRED
24	0h RW/1C	**MAS_DATA_PAR_ER:** Initiator Data Parity Error
23	0h RO	**FAST_BTB_TCAP:** Fast Back-to-Back Transaction Capable, does not apply to PCI Express HARDWIRED
22	0h RO	**Reserved**
21	0h RO	**OLF_FREQ_CAP:** 66 MHz Capable, does not apply to PCI Express HARDWIRED
20	1h RO	**CAP_LST:** Capability List, must be set to 1
19	0h RO	**INTRPT_STS:** Interrupt status, reflects the state of the interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**INTRPT_DIS:** Interrupt Disable, controls the ability of the device to generate legacy interrupt messages
9	0h RO	**FAST_BTB_TNSCEN:** Fast Back-to-Back Transaction Enable, does not apply to PCI Express HARDWIRED
8	0h RW	**SERR_EN:** SERR Enable, when set 1, the device can drive the SERR# line
7	0h RO	**IDSEL_STEP_W_CY:** IDSEL Stepping/Wait Cycle Control, does not apply to PCI Express HARDWIRED
6	0h RW	**PAR_ERR:** Parity Error Enable
5	0h RO	**VGA_PALT_SNOOP:** VGA Palette Snoop, does not apply to PCI Express HARDWIRED
4	0h RO	**MEM_WR_INVALD:** Memory Write and Invalidate, does not apply to PCI Express HARDWIRED
3	0h RO	**SPEC_CYC_ENB:** Special Cycle Enable, does not apply to PCI Express HARDWIRED
2	0h RW	**BUS_MAS:** Bus Initiator Enable
1	0h RW	**MEM_SP_ACC:** Memory Space access enable
0	0h RO	**IO_SPC_AC_EN_0:** IO Space access enable

27.1.3 PCI CLASS CODE (PCI_CLASS_CODE) — Offset 8h

revision identifier and class code(Offset 008 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 8h	02800000h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:24	02h RO	**SE_CLASS:** Base Class, classifies the type of function the device perform
23:16	80h RO	**SUB_CLASS:** Sub-Class, identifies more specifically the function of the device
15:8	00h RO	**INTERFACE:** Interface, identifies a specific register-level programming interface
7:0	00h RO	**REV_ID:** Revision ID identifies the revision of particular PCI device

27.1.4 BAR #0 (BAR0) — Offset 10h

Base Address Register BAR0 Low (Offset 010 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 10h	00000004h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	00000h RW	**BS_ADD_FLD_RW:** Base Address Field
13:4	000h RO	**BS_ADD_FLD_RO:** Base Address Field HARDWIRED
3	0h RO	**PREFETCHBL:** Prefetchable, defines the block of memory as Prefetchable or not
2:1	2h RO	**DECOD_WDTH_FLD:** Decoder Width Field (10b-64bit reg) HARDWIRED
0	0h RO	**MEM_SPAC_INDIC:** Memory Space Indicator HARDWIRED

27.1.5 BAR #1 (BAR1) — Offset 14h

Base Address Register BAR0 High (Offset 014 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 14h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000 h RW	**BS_ADD_FLD:** Base Address Field

27.1.6 SUBSYS Identification (SUBSYS_ID) — Offset 2Ch

identifies the manufacturer of the device(vendor) and type.(Offset 02C h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 2Ch	00008086h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**SB_DEV_ID:** Subsystem (device) ID
15:0	8086h RO	**SB_VEN_ID:** Subsystem Vendor ID

27.1.7 CAP PTR (CAP_PTR) — Offset 34h

capabilities pointer register (Offset 034 h)

bit [7:0] Point to the first item in the list of capabilities, provides an \n offset in the device's PCI Configuration Space for the location of the first

item in the Capabilities List

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 34h	000000C8h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	C8h RO	**CARDB_PTR:** Capabilities Pointer

27.1.8 Interrupt Error UPT (INTERRUPT) — Offset 3Ch

revision identifier and class code(Offset 03C h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 3Ch	00000100h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**MAX_LATNC:** Max_Lat , Does not apply to PCI Express HARDWIRED
23:16	00h RO	**MIN_GNT:** Min_Gnt , Does not apply to PCI Express HARDWIRED
15:8	01h RO	**INT_PIN:** Interrupt Pin , Tells which interrupt pin the device uses
7:0	00h RW	**INT_LINE:** Interrupt Line, id which input interrupt request pin is routed.

27.1.9 GIO CAP (GIO_CAP) — Offset 40h

PCI Express Capabilities Register. (Offset 040 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 40h	00928010h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:25	00h RO	**INTRPT_MSG_NUM:** Interrupt Message Number HARDWIRED
24	0h RO	**SLT_IMPLNT:** Slot Implemented HARDWIRED
23:20	9h RO	**DEV_POR_TYP:** Device/Port Type
19:16	2h RO	**CAP_VER:** Capability Version
15:8	80h RO	**GIO_CAP_NXT_OFS:** The offset to the next PCI capability structure HARDWIRED
7:0	10h RO	**INCD_PCIE_CST:** indicates PCI Express Capability Structure HARDWIRED

27.1.10 GIO DEV CAP (GIO_DEV_CAP) — Offset 44h

The Device Capabilities register identifies PCI Express device specific capabilities.(Offset 044 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 44h	10000EC0h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28	1h RO	**FUNC_LVL_RES:** Function Level Reset Capability [too add GEN_2]
27:26	0h RO	**SLT_PW_LSCL:** Captured Slot Power Limit Scale
25:18	00h RO	**SLT_PW_LVAL:** Captured Slot Power Limit Value

Bit Range	Default & Access	Field Name (ID): Description
17:16	0h RO	**Reserved**
15	0h RO	**ROLE_BASED_ERR:** This field indicates that the device support Error reporting
14:12	0h RO	**Reserved**
11:9	7h RO	**L1_ACC_LAT:** Endpoint L1 Acceptable Latency
8:6	3h RO	**L0S_ACC_LAT:** Endpoint L0s Acceptable Latency
5	0h RO	**EX_TAG_FIELD:** Extended Tag Field Supported
4:3	0h RO	**PHAN_FUNCS:** Phantom Functions Supported
2:0	0h RO	**MAX_PL_SIZE:** Max_Payload_Size Supported

27.1.11 GIO DEV (GIO_DEV) — Offset 48h

Device Control Register. (Offset 048 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 48h	00100C10h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	0h RO	**TRANS_PEND:** indicates that a device has Non-Posted Requests which have not been completed
20	1h RO	**AUX_P_DET:** device that requires AUX power reports this bit (asynch signal)
19	0h RW/1C	**UNSOP_REQ_DET:** indicates that the device received Unsupported Request
18	0h RW/1C	**FAT_ERR_DET:** indicates status of fatal errors detected
17	0h RW/1C	**NFAT_ER_DET:** indicates status of non-fatal errors detected
16	0h RW/1C	**COR_ERR_DET:** indicates status of correctable errors detected

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**INIT_FNC_LV_RS:** Initiate Function Level Reset - A write of 1b initiates Function (init FLR) this bit is RW after gf_cfg_dev_cap_flr_sup is set from OTP
14:12	0h RW	**MAX_RDRQ_SIZE:** sets the maximum Read Request size
11	1h RW	**EN_NO_SNOOP:** Enable No Snoop (if set device is permitted to set No Snoop bit)
10	1h RW	**AUX_PM_EN:** Auxiliary (AUX) Power PM Enable. sticky value.
9	0h RO	**Reserved**
8	0h RO	**IO_SPC_AC_EN_8:** IO Space access enable
7:5	0h RW	**MAX_PAY_SIZE:** sets maximum TLP payload size for the device functions
4	1h RW	**EN_REL_ORD:** when set device permitted to set the Relaxed Ordering bit
3	0h RW	**UNSOP_REQ_REP:** enables reporting of Unsupported Request when set
2	0h RW	**FAT_ERR_REP:** controls reporting of fatal errors
1	0h RW	**NFAT_ER_REP:** controls reporting of non-fatal errors
0	0h RW	**COR_ERR_REP:** controls reporting of correctable errors

27.1.12 GIO DEV CAP #2 (GIO_DEV_CAP_2) — Offset 64h

device control 2 (and status) register. (Offset 064 h)

new at Wilkins2

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 64h	00080812h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:20	0h RO	**Reserved**
19:18	2h RO	**OBFF_MEC_SUP:** OBFF suported : 0x00 -unsupported , 0x01 -sup using message signaling A, 0x10 -sup using signaling B ,0x11-supported using WAKE signaling

Bit Range	Default & Access	Field Name (ID): Description
17:12	0h RO	**Reserved**
11	1h RO	**LTR_MEC_SUP:** LTR Mechanism Supported - a value of 1b indicates support for LTR.
10:5	0h RO	**Reserved**
4	1h RO	**CMP_TO_DIS_SUP:** 1- support for the Completion Timeout Disable, 0- not supported hardwired to 0x1
3:0	2h RO	**CMP_TO_RNG_SUP:** Completion Timeout Ranges Supported hardwired to 0x2

27.1.13 GIO DEV #2 (GIO_DEV_2) — Offset 68h

device control (and status) register. (Offset 068 h)

spec section:7.8.16 new at Wilkins2

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 68h	00000005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	**Reserved**
14:13	0h RW	**OBFF_MEC_ENA:** OBFF enable: 0x00 -disable , 0x01 - enabled using message signaling A, 0x10 - message signaling B ,0x11-enabled using WAKE signaling
12:11	0h RO	**Reserved**
10	0h RW	**LTR_MEC_EN:** LTR Mechanism Enable - When Set enables the LTR.
9:5	0h RO	**Reserved**
4	0h RW	**CMP_TO_DIS:** When Set, this bit disables the Completion Timeout mechanism
3:0	5h RW	**CMP_TO_VAL:** this field allows system SW to modify the Completion Timeout value

27.1.14 MSIX CAP HEAD (MSIX_CAP_HEAD) — Offset 80h

MSIX Capability .(Offset 080 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 80h	000F0011h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**MSIX_ENABLE:** If set to 1, the function is permitted to use MSI-X to request service. System configuration software sets this bit to enable MSI-X. A device driver is prohibited from writing this bit to mask a function's service request. If 0, the function is prohibited from using MSI-X to request service.
30	0h RW	**FUN_MASK:** If set to 1, all of the vectors associated with the function are masked, regardless of their per-vector Mask bit states. If 0, each vector's Mask bit determines whether the vector is masked or not. Setting or clearing the MSI-X Function Mask bit has no effect on the state of the per-vector Mask bits
29:27	0h RO	**Reserved**
26:16	00Fh RO	**TABLE_SIZE:** System software reads this field to determine the MSI-X Table Size N, which is encoded as (N-1). Wifi Host supports Table Size of 16 and encodes a number of 15 (Pulsar).
15:8	00h RO	**NEXT_PTR:** Pointer to the next item in the capabilities list. NULL if last
7:0	11h RO	**MSIX_CAP_ID:** The value of 11h in this field identifies the function as being MSI-X capable.

27.1.15 MSIX TABLE OFFSET (MSIX_TABLE_OFFSET) — Offset 84h

MSIX Capability Structure - Table Offset Reg.(Offset 084 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 84h	00002000h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000400h RO	**TABLE_OFFSET:** Used as an offset from the address contained by the Base Address register to point to the base of the MSI-X Table. The lower 3 bits are masked off (set to zero) by software to form a 32-bit QWORD-aligned offset. In Wifi Host the table is at 0x2000, so the value of this field in 0x400.

Bit Range	Default & Access	Field Name (ID): Description
2:0	0h RO	**TABLE_BIR:** Indicates which one of a function's Base Address registers, located beginning at 10h in configuration Space, and is used to map the function's MSI-X Table into Memory Space. Wifi Host cluster uses a single BAR to point to the MSI-X structures.

27.1.16 MSIX PBA OFFSET (MSIX_PBA_OFFSET) — Offset 88h

MSIX Capability Structure - Pending Bit Array Offset Reg.(Offset 088 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 88h	00003000h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:3	00000600h RO	**TABLE_OFFSET:** Used as an offset from the address contained by the Base Address register to point to the base of the MSI-X PBA Table. The lower 3 bits are masked off (set to zero) by software to form a 32-bit QWORD-aligned offset. In Wifi Host the table is at 0x3000, so the value of this field in 0x600.
2:0	0h RO	**TABLE_BIR:** Indicates which one of a function's Base Address registers, located beginning at 10h in configuration Space, and is used to map the function's MSI-X Table into Memory Space. Wifi Host cluster uses a single BAR to point to the MSI-X structures.

27.1.17 PMC — Offset C8h

Power Management Capabilities Register(Offset 0C8 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + C8h	C823D001h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:27	19h RO	**PME_SUPRT:** PME Support,indicates the power states in which the device may assert PME

Bit Range	Default & Access	Field Name (ID): Description
26	0h RO	**D2_PWR_MANG:** D2 Power Management State support
25	0h RO	**D1_PWR_MANG:** D1 Power Management State support
24:22	0h RO	**AUX_CUR:** AUX Current (Used data register instead)
21	1h RO	**DEV_SPC_INT:** Device Specific Initialization
20	0h RO	**Reserved**
19	0h RO	**PME_CLK:** PME Clock, does not apply to PCI Express HARDWIRED
18:16	3h RO	**VERSION:** value indicates that this function complies with the Revision 1.2
15:8	D0h RO	**PMC_NXT_PTR:** Next PTR, pointing to the location of next item in the functions capability list HARDWIRED
7:0	01h RO	**PMC_CAP_ID:** Capability ID, Indicates the linked list item is the PCI Power Management Registers HARDWIRED

27.1.18 PMCSR — Offset CCh

Power Management Status and Control (Offset 0CC h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + CCh	0D000008h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0Dh RO	**PWR_DIS_CON:** used to report power consumption and heat dissipation
23	0h RO	**BUS_PWR_CLK_CEN:** Bus Power/Clock Control Enable, does not apply to PCI Express HARDWIRED
22	0h RO	**B2_B3_SUPRT:** B2/B3 Support, does not apply to PCI Express HARDWIRED
21:16	0h RO	**Reserved**
15	0h RW/1C	**PME_STAT:** This bit reflects whether the function has experienced a PME. sticky value.

Bit Range	Default & Access	Field Name (ID): Description
14:13	0h RO	**DAT_SCALE:** Data Scale
12:9	0h RW	**DAT_SEL:** Data Select, selects the data value to be viewed through the Data register
8	0h RW	**PME_ENA:** PME Enable. sticky value.
7:4	0h RO	**Reserved**
3	1h RO	**NO_SOFT_RESET:** No_Soft_Reset
2	0h RO	**Reserved**
1:0	0h RW	**PWR_STATE:** Power State

27.1.19 MSI Message Control (MSI_MSG_CTRL) — Offset D0h

Capability ID and Message Control .(Offset 0D0 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + D0h	00804005h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	1h RO	**BITA_CAP_64:** 64 bit address capable HARDWIRED
22:20	0h RO	**MUL_MSG_ENB:** Multiple Message Enable HARDWIRED
19:17	0h RO	**MUL_MSG_CAP:** Multiple Message Capable HARDWIRED
16	0h RW	**MSI_ENA:** function is enabled to use MSI to request service and is forbidden to use its interrupt pin
15:8	40h RO	**MSI_MC_NXT_PTR:** Next Capability ponter offset new at Wilkins2 HARDWIRED
7:0	05h RO	**MSI_MC_CAP_ID:** Capability ID HARDWIRED

27.1.20 MSI LOW ADD (MSI_LOW_ADD) — Offset D4h

Specifies the lower DWORD of the address for the MSI memory write transaction (Offset 0D4 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + D4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	00000000 h RW	**MSG_ADD_LOW:** ower DWORD of the address
1:0	0h RO	**MSI_LOW_AD_1_0:** HARDWIRED

27.1.21 MSI HIGH ADD (MSI_HIGH_ADD) — Offset D8h

Specifies the upper DWORD of the address for the MSI memory write transaction (Offset 0D8 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + D8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000 h RW	**MSG_ADD_UP:** upper DWORD of the address

27.1.22 MSI DATA (MSI_DATA) — Offset DCh

Written by the system to indicate the lower 16 bits of the data written in the MSI memory write DWORD transaction (Offset 0DC h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + DCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0000h RW	**MSG_DATA:** data written in the MSI memory write DWORD transaction

27.1.23 LTR EXTND CAP HEAD (LTR_EXTND_CAP_HEAD) — Offset 100h

header of LTR extended capability reg .(Offset 100 h, in Pulsar it was 14C h)

new at Wilkins2

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 100h	16410018h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:20	164h RO	**LTR_HD_NXT_PTR:** Next Capability Offset. next is the Vendor Specific Capability Header
19:16	1h RO	**LTR_HD_CAP_VER:** Capability Version. must be 1 for this version
15:0	0018h RO	**LTR_HD_CAP_ID:** PCI Express Extended Capability ID for the LTR Extended Capability is 0018h

27.1.24 LTR Maximum SNOOP NOSNOOP LAT (LTR_MAX_SNOOP_NOSNOOP_LAT) — Offset 104h

this register specifies the maximum nosnoop latency that a device is permitted to request. (Offset 104 h)

new at Wilkins2

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 104h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	**Reserved**
28:26	0h RW	**NSNP_MX_LAT_SCL:** no-snoop max latency scale. set by SW
25:16	000h RW	**NSNP_MX_LAT_VAL:** no-snoop max latency value. set by SW
15:13	0h RO	**Reserved**
12:10	0h RW	**SNP_MAX_LAT_SCL:** snoop max latency scale. set by SW
9:0	000h RW	**SNP_MAX_LAT_VAL:** snoop max latency value. set by SW

27.1.25 UNCORRECT Error SEV (UNCORRECT_ERR_SEV) — Offset 10Ch

Uncorrectable Error severity Register. (Offset 10C h)

at this reg bits of type RWS - the error is reported as fatal when the field is set to 1, g if it is cleared to 0, the error is considered non-fatal

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 10Ch	00462031h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	**Reserved**
25	0h RW	**TLP_PRFIX_BLOCKED_SVR:** TLP Prefix Blocked Error Severity (Optional) - report is not implemented. sticky value
24	0h RW	**ATMC_EGRS_BLOCKED_SVR:** AtomicOps Egress Blocked Severity (Optional) - report is not implemented. sticky value

Bit Range	Default & Access	Field Name (ID): Description
23	0h RW	**MC_BLOCKED_TLP_SVR:** MC Blocked TLP Severity (Optional) - report is not implemented. sticky value
22	1h RW	**UNCORCT_INT_ERR_SVR:** Uncorrectable Internal Error Severity (Optional) - report is not implemented. sticky value
21	0h RW	**ACS_VIOL_SVR:** ACS Violation Severity (Optional) - report is not implemented. sticky value
20	0h RW	**UNSPR_REQ_ERR_SVR:** Unsupported Request Error severity sticky value
19	0h RO	**ECRC_ERR_SVR_19:** ECRC Error severity, is not implemented.
18	1h RW	**MAL_TLP_SVR:** Malformed TLP severity . sticky value
17	1h RW	**REC_OVRF_SVR:** Receiver Overflow severity . sticky value
16	0h RW	**UNXPL_COM_SVR:** Unexpected Completion severity . sticky value
15	0h RW	**COM_AB_SVR:** Completer Abort severity . sticky value
14	0h RW	**COM_TO_SVR:** Completion Timeout severity. sticky value
13	1h RW	**FLWCNT_PR_SVR:** Flow Control Protocol Error severity. sticky value
12	0h RW	**POIS_TLP_SVR:** Poisoned TLP severity . sticky value
11:6	0h RO	**Reserved**
5	1h RW	**SURPRISE_DWN_SVR:** Surprise Down Error Severity (Optional) . sticky value
4	1h RW	**DLNK_PRERR_SVR:** Data Link Protocol Error severity . sticky value
3:1	0h RO	**Reserved**
0	1h RO	**TRNG_ERR_SVR_0:** Training Error severity

27.1.26 CORRECT Error Status (CORRECT_ERR_STAT) — Offset 110h

PCI Express Capabilities Register. (Offset 110 h)

at this reg bits of type RW1CS - , if is set to 1 indicates that the error occurred; g software may clear the bit by writing a 1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 110h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	0h RW	**ADV_NON_FATAL:** Advisory Non Fatal Error
12	0h RW/1C	**REPL_TO_ST:** Replay Timer Timeout Error status . sticky value
11:9	0h RO	**Reserved**
8	0h RW/1C	**REPL_ROLVR_ST:** REPLAY_NUM Rollover status . sticky value
7	0h RW/1C	**BD_DLLP_ST:** Bad DLLP status . sticky value
6	0h RW/1C	**BD_TLP_ST:** Bad TLP status . sticky value
5:1	0h RO	**Reserved**
0	0h RW/1C	**REV_ERR_ST:** Receiver Error status . sticky value

27.1.27 CORRECT Error MASK (CORRECT_ERR_MASK) — Offset 114h

PCI Express Capabilities Register. (Offset 114 h)

at this reg bits of type RWS - if set to 1 the error is masked and not reported.

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 114h	00002000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	**Reserved**
13	1h RW	**ADV_NON_FATAL:** Advisory Non Fatal Error -- masked by default
12	0h RW	**REPL_TO_MSK:** Replay Timer Timeout Error mask . sticky value
11:9	0h RO	**Reserved**
8	0h RW	**REPL_ROLVR_MSK:** REPLAY_NUM Rollover mask . sticky value
7	0h RW	**BD_DLLP_MSK:** Bad DLLP mask . sticky value
6	0h RW	**BD_TLP_MSK:** Bad TLP mask . sticky value
5:1	0h RO	**Reserved**
0	0h RW	**REV_ERR_MSK:** Receiver Error mask . sticky value

27.1.28 ADVANCED Error CAP (ADVANCED_ERR_CAP) — Offset 118h

Advanced Error Capabilities and Control register. (Offset 118 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 118h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RO	**ECRC_CHK_EN:** ECRC Check Enable, if set enables ECRC checking

Bit Range	Default & Access	Field Name (ID): Description
7	0h RO	**ECRC_CHK_CP:** ECRC Check Capable, indicates the device is capable of checking ECRC
6	0h RO	**ECRC_GEN_EN:** ECRC Generation Enable, if set enables ECRC generation
5	0h RO	**ECRC_GEN_CP:** ECRC Generation Capable, indicates that the device is capable of generation ECRC
4:0	00h RO	**FRST_ERR_PNT:** error reported in the Uncorrectable Error Status register First Error Pointer, identifies bit position of the first

27.1.29 HEADER LOG #1 (HEADER_LOG1) — Offset 11Ch

captures the header of TLP associated with error. (Offset 11C h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 11Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**HEADER_LOG_1:** captures the header of TLP associated with error

27.1.30 HEADER LOG #2 (HEADER_LOG2) — Offset 120h

captures the header of TLP associated with error. (Offset 120 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 120h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**HEADER_LOG_2:** captures the header of TLP associated with error

27.1.31 HEADER LOG #3 (HEADER_LOG3) — Offset 124h

captures the header of TLP associated with error. (Offset 124 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 124h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**HEADER_LOG_3:** captures the header of TLP associated with error

27.1.32 HEADER LOG #4 (HEADER_LOG4) — Offset 128h

captures the header of TLP associated with error. (Offset 128 h)

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:20, F:3] + 128h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
R	R	R

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**HEADER_LOG_4:** captures the header of TLP associated with error

28 Integrated Sensor Hub (ISH) (D18:F0)

28.1 ISH PCI Configuration Registers

Table 28-1. Summary of ISH PCI Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Device ID and Vendor ID (DEVVENDID)—Offset 0h	22D88086h
4h	7h	Status and Command (STATUSCOMMAND)—Offset 4h	100000h
8h	Bh	Revision ID and Class Code (REVCLASSCODE)—Offset 8h	6h
Ch	Fh	Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch	800000h
10h	13h	Base Address Register (BAR)—Offset 10h	4h
14h	17h	Base Address Register High (BAR_HIGH)—Offset 14h	0h
18h	1Bh	Base Address Register1 (BAR1)—Offset 18h	0h
1Ch	1Fh	Base Address Register1 High (BAR1_HIGH)—Offset 1Ch	0h
2Ch	2Fh	Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch	0h
34h	37h	Capabilities Pointer (CAPABILITYPTR)—Offset 34h	80h
3Ch	3Fh	Interrupt Register (INTERRUPTREG)—Offset 3Ch	0h
80h	83h	PowerManagement Capability ID (POWERCAPID)—Offset 80h	48039001h
84h	87h	Power Management Control and Status (PMECTRLSTATUS)—Offset 84h	8h
90h	93h	PCI Device Idle Vendor Capability (PCIDEVIDLE_CAP_RECORD)—Offset 90h	F0140009h
98h	9Bh	Software LTR Update MMIO Location (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h	0h
A0h	A3h	D0i3 And Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h	80800h

28.1.1 Device ID and Vendor ID (DEVVENDID)—Offset 0h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 18
Function: 0

Default: 22D88086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	22D8h RO/P	**Device Identification (DEVICEID):** This is a 16-bit value assigned to the PCH ISH.
15:0	8086h RO	**Vendor Identification (VENDORID):** This is a 16-bit value assigned to Intel. Intel VID = 8086h

28.1.2 Status and Command (STATUSCOMMAND)—Offset 4h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 18
Function: 0

Default: 100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	0h RW/1C	**Received Initiator Abort (RMA)**
28	0h RW/1C	**Received Target Abort (RTA)**
27:21	0h RO	Reserved.
20	1h RO	**Capabilities List (CAPLIST):** Indicates that the controller contains a capabilities pointer list
19	0h RO	**Interrupt Status: (INTR_STATUS):** This bit reflects state of interrupt in the device
18:11	0h RO	Reserved.
10	0h RW	**Interrupt Disable (INTR_DISABLE)**
9	0h RO	Reserved.
8	0h RW	**SERR Enable (SERR_ENABLE):** Not implemented
7:3	0h RO	Reserved.
2	0h RW	**Bus Initiator Enable (BME)**
1	0h RW	**Memory Space Enable (MSE):** 0 = Disables memory mapped configuration space. 1 = Enables memory mapped configuration space
0	0h RO	Reserved.

