33.2.58 PWM Control (PWMC) — Offset 204h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 204h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW	**EN:** 0 = Disable PWM Output 1 = Enable PWM Output
30	0h RW/1S/V	**Software Update (SWUP):** Indication that there is an update to PWM settings pending. SW sets this bit to 1 when updating the PWM_base_unit or PWM_on_time_divisor fields. The PWM module will apply the new settings at the end of the current cycle and reset this bit. 0 = No updates pending 1 = Update pending
29:8	000000h RW	**Base Unit (BASEUNIT):** Base unit register. Unsigned 8 integer bits, 14 fraction bits. Used to determine PWM output frequency. The PWM base frequency for SPT is 32.768 KHz. Refer to PWM section for programming details.
7:0	00h RW	**On Time Divisor (ONTIMEDIV):** PWM duty cycle = PWM_on-time_divisor/256.

33.2.59 GPIO Serial Blink Enable (GP_SER_BLINK) — Offset 20Ch

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 20Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	**Reserved**
4:0	00h RW	**GP SER BLINK (GP_SER_BLINK):** The setting of this bit has no effect if the corresponding GPIO is programmed as an input, if the corresponding GPIO has the PWM enabled, or if Serial Blink capability does not exist . This bit should be set to a 1 before output buffer is enabled. When set to a '0', the corresponding GPIO will function normally. This bit should be set to a 1 while the corresponding PMode bit is set to 0h (GPIO Mode). Setting the PMode bit to other value (non-GPIO Mode) after the GP_SER_BLINK bit ensures PCH will not drive a 1 on the pin as an output. When this corresponding bit is set to a 1 and the pin is configured to output mode, the serial blink capability is enabled and the programmed message is serialized out through an open-drain buffer configuration. The value of the corresponding GPIOTxState bit remains unchanged and does not impact the serial blink capability in any way. Writes to this register have no effect when the corresponding pin is configured in native mode and the read value returned is undefined. Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= Pad N-1 Note: N is the number of Pads in the Community. Optionally N may be the number of pads for a group of pads in the Community. In which case there is a register for each group.

33.2.60 GPIO Serial Blink Command/Status (GP_SER_CMDSTS) — Offset 210h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 210h	00080000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23:22	0h