28.1.3 Revision ID and Class Code (REVCLASSCODE)—Offset 8h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 18
Function: 0

Default: 6h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Class Code (CLASS_CODES):** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	6h RO/P	**Revision ID (RID):** Revision ID identifies the revision of particular PCI device.

28.1.4 Cache Line Latency Header and BIST (CLLATHEADERBIST)—Offset Ch

Cache Line size as RW with def 0 Latency timer RW with def 0 Header type with Type 0 configuration header and Reserved BIST register

Access Method

Type: CFG Register (Size: 32 bits)

Device: 18
Function: 0

Default: 800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23	1h RO	**Multi-Function Device (MULFNDEV)**
22:16	0h RO	**Header Type (HEADERTYPE):** Implements Type 0 Configuration header
15:8	0h RO	**Latency Timer (LATTIMER)**
7:0	0h RW/P	**Cache Line Size (CACHELINE_SIZE)**

28.1.5 Base Address Register (BAR)—Offset 10h

Access Method

Type: CFG Register (Size: 32 bits)

Device: 18
Function: 0

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**Base Address (BASEADDR):** Provides system memory base address.
11:4	0h RO	**Size Indicator (SIZEINDICATOR):** Always returns. 0 The size of this register depends on the size of the memory space
3	0h RO	**Prefetchable (PREFETCHABLE):** Indicates that this BAR is not prefetchable
2:1	2h RO	**Type (TYPE):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE):** 0 indicates this BAR is present in the memory space.

28.1.6 Base Address Register High (BAR_HIGH)—Offset 14h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 18
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Base Address high (BASEADDR_HIGH)**

28.1.7 Base Address Register1 (BAR1)—Offset 18h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 18
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**Base Address 1 (BASEADDR1):** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	0h RO	**Size Indicator (SIZEINDICATOR1):** Always is 0 as minimum size is 4K
3	0h RO	**Prefetchable (PREFETCHABLE1):** Indicates that this BAR is not prefetchable.
2:1	0h RO	**Type (TYPE1):** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**Memory Space Indicator (MESSAGE_SPACE1):** 0 Indicates this BAR is present in the memory space.

28.1.8 Base Address Register1 High (BAR1_HIGH)—Offset 1Ch

Base Address Register1 High enabled only if [2:1] of BAR1 register is 10

Access Method

Type: CFG Register (Size: 32 bits)
Device: 18
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Base Address 1 High (BASEADDR1_HIGH)**

28.1.9 Subsystem Vendor and Subsystem ID (SUBSYSTEMID)—Offset 2Ch

SVID register along with SID register is to distinguish subsystem from another

Access Method

Type: CFG Register (Size: 32 bits)
Device: 18
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/O/P	**Subsystem ID (SUBSYSTEMID):** This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0h RW/O/P	**Subsystem Vendor ID (SUBSYSTEMVENDORID):** This register must be implemented for any function that can be instantiated more than once in a given system

28.1.10 Capabilities Pointer (CAPABILITYPTR)—Offset 34h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 18
Function: 0

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	80h RO	**Capabilities Pointer (CAPPTR_POWER):** Indicates what the next capability is.

28.1.11 Interrupt Register (INTERRUPTREG)—Offset 3Ch

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 18
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Max Latency (MAX_LAT):** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	0h RO	**Min Latency (MIN_GNT):** Value of 0 indicates device has no major requirements for the settings of latency timers // Re-Check Desc Padma
15:12	0h RO	Reserved.
11:8	0h RO	**Interrupt Pin (INTPIN)**
7:0	0h RW/P	**Interrupt Line (INTLINE):** It is used to communicate to software, the interrupt line to which the interrupt pin is connected

28.1.12 PowerManagement Capability ID (POWERCAPID)—Offset 80h

PowerManagement Capability ID register points to next capability structure and power mgmnt capability with Power management capabilities register for PME support and version

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 18
Function: 0

Default: 48039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	9h RO	**PME Support (PMESUPPORT):** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	Reserved.
18:16	3h RO	**Version (VERSION):** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	90h RO	**Next Capability (NXTCAP):** Points to the next capability structure.
7:0	1h RO	**Power Management Capability (POWER_CAP):** Indicates this is power management capability.

28.1.13 Power Management Control and Status (PMECTRLSTATUS)—Offset 84h

power management control and status register to set and read PME status PME enable No Soft reset and power state

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 18
Function: 0

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW/1C/P	**PME Status (PMESTATUS)**
14:9	0h RO	Reserved.
8	0h RW/P	**PME Enable (PMEENABLE)**
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NO_SOFT_RESET):** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	Reserved.
1:0	0h RW	**Power State (POWERSTATE):** This field is used both to determine the current power state and to set a new power state.

28.1.14 PCI Device Idle Vendor Capability (PCIDEVIDLE_CAP_RECORD)—Offset 90h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 18
Function: 0

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**Vendor Cap Field (VEND_CAP):** Vendor Specific Capability ID
27:24	0h RO	**Revision IDField (REVID):** Revision ID of capability structure
23:16	14h RO	**Cap Length Field (CAP_LENGTH):** Vendor Specific Capability Length
15:8	0h RO	**Next Capability Field (NEXT_CAP):** Next Capability
7:0	9h RO	**Capability ID Field (CAPID):** Capability ID

28.1.15 Software LTR Update MMIO Location (D0I3_CONTROL_SW_LTR_MMIO_REG)—Offset 98h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 18
Function: 0

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Dword Offset Field (SW_LAT_DWORD_OFFSET):** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW LTR BAR Number Field (SW_LAT_BAR_NUM):** Indicates that the SW LTR update MMIO location is always at BAR0
0	0h RO	**SW LTR Valid Field (SW_LAT_VALID):** This value is reflected from the SW LTR valid strap at the top level

28.1.16 D0i3 And Power Control Enable Register (D0I3_MAX_POW_LAT_PG_CONFIG)—Offset A0h

Access Method

Type: CFG Register (Size: 32 bits)
Device: 18
Function: 0

Default: 80800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	Reserved.
21	0h RW/P	**HAE Field (HAE):** Hardware Autonomous Enable
20	0h RO	Reserved.
19	1h RW/P	**Sleep Enable Field (SLEEP_EN):** Sleep Enable
18	0h RW/P	**D3 Hen Field (D3HEN):** DEVIDLE Enable (DEVIDLEN): If 1 then the function will power gate when idle and the DevIdle register (DevIdleC[2] = 1) is set.
17	0h RW/P	**Device Idle En Field (DEVIDLEN):** PMCRE: PMC Request Enable
16	0h RW/P	**PMC Request Enable Field (PMCRE):** D3-Hot Enable (D3HEN): If 1 then function will power gate when idle and the PMCSR[1:0] register in the function = 11 (D3).
15:13	0h RO	Reserved.
12:10	2h RW/O/P	**Power Latency Scale Field (POW_LAT_SCALE):** Power On Latency Scale
9:0	0h RW/O/P	**Power Latency Value Field (POW_LAT_VALUE):** Power On Latency value

28.2 ISH MMIO Registers

Table 28-2. Summary of ISH MMIO Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
34h	37h	ISH Host Firmware Status (ISH_HOST_FWSTS)—Offset 34h	0h
38h	3Bh	Host Communication (HOST_COMM)—Offset 38h	0h
48h	4Bh	Inbound Doorbell Host To ISH (HOST2ISH_DOORBELL)—Offset 48h	0h
54h	57h	Outbound Doorbell ISH to Host (ISH2HOST_DOORBELL)—Offset 54h	0h
60h	63h	Outbound ISH to Host Message (ISH2HOST_MSG1)—Offset 60h	0h
E0h	E3h	Inbound Host to ISH Message (HOST2ISH_MSG1)—Offset E0h	0h
360h	363h	Remap 0 (REMAP0)—Offset 360h	0h
364h	367h	REMAP 1 (REMAP1)—Offset 364h	0h
368h	36Bh	REMAP 2 (REMAP2)—Offset 368h	0h
36Ch	36Fh	REMAP 3 (REMAP3)—Offset 36Ch	0h
6D0h	6D3h	D0I3 Control (IPC_d0i3C_reg)—Offset 6D0h	8h

28.2.1 ISH Host Firmware Status (ISH_HOST_FWSTS)—Offset 34h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**ISH_HOST_FWSTS:** This is a 32 bit register which is set to 0x0000 on a system reset or a wakeup from D3Cold. As the firmware comes up after the reset or power cycle it sets bits of this register to indicate its status.

28.2.2 Host Communication (HOST_COMM)—Offset 38h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**HOST_COMM:** Host communication register.

28.2.3 Inbound Doorbell Host To ISH (HOST2ISH_DOORBELL)—Offset 48h

Inbound doorbell register, Host core to interrupt ISH. Data 30:0 is 31bits message payload used for backward compatibility. Software can use either this 31bit message payload or 256bit payload registers. When software writes the message in to respective message register, it should set bit 31(BUSY Bit) of doorbell register to indicate that new data is written. The ISH will assert a level sensitive interrupt to the IOAPIC as long as the BUSY bit is set. When the ISH reads the message code from this register it should write back to this register and clear the BUSY bit.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**BUSY:** When this bit is cleared, the ISH CPU is Ready to accept a new message.
30:0	0h RW	**PAYLOAD_31BIT:** 31bits message payload for backward compatibility.

28.2.4 Outbound Doorbell ISH to Host (ISH2HOST_DOORBELL)—Offset 54h

Outbound doorbell register for the ISH to interrupt the Host. Setting bit 31 of this register causes the Host to receive a IRQn interrupt. Data 30:0 is 31bits message payload used for backward compatibility. Software can use either this 31bit message payload or 256bit payload registers. The ISH will set bit 31 of this reg to ring the doorbell after it has completed programming the message to Host. When the Host reads the message code from this register it should write back to this register and clear the BUSY bit.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**BUSY:** When this bit is cleared, the HOST CPU is Ready to accept a new message.
30:0	0h RW	**PAYLOAD_31BIT:** 31bits message payload for backward compatibility.

28.2.5 Outbound ISH to Host Message (ISH2HOST_MSG1)—Offset 60h

Inter-process Message registers for ISH core to communicate to the HOST. These are eight 32bit registers that hold the message payload from the ISH to Host. These registers are meant to be written by the ISH and read by Host. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**MSG:** Message from ISH to HOST.

28.2.6 Inbound Host to ISH Message (HOST2ISH_MSG1)—Offset E0h

Inter-process Message registers for Host to communicate to the ISH. These are eight 32bit registers that hold the message payload from the Host to ISH. These registers are meant to be written by the Host and read by ISH. The format of the message bit 31:0 is defined in the ISH FW specification. When software writes the message in this registers, it should set bit 31(BUSY Bit) of the doorbell register.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**MSG:** Message from HOST to ISH.

28.2.7 Remap 0 (REMAP0)—Offset 360h

Remap register for Host to communicate addresses to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**REMAP0:** REMAP0.

28.2.8 REMAP 1 (REMAP1)—Offset 364h

Remap register for Host to communicate addresses to ISH.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**REMAP1:** REMAP1.

28.2.9 REMAP 2 (REMAP2)—Offset 368h

Remap register for Host to communicate addresses to ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**REMAP2:** REMAP2.

28.2.10 REMAP 3 (REMAP3)—Offset 36Ch

Remap register for Host to communicate addresses to ISH.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**REMAP3:** REMAP3.

28.2.11 D0I3 Control (IPC_d0i3C_reg)—Offset 6D0h

This is a 32 bit register which is set to 0 on a system reset or a wakeup from D3Cold. When ME writes to any of these bits with 1, an interrupt is generated. The Interrupt is then cleared by writing 1`b1 to this register after the appropriate ISR is serviced.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved (RESERVED0):** D0i3 register for storing power related information.
4	0h RO	Reserved.
3	1h RW/1C	**Resetore Required (RR):** D0i3 register for storing power related information.
2	0h RW	**D0i3 (D0i3):** D0i3 register for storing power related information.
1	0h RW	**Interrupt Required (IR):** D0i3 register for storing power related information.
0	0h RW/1C	**Command In Progress (CIP):** D0i3 register for storing power related information.

§ §

29 Touch Host Controller (THC) Interface (D16:F6-F7)

29.1 Touch Host Controller (D16:F6 and D16:F7) Registers

Table 29-1. Summary of Touch Host Controller (D16:F6 and D16:F7) Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	Device ID and Vendor ID (THC_CFG_DID_VID)—Offset 0h	XXXX8086h
4h	7h	Status and Command (THC_CFG_STS_CMD)—Offset 4h	2900000h
8h	Bh	Revision ID and Class Code (THC_CFG_CC_RID)—Offset 8h	90100XXh
Ch	Fh	BIST_Header Type_Latency Timer_Cache Line Size (THC_CFG_BIST_HTYPE_LT_CLS)—Offset Ch	800000h
10h	13h	THC BAR0 MMIO Low (THC_CFG_BAR0_LOW)—Offset 10h	4h
14h	17h	THC BAR0 MMIO High (THC_CFG_BAR0_HI)—Offset 14h	0h
2Ch	2Fh	Subsystem and Vendor ID (THC_CFG_SID_SVID)—Offset 2Ch	0h
34h	37h	Capability List Pointer (THC_CFG_CAPP)—Offset 34h	50h
3Ch	3Fh	Interrupt Configuration (THC_CFG_INT)—Offset 3Ch	0h
40h	43h	THC Unsupported Request Status (THC_CFG_UR_STS_CTL)—Offset 40h	0h
50h	53h	MSI Message Control_ Next Pointer and Capability ID (THC_CFG_MSIMC_MSINP_MSICID)—Offset 50h	807005h
54h	57h	MSI Message Address (THC_CFG_MSIMA)—Offset 54h	0h
58h	5Bh	MSI Message Upper Address (THC_CFG_MSIMUA)—Offset 58h	0h
5Ch	5Fh	MSI Message Data (THC_CFG_MSIMD)—Offset 5Ch	0h
70h	73h	PCI Power Management Capability (THC_CFG_PMCAP_PMNP_PMCID)—Offset 70h	C0030001h
74h	77h	PCI Power Management Control and Status (THC_CFG_PMD_PMCSRBSE_PMCSR)—Offset 74h	8h
90h	93h	Device Idle Capability (THC_CFG_DEVIDLE)—Offset 90h	F0140009h
94h	97h	Vendor Specific Header (THC_CFG_VSHDR)—Offset 94h	1400010h
98h	9Bh	SW LTR Pointer Register (THC_CFG_SWLTRPTR)—Offset 98h	0h
9Ch	9Fh	Device Idle Pointer Register (THC_CFG_DEVIDLEPTR)—Offset 9Ch	101h
A0h	A3h	Device Idle Power On Latency (THC_CFG_DEVIDLEPOL)—Offset A0h	800h
A4h	A7h	Power Control Enables (THC_CFG_PCE)—Offset A4h	8h

29.1.1 Device ID and Vendor ID (THC_CFG_DID_VID)—Offset 0h

Access Method

Type: CFG Register (Size: 32 bits)

Device: 16
Function: 6

Default: XXXX8086h

Bit Range	Default and Access	Field Name (ID): Description
31:16	-- RO/V	**Device Identification (DID):** This is a 16-bit value assigned to the controller. Refer the Device and Revision ID Table in Volume 1 for the default value.
15:0	8086h RO	**Vendor Identification (VID):** This field identifies the manufacturer of the device. Valid vendor identifiers are allocated by the PCI SIG to ensure uniqueness. 0x8086 indicates Intel

29.1.2 Status and Command (THC_CFG_STS_CMD)—Offset 4h

This is a standard PCI config register. Refer the PCI spec for bit descriptions.

Access Method

Type: CFG Register (Size: 32 bits)

Device: 16
Function: 6

Default: 2900000h

Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/1C/V	**Detected Parity Error (DPE):** Refer the PCI spec.
30	0h RW/1C/V	**Signaled System Error (SSE):** Refer the PCI spec.
29	0h RW/1C/V	**Received Initiator Abort (RMA):** Refer the PCI spec
28	0h RW/1C/V	**Received Target Abort (RTA):** Refer the PCI spec
27	0h RW/1C/V	**Signaled Target Abort (STA):** Refer the PCI spec
26:25	1h RO	**Devsel Timing (DEVT):** Refer the PCI spec
24	0h RW/1C/V	**Initiator Data Parity Error (MDPE):** Refer the PCI spec
23	1h RO	**Fast Back to Back Capable (FBTBC):** Has no meaning on the internalbackbone
22	0h RO	Reserved.
21	0h RO	**66 Mhz Capable (MCAP):** Not 66 MHz capable device. Has no meaning on the internal backbone.
20	1h RO	**Capablities List (CAPL):** Refer the PCI spec
19	0h RO/V	**Interrupt Status (INTS):** Refer the PCI spec
18:11	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
10	0h RW	**Interrupt Disable (INTD):** Refer the PCI spec
9	0h RO	**Fast Back to Back Enable (FBTBEN):** Refer the PCI spec
8	0h RW	**System Error Enable (SERREN):** Refer the PCI spec
7	0h RO	Reserved.
6	0h RW	**Parity Error Response (PERRR):** Refer the PCI spec
5	0h RO	**VGA Palette Snoop (VGAPS):** Refer the PCI spec
4	0h RO	**Memory Write and Invalidate Enable (MWRIEN):** Refer the PCI spec
3	0h RO	**Special Cycles (SPCYC):** Refer the PCI spec
2	0h RW	**Bus Initiator Enable (BME):** Refer the PCI spec
1	0h RW	**Memory Space Enable (MSE):** Refer the PCI spec
0	0h RO	**IO Space Enable (IOSE):** Refer the PCI spec

29.1.3 Revision ID and Class Code (THC_CFG_CC_RID)—Offset 8h

Revision ID and Class Code

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 90100XXh

Bit Range	Default and Access	Field Name (ID): Description
31:24	9h RW/O	**Base Class Code (BCC):** Input Device. It is a requirement that this can be programmed by BIOS following a Host reset.
23:16	1h RW/O	**Sub-Class Code (SCC):** 01h= Digitizer. It is a requirement that this can be programmed by BIOS following a Host reset.
15:8	0h RW/O	**Programming Interface (PI):** 00h = Touch Host Controller that conforms to this specification.
7:0	-- RO/V	**Revision ID (RID):** Indicates the part revision. This will reset to 0 but will overridden by the SetID IOSF-SB message during the power-up sequence.

29.1.4 BIST_Header Type_Latency Timer_Cache Line Size (THC_CFG_BIST_HTYPE_LT_CLS)—Offset Ch

BIST_Header Type, Latency Timer, Cache Line Size

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 800000h

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23	1h RO/V	**Multi-function Device (MFD):** See the PCI spec. The default value is from the top level parameter THC_PCI_MFD. (Note: Onesource does not support parameter for the reset value. SO the parameter need to be added to RTL/RDL directly.)
22:16	0h RO	**Header Type (HTYPE):** See the PCI spec.
15:8	0h RO	**Latency Timer (LT):** See the PCI spec.
7:0	0h RO	**Cacheline Size (CLSZ):** See the PCI spec.

29.1.5 THC BAR0 MMIO Low (THC_CFG_BAR0_LOW)—Offset 10h

Attributes and lower address bits of base address for MMIO registers.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 4h

Bit Range	Default and Access	Field Name (ID): Description
31:15	0h RW	**Memory BAR (MEMBAR):** Software programs this register with the lower 32 bit base address of the device's memory region. The MMIO registers in the touch controller are offset from this BAR.
14:4	0h RO	**Memory Size (MEMSIZE):** Hardwired to 0 to indicate 32KB of memory space.
3	0h RO	**Prefetchable (PREFETCH):** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables.
2:1	2h RO	**Type (TYP):** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space.

Bit Range	Default and Access	Field Name (ID): Description
0	0h RO	**Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR.

29.1.6 THC BAR0 MMIO High (THC_CFG_BAR0_HI)—Offset 14h

Upper address bits of base address for MMIO registers.

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Memory BAR (MEMBAR):** Software programs this register with the high 32-bit base address of the device's memory region. The MMIO registers in the touch controller are offset from this BAR.

29.1.7 Subsystem and Vendor ID (THC_CFG_SID_SVID)—Offset 2Ch

Subsystem and Vendor ID

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RW/O	**Subsystem ID (SSID):** This is written by BIOS. No hardware action taken on this value.
15:0	0h RW/O	**Subsystem Vendor ID (SSVID):** This is written by BIOS. No hardware action taken on this value.

29.1.8 Capability List Pointer (THC_CFG_CAPP)—Offset 34h

Capability List Pointer

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 50h

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	50h RO	**Capability Pointer (CP):** This register points to the starting offset of the capabilities ranges.

29.1.9 Interrupt Configuration (THC_CFG_INT)—Offset 3Ch

Interrupt Configuration

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	0h RW/O	**Interrupt pin (IPIN):** reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired). 8'h01 = INTA 8'h02 = INTB 8'h03 = INTC 8'h04 = INTD others = INTA
7:0	0h RW	**Interrupt Line (ILINE):** This data is not used by the THC. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to.

29.1.10 THC Unsupported Request Status (THC_CFG_UR_STS_CTL)—Offset 40h

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RO	Reserved.
2	0h RW/L	**Function Disable (FD):** If set to 1 by software, THC is disabled
1	0h RW/1C/V	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unspported Request that is not considered an Advisory Non-Fatal error. Cleared to 0 when software writes a 1 to this register.
0	0h RW	**Unsupported Request Reporting Enabled (URRE):** If set to 1 by software, the touch host controller generates a DoSERR sideband message when the URD bit transitions from 0 to 1.

29.1.11 MSI Message Control_ Next Pointer and Capability ID (THC_CFG_MSIMC_MSINP_MSICID)—Offset 50h

MSI Message Control, Next Pointer and Capability ID

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 807005h

Bit Range	Default and Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RO	**Per Vector Masking Capable (PVMC):** This function does not support MSI per vector masking
23	1h RO	**64 bit address capable (XAC):** This function is not capable of sending 64 bit message address
22:20	0h RO	**Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW. Value of zero indicates one vector.
19:17	0h RO	**Multiple Message Capable (MMC):** Encoded number of interrupt vectors supported. Value of zero indicates one vector.
16	0h RW	**MSI Enable (MSIE):** If set to '1' MSI interrupt delivery is enabled. When this bit is cleared, prior to returning the configuration write completion, the device must send any pending MSI(s).
15:8	70h RO	**Next Item Pointer (NXTP):** Indicates the pointer for the next entry in the capabilities list
7:0	5h RO	**Capability ID (CAPID):** Indicates the linked list item as being the MSI Capability registers

29.1.12 MSI Message Address (THC_CFG_MSIMA)—Offset 54h

Lower bits of the MSI Message Address

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:2	0h RW	**Message Address (MADDR):** DW aligned MSI message address.
1:0	0h RO	Reserved.

29.1.13 MSI Message Upper Address (THC_CFG_MSIMUA)—Offset 58h

Upper bits of the MSI Message Address

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**Message Address (MAUDDR):** Upper DW MSI message address.

29.1.14 MSI Message Data (THC_CFG_MSIMD)—Offset 5Ch

MSI Message Data

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:0	0h RW	**Message Data (MDAT):** MSI Message Data

29.1.15 PCI Power Management Capability (THC_CFG_PMCAP_PMNP_PMCID)—Offset 70h

PCI Power Management Capability

Access Method

Type: CFG Register (Size: 32 bits)
Device: 16
Function: 6

Default: C0030001h

Bit Range	Default and Access	Field Name (ID): Description
31:27	18h RW/O	**PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. bit(27) X XXX1b - PME# can be asserted from D0 bit(28) X XX1Xb - PME# can be asserted from D1 bit(29) X X1XXb - PME# can be asserted from D2 bit(30) X 1XXXb - PME# can be asserted from D3hot bit(31) 1 XXXXb - PME# can be asserted from D3cold
26	0h RO	**D2 Support (D2S):** This device does not support D2
25	0h RO	**D1 Support (D1S):** This device does not support D1
24:22	0h RO	**Aux Current (AUXC):** Not Applicable
21	0h RO	**Device Specific Initialization (DSI):** See PCI Power Management Interface specification.
20	0h RO	Reserved.
19	0h RO	**PME Clock (PMECLK):** Not Applicable
18:16	3h RO	**Version (VER):** Value of 011b indicates that this function complies with rev 1.2 of PCI Power Management Interface Spec
15:8	0h RW/O	**Next Item Pointer (NXTP):** Indicates the pointer for the next entry in the capabilities list
7:0	1h RO	**Capability ID (CAPP):** Indicates the linked list item as being the PCI Power Management registers

29.1.16 PCI Power Management Control and Status (THC_CFG_PMD_PMCSRBSE_PMCSR)—Offset 74h

PCI Power Management Control and Status

Access Method

Type: CFG Register (Size: 32 bits)
Device: 16
Function: 6

Default: 8h

Bit Range	Default and Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	0h RW/1C/V	**PME Status (PMESTS):** See PCI Power Management Interface specification. This bit is set when the THC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.
14:13	0h RO	**Data Scale (DS):** Not Applicable
12:9	0h RO	**Data Select (DSEL):** Not Applicable
8	0h RW	**PME Enable (PMEEN):** See PCI Power Management Interface specification.
7:4	0h RO	Reserved.
3	1h RO	**No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0h RO	Reserved.
1:0	0h RW/V	**Power State (PWRST):** This 2-bit field is used both to determine the current power state of THC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally however, the data is discarded and no state change occurs. When in the D3hot state, the PCH must not accept accesses to the THC memory range but the configuration space must still be accessible.

29.1.17 Device Idle Capability (THC_CFG_DEVIDLE)—Offset 90h

Device Idle Capability

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: F0140009h

Bit Range	Default and Access	Field Name (ID): Description
31:28	Fh RO	**Vendor-Specific Capability ID (VID):** A value of Fh in this 4-bit field identifies this Vendor Specific Capability as an Extended Capability, which uses a VSEC 16-bit Extended Capability ID in the subsequent four bytes. This field allows software to differentiate this capability from other Vendor Specific capabilities.
27:24	0h RO	**Vendor-Specific Capability Revision (REV):** For a VID of Fh, this field is reserved 0h.
23:16	14h RO	**Length (LENGTH):** Indicates that this capability is 20 bytes long.

Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RO	**Next Capability Pointer (NCAPPP):** This field contains the offset to the next PCI Capability structure or 000h if no other items exist in the linked list of Capabilities.
7:0	9h RO	**Capability ID (CAPPID):** The value of 09h in this field indicates a Vendor Specific capability.

29.1.18 Vendor Specific Header (THC_CFG_VSHDR)—Offset 94h

Vendor Specific Header

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 1400010h

Bit Range	Default and Access	Field Name (ID): Description
31:20	14h RO	**VSEC Length (VSECL):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Extended Capability header, the Vendor-Specific header, and the Vendor-Specific register
19:16	0h RO	**VSEC Rev (VSECR):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field.
15:0	10h RO	**VSECID:** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field.

29.1.19 SW LTR Pointer Register (THC_CFG_SWLTRPTR)—Offset 98h

SWLTRPTR Pointer Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RO	**SW LTR Update MMIO Offset Location (SWLTRLOC):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is a do not care, if the Valid bit is not set
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0s based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a do not care, if the Valid bit is not set.
0	0h RO	**Valid (VALID):** Set to 1 to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to 0 to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.

29.1.20 Device Idle Pointer Register (THC_CFG_DEVIDLEPTR)—Offset 9Ch

Device Idle Pointer Register

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 101h

Bit Range	Default and Access	Field Name (ID): Description
31:4	10h RW/O	**DevIdle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is a do not care, if the Valid bit is not set.
3:1	0h RO	**Base Address Register Number (BARNUM):** Contains the 0s based BAR Number of the BAR which contains the location of the DevIdle MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a do not care, if the Valid bit is not set.
0	1h RW/O	**Valid (VALID):** Set to 1 to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to 0 to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented DevIdle at all, or has a device specific version of DevIdle.

29.1.21 Device Idle Power On Latency (THC_CFG_DEVIDLEPOL)—Offset A0h

Device Idle Power On Latency

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 800h

Bit Range	Default and Access	Field Name (ID): Description
31:13	0h RO	Reserved.
12:10	2h RW/O	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved. The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is 0.
9:0	0h RW/O	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is 0.

29.1.22 Power Control Enables (THC_CFG_PCE)—Offset A4h

Power Control Enables

Access Method

Type: CFG Register
(Size: 32 bits)

Device: 16
Function: 6

Default: 8h

Bit Range	Default and Access	Field Name (ID): Description
31:6	0h RO	Reserved.
5	0h RW/V	**Hardware Autonomous Enable (HAE):** If set, then the PGCB may request a PG whenever it is idle. This bit is loaded with the value from the PowerGateEnable soft strap when the soft strap pull is complete.
4	0h RO	Reserved.
3	1h RW/V	**Sleep Enable (SE):** : if clear, then IP will never asset Sleep to the retention flops. If set, then IP may assert Sleep during PG'ing. Note that some platforms may default this bit to 0, others to 1. The SE bit is RW only. Otherwise the bit is RO.
2	0h RW	**D3-Hot Enable (D3HE):** if set, then IP will PG when idle and the PMCSR[1:0] register in the IP = 11.
1	0h RW	**I3 Enable (I3E):** if set, then IP will PG when idle and the D0i3 register (D0i3C[2] = 1) is set.
0	0h RW	**Software PowerGate Enable (SPE):** Software PowerGate Enable: If this bit is set, the IP will PG when pmc_sw_pg_req_b =0. NOTE: PMCSR[1:0] must not be used for this condition. It may be any value and the IP must PG if this bit is set and it sees pmc_sw_pg_req_b asserted and IP has met its IDLE requirements for Power Gating. This is not a force power gate mechanism, rather a PMC assisted Hardware Autonomous.

29.2 THC MMIO Space Common Register Map Registers

Table 29-2. Summary of THC MMIO Space Common Register Map Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
10h	13h	Device Idle Control Register (THC_M_CMN_DEVIDLECTRL)—Offset 10h	8h
14h	17h	THC LTR Control Register (THC_M_CMN_LTR_CTRL)—Offset 14h	C0000000h

29.2.1 Device Idle Control Register (THC_M_CMN_DEVIDLECTRL)—Offset 10h

Device Idle Control Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4	0h RO	**Interrupt Request Capable (IRC):** Set to 1 by HW if it is capable of generating an interrupt on command completion, else 0.
3	1h RW/1C/V	**RestoreRequired (RR):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**DevIdle (DEVIDLE):** SW sets this bit to 1 to move the function into the DevIdle state. Writing this bit to 0 will return the function to the fully active D0 state (D0i0) THC currently does not support D0i3 and writing to this register has no effect.
1	0h RO	**Interrupt Request (IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register.
0	0h RO/V	**Command-In-Progress (CIP):** HW sets this bit on a 1-0 or 0-1 transition of bit [2]. While set, the other bits in this register are not valid and it is unsupported for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit. If Interrupt Request bit [1] was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to the HW. SW writes to this bit have no effect. THC currently does not support D0i3 and this bit will not ever read 1'b1.

29.2.2 THC LTR Control Register (THC_M_CMN_LTR_CTRL)—Offset 14h

THC LTR Control Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: C0000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	3h RO/V	**Last LTR Message Sent (LAST_LTR_SENT):** This field reflects the last LTR message that was sent by the THC hardware. 00: infinite 01: active 10: low power 11: none
29:20	0h RW	**Active Latency Value (ACT_LTR_VAL):** The agent's latency tolerance is this value multiplied by ACT_LTR_SCALE.
19:17	0h RW	**Active Latency Scale (ACT_LTR_SCALE):** Specifies the scale for the value reported in the ACT_LTR_VAL field. Encodings: 000 - Value times 1 ns 001 - Value times 32 ns 010 - Value times 1,024 ns 011 - Value times 32,768 ns 100 - Value times 1,048,576 ns 101 - Value times 33,554,432 ns 110-111 - Not Permitted
16:7	0h RW	**Low Power Latency Value (LP_LTR_VAL):** The agent's latency tolerance is this value multiplied by LP_LTR_SCALE.
6:4	0h RW	**Low Power Latency Scale (LP_LTR_SCALE):** Specifies the scale for the value reported in the LP_LTR_VAL field. Encodings: 000 - Value times 1 ns 001 - Value times 32 ns 010 - Value times 1,024 ns 011 - Value times 32,768 ns 100 - Value times 1,048,576 ns 101 - Value times 33,554,432 ns 110-111 - Not Permitted
3	0h RO	Reserved.
2	0h RW	**Low Power LTR Requirement (LP_LTR_REQ):** If this bit is set to 1 then the agent's low power latency tolerance is LP_LTR_VAL multiplied by LP_LTR_SCALE. If this bit is 0 then the agent has no low power latency requirement (i.e. infinite latency).
1	0h RO	Reserved.
0	0h RW	**Active LTR Requirement (ACTIVE_LTR_REQ):** If this bit is set to 1 then the agent's latency tolerance is ACT_LTR_VAL multiplied by ACT_LTR_SCALE. If this bit is 0 then the agent has no active latency requirement (i.e. infinite latency).

29.3 THC MMIO Space Port 0 Register Map Registers

Table 29-3. Summary of THC MMIO Space Port 0 Register Map Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1008h	100Bh	Touch Host Controller Control Register (THC_M_PRT_CONTROL)—Offset 1008h	10000006h
1010h	1013h	THC SPI Bus Configuration Register (THC_M_PRT_SPI_CFG)—Offset 1010h	700273h
1020h	1023h	THC Interrupt Enable Register (THC_M_PRT_INT_EN)—Offset 1020h	20003604h
1024h	1027h	THC Interrupt Status Register (THC_M_PRT_INT_STATUS)—Offset 1024h	0h
1028h	102Bh	THC Error Cause Register (THC_M_PRT_ERR_CAUSE)—Offset 1028h	0h
1040h	1043h	THC SW sequencing Control (THC_M_PRT_SW_SEQ_CNTRL)—Offset 1040h	0h

Table 29-3. Summary of THC MMIO Space Port 0 Register Map Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1044h	1047h	THC SW sequencing Status (THC_M_PRT_SW_SEQ_STS)—Offset 1044h	0h
1048h	104Bh	THC SW Sequencing Data DW0 or SPI Address Register (THC_M_PRT_SW_SEQ_DATA0_ADDR)—Offset 1048h	0h
104Ch	104Fh	THC SW sequencing Data DW1 (THC_M_PRT_SW_SEQ_DATA1)—Offset 104Ch	0h
1050h	1053h	THC SW sequencing Data DW2 (THC_M_PRT_SW_SEQ_DATA2)—Offset 1050h	0h
1054h	1057h	THC SW sequencing Data DW3 (THC_M_PRT_SW_SEQ_DATA3)—Offset 1054h	0h
1058h	105Bh	THC SW sequencing Data DW4 (THC_M_PRT_SW_SEQ_DATA4)—Offset 1058h	0h
105Ch	105Fh	THC SW sequencing Data DW5 (THC_M_PRT_SW_SEQ_DATA5)—Offset 105Ch	0h
1060h	1063h	THC SW sequencing Data DW6 (THC_M_PRT_SW_SEQ_DATA6)—Offset 1060h	0h
1064h	1067h	THC SW sequencing Data DW7 (THC_M_PRT_SW_SEQ_DATA7)—Offset 1064h	0h
1068h	106Bh	THC SW sequencing Data DW8 (THC_M_PRT_SW_SEQ_DATA8)—Offset 1068h	0h
106Ch	106Fh	THC SW sequencing Data DW9 (THC_M_PRT_SW_SEQ_DATA9)—Offset 106Ch	0h
1070h	1073h	THC SW sequencing Data DW10 (THC_M_PRT_SW_SEQ_DATA10)—Offset 1070h	0h
1074h	1077h	THC SW sequencing Data DW11 (THC_M_PRT_SW_SEQ_DATA11)—Offset 1074h	0h

1080h	1083h	THC SW sequencing Data DW14 (THC_M_PRT_SW_SEQ_DATA14)—Offset 1080h	0h
1084h	1087h	THC SW sequencing Data DW15 (THC_M_PRT_SW_SEQ_DATA15)—Offset 1084h	0h
1088h	108Bh	THC SW sequencing Data DW16 (THC_M_PRT_SW_SEQ_DATA16)—Offset 1088h	0h
1090h	1093h	THC Write PRD Base Address Register Low (THC_M_PRT_WPRD_BA_LOW)—Offset 1090h	0h
1094h	1097h	THC Write PRD Base Address Register High (THC_M_PRT_WPRD_BA_HI)—Offset 1094h	0h
1098h	109Bh	THC Write DMA Control (THC_M_PRT_WRITE_DMA_CNTRL)—Offset 1098h	800000h
109Ch	109Fh	THC Write Interrupt Status (THC_M_PRT_WRITE_INT_STS)—Offset 109Ch	0h
10B4h	10B7h	THC device address for the bulk write (THC_M_PRT_WR_BULK_ADDR)—Offset 10B4h	1000h
10B8h	10BBh	THC Device Interrupt Cause Register Address (THC_M_PRT_DEV_INT_CAUSE_ADDR)—Offset 10B8h	0h
10BCh	10BFh	THC Device Interrupt Cause Register Value (THC_M_PRT_DEV_INT_CAUSE_REG_VAL)—Offset 10BCh	0h
10E0h	10E3h	THC TXDMA Frame Count (THC_M_PRT_TX_FRM_CNT)—Offset 10E0h	0h

Table 29-3. Summary of THC MMIO Space Port 0 Register Map Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
10E4h	10E7h	THC TXDMA Packet Count (THC_M_PRT_TXDMA_PKT_CNT)—Offset 10E4h	0h
10E8h	10EBh	THC Device Interrupt Count on this port (THC_M_PRT_DEVINT_CNT)—Offset 10E8h	0h
1100h	1103h	THC Read PRD Base Address Low for the 1st RXDMA (THC_M_PRT_RPRD_BA_LOW_1)—Offset 1100h	0h
1104h	1107h	THC Read PRD Base Address High for the 1st RXDMA (THC_M_PRT_RPRD_BA_HI_1)—Offset 1104h	0h
1108h	110Bh	THC Read PRD Control for the 1st RXDMA (THC_M_PRT_RPRD_CNTRL_1)—Offset 1108h	0h
110Ch	110Fh	THC Read DMA Control for the 1st RXDMA (THC_M_PRT_READ_DMA_CNTRL_1)—Offset 110Ch	40000000h
1110h	1113h	THC Read Interrupt Status for the 1st RXDMA (THC_M_PRT_READ_DMA_INT_STS_1)—Offset 1110h	0h
1114h	1117h	THC Read DMA Error Register for the 1st RXDMA (THC_M_PRT_READ_DMA_ERR_1)—Offset 1114h	0h
1118h	111Bh	Touch Sequencer GuC Tail Offset Address Low for the 1st RXDMA (THC_M_PRT_GUC_OFFSET_LOW_1)—Offset 1118h	0h
111Ch	111Fh	Touch Sequencer GuC Tail Offset Address High for the 1st RXDMA (THC_M_PRT_GUC_OFFSET_HI_1)—Offset 111Ch	0h
1120h	1123h	Touch Host Controller GuC Work Queue Item Size for the 1st RXDMA (THC_M_PRT_GUC_WORKQ_ITEM_SZ_1)—Offset 1120h	0h
1124h	1127h	Touch Host Controller GuC Control register for the 1st RXDMA (THC_M_PRT_GUC_WORKQ_SZ_1)—Offset 1124h	0h
1128h	112Bh	Touch Sequencer Control for the 1st DMA (THC_M_PRT_TSEQ_CNTRL_1)—Offset 1128h	0h
1130h	1133h	Touch Sequencer GuC Doorbell Address Low for the 1st RXDMA (THC_M_PRT_GUC_DB_ADDR_LOW_1)—Offset 1130h	0h
1134h	1137h	Touch Sequencer GuC Doorbell Address High for the 1st RXDMA (THC_M_PRT_GUC_DB_ADDR_HI_1)—Offset 1134h	0h
1138h	113Bh	Touch Sequencer GuC Doorbell Data (THC_M_PRT_GUC_DB_DATA_1)—Offset 1138h	1h
1140h	1143h	Touch Sequencer GuC Tail Offset Initial Value for the 1st RXDMA (THC_M_PRT_GUC_OFFSET_INITVAL_1)—Offset 1140h	0h
1170h	1173h	THC Device Address for the bulk/touch data read for the 1st RXDMA (THC_M_PRT_RD_BULK_ADDR_1)—Offset 1170h	1000h
11A0h	11A3h	THC Gfx/SW Doorbell Count from the 1st Stream RXDMA on this port (THC_M_PRT_DB_CNT_1)—Offset 11A0h	0h
11A4h	11A7h	THC Frame Count from the 1st Stream RXDMA on this port (THC_M_PRT_FRM_CNT_1)—Offset 11A4h	0h
11A8h	11ABh	THC Micro Frame Count from the 1st Stream RXDMA on this port (THC_M_PRT_UFRM_CNT_1)—Offset 11A8h	0h
11ACh	11AFh	THC Packet Count from the 1st Stream RXDMA on this port (THC_M_PRT_RXDMA_PKT_CNT_1)—Offset 11ACh	0h
11B0h	11B3h	THC Software Interrupt Count from the 1st Stream RXDMA on this port (THC_M_PRT_SWINT_CNT_1)—Offset 11B0h	0h
11B4h	11B7h	Touch Sequencer Frame Drop Counter for the 1st RXDMA (THC_M_PRT_FRAME_DROP_CNT_1)—Offset 11B4h	0h
1200h	1203h	THC Read PRD Base Address Low for the 2nd RXDMA (THC_M_PRT_RPRD_BA_LOW_2)—Offset 1200h	0h

Table 29-3. Summary of THC MMIO Space Port 0 Register Map Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1204h	1207h	THC Read PRD Base Address High for the 2nd RXDMA (THC_M_PRT_RPRD_BA_HI_2)—Offset 1204h	0h
1208h	120Bh	THC Read PRD Control for the 2nd RXDMA (THC_M_PRT_RPRD_CNTRL_2)—Offset 1208h	0h
120Ch	120Fh	THC Read DMA Control for the 2nd RXDMA (THC_M_PRT_READ_DMA_CNTRL_2)—Offset 120Ch	40000000h
1210h	1213h	THC Read Interrupt Status for the 2nd RXDMA (THC_M_PRT_READ_DMA_INT_STS_2)—Offset 1210h	0h
1214h	1217h	THC Read DMA Error Register for the 2nd RXDMA (THC_M_PRT_READ_DMA_ERR_2)—Offset 1214h	0h
1218h	121Bh	Touch Sequencer GuC Tail Offset Address Low for the 2nd RXDMA (THC_M_PRT_GUC_OFFSET_LOW_2)—Offset 1218h	0h
121Ch	121Fh	Touch Sequencer GuC Tail Offset Address High for the 2nd RXDMA (THC_M_PRT_GUC_OFFSET_HI_2)—Offset 121Ch	0h
1220h	1223h	Touch Host Controller GuC Work Queue Item Size for the 2nd RXDMA (THC_M_PRT_GUC_WORKQ_ITEM_SZ_2)—Offset 1220h	0h
1224h	1227h	Touch Host Controller GuC Control register for the 2nd RXDMA (THC_M_PRT_GUC_WORKQ_SZ_2)—Offset 1224h	0h

29.3.1 Touch Host Controller Control Register (THC_M_PRT_CONTROL)—Offset 1008h

THC Control Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 10000006h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Port type for this port instance (PORT_TYPE):** 00: SPI port 01: thc port Others: reserved
29	0h RO/V	**Indication of SPI IO (SPI_IO_RDY):** 0: This SPI port IO is not ready for operation 1: This SPI port IO is ready for operation This bit is used by driver to decide whether the SPI port is ready to use, including rcomp done completion etc. SW needs to wait this bit to be 1 once on D0 entry (boot or D3 exit) before running any PIO/DMA cycles on SPI bus.
28	1h RW/L	**Whether this port is supported or not (PORT_SUPPORTED):** 0: This port is not supported 1: This port is supported This bit is used by driver to decide whether this port is supported or not. In the per port driver model, ii. BIOS will set the PORT_SUPPORTED bit to 1 only for the first port under each controller. Driver will not operate the other ports where the PORT_SUPPORTED bit is 0. In the multi-port shared driver model, BIOS may set this bit to 1 for multiple ports under the 1st THC. It will function disable the other THC. This bit is locked by THC_BIOS_LOCK_EN. For security reason, BIOS shall lock them after it completes the programming, before host software/OS is brought up.
27	0h RW/L	**Lock bit for several BIOS registers (THC_BIOS_LOCK_EN):** 0: The registers listed below are not locked 1: The registers listed below are locked. The registers locked by this bit includes: THC_M_PRT_GUC_VDM* For security reason, BIOS shall lock them after it completes the programming, before host software/OS is brought up.
26:23	0h RO	Reserved.
22:20	0h RO/V	**Port index under this THC (PORT_INDEX):** This field indicates the 0-based port index of this port in the THC.
19	0h RO	Reserved.
18:16	0h RO/V	**THC Instance index of this THC (THC_INSTANCE_INDEX):** This field indicates the 0-based instance index of this THC.
15:14	0h RO	Reserved.
13	0h RW/L	**THC Locking bit to lock driver registers (THC_DRV_LOCK_EN):** When set to 1 , prevents INT_SW_DMA_EN, INT_SW_DMA_EN2 from being changed. This bit can only be written from 0 to 1 once. Once set to 1, this bit can only be cleared by a hardware reset.
12:4	0h RO	Reserved.
3	0h RW	**Device GPIO Reset (DEVRST):** 1: Deassert Device reset/power on through GPIO. 0: Assert Device reset/power off through GPIO.

Bit Range	Default & Access	Field Name (ID): Description
2	1h RO/V	**Hardware Status for Quiesce Status bit (THC_DEVINT_QUIESCE_HW_STS):** HW will set this bit once RX sequencer is IDLE, after completing processing of any microframe that started before the THC_DEVINT_QUIESCE_EN. SW cannot clear THC_DEVINT_QUIESCE_EN until it sees this bit set
1	1h RW	**Quiesce bit for the device interrupt (THC_DEVINT_QUIESCE_EN):** When this bit is set, THC shall complete servicing the current touch microframe or current device interrupt, and ignore the TIC's interrupt (including touch and non-touch interrupt) until the bit is cleared by SW. When SW writes 1 to this bit, THC is expected to complete processing the current microframe and then set THC_DEVINT_QUIESCE_HW_STS. THC shall not drop any outstanding interrupt asserted when THC_DEVINT_QUIESCE_EN is set. SW shall poll THC_DEVINT_QUIESCE_HW_STS to be 1 before it can clear THC_DEVINT_QUIESCE_EN. After the bit is cleared by SW, THC shall start service device interrupt as usual. This bit does not impact the activities on TXDMA and PIO operations.
0	0h RO	Reserved.

29.3.2 THC SPI Bus Configuration Register (THC_M_PRT_SPI_CFG)—Offset 1010h

THC SPI Port Configuration Register
Note: The THC_M_PRT_SPI_CFG register can't be written/updated when TX/RX DMAs is running or PIO is running cycles on the bus.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 700273h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23	0h RW	**Enable SPI Clock Divide by 8 to support low freq device. (SPI_LOW_FREQ_EN):** 1: All the SPI read/write clock frequency (defined in SPI_TCWF/SPI_TCRF) will be divided further by 8 0: No further divider is supported.
22:20	7h RW	**SPI Touch Cycle Write Frequency (SPI_TCWF):** The listed frequencies are approximate. 100 : 30MHz divide by 4 101 : 24MHz, divide by 5 110 : 20MHz, divide by 6 111 : 17MHz, divide by 7 Others: Reserved
19:18	0h RW	**SPI Touch IO Write mode (SPI_TWMODE):** Firmware programs this mode after discovering capabilities of Touch device.
17:16	0h RO	Reserved.
15:7	4h RO	**SPI READ Max Packet Size (SPI_RD_MPS):** SPI Read Max Packet Size in 16 bytes. Software shall program this register after it negotiates with the device. This has to be programmed before it issues any other cycles to the device including the configuration, TX DMA and RX DMA.

Bit Range	Default & Access	Field Name (ID): Description
6:4	7h RW	**SPI Touch Cycle Read Frequency (SPI_TCRF):** The listed frequencies are approximate. 100 : 30MHz divide by 4 101 : 24MHz, divide by 5 110 : 20MHz, divide by 6 111 : 17MHz, divide by 7 Others: Reserved
3:2	0h RW	**SPI Touch IO Read mode (SPI_TRMODE):** Firmware programs this mode after discovering capabilities of Touch device. 00 : Single IO Read (1-1-1 0B) enabled 01: Dual IO Read (1-2-2 BBh) enabled (DIORE) 10: Quad IO Read (1-4-4/EBh) mode (QIORE) 11: Quad Parrellel IO Read (4-4-4/FBh) mode (QPIRE) enabled.
1:0	3h RW	**SPI Touch IO Read Dummy Clocks (SPI_TRDC):** Firmware programs this mode after discovering capabilities of Touch device.

29.3.3 THC Interrupt Enable Register (THC_M_PRT_INT_EN)—Offset 1020h

THC Port Interrupt Enable Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 20003604h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	1h RW	**Enable THC Transaction Error Reporting with Interrupt (TXN_ERR_INT_EN):** b0: Disable THC Transaction Error Reporting Interrupt b1: Enable HCI Transaction Error Reporting Interrupt Note:The Interrupt enable is also qualified by the MSIE or Line Interrupt Enable. When all these enables are set and when THC_TXN_ERR_INT_STS is set, an interrupt will be sent to SW.
28:24	0h RO	Reserved.
23:16	0h RW	**Enable THC Fatal Error Reporting with Interrupt (FATAL_ERR_INT_EN):** b0: Disable THC Fatal Error Reporting Interrupt b1: Enable THC Fatal Error Reporting Interrupt Note:The Interrupt enable is also qualified by the MSIE or Line Interrupt Enable. When all these enables are set and when THC_FATAL_ERR_INT_STS is set, an interrupt will be sent to SW.
15:14	0h RO	Reserved.
13	1h RW	**Enable PRD Entry Error Reporting with Interrupt (PRD_ENTRY_ERR_INT_EN)**
12	1h RW	**Enable THC Buffer Overrun Error Reporting with Interrupt (BUF_OVRRUN_ERR_INT_EN)**
11	0h RO	Reserved.
10	1h RW	**Enable Frame Babble Error Reporting with Interrupt (FRAME_BABBLE_ERR_INT_EN)**

Bit Range	Default & Access	Field Name (ID): Description
9	1h RW	**Enable Invalid Device Register Error Reporting with Interrupt (INVLD_DEV_ENTRY_INT_EN)**
8:4	0h RO	Reserved.
3	0h RW	**Stop on Frame Babble (SOFB):** When set, HW will clear the Start bit, upon detection of a frame babble, and stop read DMA operations.
2	1h RW	**Stop on Invalid Device Register (SIDR):** When set, HW will clear the Start bit, upon detection of a invalid device register, and stop read DMA operations.
1	0h RW	**Stop on THC buffer overrun (SBO):** When set, HW will clear the Start bit, upon detection of a buffer overrun, and stop read DMA operations.
0	0h RW	**Stop on Invalid PRD entry (SIPE):** When set, HW will clear the Start bit, upon detection of an invalid PRD entry, and stop read DMA operations.

29.3.4 THC Interrupt Status Register (THC_M_PRT_INT_STATUS)—Offset 1024h

THC Port Interrupt Status Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30	0h RW/1C/V	**Interrupt Status of THC fatal error (FATAL_ERR_INT_STS):** Interrupt status when a THC fatal error occurs. If the THC_Fatal_Err_Intr_En bit is also 1, then an interrupt is generated. SW clears the bit by writing 1 to the bit. 1 - A THC Fatal error occured. The error cause is captured in the FATAL_ERR_CAUSE register. 0 - No Connection status change.
29	0h RO	Reserved.
28	0h RW/1C/V	**Interrupt Status of THC transaction error (TXN_ERR_INT_STS):** Interrupt status when a THC transaction error occurs. If the THC_TXN_Err_Intr_En bit is also 1, then an interrupt is generated. SW clears the bit by writing 1 to the bit. 1 - A THC transaction error occured. The error cause is captured in the TXN_ERR_CAUSE register. 0 - No Connection status change.
27:0	0h RO	Reserved.

29.3.5 THC Error Cause Register (THC_M_PRT_ERR_CAUSE)—Offset 1028h

THC Port Interrupt Status Register

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:16	0h RO/V	**THC Fatal Error Cause (FATAL_ERR_CAUSE):** There is no fatal error cause in SPI mode.
15:14	0h RO	Reserved.
13	0h RW/1C/V	**THC Transaction Error Cause - Invalid PRD Entry (PRD_ENTRY_ERR):** This error condition occurs when the THC detects an invalid PRD entry. A PRD entry is invalid when its length is 0.
12	0h RW/1C/V	**THC Transaction Error Cause - THC Buffer Overrun (BUF_OVRRUN_ERR):** This error condition occurs when the THC can't keep up with the incoming touch data due to IOSF or other internal bottleneck, and cause internal buffer overflow.
11	0h RO	Reserved.
10	0h RW/1C/V	**THC Transaction Error Cause - Frame Babble (FRAME_BABBLE_ERR):** This error condition occurs when the THC receives larger size of the touch data than the PRD table size for the current frame. This condition is detected when the micro-frame size is read from device register and the value exceeds the remaining buffer space for the current frame.
9	0h RW/1C/V	**THC Transaction Error Cause - Invalid Device Register Setting (INVLD_DEV_ENTRY):** This error condition occurs when the THC detects invalid settings in the touch device's register INT_CAUSE. The touch device's register settings are defined in Intel Precise Touch & Stylus Gen2. The device register setting is invalid if the microframe size field is 0.
8:0	0h RO	Reserved.

29.3.6 THC SW sequencing Control (THC_M_PRT_SW_SEQ_CNTRL)—Offset 1040h

THC SW sequencing Control

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/L	**THC SW Sequencing Bus Byte Count (THC_SS_BC):** This field specifies the SPI read/write byte count to send out during the SW sequencing cycle. For SPI, this is a 1-based byte count for read or write. i.e. value 1 is for 1 byte and 2 is for 2 bytes. Valid values are in the range of 1-64. Any other value will result in THC_SS_ERR being set.
15:8	0h RW/L	**THC SW Sequencing Bus Command (THC_SS_CMD):** In SPI port, the register read and touch data read commands are mapped to SPI read cycles. The register write and bulk write commands are mapped to SPI write cycles. The other commands are not used in SPI mode.
7:2	0h RO	Reserved.
1	0h RW/L	**THC SW Sequencing Cycle Done Interrupt Enable (THC_SS_CD_IE):** When set to 1, the THC asserts an interrupt request whenever the Touch Cycle Done bit is 1.
0	0h RW/1S/V/L	**THC SW Sequence Cycle Go (TSSGO):** A write to this register with THC Arbiter to start a cycle. This register is cleared by hardware when the cycle is granted by the THC arbiter to run the cycle on the THC bus. When the cycle is complete, the TSSDONE bit is set. Software is forbidden to write to any register in the THC_SS_SEQ_CNTRL/DATA register between the TSSGO bit getting set and the TSSDONE bit being cleared. Any attempt to violate this rule will be ignored by hardware. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write. This bit remains set until the transaction is granted by the THC Controller's internal arbiter.

29.3.7 THC SW sequencing Status (THC_M_PRT_SW_SEQ_STS)—Offset 1044h

THC SW sequencing Status

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	0h RO/V	**THC SW Sequencing Cycle In Progress (THC_SS_CIP):** Hardware sets this bit when software sets the THC Cycle Go (TSSGO) bit. This bit remains set until the cycle completes on the bus interface. Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0.
2	0h RO	Reserved.
1	0h RW/1C/V	**THC SW Sequencing Error (THC_SS_ERR):** Hardware sets this bit to 1 when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1 or until a partition reset occurs. Software must clear this bit before setting the THC Cycle GO bit in this register.
0	0h RW/1C/V	**THC SW Sequence Cycle Done (TSSDONE):** The THC sets this bit to 1 when the SW Touch Cycle completes after software previously set the TSSGO bit. This bit remains asserted until cleared by software writing a 1 or host partition reset. When this bit is set and the THC_SS_CD_IE MSI Enable bit is set the THC controller sends MSI. Software must make sure this bit is cleared prior to enabling the TDONE MSI assertion for a new programmed access.

29.3.8 THC SW Sequencing Data DW0 or SPI Address Register (THC_M_PRT_SW_SEQ_DATA0_ADDR)—Offset 1048h

THC SW sequencing Data DW0/Address

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**THC SW sequencing Data/Address (THC_SW_SEQ_DATA0_ADDR):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc. In SPI mode, this DW are programmed with byte address field. The upper address bits [31:24] will be ignored by THC on the SPI bus.

29.3.9 THC SW sequencing Data DW1 (THC_M_PRT_SW_SEQ_DATA1)—Offset 104Ch

THC SW sequencing Data DW1

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data 1 (THC_SW_SEQ_DATA1):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.10 THC SW sequencing Data DW2 (THC_M_PRT_SW_SEQ_DATA2)—Offset 1050h

THC SW sequencing Data DW2

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data DW2 (THC_SW_SEQ_DATA2):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.11 THC SW sequencing Data DW3 (THC_M_PRT_SW_SEQ_DATA3)—Offset 1054h

THC SW sequencing Data DW3

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data DW3 (THC_SW_SEQ_DATA3):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.12 THC SW sequencing Data DW4 (THC_M_PRT_SW_SEQ_DATA4)—Offset 1058h

THC SW sequencing Data DW4

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data DW4 (THC_SW_SEQ_DATA4):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.13 THC SW sequencing Data DW5 (THC_M_PRT_SW_SEQ_DATA5)—Offset 105Ch

THC SW sequencing Data DW5

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data DW5 (THC_SW_SEQ_DATA5):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.14 THC SW sequencing Data DW6 (THC_M_PRT_SW_SEQ_DATA6)—Offset 1060h

THC SW sequencing Data DW6

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW Sequencing Data DW6 (THC_SW_SEQ_DATA6):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.15 THC SW sequencing Data DW7 (THC_M_PRT_SW_SEQ_DATA7)—Offset 1064h

THC SW sequencing Data DW7

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data 7 (THC_SW_SEQ_DATA7):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.16 THC SW sequencing Data DW8 (THC_M_PRT_SW_SEQ_DATA8)—Offset 1068h

THC SW sequencing Data DW8

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data DW8 (THC_SW_SEQ_DATA8):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.17 THC SW sequencing Data DW9 (THC_M_PRT_SW_SEQ_DATA9)—Offset 106Ch

THC SW sequencing Data DW9

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data DW9 (THC_SW_SEQ_DATA9):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.18 THC SW sequencing Data DW10 (THC_M_PRT_SW_SEQ_DATA10)—Offset 1070h

THC SW sequencing Data DW10

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data 10 (THC_SW_SEQ_DATA10):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.19 THC SW sequencing Data DW11 (THC_M_PRT_SW_SEQ_DATA11)—Offset 1074h

THC SW sequencing Data DW11

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data DW11 (THC_SW_SEQ_DATA11):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.20 THC SW sequencing Data DW12 (THC_M_PRT_SW_SEQ_DATA12)—Offset 1078h

THC SW sequencing Data DW12

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data DW12 (THC_SW_SEQ_DATA12):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.21 THC SW sequencing Data DW13 (THC_M_PRT_SW_SEQ_DATA13)—Offset 107Ch

THC SW sequencing Data DW13

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data DW13 (THC_SW_SEQ_DATA13):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.22 THC SW sequencing Data DW14 (THC_M_PRT_SW_SEQ_DATA14)—Offset 1080h

THC SW sequencing Data DW14

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data DW14 (THC_SW_SEQ_DATA14):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.23 THC SW sequencing Data DW15 (THC_M_PRT_SW_SEQ_DATA15)—Offset 1084h

THC SW sequencing Data DW15

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data DW15 (THC_SW_SEQ_DATA15):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.24 THC SW sequencing Data DW16 (THC_M_PRT_SW_SEQ_DATA16)—Offset 1088h

THC SW sequencing Data DW16

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/V/L	**THC SW sequencing Data DW16 (THC_SW_SEQ_DATA16):** This field is shifted in/out as the THC Data during the data portion of the THC cycle. The data is always shifted starting with the least significant byte, followed by the next least significant byte, etc.

29.3.25 THC Write PRD Base Address Register Low (THC_M_PRT_WPRD_BA_LOW)—Offset 1090h

THC Write PRD Base Address

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**THC Write PRD Base Address (THC_M_PRT_WPRD_BA_LOW):** This register initializes the lower 32 bits of the 64 bit write PRD table base address, 4K aligned, thus 20bits are allocated.
11:0	0h RO	Reserved.

29.3.26 THC Write PRD Base Address Register High (THC_M_PRT_WPRD_BA_HI)—Offset 1094h

THC Write PRD Base Address Register Hi

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**THC Write PRD Base Address Register Hi (THC_M_PRT_WPRD_BA_HI):** This register initializes the upper 32 bits of the 64 bit write PRD table base address.

29.3.27 THC Write DMA Control (THC_M_PRT_WRITE_DMA_CNTRL)—Offset 1098h

THC Write DMA Control

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RW	**PRD Table Entry Count for WRDMA (THC_WRDMA_PTEC):** The number of PRD entries in the write PRD tables. 00h: 1 PRD entry for the write PRD Table 01h: 2 PRD entries for the write PRD Table :: FFh: 256 PRD entries for each PRD Table
23	1h RO	**Update HW Status for WRDMA (THC_WRDMA_UHS):** If set, the HwStatus field of each PRD entry (for each PRD table) bit is updated (successful or error).
22:4	0h RO	Reserved.
3	0h RW	**Interrupt Enable on WRDMA Completion (THC_WRDMA_IE_IOC_DMACPL):** When set, interrupt is generated upon completion of the Write DMA PRD table.
2	0h RW	**Interrupt Enable on IOC for WRDMA (THC_WRDMA_IE_IOC):** When set, interrupt is generated upon completion of the PRD block transfer, with IOC=1, or when an error is encountered with the Error=1 in the THC_WRITE_DMA_INT_STS register.
1	0h RW	**Interrupt Enable on Error for WRDMA (THC_WRDMA_IE_IOC_ERROR):** When set, interrupt is generated when an error is encountered with the Write DMA Error=1.
0	0h RW/V	**Start WRDMA (THC_WRDMA_START):** SW sets the Start bit to arm the Write DMA engine. HW clears the bit after the DMA completion as indicated by interrupt and/or Status bits. SW can also clear the Start bit to abort an on-going DMA operation. In this case, HW completes all the outstanding requests to system memory and then stops the PRD actions at a safe point. SW shall poll this bit after it writes 0 to the start bit until HW completes the stop and clears the bit.

29.3.28 THC Write Interrupt Status (THC_M_PRT_WRITE_INT_STS)—Offset 109Ch

THC Write Interrupt Status

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	0h RO/V	**Active status for Write DMA (THC_WRDMA_ACTIVE):** Write DMA is active. Set by HW when the Write DMA Start bit is set by SW and auto-cleared by HW in the following conditions: - The entire Write DMA operation has been completed successfully or - The Write DMA operation has been halted by software clearing the Write DMA Start bit (and no read completion pending).
2	0h RW/1C/V	**Interrupt Status for IOC for Write DMA (THC_WRDMA_IOC_STS):** A PRD entry with IOC bit set has been completed during WRDMA operation. If the THC_WRDMA_IE_IOC bit is also 1, then an interrupt is generated. In polling mode, when THC_WRDMA_IE_IOC=0, SW clears the bit by writing 1 to the bit.
1	0h RW/1C/V	**Write DMA Error Status (THC_WRDMA_ERROR_STS):** Error encountered during write DMA operation. If the THC_WRDMA_IE_ERROR bit is also 1, then an interrupt is generated. In polling mode, when THC_WRDMA_IE_ERROR=0, SW clears the bit by writing 1 to the bit. Note: For SPI bus, there is no known error condition for this bit.
0	0h RW/1C/V	**Write DMA Completion Status bit (THC_WRDMA_CMPL_STATUS):** This bit is set upon successful completion of the Write DMA operation or by the rising edge of the Error bit. If the THC_WRDMA_IE_IOC_DMACPL bit is also 1, then an interrupt is generated. In polling mode, when THC_WRDMA_IE_IOC_DMACPL=0, SW clears the bit by writing 1 to the bit.

29.3.29 THC device address for the bulk write (THC_M_PRT_WR_BULK_ADDR)—Offset 10B4h

THC device address for the bulk write

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	1000h RW/O	**THC device address for the bulk write (THC_M_PRT_WR_BULK_ADDR):** THC Device Address for the bulk data write. The bulk write cycles addresses start from the bulk address defined in THC_M_PRT_WR_BULK_ADDR (default 0x1000) and increment on every packet until the end of the write frame. The bulk write address resumes using the address in THC_M_PRT_WR_BULK_ADDR at the beginning of every write frame. SW is responsible to program this register correctly, and make sure all resulting touch cycles will not exceed the touch device's bulk address space or roll over. Otherwise, THC's behavior is undefined. Note: For SPI devices, only 24bit addressing space is supported. Default to 0x1000.

29.3.30 THC Device Interrupt Cause Register Address (THC_M_PRT_DEV_INT_CAUSE_ADDR)—Offset 10B8h

THC Device Interrupt Cause Register Address

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/O	**THC Device Interrupt Cause Register Address (THC_M_PRT_DEV_INT_CAUSE_ADDR):** THC Device Interrupt Cause Register Address. This register defines the Device Interrupt Cause Register Address for RXDMA and SW operation. SW is responsible to program this register correctly based on the device register offset, and make sure all resulting touch cycles will not cause malfunction of the touch device. Otherwise, THC's behavior is undefined. Note: For SPI devices, only 24bit addressing space is supported. Default to 0x0.

29.3.31 THC Device Interrupt Cause Register Value (THC_M_PRT_DEV_INT_CAUSE_REG_VAL)—Offset 10BCh

THC Device Interrupt Cause Register Value

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO/V	**THC Device Interrupt Cause Register Value (THC_M_PRT_DEV_INT_CAUSE_REG_VAL):** THC Device Interrupt Cause Register Value. This register reflects the latest values of the Device Interrupt Cause Register when it read by the RXDMA sequencer.

29.3.32 THC TXDMA Frame Count (THC_M_PRT_TX_FRM_CNT)—Offset 10E0h

Touch TX Frame Counter

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Touch TX Frame Counter Reset (THC_M_PRT_TX_FRM_CNT_RST):** Reset the THC_M_PRT_TX_FRM_CNT counter. SW writing this bit to a 0x1, resets the THC_M_PRT_TX_FRM_CNT counter to a 0x0.HW clears this bit to a 0x0 after the counter has been reset.SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Touch TX Frame Counter (THC_M_PRT_TX_FRM_CNT):** Number of Touch Frames sent from this port. The counter shall roll over back to 0 after reaching the maximum value.

29.3.33 THC TXDMA Packet Count (THC_M_PRT_TXDMA_PKT_CNT)—Offset 10E4h

Touch TX DMA Packet Counter

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Touch TX DMA Packet Counter Reset (THC_M_PRT_TXDMA_PKT_CNT_RST):** Reset the THC_M_PRT_TXDMA_PKT_CNT counter. SW writing this bit to a 0x1, resets the THC_M_PRT_TXDMA_PKT_CNT clears this bit to a 0x0 after the counter has been reset.SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Touch TX DMA Packet Counter (THC_M_PRT_TXDMA_PKT_CNT):** Number of TX DMA Packet sent on this port. The counter shall roll over back to 0 after reaching the maximum value.

29.3.34 THC Device Interrupt Count on this port (THC_M_PRT_DEVINT_CNT)—Offset 10E8h

Touch Device Interrupt Counter

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Touch Device Interrupt Counter (THC_M_PRT_DEVINT_CNT_RST):** Reset the THC_M_PRT_DEVINT_CNT counter. SW writing this bit to a 0x1, resets the THC_M_PRT_DEVINT_CNT counter to a 0x0.HW clears this bit to a 0x0 after the counter has been reset.SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Touch Device Interrupt Counter (THC_M_PRT_DEVINT_CNT):** Number of Device interrupts Received on this port. The counter shall roll over back to 0 after reaching the maximum value.

29.3.35 THC Read PRD Base Address Low for the 1st RXDMA (THC_M_PRT_RPRD_BA_LOW_1)—Offset 1100h

THC Read PRD Base Address for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**THC Read PRD Base Address for the 1st RXDMA (THC_M_PRT_RPRD_BA_LOW):** This register initializes the lower 32 bits of the 64 bit PRD table base address for the 1st RXDMA, 4K aligned, thus 20bits are allocated.
11:0	0h RO	Reserved.

29.3.36 THC Read PRD Base Address High for the 1st RXDMA (THC_M_PRT_RPRD_BA_HI_1)—Offset 1104h

THC Read PRD Base Address High for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**THC Read PRD Base Address High for the 1st RXDMA (THC_M_PRT_RPRD_BA_HI):** This register initializes the upper 32 bits of the 64 bit PRD table base address for the 1st RXDMA.

29.3.37 THC Read PRD Control for the 1st RXDMA (THC_M_PRT_RPRD_CNTRL_1)—Offset 1108h

THC Read PRD Control for the 1st RX DMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	0h RW	**PRD Table Entry Count for the 1st RX DMA (PTEC):** The number of PRD entries in each of the PRD tables held in the circular buffer. The PRD Entry Count must be large enough to contain the maximum raw data buffer size for any touch device. A fragmented data buffer could require a PRD entry for every 4KB of host memory allocated. In this case, for a 1MB raw data buffer, 128 PRD entries would be required. 00h: 1 PRD entry for each PRD Table 01h: 2 PRD entries for each PRD Table :: FFh: 256 PRD entries for each PRD Table
7	0h RO	Reserved.
6:0	0h RW	**PRD CB Depth for the 1st RX DMA (PCD):** This field indicates the number of PRD tables contained in the PRD address space. The filed directly corresponds to the number of raw data buffers used in the iTouch system. The raw data buffers are allocated by the host HID driver running in the OS. 00h: 1 PRD Table 01h: 2 PRD Table :: 7Fh: 128 PRD Tables

29.3.38 THC Read DMA Control for the 1st RXDMA (THC_M_PRT_READ_DMA_CNTRL_1)—Offset 110Ch

THC Read DMA Control for the 1st RXDMA

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 40000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**THC PRD CB Pointer Reset for the 1st RXDMA (TPCPR):** Setting this bit to a 1b resets DMA circular buffers read and write pointers to 00h. After the DMA CB pointers have been reset to 00h, hardware clears this bit to 0. SW can only reset tail offset when active and start are 0, i.e. DMA is idle.
30	1h RO	**Update HwStatus for the 1st RXDMA (UHS):** If set, the HwStatus field of each PRD entry (for each PRD table) bit is updated (successful or error).
29	0h RW	**Stop on Overflow for the 1st RXDMA (SOO):** When set, HW will clear the Start bit, upon detection of a DMA Buffer overflow, and stop read DMA operations.. An overflow condition occurs when the read and write pointers contain the same value.
28	0h RW/L	**Interrupt SW Enable on DMA Device Interrupt for the 1st RXDMA (INT_SW_DMA_EN):** When set to 1, an interrupt is generated to host SW even when a "touch data ready" interrupt cause is read from the touch IC INT_CAUSE register. The read DMA in the HW sequencer is not running to read the touch data in this case. The non-DMA device inband interrupt status bit is set. SW is expected to read the device interrupt cause register and if it sees the 01 (touch data ready) is set, it could potentially read the touch device using PIO.
27:24	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RW/V	**THC PRD CB Write Pointer for the 1st RXDMA (TPCWP):** The write pointer is updated by SW. The write pointer points to location in the DMA CB, where the next PRD table is going to be stored. SW needs to ensure that this pointer rolls over once the circular buffer's depth has been traversed with Bit[7] as the rollover bit. E.g. if the DMA CB depth is equal to 5 entries (0100b), then the write pointers will follow this pattern (SW is required to honor this behavior) 00h 01h 02h 03h 04h 80h 81h 82h 83h 84h 00h 01h ..
15:8	0h RO/V	**THC PRD CB Read Pointer for the 1st RXDMA (TPCRP):** DMA HW consumes the PRD tables in the CB, one PRD entry at a time until the EOP bit is found set in a PRD entry. At this point HW increments the PRD read pointer. Thus, the read pointer points to the PRD which the DMA engine is currently processing. This pointer rolls over once the circular buffer's depth has been traversed with bit[7] the Rollover bit. E.g. if the DMA CB depth is equal to 4 entries (0011b), then the read pointers will follow this pattern (HW is required to honor this behavior) 00h 01h 02h 03h 80h 81h 82h 83h 00h 01h ...
7	0h RW	**Interrupt Enable on DMA Completion for the 1st RXDMA (IE_DMACPL):** When set, interrupt is generated upon completion of DMA (DMACPL_STS=1).
6	0h RO	Reserved.
5	0h RW	**Interrupt Enable at EOF for the 1st RXDMA (IE_EOF):** When set, an interrupt will be generated when EOF is detected. For raw data mode, this occurs when all micro frames have been DMA'd. For HID mode, this occurs after each HID report is DMA'd.
4	0h RW	**Interrupt Enable on Non DMA Device Interrupt (IE_NDDI):** When set, an interrupt is generated to host SW when a non-DMA device inband interrupt is received.
3	0h RW	**Interrupt Enable on Stall for the 1st RXDMA (IE_STALL):** When set, an interrupt is generated to host SW when the CB read and write pointers are the same. This condition could be used to detect a stall of the GPU and subsequent buffer overrun internal to the Touch IC.
2	0h RW	**Interrupt Enable on Completion for the 1st RXDMA (IE_IOC):** When set, interrupt is generated upon completion of the PRD block transfer, with IOC=1, or when an error is encountered with the Error=1.
1	0h RW	**Interrupt Enable (IE) on Error for the 1st RXDMA (IE_ERROR):** When set, interrupt is generated upon an read DMA error is encountered.
0	0h RW/V	**Start for the 1st RXDMA (START):** SW sets the Start bit to arm the DMA engine. Once SW sets the Start bit it cannot modify entries in the PRD table. This gives HW the option of caching the PRD table for performance reasons. SW clears the bit after the DMA completion as indicated by interrupt and/or Status bits. SW can also clear the Start bit to abort an on-going DMA operation. DMA hardware completes all the outstanding requests to system memory and then stops the PRD actions at a safe point, e.g. at a microframe boundary so that it can resumed gracefully after SW set the start bit again. HW will clear this bit upon error conditions.

29.3.39 THC Read Interrupt Status for the 1st RXDMA (THC_M_PRT_READ_DMA_INT_STS_1)—Offset 1110h

THC Read DMA Interrupt Status Register

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h RO/V	**Active status for the 1st RXDMA (ACTIVE):** DMA is active and not completed. Set by HW when the Start bit is set by SW and auto-cleared by HW in the following conditions: - The entire DMA operation has been completed or - The DMA operation has been halted by software clearing the Start bit (and no read completion pending).
7:6	0h RO	Reserved.
5	0h RW/1C/V	**Interrupt Status of EOF Interrupt for the 1st RXDMA (EOF_INT_STS):** Interrupt status when an EOF is encountered. If the IE_EOF bit is also 1, then an interrupt is generated. SW clears the bit by writing 1 to the bit.
4	0h RW/1C/V	**Interrupt Status of non DMA device interrupt (NONDMA_INT_STS):** Interrupt status when a non-DMA device inband interrupt is received. If the IE_NDDI bit is also 1, then an interrupt is generated. SW clears the bit by writing 1 to the bit.
3	0h RW/1C/V	**Interrupt Status of PRD table stalls for the 1st RXDMA (STALL_STS):** Interrupt status when the CB read and write pointers are the same and device sends moer touch data to THC. This condition could be used to detect a stall of the GPU and subsequent buffer overrun internal to the Touch IC. If the IE_STALL bit is also 1, then an interrupt is generated. SW clears the bit by writing 1 to the bit.
2	0h RW/1C/V	**Interrupt Status of PRD completion with IOC =1 for the 1st RXDMA (IOC_STS):** An PRD entry with IOC bit set has been completed during DMA operation. If the IE_IOC bit is also 1, then an interrupt is generated. SW clears the bit by writing 1 to the bit.
1	0h RW/1C/V	**Error status for the 1st RXDMA (ERROR_STS):** Error encountered during DMA operation. An interrupt is generated if the interrupt is enabled. SW clears the bit by writing 1 to the bit.
0	0h RW/1C/V	**DMA Complete for the 1st RXDMA (DMACPL_STS):** This bit is set upon successful completion of the DMA operation when the CB read and write pointers are the same. If the IE bit is also 1, then an interrupt is generated. SW clears the bit by writing 1 to the bit.

29.3.40 THC Read DMA Error Register for the 1st RXDMA (THC_M_PRT_READ_DMA_ERR_1)—Offset 1114h

THC Read DMA Error Register for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW/1C/V	**DMA Length Error for the 1st RXDMA (DLERR):** Indicates the raw data transfer request from the Touch IC is longer than allocated PRD entries accounted for. This error condition does not apply to SPI touch device.

29.3.41 Touch Sequencer GuC Tail Offset Address Low for the 1st RXDMA (THC_M_PRT_GUC_OFFSET_LOW_1)—Offset 1118h

Touch Sequencer GuC Tail Offset Address Low for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RW	**Touch Sequencer GuC Tail Offset Address Low for the 1st RXDMA (THC_M_PRT_GUC_OFFSET_LOW):** This register initializes the lower 32 bits of the 64 bit GuC tail offset address, OW aligned. The GuC Tail Offset is a 32 bit value, updated by the THC Controller to set the GuC circular buffer to the correct value. The 64 bit memory address containing the tail offset is allocated by the graphics driver and passed to the THC Controller Driver.
2:0	0h RO	Reserved.

29.3.42 Touch Sequencer GuC Tail Offset Address High for the 1st RXDMA (THC_M_PRT_GUC_OFFSET_HI_1)—Offset 111Ch

Touch Sequencer GuC Tail Offset Address HIGH for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Touch Sequencer GuC Tail Offset Address HIGH for the 1st RXDMA (THC_M_PRT_GUC_OFFSET_HI):** This register initializes the upper 32 bits of the 64 bit GuC tail offset address. The GuC Tail Offset is a 32 bit value, updated by the THC Controller to set the GuC circular buffer to the correct value. The 64 bit memory address containing the tail offset is allocated by the graphics driver and passed to the THC Controller Driver.

29.3.43 Touch Host Controller GuC Work Queue Item Size for the 1st RXDMA (THC_M_PRT_GUC_WORKQ_ITEM_SZ_1)—Offset 1120h

Touch Host Controller GuC Work Queue Item Size for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:0	0h RW	**Touch Host Controller GuC Work Queue Item Size for the 1st RXDMA (WORKQ_ITEM_SZ):** This register initializes the WorkQueueItemSz for the GuC processing algorithm

29.3.44 Touch Host Controller GuC Control register for the 1st RXDMA (THC_M_PRT_GUC_WORKQ_SZ_1)—Offset 1124h

Touch Host Controller GuC Control register for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:0	0h RW	**Guc Work Queue Size for the 1st RXDMA (WORKQ_SZ):** This register initializes the WorkQueueSz for the GuC processing algorithm

29.3.45 Touch Sequencer Control for the 1st DMA (THC_M_PRT_TSEQ_CNTRL_1)—Offset 1128h

Touch Sequencer Control for the 1st DMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4	0h RW/1S/V	**Reset Tail Offset for the 1st RXDMA (RTO):** SW writing this bit to a 0x1 resets the current TailOffset value (that is maintained as a result of the Tail Offset calculation) to 0x0. After HW has reset the tail offset to 0x0, HW resets RTO to 0x0.
3	0h RW	**Enable GuC Processing for the 1st RXDMA (EGP):** When this bit is set to 1b, the THC sequencer will execute the GuC processing flow when TOUCH_FRAME_CHAR.EOF=1 TOUCH_FRAME_CHAR.HDR=0.
2	0h RW/1S/V	**Reset GuC Doorbell for the 1st RXDMA (RGD):** SW Writing this bit to a 0x1, resets the GuC Doorbell to 0x1 (The doorbell can never be a value of 0x0). After HW has set the doorbell to 0x1, HW sets RGD to 0x0.
1:0	0h RO	Reserved.

29.3.46 Touch Sequencer GuC Doorbell Address Low for the 1st RXDMA (THC_M_PRT_GUC_DB_ADDR_LOW_1)—Offset 1130h

Touch Sequencer GuC Doorbell Address Low for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**Touch Sequencer GuC Doorbell Address Low for the 1st RXDMA (GUC_DB_ADDR_LOW):** This register initializes the lower 32 bits of the 64 bit GuC doorbell address for the 1st RXDMA, which is required to be DW aligned.
1:0	0h RO	Reserved.

29.3.47 Touch Sequencer GuC Doorbell Address High for the 1st RXDMA (THC_M_PRT_GUC_DB_ADDR_HI_1)—Offset 1134h

Touch Sequencer GuC Doorbell Address High for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Touch Sequencer GuC Doorbell Address High for the 1st RXDMA (GUC_DB_ADDR_HI):** This register initializes the upper 32 bits of the 64 bit GuC doorbell address for the 1st RXDMA.

29.3.48 Touch Sequencer GuC Doorbell Data (THC_M_PRT_GUC_DB_DATA_1)—Offset 1138h

Touch Sequencer GuC Doorbell Data for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:0	1h RW/V	**Touch Sequencer GuC Doorbell Data for the 1st RXDMA (GUC_DB_DATA):** This register initializes the 32 bits of the GuC doorbell Data for the 1st RXDMA 1)This register is also changed when HW increments the value, AND 2)SW can only re-initialize it when RXDMA is stopped including during initialization.

29.3.49 Touch Sequencer GuC Tail Offset Initial Value for the 1st RXDMA (THC_M_PRT_GUC_OFFSET_INITVAL_1)—Offset 1140h

Touch Sequencer GuC Tail Offset Initial Value for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Touch Sequencer GuC Tail Offset Initial Value for the 1st RXDMA (THC_M_PRT_GUC_OFFSET_INITVAL):** This register initializes the initial value of the GuC tail offset. The GuC Tail Offset is a 32 bit value, updated by the THC Controller to set the GuC circular buffer to the correct value.

29.3.50 THC Device Address for the bulk/touch data read for the 1st RXDMA (THC_M_PRT_RD_BULK_ADDR_1)—Offset 1170h

THC Device Address for the bulk/touch data read for the 1st RXDMA

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	1000h RW/O	**THC Device Address for the bulk/touch data read for the 1st RXDMA (THC_M_PRT_RD_BULK_ADDR):** THC Device Address for the bulk/touch data read. In SPI mode, the touch data read cycles addresses start from the bulk address specified in this register and increment every packet until the end of the microframe. The touch read address resumes using the address in this register at the beginning of every new microframe. SW is responsible to program this register correctly, and make sure all resulting touch cycles will not exceed the touch device's bulk address space or roll over. Otherwise, THC's behavior is undefined. Note: For SPI devices, only 24bit addressing space is supported. Default to 0x1000.

29.3.51 THC Gfx/SW Doorbell Count from the 1st Stream RXDMA on this port (THC_M_PRT_DB_CNT_1)—Offset 11A0h

Touch Host Controller Doorbell Counter for the 1st RXDMA

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Touch Host Controller Doorbell Counter Reset for the 1st RXDMA (THC_M_PRT_DB_CNT_RST):** Reset the THC_M_PRT_DB_CNT counter. SW writing this bit to a 0x1, resets the THC_M_PRT_DB_CNT counter to a 0x0.HW clears this bit to a 0x0 after the counter has been reset.SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Touch Host Controller Doorbell Counter for the 1st RXDMA (THC_M_PRT_DB_CNT):** Number of Touch Host Controller Doorbell sent on this port. The counter shall roll over back to 0 after reaching the maximum value.

29.3.52 THC Frame Count from the 1st Stream RXDMA on this port (THC_M_PRT_FRM_CNT_1)—Offset 11A4h

Touch Frame Counter

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Touch Frame Counter Reset (THC_M_PRT_FRM_CNT_RST):** Reset the THC_M_PRT_FRM_CNT counter. SW writing this bit to a 0x1, resets the THC_M_PRT_FRM_CNT counter to a 0x0.HW clears this bit to a 0x0 after the counter has been reset.SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Touch Frame Counter (THC_M_PRT_FRM_CNT):** Number of Touch Frames received on this DMA engine, including the dropped frames. The counter shall roll over back to 0 after reaching the maximum value.

29.3.53 THC Micro Frame Count from the 1st Stream RXDMA on this port (THC_M_PRT_UFRM_CNT_1)—Offset 11A8h

Touch Microframe Counter for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Touch Microframe Counter Reset for the 1st RXDMA (THC_M_PRT_UFRM_CNT_RST):** Reset the THC_M_PRT_UFRM_CNT_1 counter. SW writing this bit to a 0x1, resets the THC_M_PRT_UFRM_CNT counter to a 0x0.HW clears this bit to a 0x0 after the counter has been reset.SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Touch Microframe Counter for the 1st RXDMA (THC_M_PRT_UFRM_CNT):** Number of Touch Microframes received on this DMA stream. The counter shall roll over back to 0 after reaching the maximum value.

29.3.54 THC Packet Count from the 1st Stream RXDMA on this port (THC_M_PRT_RXDMA_PKT_CNT_1)—Offset 11ACh

Touch RX DMA Packet Counter for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Touch RX DMA Packet Counter Reset for the 1st RXDMA (THC_M_PRT_RXDMA_PKT_CNT_RST):** Reset the THC_M_PRT_RXDMA_PKT_CNT counter. SW writing this bit to a 0x1, resets the THC_M_PRT_RXDMA_PKT_CNT clears this bit to a 0x0 after the counter has been reset.SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Touch RX DMA Packet Counter for the 1st RXDMA (THC_M_PRT_RXDMA_PKT_CNT):** Number of RX DMA Packet received on this DMA engine. The counter shall roll over back to 0 after reaching the maximum value.

29.3.55 THC Software Interrupt Count from the 1st Stream RXDMA on this port (THC_M_PRT_SWINT_CNT_1)—Offset 11B0h

Touch Host Controller Doorbell Counter for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Touch Host Controller Software Interrupt Counter Reset for the 1st RXDMA (THC_M_PRT_SWINT_CNT_RST):** Reset the THC_M_PRT_SWINT_CNT_1 counter. SW writing this bit to a 0x1, resets the THC_M_PRT_SWINT_CNT_1 counter to a 0x0.HW clears this bit to a 0x0 after the counter has been reset.SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Touch Host Controller Interrupt Counter for the 1st RXDMA (THC_M_PRT_SWINT_CNT):** Number of Touch Host Controller Doorbell sent on this DMA engine. The counter shall roll over back to 0 after reaching the maximum value.

29.3.56 Touch Sequencer Frame Drop Counter for the 1st RXDMA (THC_M_PRT_FRAME_DROP_CNT_1)—Offset 11B4h

Touch Sequencer Frame Drop Counter for the 1st RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Reset Frame Dropped Counter for the 1st RXDMA (RFDC):** SW writing this bit to a 0x1, resets the frame dropped counter, TSEQ_FRAME_DROP_CTR, to a 0x0. HW clears this bit to a 0x0 after the counter has been reset. SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Number of Frames Dropped for the 1st RXDMA (NOFD):** Number of Frames Dropped for the 1st RXDMA. When the counter reaches the maximum value, it shall be kept to the maximum value until the SW reset the counter using RFDC_1 bit.

29.3.57 THC Read PRD Base Address Low for the 2nd RXDMA (THC_M_PRT_RPRD_BA_LOW_2)—Offset 1200h

THC Read PRD Base Address for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0h RW	**THC Read PRD Base Address for the 2nd RXDMA (THC_M_PRT_RPRD_BA_LOW):** This register initializes the lower 32 bits of the 64 bit PRD table base address for the 2nd RXDMA, 4K aligned, thus 20bits are allocated.
11:0	0h RO	Reserved.

29.3.58 THC Read PRD Base Address High for the 2nd RXDMA (THC_M_PRT_RPRD_BA_HI_2)—Offset 1204h

THC Read 2nd RXDMA PRD Base Address

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**2nd RXDMA PRD Base Address Hi (THC_M_PRT_RPRD_BA_HI):** This register initializes the upper 32 bits of the 64 bit PRD table base address..

29.3.59 THC Read PRD Control for the 2nd RXDMA (THC_M_PRT_RPRD_CNTRL_2)—Offset 1208h

THC Read PRD Control for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:8	0h RW	**Table Entry Count for the 2nd RXDMA (PTEC):** The number of PRD entries in each of the PRD tables held in the circular buffer. The PRD Entry Count must be large enough to contain the maximum raw data buffer size for any touch device. A fragmented data buffer could require a PRD entry for every 4KB of host memory allocated. In this case, for a 1MB raw data buffer, 128 PRD entries would be required. 00h: 1 PRD entry for each PRD Table 01h: 2 PRD entries for each PRD Table :: FFh: 256 PRD entries for each PRD Table
7	0h RO	Reserved.
6:0	0h RW	**CB Depth for the 2nd RXDMA (PCD):** This field indicates the number of PRD tables contained in the PRD address space. The filed directly corresponds to the number of raw data buffers used in the iTouch system. The raw data buffers are allocated by the host HID driver running in the OS. 00h: 1 PRD Table 01h: 2 PRD Table :: 7Fh: 128 PRD Tables For Example: iTouch allocates 16 PRD tables. Each PRD table need to address 1MB of address space, requiring 256 entries. 16 PRD Tables * 256 Entries/table * 16B per table == 64KB of PRD entries.

29.3.60 THC Read DMA Control for the 2nd RXDMA (THC_M_PRT_READ_DMA_CNTRL_2)—Offset 120Ch

THC Read DMA Control for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 40000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**THC PRD CB Pointer Reset for the 2nd RXDMA (TPCPR):** Setting this bit to a 1b resets DMA circular buffers read and write pointers to 00h. After the DMA CB pointers have been reset to 00h, hardware clears this bit to 0. SW can only reset tail offset when active and start are 0, i.e. DMA is idle.
30	1h RO	**Update HwStatus for the 2nd RXDMA (UHS):** If set, the HwStatus field of each PRD entry (for each PRD table) bit is updated (successful or error).
29	0h RW	**Stop on Overflow for the 2nd RXDMA (SOO):** When set, HW will clear the Start bit, upon detection of a DMA Buffer overflow, and stop read DMA operations. An overflow condition occurs when the read and write pointers contain the same value.
28	0h RW/L	**Interrupt SW Enable on DMA Device Interrupt for the 2nd RXDMA (INT_SW_DMA_EN):** When set to 1, an interrupt is generated to host SW even when a "touch data ready" interrupt cause is read from the touch IC INT_CAUSE register. The read DMA in the HW sequencer is not running to read the touch data in this case. The non-DMA device inband interrupt status bit is set. SW is expected to read the device interrupt cause register and if it sees the 01 (touch data ready) is set, it could potentially read the touch device using PIO.
27:24	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
23:16	0h RW/V	**THC PRD CB Write Pointer for the 2nd RXDMA (TPCWP):** The write pointer is updated by SW. The write pointer points to location in the DMA CB, where the next PRD table is going to be stored. SW needs to ensure that this pointer rolls over once the circular buffer's depth has been traversed with Bit[7] as the rollover bit. E.g. if the DMA CB depth is equal to 5 entries (0100b), then the write pointers will follow this pattern (SW is required to honor this behavior) 00h 01h 02h 03h 04h 80h 81h 82h 83h 84h 00h 01h ..
15:8	0h RO/V	**THC PRD CB Read Pointer for the 2nd RXDMA (TPCRP):** DMA HW consumes the PRD tables in the CB, one PRD entry at a time until the EOP bit is found set in a PRD entry. At this point HW increments the PRD read pointer. Thus, the read pointer points to the PRD which the DMA engine is currently processing. This pointer rolls over once the circular buffer's depth has been traversed with bit[7] the Rollover bit. E.g. if the DMA CB depth is equal to 4 entries (0011b), then the read pointers will follow this pattern (HW is required to honor this behavior) 00h 01h 02h 03h 80h 81h 82h 83h 00h 01h ...
7	0h RW	**Interrupt Enable on DMA Completion for the 2nd RXDMA (IE_DMACPL):** When set, interrupt is generated upon completion of DMA (DMACPL_STS=1).
6	0h RO	Reserved.
5	0h RW	**Interrupt Enable at EOF for the 2nd RXDMA (IE_EOF):** When set, an interrupt will be generated when EOF is detected. For raw data mode, this occurs when all micro frames have been DMA'd. For HID mode, this occurs after each HID report is DMA'd. When EGP is set, the interrupt occurs after GuC processing is complete.
4	0h RO	Reserved.
3	0h RW	**Interrupt Enable on Stall for the 2nd RXDMA (IE_STALL):** When set, an interrupt is generated to host SW when the CB read and write pointers are the same. This condition could be used to detect a stall of the GPU and subsequent buffer overrun internal to the Touch IC.
2	0h RW	**Interrupt Enable on Completion for the 2nd RXDMA (IE_IOC):** When set, interrupt is generated upon completion of the PRD block transfer, with IOC=1, or when an error is encountered with the Error=1.
1	0h RW	**Interrupt Enable on Error for the 2nd RXDMA (IE_ERROR):** When set, interrupt is generated upon an read DMA error is encountered.
0	0h RW/V	**Start for the 2nd RXDMA (START):** SW sets the Start bit to arm the DMA engine. Once SW sets the Start bit it cannot modify entries in the PRD table. This gives HW the option of caching the PRD table for performance reasons. SW clears the bit after the DMA completion as indicated by interrupt and/or Status bits. SW can also clear the Start bit to abort an on-going DMA operation. DMA hardware completes all the outstanding requests to system memory and then stops the PRD actions at a safe point, e.g. at a microframe boundary so that it can resumed gracefully after SW set the start bit again. HW will clear this bit upon error conditions.

29.3.61 THC Read Interrupt Status for the 2nd RXDMA (THC_M_PRT_READ_DMA_INT_STS_2)—Offset 1210h

THC Read Interrupt Status for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	Reserved.
8	0h RO/V	**Active status bit for the 2nd RXDMA (ACTIVE):** DMA is active and not completed. Set by HW when the Start bit is set by SW and auto-cleared by HW in the following conditions: - The entire DMA operation has been completed or - The DMA operation has been halted by software clearing the Start bit (and no read completion pending).
7:6	0h RO	Reserved.
5	0h RW/1C/V	**Interrupt Status of EOF for the 2nd RXDMA (EOF_INT_STS):** Interrupt status when an EOF is encountered. If the IE_EOF bit is also 1, then an interrupt is generated. SW clears the bit by writing 1 to the bit.
4	0h RO	Reserved.
3	0h RW/1C/V	**Interrupt Status of PRD table stalls bit for the 2nd RXDMA (STALL_STS):** Interrupt status when the CB read and write pointers are the same. This condition could be used to detect a stall of the GPU and subsequent buffer overrun internal to the Touch IC. If the IE_STALL bit is also 1, then an interrupt is generated. SW clears the bit by writing 1 to the bit.
2	0h RW/1C/V	**Interrupt Status of PRD completion with IOC =1 for the 2nd RXDMA (IOC_STS):** An PRD entry with IOC bit set has been completed during DMA operation. If the IE_IOC bit is also 1, then an interrupt is generated. SW clears the bit by writing 1 to the bit.
1	0h RW/1C/V	**Error status bit for the 2nd RXDMA (ERROR_STS):** Error encountered during DMA operation. An interrupt is generated if the interrupt is enabled. SW clears the bit by writing 1 to the bit.
0	0h RW/1C/V	**DMA Complete bit for the 2nd RXDMA (DMACPL_STS):** This bit is set upon successful completion of the DMA operation. If the IE bit is also 1, then an interrupt is generated. SW clears the bit by writing 1 to the bit.

29.3.62 THC Read DMA Error Register for the 2nd RXDMA (THC_M_PRT_READ_DMA_ERR_2)—Offset 1214h

THC Read DMA Error Register for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	Reserved.
0	0h RW/1C/V	**DMA Length Error for the 2nd RXDMA (DLERR):** Indicates the raw data transfer request from the Touch IC is longer than allocated PRD entries accounted for. This error condition does not apply to SPI touch device.

29.3.63 Touch Sequencer GuC Tail Offset Address Low for the 2nd RXDMA (THC_M_PRT_GUC_OFFSET_LOW_2)—Offset 1218h

Touch Sequencer GuC Tail Offset Address Low for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0h RW	**Touch Sequencer GuC Tail Offset Address Low for the 2nd RXDMA (THC_M_PRT_GUC_OFFSET_LOW):** This register initializes the lower 32 bits of the 64 bit GuC tail offset address, OW aligned. The GuC Tail Offset is a 32 bit value, updated by the THC Controller to set the GuC circular buffer to the correct value. The 64 bit memory address containing the tail offset is allocated by the graphics driver and passed to the THC Controller Driver.
2:0	0h RO	Reserved.

29.3.64 Touch Sequencer GuC Tail Offset Address High for the 2nd RXDMA (THC_M_PRT_GUC_OFFSET_HI_2)—Offset 121Ch

Touch Sequencer GuC Tail Offset Address High for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Touch Sequencer GuC Tail Offset Address High for the 2nd RXDMA (THC_M_PRT_GUC_OFFSET_HI):** This register initializes the upper 32 bits of the 64 bit GuC tail offset address. The GuC Tail Offset is a 32 bit value, updated by the THC Controller to set the GuC circular buffer to the correct value. The 64 bit memory address containing the tail offset is allocated by the graphics driver and passed to the THC Controller Driver.

29.3.65 Touch Host Controller GuC Work Queue Item Size for the 2nd RXDMA (THC_M_PRT_GUC_WORKQ_ITEM_SZ_2)—Offset 1220h

Touch Host Controller GuC Work Queue Item Size for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:0	0h RW	**WORKQ_ITEM_SZ for the 2nd RXDMA (WORKQ_ITEM_SZ):** This register initializes the WorkQueueItemSz for the GuC processing algorithm for the 2nd RXDMA

29.3.66 Touch Host Controller GuC Control register for the 2nd RXDMA (THC_M_PRT_GUC_WORKQ_SZ_2)—Offset 1224h

Touch Host Controller GuC Control register for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:0	0h RW	**WORKQ_SZ for PRD2 (WORKQ_SZ):** This register initializes the WorkQueueSz for the GuC processing algorithm

29.3.67 Touch Sequencer Control for the 2nd DMA (THC_M_PRT_TSEQ_CNTRL_2)—Offset 1228h

Touch Sequencer Control for the 2nd DMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4	0h RW/1S/V	**Reset Tail Offset for the 2nd RXDMA (RTO):** SW writing this bit to a 0x1 resets the current TailOffset value (that is maintained as a result of the Tail Offset calculation) to 0x0. After HW has reset the tail offset to 0x0, HW resets RTO to 0x0.
3	0h RW	**Enable GuC Processing for the 2nd RXDMA (EGP):** When this bit is set to 1b, the THC sequencer will execute the GuC processing flow when TOUCH_FRAME_CHAR.EOF=1 TOUCH_FRAME_CHAR.HDR=0.
2	0h RW/1S/V	**Reset GuC Doorbell for the 2nd RXDMA (RGD):** SW Writing this bit to a 0x1, resets the GuC Doorbell to 0x1 (The doorbell can never be a value of 0x0). After HW has set the doorbell to 0x1, HW sets RGD to 0x0.
1:0	0h RO	Reserved.

29.3.68 Touch Sequencer GuC Doorbell Address Low for the 2nd RXDMA (THC_M_PRT_GUC_DB_ADDR_LOW_2)—Offset 1230h

Touch Sequencer GuC Doorbell Address Low for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RW	**Touch Sequencer GuC Doorbell Address Low for the 2nd RXDMA (GUC_DB_ADDR_LOW):** This register initializes the lower 32 bits of the 64 bit GuC doorbell address for the 2nd RXDMA, which is required to be DW aligned.
1:0	0h RO	Reserved.

29.3.69 Touch Sequencer GuC Doorbell Address High for the 2nd RXDMA (THC_M_PRT_GUC_DB_ADDR_HI_2)—Offset 1234h

Touch Sequencer GuC Doorbell Address High for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Touch Sequencer GuC Doorbell Address High for the 2nd RXDMA (GUC_DB_ADDR_HI):** This register initializes the upper 32 bits of the 64 bit GuC doorbell address for the 2nd RXDMA

29.3.70 Touch Sequencer GuC Doorbell Data for PRD2 (THC_M_PRT_GUC_DB_DATA_2)—Offset 1238h

Touch Sequencer GuC Doorbell Data for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:0	1h RW/V	**Touch Sequencer GuC Doorbell Data for the 2nd RXDMA (GUC_DB_DATA):** This register initializes the 32 bits of the GuC doorbell Data for the 2nd RXDMA. 1)This register is also changed when HW increments the value, AND 2)SW can only re-initialize it when RXDMA is stopped including during initialization.

29.3.71 Touch Sequencer GuC Tail Offset Initial Value for the 2nd RXDMA (THC_M_PRT_GUC_OFFSET_INITVAL_2)—Offset 1240h

Touch Sequencer GuC Tail Offset Initial Value for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Touch Sequencer GuC Tail Offset Initial Value for the 2nd RXDMA (THC_M_PRT_GUC_OFFSET_INITVAL):** This register initializes the initial value of the GuC tail offset. The GuC Tail Offset is a 32 bit value, updated by the THC Controller to set the GuC circular buffer to the correct value.

29.3.72 THC Device Address for the bulk/touch data read for the 2nd RXDMA (THC_M_PRT_RD_BULK_ADDR_2)—Offset 1270h

THC Device Address for the bulk/touch data read for the 2nd RXDMA

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 1000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	1000h RW/O	**THC Device Address for the bulk/touch data read for the 2nd RXDMA (THC_M_PRT_RD_BULK_ADDR):** THC Device Address for the bulk/touch data read. In SPI mode, the touch data read cycles addresses start from the bulk address specified in this register and increment every packet until the end of the microframe. The touch read address resumes using the address in this register at the beginning of every new microframe. SW is responsible to program this register correctly, and make sure all resulting touch cycles will not exceed the touch device's bulk address space or roll over. Otherwise, THC's behavior is undefined. Note: For SPI devices, only 24bit addressing space is supported. Default to 0x1000.

29.3.73 THC Gfx/SW Doorbell Count from the 2nd Stream RXDMA on this port (THC_M_PRT_DB_CNT_2)—Offset 12A0h

Touch Host Controller Doorbell Counter for the 2nd DMA engine

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Touch Host Controller Doorbell Counter Reset (THC_M_PRT_DB_CNT_RST):** Reset the THC_M_PRT_DB_CNT_2 counter. SW writing this bit to a 0x1, resets the THC_M_PRT_DB_CNT2 counter to a 0x0.HW clears this bit to a 0x0 after the counter has been reset.SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Touch Host Controller Doorbell Counter (THC_M_PRT_DB_CNT):** Number of Touch Host Controller Doorbell sent on this port. The counter shall roll over back to 0 after reaching the maximum value.

29.3.74 THC Frame Count from the 2nd Stream RXDMA on this port (THC_M_PRT_FRM_CNT_2)—Offset 12A4h

Touch Frame Counter for the 2nd DMA engine

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Touch Frame Counter Reset (THC_M_PRT_FRM_CNT_RST):** Reset the THC_M_PRT_FRM_CNT_2 counter. SW writing this bit to a 0x1, resets the THC_M_PRT_FRM_CNT2 counter to a 0x0.HW clears this bit to a 0x0 after the counter has been reset.SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Touch Frame Counter (THC_M_PRT_FRM_CNT):** Number of Touch Frames received on this DMA engine, including the dropped frames. The counter shall roll over back to 0 after reaching the maximum value.

29.3.75 THC Micro Frame Count from the 2nd Stream RXDMA on this port (THC_M_PRT_UFRM_CNT_2)—Offset 12A8h

Touch Microframe Counter for the 2nd DMA engine

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Touch Microframe Counter Reset for the 2nd DMA engine (THC_M_PRT_UFRM_CNT_RST):** Reset the THC_M_PRT_UFRM_CNT_2 counter. SW writing this bit to a 0x1, resets the THC_M_PRT_UFRM_CNT2 counter to a 0x0.HW clears this bit to a 0x0 after the counter has been reset.SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Touch Microframe Counter for the 2nd DMA engine (THC_M_PRT_UFRM_CNT):** Number of Touch Microframes received on this DMA engine.The counter shall roll over back to 0 after reaching the maximum value.

29.3.76 THC Packet Count from the 2nd Stream RXDMA on this port (THC_M_PRT_RXDMA_PKT_CNT_2)—Offset 12ACh

Touch RX DMA Packet Counter for the 2nd DMA engine

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Touch RX DMA Packet Counter Reset (THC_M_PRT_RXDMA_PKT_CNT_RST):** Reset the THC_M_PRT_RXDMA_PKT_CNT2 counter. SW writing this bit to a 0x1, resets the THC_M_PRT_INT_CNTTHC_M_PRT_RXDMA_PKT_CNT2 clears this bit to a 0x0 after the counter has been reset.SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Touch RX DMA Packet Counter (THC_M_PRT_RXDMA_PKT_CNT):** Number of RX DMA Packet received on this DMA engine. The counter shall roll over back to 0 after reaching the maximum value.

29.3.77 THC Software Interrupt Count from the 2nd Stream RXDMA on this port (THC_M_PRT_SWINT_CNT_2)—Offset 12B0h

Touch Host Controller Doorbell Counter for the 2nd DMA engine

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Touch Host Controller Software Interrupt Counter Reset (THC_M_PRT_SWINT_CNT_RST):** Reset the THC_M_PRT_SWINT_CNT2 counter. SW writing this bit to a 0x1, resets the THC_M_PRT_SWINT_CNT2 counter to a 0x0.HW clears this bit to a 0x0 after the counter has been reset.SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Touch Host Controller Interrupt Counter (THC_M_PRT_SWINT_CNT):** Number of Touch Host Controller Doorbell sent on this DMA engine. The counter shall roll over back to 0 after reaching the maximum value.

29.3.78 Touch Sequencer Frame Drop Counter for the 2nd RXDMA (THC_M_PRT_FRAME_DROP_CNT_2)—Offset 12B4h

Touch Sequencer Frame Drop Counter for the 2nd RXDMA

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/1S/V	**Reset Frame Dropped Counter for the 2nd RXDMA (RFDC):** SW writing this bit to a 0x1, resets the frame dropped counter, TSEQ_FRAME_DROP_CTR, to a 0x0. HW clears this bit to a 0x0 after the counter has been reset. SW writing this bit to a 0x0 has not effect.
30:0	0h RO/V	**Number of Frames Dropped for the 2nd RXDMA (NOFD):** Number of Frames Dropped for the 2nd RXDMA. Number of Frames Dropped for the 1st RXDMA. When the counter reaches the maximum value, it shall be kept to the maximum value until the SW reset the counter using RFDC_2 bit.

30 8254 Timer

30.1 8254 Timer Registers

Table 30-1. Summary of 8254 Timer Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
40h	40h	Counter 0 - Counter Access Ports Register (C0_CAPR)—Offset 40h	0h
40h	40h	Counter 0 - Interval Timer Status Byte Format Register (C0_ITSBFR)—Offset 40h	C4h
42h	42h	Counter 2 - Counter Access Ports Register (C2_CAPR)—Offset 42h	0h
42h	42h	Counter 2 - Interval Timer Status Byte Format Register (C2_ITSBFR)—Offset 42h	0h
43h	43h	Timer Control Word Register (TCW)—Offset 43h	0h
43h	43h	Read Back Command (RBC)—Offset 43h	C0h
43h	43h	Counter Latch Command (CLC)—Offset 43h	0h

30.1.1 Counter 0 - Counter Access Ports Register (C0_CAPR)—Offset 40h

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW/V	**Counter Port (CP):** Each counter port address is used to program the 16-bit Count Register. The order of programming, either LSB only, MSB only, or LSB then MSB, is defined with the Interval Counter Control Register at port 43h. The counter port is also used to read the current count from the Count Register, and return the status of the counter programming following a Read Back Command.

30.1.2 Counter 0 - Interval Timer Status Byte Format Register (C0_ITSBFR)—Offset 40h

Each counter's status byte can be read following a Read Back Command. If latch status is chosen (bit 4=0, Read Back Command) as a read back option for a given counter, the next read from the counter's Counter Access Ports Register (40h for counter 0 and 42h for counter 2) returns the status byte. The status byte returns the following:

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: C4h

Bit Range	Default and Access	Field Name (ID): Description
7	1h RO	**Counter OUT Pin State (COPS):** When this bit is a 1, the OUT pin of the counter is also a 1. When this bit is a 0, the OUT pin of the counter is also a 0.
6	1h RO	**Count Register Status (CRSTS):** This bit indicates when the last count written to the Count Register (CR) has been loaded into the counting element (CE). The exact time this happens depends on the counter mode, but until the count is loaded into the counting element (CE), the count value will be incorrect. 0 Count has been transferred from CR to CE and is available for reading. 1 Null Count. Count has not been transferred from CR to CE and is not yet available for reading.
5:4	0h RO	**Read/Write Selection Status (RW_SLT_STS):** These reflect the read/write selection made through bits[5:4] of the control register. The binary codes returned during the status read match the codes used to program the counter read/write selection. 00 Counter Latch Command 01 Read/Write Least Significant Byte (LSB) 10 Read/Write Most Significant Byte (MSB) 11 Read/Write LSB then MSB
3:1	2h RO	**Mode Selection Status (MD_SLT_STS):** These bits return the counter mode programming. The binary code returned matches the code used to program the counter mode, as listed under the bit function above. 000 0 Out signal on end of count (=0) 001 1 Hardware retriggerable one-shot x10 2 Rate generator (divide by n counter) x11 3 Square wave output 100 4 Software triggered strobe 101 5 Hardware triggered strobe
0	0h RO	**Countdown Type Status (CDT_STS):** This bit reflects the current countdown type, ether 0 for binary countdown or a 1 for binary coded decimal (BCD) countdown.

30.1.3 Counter 2 - Counter Access Ports Register (C2_CAPR)—Offset 42h

Same definition as Counter 0 - Counter Access Ports Register.

30.1.4 Counter 2 - Interval Timer Status Byte Format Register (C2_ITSBFR)—Offset 42h

Same definition as counter 0.

30.1.5 Timer Control Word Register (TCW)—Offset 43h

This register is programmed prior to any counter being accessed to specify counter modes. Following reset, the control words for each register are undefined and each counter output is 0. Each timer must be programmed to bring it into a known state. There are two special commands that can be issued to the counters through this register, the Read Back Command and the Counter Latch Command. When these commands are chosen, several bits within this register are redefined.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:6	0h WO	**Counter Select (CNT_SLT):** The Counter Selection bits select the counter the control word acts upon as shown below. The Read Back Command is selected when bits[7:6] are both 1 00 Counter 0 select 01 Reserved 10 Counter 2 select 11 Read Back Command
5:4	0h WO	**Read/Write Select: (RW_SLT):** These bits are the read/write control bits. The actual counter programming is done through the counter port (40h for counter 0 and 42h for counter 2) 00 Counter Latch Command 01 Read/Write Least Significant Byte (LSB) 10 Read/Write Most Significant Byte (MSB) 11 Read/Write LSB then MSB
3:1	0h WO	**Counter Mode Selection (CNT_MD_SLTN):** These bits select one of six possible modes of operation for the selected counter. 000 0 Out signal on end of count (=0) 001 1 Hardware retriggerable one-shot x10 2 Rate generator (divide by n counter) x11 3 Square wave output 100 4 Software triggered strobe 101 5 Hardware triggered strobe
0	0h WO	**Binary/BCD Countdown Select (B_BCD_CNTDWN_SLT):** 0 Binary countdown is used. The largest possible binary count is 2^16 1 Binary coded decimal (BCD) count is used.The largest possible BCD count is 10^4

30.1.6 Read Back Command (RBC)—Offset 43h

The Read Back Command is used to determine the count value, programmed mode, and current states of the OUT pin and Null count flag of the selected counter or counters. Status and/or count may be latched in any or all of the counters by selecting the counter during the register write. The count and status remain latched until read, and further latch commands are ignored until the count is read.
Both count and status of the selected counters may be latched simultaneously by setting both bit 5 and bit 4 to 0. If both are latched, the first read operation from that counter returns the latched status. The next one or two reads, depending on whether the counter is programmed for one or two byte counts, returns the latched count. Subsequent reads return an unlatched count.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: C0h

Bit Range	Default and Access	Field Name (ID): Description
7:6	3h WO	**Read Back Command (RBC):** Must be 11 to select the Read Back Command
5	0h WO	**Latch Count of Selected Counters (LCSC):** 0 Current count value of the selected counters will be latched 1 Current count will not be latched
4	0h WO	**Latch Status of Selected Counters (LSSC):** 0 Status of the selected counters will be latched 1 Status will not be latched
3	0h WO	**Counter 2 Select (CNT_2_SLT):** When set to 1, Counter 2 count and/or status will be latched
2	0h RO	Reserved.
1	0h WO	**Counter 0 Select (CNT_0_SLT):** When set to 1, Counter 0 count and/or status will be latched.
0	0h RO	Reserved.

30.1.7 Counter Latch Command (CLC)—Offset 43h

The Counter Latch Command latches the current count value. This command is used to insure that the count read from the counter is accurate. The count value is then read from each counter's count register through the Counter Ports Access Ports Register (40h for counter 0 and 42h for counter 2). The count must be read according to the programmed format, i.e. if the counter is programmed for two byte counts, two bytes must be read. The two bytes do not have to be read one right after the other (read, write, or programming operations for other counters may be inserted between the reads). If a counter is latched once and then latched again before the count is read, the second Counter Latch Command is ignored.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:6	0h WO	**Counter Selection (CNT_SLT):** These bits select the counter for latching. If 11 is written, then the write is interpreted as a read back command. 00 = Counter 0 01 = Reserved 10 = Counter 2
5:4	0h WO	**Counter Latch Command (CLC):** Write 00 to select the Counter Latch Command.
3:0	0h RO	Reserved.

§ §

31 Advanced Programmable Interrupt (APIC)

31.1 APIC Indirect Registers

APIC Indirect Registers lists the registers that can be accessed within the APIC using the Index Register. When accessing these registers, accesses must be done one DWord at a time. For example, software should never access byte 2 from the Data register before accessing bytes 0 and 1. The hardware will not attempt to recover from a bad programming model in this case.

Index	Mnemonic	Register Name
10-11h	RTE0	Redirection Table Entry 0
12-13h	RTE1	Redirection Table Entry 1
14-15h	RTE2	Redirection Table Entry 2

31.1.1 Identification Register (ID)—Offset 0h

This APIC ID serves as a physical name of the APIC. The APIC bus arbitration ID for the APIC is derived from its I/O APIC ID. This register is reset to 0 on power-up reset.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:28	0h RO	Reserved.
27:24	0h RW	**APIC Identification (AID):** Software must program this value before using the APIC.
23:16	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
15	0h RW	**Scratchpad (SPD):** Scratchpad Field
14:0	0h RO	Reserved.

31.1.2 Version Register (VER)—Offset 1h

Each I/O APIC contains a hardwired Version Register that identifies different implementation of APIC and their versions. The maximum redirection entry information is also in this register to let software know how many interrupt are supported by this APIC.

Access Method

Type: MEM Register (Size: 32 bits)

Device:
Function:

Default: 770020h

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:16	77h RW/O	**Maximum Redirection Entries (MRE):** This is the entry number (0 being the lowest entry) of the highest entry in the redirection table. It is equal to the number of interrupt input pins minus one and is in the range of 0 through 239. In PCH this field is defaulted to 17h to indicate 24 interrupts. This field is Read-Write-Once. BIOS must write to this field after PLTRST# to lockdown the value. This allows BIOS to utilize some of the entries for its own purpose and thus advertising fewer IOxAPIC Redirection Entries to OS. BIOS may to program this field up to 78h (maximum 120 entries).
15	0h RO	**Pin Assertion Register Supported (PRQ):** Indicate that the IOxAPIC does not implement the Pin Assertion Register.
14:8	0h RO	Reserved.
7:0	20h RO	**Version (VS):** Identifies the implementation version as IOxAPIC.

31.1.3 Redirection Table Entry 0 (RTE0)—Offset 10h

The Redirection Table has a dedicated entry for each interrupt input pin. The information in the Redirection Table is used to translate the interrupt manifestation on the corresponding interrupt pin into an APIC message.
The APIC will respond to an edge triggered interrupt as long as the interrupt is held until after the acknowledge cycle has begun. Once the interrupt is detected, a delivery status bit internally to the I/O APIC is set. The state machine will step ahead and wait for an acknowledgement from the APIC unit that the interrupt message was sent. Only then will the I/O APIC be able to recognize a new edge on that interrupt pin. That new

edge will only result in a new invocation of the handler if its acceptance by the destination APIC causes the Interrupt Request register bit to go from 0 to 1. (In other words, if the interrupt was not already pending a the destination.)

Access Method

Type: MEM Register (Size: 64 bits)

Device:
Function:

Default: 10000h

Bit Range	Default and Access	Field Name (ID): Description
63:56	0h RW	**Destination ID (DID):** Destination ID of the local APIC
55:48	0h RW	**Extended Destination ID (EDID):** These bits are sent to a local APIC only when in Processor System Bus mode. They become bits 11:4 of the address.
47:17	0h RO	Reserved.
16	1h RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt.
15	0h RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive.
14	0h RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts; its meaning is undefined for edge triggered interrupts. 0 = Reset when an EOI message is received that matches the VCT field. 1 = Set when IOxAPIC sends the level interrupt message to the CPU. Note, this bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.
13	0h RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low.
12	0h RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry
11	0h RW	**Destination Mode (DSM):** This field is used by the local Apic to determine whether it is the destination of the message.
10:8	0h RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: Val Name Notes 000 Fixed 001 Lowest Priority 010 SMI Not supported 011 Reserved 100 NMI Not supported 101 INIT Not supported 110 Reserved 111 ExtINT
7:0	0h RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh.

31.1.4 Redirection Table Entry 1 (RTE1)—Offset 12h

This register has the same bit definition as RTE0.

31.1.5 Redirection Table Entry 2 (RTE2)—Offset 14h

This register has the same bit definition as RTE0.

31.1.6 Redirection Table Entry 3 (RTE3)—Offset 16h

This register has the same bit definition as RTE0.

31.1.7 Redirection Table Entry 4 (RTE4)—Offset 18h

This register has the same bit definition as RTE0.

31.1.8 Redirection Table Entry 5 (RTE5)—Offset 1Ah

This register has the same bit definition as RTE0.

31.1.9 Redirection Table Entry 6 (RTE6)—Offset 1Ch

This register has the same bit definition as RTE0.

31.1.10 Redirection Table Entry 7 (RTE7)—Offset 1Eh

This register has the same bit definition as RTE0.

31.1.11 Redirection Table Entry 8 (RTE8)—Offset 20h

This register has the same bit definition as RTE0.

31.1.12 Redirection Table Entry 9 (RTE9)—Offset 22h

This register has the same bit definition as RTE0.

31.1.13 Redirection Table Entry 10 (RTE10)—Offset 24h

This register has the same bit definition as RTE0.

31.1.14 Redirection Table Entry 11 (RTE11)—Offset 26h

This register has the same bit definition as RTE0.

31.1.15 Redirection Table Entry 12 (RTE12)—Offset 28h

This register has the same bit definition as RTE0.

31.1.16 Redirection Table Entry 13 (RTE13)—Offset 2Ah

This register has the same bit definition as RTE0.

31.1.17 Redirection Table Entry 14 (RTE14)—Offset 2Ch

This register has the same bit definition as RTE0.

31.1.18 Redirection Table Entry 15 (RTE15)—Offset 2Eh

This register has the same bit definition as RTE0.

31.1.19 Redirection Table Entry 16 (RTE16)—Offset 30h

This register has the same bit definition as RTE0.

31.1.20 Redirection Table Entry 17 (RTE17)—Offset 32h

This register has the same bit definition as RTE0.

31.1.21 Redirection Table Entry 18 (RTE18)—Offset 34h

This register has the same bit definition as RTE0.

31.1.22 Redirection Table Entry 19 (RTE19)—Offset 36h

This register has the same bit definition as RTE0.

31.1.23 Redirection Table Entry 20 (RTE20)—Offset 38h

This register has the same bit definition as RTE0.

31.1.24 Redirection Table Entry 21 (RTE21)—Offset 3Ah

This register has the same bit definition as RTE0.

31.1.25 Redirection Table Entry 22 (RTE22)—Offset 3Ch

This register has the same bit definition as RTE0.

31.1.26 Redirection Table Entry 23 (RTE23)—Offset 3Eh

This register has the same bit definition as RTE0.

31.1.27 Redirection Table Entry 24 (RTE24)—Offset 40h

This register has the same bit definition as RTE0.

31.1.28 Redirection Table Entry 25 (RTE25)—Offset 42h

This register has the same bit definition as RTE0.

31.1.29 Redirection Table Entry 26 (RTE26)—Offset 44h

This register has the same bit definition as RTE0.

31.1.30 Redirection Table Entry 27 (RTE27)—Offset 46h

This register has the same bit definition as RTE0.

31.1.31 Redirection Table Entry 28 (RTE28)—Offset 48h

This register has the same bit definition as RTE0.

31.1.32 Redirection Table Entry 29 (RTE29)—Offset 4Ah

This register has the same bit definition as RTE0.

31.1.33 Redirection Table Entry 30 (RTE30)—Offset 4Ch

This register has the same bit definition as RTE0.

31.1.34 Redirection Table Entry 31 (RTE31)—Offset 4Eh

This register has the same bit definition as RTE0.

31.1.35 Redirection Table Entry 32 (RTE32)—Offset 50h

This register has the same bit definition as RTE0.

31.1.36 Redirection Table Entry 33 (RTE33)—Offset 52h

This register has the same bit definition as RTE0.

31.1.37 Redirection Table Entry 34 (RTE34)—Offset 54h

This register has the same bit definition as RTE0.

31.1.38 Redirection Table Entry 35 (RTE35)—Offset 56h

This register has the same bit definition as RTE0.

31.1.39 Redirection Table Entry 36 (RTE36)—Offset 58h

This register has the same bit definition as RTE0.

31.1.40 Redirection Table Entry 37 (RTE37)—Offset 5Ah

This register has the same bit definition as RTE0.

31.1.41 Redirection Table Entry 38 (RTE38)—Offset 5Ch

This register has the same bit definition as RTE0.

31.1.42 Redirection Table Entry 39 (RTE39)—Offset 5Eh

This register has the same bit definition as RTE0.

31.1.43 Redirection Table Entry 40 (RTE40)—Offset 60h

This register has the same bit definition as RTE0.

31.1.44 Redirection Table Entry 41 (RTE41)—Offset 62h

This register has the same bit definition as RTE0.

31.1.45 Redirection Table Entry 42 (RTE42)—Offset 64h

This register has the same bit definition as RTE0.

31.1.46 Redirection Table Entry 43 (RTE43)—Offset 66h

This register has the same bit definition as RTE0.

31.1.47 Redirection Table Entry 44 (RTE44)—Offset 68h

This register has the same bit definition as RTE0.

31.1.48 Redirection Table Entry 45 (RTE45)—Offset 6Ah

This register has the same bit definition as RTE0.

31.1.49 Redirection Table Entry 46 (RTE46)—Offset 6Ch

This register has the same bit definition as RTE0.

31.1.50 Redirection Table Entry 47 (RTE47)—Offset 6Eh

This register has the same bit definition as RTE0.

31.1.51 Redirection Table Entry 48 (RTE48)—Offset 70h

This register has the same bit definition as RTE0.

31.1.52 Redirection Table Entry 49 (RTE49)—Offset 72h

This register has the same bit definition as RTE0.

31.1.53 Redirection Table Entry 50 (RTE50)—Offset 74h

This register has the same bit definition as RTE0.

31.1.54 Redirection Table Entry 51 (RTE51)—Offset 76h

This register has the same bit definition as RTE0.

31.1.55 Redirection Table Entry 52 (RTE52)—Offset 78h

This register has the same bit definition as RTE0.

31.1.56 Redirection Table Entry 53 (RTE53)—Offset 7Ah

This register has the same bit definition as RTE0.

31.1.57 Redirection Table Entry 54 (RTE54)—Offset 7Ch

This register has the same bit definition as RTE0.

31.1.58 Redirection Table Entry 55 (RTE55)—Offset 7Eh

This register has the same bit definition as RTE0.

31.1.59 Redirection Table Entry 56 (RTE56)—Offset 80h

This register has the same bit definition as RTE0.

31.1.60 Redirection Table Entry 57 (RTE57)—Offset 82h

This register has the same bit definition as RTE0.

31.1.61 Redirection Table Entry 58 (RTE58)—Offset 84h

This register has the same bit definition as RTE0.

31.1.62 Redirection Table Entry 59 (RTE59)—Offset 86h

This register has the same bit definition as RTE0.

31.1.63 Redirection Table Entry 60 (RTE60)—Offset 88h

This register has the same bit definition as RTE0.

31.1.64 Redirection Table Entry 61 (RTE61)—Offset 8Ah

This register has the same bit definition as RTE0.

31.1.65 Redirection Table Entry 62 (RTE62)—Offset 8Ch

This register has the same bit definition as RTE0.

31.1.66 Redirection Table Entry 63 (RTE63)—Offset 8Eh

This register has the same bit definition as RTE0.

31.1.67 Redirection Table Entry 64 (RTE64)—Offset 90h

This register has the same bit definition as RTE0.

31.1.68 Redirection Table Entry 65 (RTE65)—Offset 92h

This register has the same bit definition as RTE0.

31.1.69 Redirection Table Entry 66 (RTE66)—Offset 94h

This register has the same bit definition as RTE0.

31.1.70 Redirection Table Entry 67 (RTE67)—Offset 96h

This register has the same bit definition as RTE0.

31.1.71 Redirection Table Entry 68 (RTE68)—Offset 98h

This register has the same bit definition as RTE0.

31.1.72 Redirection Table Entry 69 (RTE69)—Offset 9Ah

This register has the same bit definition as RTE0.

31.1.73 Redirection Table Entry 70 (RTE70)—Offset 9Ch

This register has the same bit definition as RTE0.

31.1.74 Redirection Table Entry 71 (RTE71)—Offset 9Eh

This register has the same bit definition as RTE0.

31.1.75 Redirection Table Entry 72 (RTE72)—Offset A0h

This register has the same bit definition as RTE0.

31.1.76 Redirection Table Entry 73 (RTE73)—Offset A2h

This register has the same bit definition as RTE0.

31.1.77 Redirection Table Entry 74 (RTE74)—Offset A4h

This register has the same bit definition as RTE0.

31.1.78 Redirection Table Entry 75 (RTE75)—Offset A6h

This register has the same bit definition as RTE0.

31.1.79 Redirection Table Entry 76 (RTE76)—Offset A8h

This register has the same bit definition as RTE0.

31.1.80 Redirection Table Entry 77 (RTE77)—Offset AAh

This register has the same bit definition as RTE0.

31.1.81 Redirection Table Entry 78 (RTE78)—Offset ACh

This register has the same bit definition as RTE0.

31.1.82 Redirection Table Entry 79 (RTE79)—Offset AEh

This register has the same bit definition as RTE0.

31.1.83 Redirection Table Entry 80 (RTE80)—Offset B0h

This register has the same bit definition as RTE0.

31.1.84 Redirection Table Entry 81 (RTE81)—Offset B2h

This register has the same bit definition as RTE0.

31.1.85 Redirection Table Entry 82 (RTE82)—Offset B4h

This register has the same bit definition as RTE0.

31.1.86 Redirection Table Entry 83 (RTE83)—Offset B6h

This register has the same bit definition as RTE0.

31.1.87 Redirection Table Entry 84 (RTE84)—Offset B8h

This register has the same bit definition as RTE0.

31.1.88 Redirection Table Entry 85 (RTE85)—Offset BAh

This register has the same bit definition as RTE0.

31.1.89 Redirection Table Entry 86 (RTE86)—Offset BCh

This register has the same bit definition as RTE0.

31.1.90 Redirection Table Entry 87 (RTE87)—Offset BEh

This register has the same bit definition as RTE0.

31.1.91 Redirection Table Entry 88 (RTE88)—Offset C0h

This register has the same bit definition as RTE0.

31.1.92 Redirection Table Entry 89 (RTE89)—Offset C2h

This register has the same bit definition as RTE0.

31.1.93 Redirection Table Entry 90 (RTE90)—Offset C4h

This register has the same bit definition as RTE0.

31.1.94 Redirection Table Entry 91 (RTE91)—Offset C6h

This register has the same bit definition as RTE0.

31.1.95 Redirection Table Entry 92 (RTE92)—Offset C8h

This register has the same bit definition as RTE0.

31.1.96 Redirection Table Entry 93 (RTE93)—Offset CAh

This register has the same bit definition as RTE0.

31.1.97 Redirection Table Entry 94 (RTE94)—Offset CCh

This register has the same bit definition as RTE0.

31.1.98 Redirection Table Entry 95 (RTE95)—Offset CEh

This register has the same bit definition as RTE0.

31.1.99 Redirection Table Entry 96 (RTE96)—Offset D0h

This register has the same bit definition as RTE0.

31.1.100 Redirection Table Entry 97 (RTE97)—Offset D2h

This register has the same bit definition as RTE0.

31.1.101 Redirection Table Entry 98 (RTE98)—Offset D4h

This register has the same bit definition as RTE0.

31.1.102 Redirection Table Entry 99 (RTE99)—Offset D6h

This register has the same bit definition as RTE0.

31.1.103 Redirection Table Entry 100 (RTE100)—Offset D8h

This register has the same bit definition as RTE0.

31.1.104 Redirection Table Entry 101 (RTE101)—Offset DAh

This register has the same bit definition as RTE0.

31.1.105 Redirection Table Entry 102 (RTE102)—Offset DCh

This register has the same bit definition as RTE0.

31.1.106 Redirection Table Entry 103 (RTE103)—Offset DEh

This register has the same bit definition as RTE0.

31.1.107 Redirection Table Entry 104 (RTE104)—Offset E0h

This register has the same bit definition as RTE0.

31.1.108 Redirection Table Entry 105 (RTE105)—Offset E2h

This register has the same bit definition as RTE0.

31.1.109 Redirection Table Entry 106 (RTE106)—Offset E4h

This register has the same bit definition as RTE0.

31.1.110 Redirection Table Entry 107 (RTE107)—Offset E6h

This register has the same bit definition as RTE0.

31.1.111 Redirection Table Entry 108 (RTE108)—Offset E8h

This register has the same bit definition as RTE0.

31.1.112 Redirection Table Entry 109 (RTE109)—Offset EAh

This register has the same bit definition as RTE0.

31.1.113 Redirection Table Entry 110 (RTE110)—Offset ECh

This register has the same bit definition as RTE0.

31.1.114 Redirection Table Entry 111 (RTE111)—Offset EEh

This register has the same bit definition as RTE0.

31.1.115 Redirection Table Entry 112 (RTE112)—Offset F0h

This register has the same bit definition as RTE0.

31.1.116 Redirection Table Entry 113 (RTE113)—Offset F2h

This register has the same bit definition as RTE0.

31.1.117 Redirection Table Entry 114 (RTE114)—Offset F4h

This register has the same bit definition as RTE0.

31.1.118 Redirection Table Entry 115 (RTE115)—Offset F6h

This register has the same bit definition as RTE0.

31.1.119 Redirection Table Entry 116 (RTE116)—Offset F8h

This register has the same bit definition as RTE0.

31.1.120 Redirection Table Entry 117 (RTE117)—Offset FAh

This register has the same bit definition as RTE0.

31.1.121 Redirection Table Entry 118 (RTE118)—Offset FCh

This register has the same bit definition as RTE0.

31.1.122 Redirection Table Entry 119 (RTE119)—Offset FEh

This register has the same bit definition as RTE0.

Advanced Programmable Interrupt Controller (APIC) Registers Index Register (IDX)—Offset

Table 31-2. Summary of Advanced Programmable Interrupt Controller (APIC) Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
FEC00000h	FEC00003h	Advanced Programmable Interrupt Controller (APIC) Registers Index Register (IDX)—Offset FEC00000h	0h
FEC00010h	FEC00013h	Access MethodDefault: 0hData Register (DAT)—Offset FEC00010h	0h
FEC00040h	FEC00043h	Access MethodDefault: 0hEOI Register (EOI)—Offset FEC00040h	0h

FEC00000h

The Index Register will select which APIC indirect register to be manipulated by software. Software will program this register to select the desired APIC internal register.

Access MethodDefault: 0hData Register (DAT)—Offset

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**Index Register (IDX):** This is an 8 bit pointer into the I/O APIC register table.

FEC00010h

This 32-bit register specifies the data to be read or written to the register pointed to by the Index register. This register can be accessed only in DW quantities.

Access MethodDefault: 0hEOI Register (EOI)—Offset FEC00040h

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Window Register (WDW):** This is a 32-bit register for the data to be read or written to the APIC indirect register pointed to by the Index register (Memory Address FEC0_0000h).

When a write is issued to this register, the IOxAPIC will check the lower 8 bits written to this register, and compare it with the vector field for each entry in the I/O Redirection Table. When a match is found, RTE.RIRR for that entry will be cleared. If multiple entries have the same vector, each of those entries will have RTE.RIRR cleared. Only bits 7:0 are used. Bits 31:8 are ignored.

Access MethodDefault: 0h

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h WO	**EOI Register (EOI):** When a write is issued to this register, the I/O APIC will check this field and compare it with the vector field for each entry in the I/O Redirection Table. When a match is found, the Remote_IRR bit for that I/O Redirection Entry will be cleared.

31.2 Advanced Programmable Interrupt Controller (APIC) Registers

Table 31-3. Summary of Advanced Programmable Interrupt Controller (APIC) Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
FEC00000h	FEC00003h	Advanced Programmable Interrupt Controller (APIC) Registers Index Register (IDX)—Offset FEC00000h	0h
FEC00010h	FEC00013h	Data Register (DAT)—Offset FEC00010h	0h
FEC00040h	FEC00043h	EOI Register (EOI)—Offset FEC00040h	0h

Index Register (IDX)—Offset FEC00000h

The Index Register will select which APIC indirect register to be manipulated by software. Software will program this register to select the desired APIC internal register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**Index Register (IDX):** This is an 8 bit pointer into the I/O APIC register table.

31.2.1 Data Register (DAT)—Offset FEC00010h

his 32-bit register specifies the data to be read or written to the register pointed to by the Index register. This register can be accessed only in DW quantities.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW/V	**Window Register (WDW):** This is a 32-bit register for the data to be read or written to the APIC indirect register pointed to by the Index register (Memory Address FEC0_0000h).

31.2.2 EOI Register (EOI)—Offset FEC00040h

When a write is issued to this register, the IOxAPIC will check the lower 8 bits written to this register, and compare it with the vector field for each entry in the I/O Redirection Table. When a match is found, RTE.RIRR for that entry will be cleared. If multiple entries have the same vector, each of those entries will have RTE.RIRR cleared. Only bits 7:0 are used. Bits 31:8 are ignored.

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h WO	**EOI Register (EOI):** When a write is issued to this register, the I/O APIC will check this field and compare it with the vector field for each entry in the I/O Redirection Table. When a match is found, the Remote_IRR bit for that I/O Redirection Entry will be cleared.

§ §

32 Processor Interface

32.1 Processor Interface Memory Registers Summary

Table 32-1. Summary of Processor Interface Memory Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
61h	61h	NMI Status and Control (NMI_STS_CNT)—Offset 61h	0h
70h	70h	NMI Enable (and Real Time Clock Index) (NMI_EN)—Offset 70h	80h
92h	92h	Init Register (PORT92)—Offset 92h	0h
CF9h	CF9h	Reset Control Register (RST_CNT)—Offset CF9h	0h

32.1.1 NMI Status and Control (NMI_STS_CNT)—Offset 61h

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	**SERR# NMI Source Status (SERR_NMI_STS):** This bit is set by any of the sources of the internal SERR on the PCH backbone, this includes SERR assertions forwarded from the secondary PCI bus,ssssssss error from a PCIe port, Do_SERR or standard PCIe error message from DMI, or internal Bus 0 functions that generate SERR#. Bit 2 must be cleared in this register in order for this bit to be set. This interrupt source is enabled by setting bit 2 to 0. To reset the interrupt, set bit 2 to 1 and then set it to 0. This bit is read-only. When writing to port 61h, this bit must be 0.
6	0h RO	**IOCHK# NMI Source Status (IOCHK_NMI_STS):** This bit is set if an ISA agent (via SERIRQ) asserts IOCHK# and bit 3 is cleared in this register. This interrupt source is enabled by setting bit 3 to 0. To reset the interrupt, set bit 3 to 1 and then set it to 0. This bit is read-only. When writing to port 61h, this bit must be a 0.
5	0h RO	**Timer Counter 2 OUT Status (TMR2_OUT_STS):** This bit reflects the current state of the 8254 counter 2 output. Counter 2 must be programmed following any PCI reset for this bit to have a determinate value. When writing to port 61h, this bit must be a 0.
4	0h RO	Reserved.
3	0h RW	**IOCHK# NMI Enable (IOCHK_NMI_EN):** When this bit is a 1, IOCHK# NMIs are disabled and cleared. When this bit is a 0, IOCHK# NMIs are enabled.
2	0h RW	**PCI SERR# Enable (PCI_SERR_EN):** When this bit is a 1, the SERR# NMIs are disabled and cleared. When this bit is a 0, SERR# NMIs are enabled.
1	0h RW	**Speaker Data Enable (SPKR_DAT_EN):** When this bit is a 0, the SPKR output is a 0. When this bit is a 1, the SPKR output is equivalent to the Counter 2 OUT signal value.
0	0h RW	**Timer Counter 2 Enable (TIM_CNT2_EN):** When this bit is a 0, Counter 2 counting is disabled. Counting is enabled when this bit is 1.

32.1.2 NMI Enable (and Real Time Clock Index) (NMI_EN)—Offset 70h

This register is write-only for normal operation. In Alt-Access mode, this register can be read to find the NMI Enable status and the RTC index value.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 80h

Bit Range	Default and Access	Field Name (ID): Description
7	1h RW/V	**NMI_EN# (NMI_EN):** When this bit is a 1, all NMI sources are disabled. When this bit is a 0, NMI sources are enabled.
6:0	0h RW/V	**Real Time Clock Index (Address) (RTC_INDX):** This data goes to the RTC to select which register or CMOS RAM address is being accessed.

32.1.3 Init Register (PORT92)—Offset 92h

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:1	0h RO	Reserved.
0	0h RW	**INIT NOW (INIT_NOW):** When this bit transitions from a 0 to a 1, the PCH will force INIT# active for 16 PCI clocks.

32.1.4 Reset Control Register (RST_CNT)—Offset CF9h

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:4	0h RO	Reserved.
3	0h RW	**Full Reset (FULL_RST):** When this bit is set to 1 and bit 1 is set to 1 (indicating Hard Reset, not Soft Reset), and the RST_CPU bit (bit 2) is written from 0 to 1, the PCH will do a full reset, including driving SLP_S3#, SLP_S4# and SLP_S5# active (low) for at least 3 (and no more than 5) seconds. When this bit is set, it also causes the full power cycle (SLP_S3/4/5# assertion) in response to SYSRESET#, PWROK#, and Watchdog timer reset sources.
2	0h RW	**Reset CPU (RST_CPU):** This bit will cause either a hard or soft reset to the CPU depending on the state of the SYS_RST bit (bit 1 in this same register). The software will cause the reset by setting bit 2 from a 0 to a 1.
1	0h RW	**System Reset (SYS_RST):** The bit determines the type of reset caused via RST_CPU (bit 2 of this register). If SYS_RST is 0 when RST_CPU goes from 0 to 1, then the PCH will force INIT# active for 16 PCI clocks. If SYS_RST is 1 when RST_CPU goes from 0 to 1, then the PCH will force PCI reset active for about 1 ms, however the SLP_S3#, SLP_S4# and SLP_S5# signals assertion is dependent on the value of the FULL_RST (bit3 of this register).
0	0h RO	Reserved.

Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.
6	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_B_6):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_B_5):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.
4	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_B_4):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

10	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_A_10):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'.
9	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_A_9):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_A_8):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. 33.1.15 Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_A_0) — Offset 94h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6E0000h + 94h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	**Reserved**
24	0h RO	**Pad Config Lock TXState (PADCFGLOCKTX_ESPI_CLK_LOOPBK):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.
23	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_A_23):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

Bit Range	Default & Access	Field Name (ID): Description
22	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_A_22):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.
21	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_A_21):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_A_20):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.
19	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_A_19):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_A_18):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

Bit Range	Default & Access	Field Name (ID): Description
14	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_A_14):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

33.1.35 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_0) — Offset 704h

Refer to Register Field for detail

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0100: 20k PD 1100: 20k PU 1111: Native controller selected by Pad Mode controls the Termination. This field should be set to 1111b for the selected native function that supports dynamic termination override. Refer to Vol1, GPIO chapter, for more info. Others: Reserved **Notes**: 1. The 20K pull-up/pull-down can only be enabled as long as the toggle rate on the signal is no more than 300KHz. 2. If a reserved value is programmed, pad may malfunction. 3. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, PU/PD settings should be programmed first to ensure the input does not float momentarily
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	18h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

33.1.36 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_B_0) — Offset 708h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6E0000h + 708h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:25	0h RO	**SoundWire Slew Control (sndwslewctrl) (SNDWSLEWCTRL):** 00 = Slow Slew Rate 01 = Middle Slew Rate 10 = Fast Slew Rate 11 = Fastest Slew Rate For iCDG buffers, this field is used to control the slew configuration, but extends beyond SoundWire to I2C, SDMMC and other applicable buffers. The setting may vary from one platform to another.
24	0h RO	**Bus Hold Enable (BUSHLDEN):** This feature uses the same build in pull-up/down resistor. In such, BIOS/FW needs to disable all pull-up/down to 'None' before enabling this feature. 1 = enable bus hold 0 = disable bus hold
23	0h RO	**Data Dependent Weak PU Control (DDPUCTRL):** 0 = normal I/O transmission mode. 1 = weak pull up configuration is overridden to disabled, when the raw RX pad state is 0 in output mode. During DFx mode like BSCAN, SCAN, HVM and etc, the DDPUCRTL shall be constrained to 0.
22	0h RO	**Analog Glitch Filter RX Pad State Select (ANALOGGFRXSEL):** Determine if the internal RX pad state should be subjected to analog glitch filter (implemented within the buffer) or not. This field only make sense when the buffer is configured as an input and is not disabled. 0 = Select non filtered RX pad state 1= Select filtered RX pad state. The mux to select filtered or non filtered RX pad state is implemented within the HIP family. During DFx mode like BSCAN, SCAN, HVM and etc, the AnalogGFRxSel shall be constrained to 0.
21:9	0h RO	**Reserved**
8	0h RO/V	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: high voltage 1: low voltage

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved**
4:1	0h RO	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RO	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.79 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_13) — Offset 7D4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.80 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_B_13) — Offset 7D8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.81 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_B_13) — Offset 7DCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.82 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_14) — Offset 7E0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.83 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_14) — Offset 7E4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.84 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_B_14) — Offset 7E8h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6E0000h + 7E8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:25	0h RO	**SoundWire Slew Control (sndwslewctrl) (SNDWSLEWCTRL):** 00 = Slow Slew Rate 01 = Middle Slew Rate 10 = Fast Slew Rate 11 = Fastest Slew Rate For iCDG buffers, this field is used to control the slew configuration, but extends beyond SoundWire to I2C, SDMMC and other applicable buffers. The setting may vary from one platform to another.
24	0h RO	**Bus Hold Enable (BUSHLDEN):** This feature uses the same build in pull-up/down resistor. In such, BIOS/FW needs to disable all pull-up/down to 'None' before enabling this feature. 1 = enable bus hold 0 = disable bus hold
23	0h RO	**Data Dependent Weak PU Control (DDPUCTRL):** 0 = normal I/O transmission mode. 1 = weak pull up configuration is overridden to disabled, when the raw RX pad state is 0 in output mode. During DFx mode like BSCAN, SCAN, HVM and etc, the DDPUCRTL shall be constrained to 0.
22	0h RO	**Analog Glitch Filter RX Pad State Select (ANALOGGFRXSEL):** Determine if the internal RX pad state should be subjected to analog glitch filter (implemented within the buffer) or not. This field only make sense when the buffer is configured as an input and is not disabled. 0 = Select non filtered RX pad state 1= Select filtered RX pad state. The mux to select filtered or non filtered RX pad state is implemented within the HIP family. During DFx mode like BSCAN, SCAN, HVM and etc, the AnalogGFRxSel shall be constrained to 0.
21:12	0h RO	**Reserved**
11	0h RO/V	**Pin-strap value (PINSTRAPVAL):** This bit reflects the pin-strap value.
10:9	0h RO	**Reserved**
8	0h RO/V	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: high voltage 1: low voltage

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved**
4:1	0h RO	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RO	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

33.1.85 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_B_14) — Offset 7ECh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.86 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_15) — Offset 7F0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.87 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_15) — Offset 7F4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.88 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_B_15) — Offset 7F8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.89 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_B_15) — Offset 7FCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.90 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_16) — Offset 800h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.91 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_16) — Offset 804h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.92 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_B_16) — Offset 808h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.93 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_B_16) — Offset 80Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.94 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_17) — Offset 810h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.95 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_17) — Offset 814h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.96 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_B_17) — Offset 818h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.97 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_B_17) — Offset 81Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.98 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_18) — Offset 820h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.99 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_18) — Offset 824h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.100 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_B_18) — Offset 828h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_14, offset 7E8h.

33.1.101 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_B_18) — Offset 82Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.102 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_B_23) — Offset 870h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.103 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_B_23) — Offset 874h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.104 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_B_23) — Offset 878h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_14, offset 7E8h.

33.1.105 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_B_23) — Offset 87Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.106 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_0) — Offset 9A0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.107 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_0) — Offset 9A4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.108 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_0) — Offset 9A8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.109 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_0) — Offset 9ACh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.110 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_1) — Offset 9B0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.111 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_1) — Offset 9B4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.112 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_1) — Offset 9B8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.113 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_1) — Offset 9BCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.114 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_2) — Offset 9C0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.115 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_2) — Offset 9C4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.116 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_2) — Offset 9C8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.117 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_2) — Offset 9CCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.118 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_3) — Offset 9D0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.119 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_3) — Offset 9D4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.120 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_3) — Offset 9D8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.121 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_3) — Offset 9DCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.122 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_4) — Offset 9E0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.123 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_4) — Offset 9E4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.124 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_4) — Offset 9E8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.125 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_4) — Offset 9ECh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.126 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_5) — Offset 9F0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.127 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_5) — Offset 9F4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.128 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_5) — Offset 9F8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.129 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_5) — Offset 9FCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.130 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_6) — Offset A00h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.131 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_6) — Offset A04h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.132 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_6) — Offset A08h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.133 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_6) — Offset A0Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.134 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_7) — Offset A10h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.135 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_7) — Offset A14h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.136 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_7) — Offset A18h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.137 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_7) — Offset A1Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.138 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_8) — Offset A20h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.139 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_8) — Offset A24h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.140 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_8) — Offset A28h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.141 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_8) — Offset A2Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.142 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_9) — Offset A30h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.143 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_9) — Offset A34h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.144 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_9) — Offset A38h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.145 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_9) — Offset A3Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.146 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_10) — Offset A40h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.147 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_10) — Offset A44h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.148 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_10) — Offset A48h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.149 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_10) — Offset A4Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.150 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_11) — Offset A50h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.151 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_11) — Offset A54h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.152 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_11) — Offset A58h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.153 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_11) — Offset A5Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.154 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_12) — Offset A60h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.155 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_12) — Offset A64h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.156 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_12) — Offset A68h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.157 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_12) — Offset A6Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.158 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_13) — Offset A70h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.159 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_13) — Offset A74h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.160 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_13) — Offset A78h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.161 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_13) — Offset A7Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.162 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_14) — Offset A80h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.163 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_14) — Offset A84h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.164 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_14) — Offset A88h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.165 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_14) — Offset A8Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.166 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_15) — Offset A90h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.167 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_15) — Offset A94h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.168 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_15) — Offset A98h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.169 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_15) — Offset A9Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.170 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_16) — Offset AA0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.171 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_16) — Offset AA4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.172 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_16) — Offset AA8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.173 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_16) — Offset AACh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.174 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_17) — Offset AB0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.175 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_17) — Offset AB4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.176 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_17) — Offset AB8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.177 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_17) — Offset ABCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.178 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_18) — Offset AC0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.179 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_18) — Offset AC4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.180 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_18) — Offset AC8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.181 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_18) — Offset ACCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.182 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_19) — Offset AD0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.183 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_19) — Offset AD4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.184 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_19) — Offset AD8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.185 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_19) — Offset ADCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.186 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_20) — Offset AE0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.187 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_20) — Offset AE4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.188 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_20) — Offset AE8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.189 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_20) — Offset AECh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.190 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_21) — Offset AF0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.191 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_21) — Offset AF4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.192 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_21) — Offset AF8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.193 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_21) — Offset AFCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.194 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_22) — Offset B00h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.195 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_22) — Offset B04h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.196 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_22) — Offset B08h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.197 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_22) — Offset B0Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.1.198 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_A_23) — Offset B10h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_B_0, offset 700h.

33.1.199 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_A_23) — Offset B14h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_B_0, offset 704h.

33.1.200 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_A_23) — Offset B18h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_B_0, offset 708h.

33.1.201 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_A_23) — Offset B1Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_B_0, offset 70Ch.

33.2 GPIO Community 1 Registers

This Section contains the GPIO registers of Community 1- 0x6D section.

Table 33-2. Summary of GPIO Community 1 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
8h	4	Family Base Address (FAMBAR)	00000300h
Ch	4	Pad Base Address (PADBAR)	00000700h
10h	4	Miscellaneous Configuration (MISCCFG)	33043200h
20h	4	Pad Ownership (PAD_OWN_GPP_S_0)	00000000h
24h	4	Pad Ownership (PAD_OWN_GPP_I_0)	00000000h
28h	4	Pad Ownership (PAD_OWN_GPP_I_1)	00000000h
2Ch	4	Pad Ownership (PAD_OWN_GPP_I_2)	00000000h
30h	4	Pad Ownership (PAD_OWN_GPP_H_0)	00000000h
34h	4	Pad Ownership (PAD_OWN_GPP_H_1)	00000000h
38h	4	Pad Ownership (PAD_OWN_GPP_H_2)	00000000h
3Ch	4	Pad Ownership (PAD_OWN_GPP_D_0)	00000000h
40h	4	Pad Ownership (PAD_OWN_GPP_D_1)	00000000h
44h	4	Pad Ownership (PAD_OWN_GPP_D_2)	00000000h
80h	4	Pad Configuration Lock (PADCFGLOCK_GPP_S_0)	00000000h
84h	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_S_0)	00000000h
88h	4	Pad Configuration Lock (PADCFGLOCK_GPP_I_0)	00000000h
8Ch	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_I_0)	00000000h
90h	4	Pad Configuration Lock (PADCFGLOCK_GPP_H_0)	00000000h
94h	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_H_0)	00000000h
98h	4	Pad Configuration Lock (PADCFGLOCK_GPP_D_0)	00000000h
9Ch	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_D_0)	00000000h
B0h	4	Host Software Pad Ownership (HOSTSW_OWN_GPP_S_0)	00000000h
B4h	4	Host Software Pad Ownership (HOSTSW_OWN_GPP_I_0)	00000000h
B8h	4	Host Software Pad Ownership (HOSTSW_OWN_GPP_H_0)	00000000h
BCh	4	Host Software Pad Ownership (HOSTSW_OWN_GPP_D_0)	00000000h
100h	4	GPI Interrupt Status (GPI_IS_GPP_S_0)	00000000h
104h	4	GPI Interrupt Status (GPI_IS_GPP_I_0)	00000000h
108h	4	GPI Interrupt Status (GPI_IS_GPP_H_0)	00000000h
10Ch	4	GPI Interrupt Status (GPI_IS_GPP_D_0)	00000000h
120h	4	GPI Interrupt Enable (GPI_IE_GPP_S_0)	00000000h
124h	4	GPI Interrupt Enable (GPI_IE_GPP_I_0)	00000000h
128h	4	GPI Interrupt Enable (GPI_IE_GPP_H_0)	00000000h
12Ch	4	GPI Interrupt Enable (GPI_IE_GPP_D_0)	00000000h
140h	4	GPI General Purpose Events Status (GPI_GPE_STS_GPP_S_0)	00000000h
144h	4	GPI General Purpose Events Status (GPI_GPE_STS_GPP_I_0)	00000000h
148h	4	GPI General Purpose Events Status (GPI_GPE_STS_GPP_H_0)	00000000h
14Ch	4	GPI General Purpose Events Status (GPI_GPE_STS_GPP_D_0)	00000000h
160h	4	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_S_0)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
164h	4	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_I_0)	00000000h
168h	4	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_H_0)	00000000h
16Ch	4	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_D_0)	00000000h
180h	4	SMI Status (GPI_SMI_STS_GPP_S_0)	00000000h
184h	4	SMI Status (GPI_SMI_STS_GPP_I_0)	00000000h
188h	4	SMI Status (GPI_SMI_STS_GPP_H_0)	00000000h
18Ch	4	SMI Status (GPI_SMI_STS_GPP_D_0)	00000000h
1A0h	4	SMI Enable (GPI_SMI_EN_GPP_S_0)	00000000h
1A4h	4	SMI Enable (GPI_SMI_EN_GPP_I_0)	00000000h
1A8h	4	SMI Enable (GPI_SMI_EN_GPP_H_0)	00000000h
1ACh	4	SMI Enable (GPI_SMI_EN_GPP_D_0)	00000000h
1C0h	4	NMI Status (GPI_NMI_STS_GPP_S_0)	00000000h
1C4h	4	NMI Status (GPI_NMI_STS_GPP_I_0)	00000000h
1C8h	4	NMI Status (GPI_NMI_STS_GPP_H_0)	00000000h
1CCh	4	NMI Status (GPI_NMI_STS_GPP_D_0)	00000000h
1E0h	4	NMI Enable (GPI_NMI_EN_GPP_S_0)	00000000h
1E4h	4	NMI Enable (GPI_NMI_EN_GPP_I_0)	00000000h
1E8h	4	NMI Enable (GPI_NMI_EN_GPP_H_0)	00000000h
1ECh	4	NMI Enable (GPI_NMI_EN_GPP_D_0)	00000000h
204h	4	PWM Control (PWMC)	00000000h
20Ch	4	GPIO Serial Blink Enable (GP_SER_BLINK)	00000000h
210h	4	GPIO Serial Blink Command/Status (GP_SER_CMDSTS)	00080000h
214h	4	GPIO Serial Blink Data (GP_SER_DATA)	00000000h
700h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_0)	44000300h
704h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_0)	0080006Ch
708h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_0)	00000000h
70Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_S_0)	00000000h
710h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_1)	44000300h
714h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_1)	0080006Dh
718h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_1)	00000000h
71Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_S_1)	00000000h
720h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_2)	44000300h
724h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_2)	0080006Eh
728h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_2)	00000000h
72Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_S_2)	00000000h
730h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_3)	44000300h
734h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_3)	0080006Fh
738h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_3)	00000000h
73Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_S_3)	00000000h
740h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_4)	44000300h
744h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_4)	00800070h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
748h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_4)	00000000h
74Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_S_4)	00000000h
750h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_5)	44000300h
754h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_5)	00800071h
758h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_5)	00000000h
75Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_S_5)	00000000h
760h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_6)	44000300h
764h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_6)	00800072h
768h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_6)	00000000h
76Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_S_6)	00000000h
770h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_7)	44000300h
774h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_7)	00800073h
778h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_7)	00000000h
77Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_S_7)	00000000h
7D0h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_5)	44000300h
7D4h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_I_5)	00000019h
7D8h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_I_5)	00000000h
7DCh	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_I_5)	00000000h
7F0h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_7)	44000300h
7F4h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_I_7)	0000001Bh
7F8h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_I_7)	00000000h
7FCh	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_I_7)	00000000h
800h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_8)	44000300h
804h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_I_8)	0000001Ch
808h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_I_8)	00000000h
80Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_I_8)	00000000h
810h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_9)	44000300h
814h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_I_9)	0000001Dh
818h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_I_9)	00000000h
81Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_I_9)	00000000h
820h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_10)	44000300h
824h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_I_10)	0000001Eh
828h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_I_10)	00000000h
82Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_I_10)	00000000h
830h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_11)	44000300h
834h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_I_11)	0000001Fh
838h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_I_11)	00000000h
83Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_I_11)	00000000h
840h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_12)	44000300h
844h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_I_12)	00000020h
848h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_I_12)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
84Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_I_12)	00000000h
850h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_13)	44000300h
854h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_I_13)	00000021h
858h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_I_13)	00000000h
85Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_I_13)	00000000h
860h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_14)	44000300h
864h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_I_14)	00000022h
868h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_I_14)	00000000h
86Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_I_14)	00000000h

33.2.1 Family Base Address (FAMBAR) — Offset 8h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 8h	00000300h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0300h RO	**Family Base Address (FAMBAR):** This field provides the starting byte-align address of Family0 register sets within a Community. It is meant for software to discover from where the very first Family register (i.e. Family0 register) starts to compute the next Families address offsets.

33.2.2 Pad Base Address (PADBAR) — Offset Ch

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + Ch	00000700h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0700h RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets within a Community. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

33.2.3 Miscellaneous Configuration (MISCCFG) — Offset 10h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 10h	33043200h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:24	33h RW	**GPIO Driver Mode Interrupt Select (GPDMINTSEL):** IRQ globally for all pads (GPI_IS with corresponding GPI_IE enable). 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255
23:20	0h RO	**Reserved**
19:16	4h RW	**GPIO Group to GPE_DW2 assignment encoding (GPE0_DW2):** This register assigns a specific GPIO Group to the ACPI GPE0[95:64]. The setting is SoC specific.
15:12	3h RW	**GPIO Group to GPE_DW1 assignment encoding (GPE0_DW1):** This register assigns a specific GPIO Group to the ACPI GPE0[63:32]. The setting is SoC specific.
11:8	2h RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** This register assigns a specific GPIO Group to the ACPI GPE0[31:0]. The setting is SoC specific.
7	0h RW	**GPIO IOSF Sideband VNNREQ Enable (GPVNNREQEN):** Specify whether the GPIO Community should take part in IOSFSB VNNREQ/ACK handshake 0 = Disable participation in IOSF SB VNNREQ and VNNACK handshake 1 = Enable participation in IOSF SB VNNREQ and VNNACK handshake When this bit set to 1, GPIO controller will de-assert the VNNREQ when there is no outstanding IOSF SB upstream cycle from GPIO controller. When this bit set to 1 and MISCSECCFG.SBTRIGDIS is 0, GPIO controller will assert the VNNREQ to request for the following list of IOSF-SB Message initiation. Event list: IRQ NMI SMI SSMI VNNREQ shall de-assert when MISCSECCFG.SBTRIGDIS is set to 1. As VNNAON IP, GPIO controller will assert the VNNREQ when in reset. The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pwrgate_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this power gating, this register always default to 1.
6	0h RW	**GPIO PGCB Clock Dynamic Partition Clock Gating Enable (GPPGCBDPCGEN):** Specify whether the GPIO Community PGCB clock should take part in partition clock gating 0 = Disable participation in PGCB clock dynamic partition clock gating 1 = Enable participation in PGCB clock dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**GPIO IOSF Sideband Dynamic Partition Clock Gating Enable (GPSIDEDPCGEN):** Specify whether the GPIO Community IOSF sideband clock should take part in partition clock gating 0 = Disable participation in IOSF sideband clock dynamic partition clock gating 1 = Enable participation in IOSF sideband clock dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
4	0h RW	**GPIO RCOMP clock Dynamic Local Clock Gating (GPRCOMPCDLCGEN):** Specify whether the GPIO Community should perform local clock gating on RCOMP clock 0 = Disable dynamic RCOMP clock local clock gating 1 = Enable dynamic RCOMP clock local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
3	0h RW	**GPIO RTC clock Dynamic Local Clock Gating (GPRTCDLCGEN):** Specify whether the GPIO Community should perform local clock gating on RTC clock 0 = Disable dynamic RTC clock local clock gating 1 = Enable dynamic RTC clock local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
2	0h RW	**GSX Static Local Clock Gating (GSXSLCGEN):** Specify whether the GSX controller should be statically clock gated for power saving if it is not enabled (even though the capability is available). 0 = Disable static local clock gating 1 = Enable static local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
1	0h RW	**GPIO Dynamic Partition Clock Gating Enable (GPDPCGEN):** Specify whether the GPIO Community should take part in partition clock gating 0 = Disable participation in dynamic partition clock gating 1 = Enable participation in dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
0	0h RW	**GPIO Dynamic Local Clock Gating Enable (GPDLCGEN):** Specify whether the GPIO Community should perform local clock gating 0 = Disable dynamic local clock gating 1 = Enable dynamic local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0

33.2.4 Pad Ownership (PAD_OWN_GPP_S_0) — Offset 20h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 20h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:28	0h RW	**Pad Ownership (PAD_OWN_GPP_S_7):** This register can be written by CSME GPIO Function** only. Write access without CSME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Status update: GPIO input event notification (if enabled) to embedded system owner via IOSF-SB Virtual Wire message, or Host SMI (if implemented), NMI (if implemented), SCI/GPE or GPI_INT status update All subsequent read/write accesses to the corresponding pad's Pad Configuration Register are verified with the owner's GPIO Function SAI. PAD_OWN[1:0] encoding: '00' = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. During host ownership, CSME, IE and ISH do not own this pad and are not notified of the GPIO input event. '01' = CSME GPIO Mode. CSME has ownership of the pad. All accesses to Pad Configuration register set must be verified with CSME GPIO Function SAI **. Non-posted cycle access without CSME SAI shall result into nsuccessful Completionstatus. Posted cycle access without CSME SAI shall be dropped. In CSME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to CSME GPIO Function. Only CSME GPIO Function is notified of the GPIO input event. '10' = ISH GPIO Mode. Same description as CSME GPIO Mode above except verifying ISH GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the ISH GPIO Function. '11' = IE GPIO Mode. Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'.

Bit Range	Default & Access	Field Name (ID): Description
19	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_H_19):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. 33.2.19 Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_H_0) — Offset 94h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 94h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_H_23):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.
22	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_H_22):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

Bit Range	Default & Access	Field Name (ID): Description
21	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_H_21):** PadCfgLockTx locks the GPIOTxState bit from being configured. Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20	0h RO	**Reserved**
19	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_D_19):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_D_18):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'.
17	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_D_17):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	**Reserved**
20	0h RO	**Reserved**
19	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_D_19):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_D_18):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.
17	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_D_17):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

Bit Range	Default & Access	Field Name (ID): Description
16	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_D_16):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ...
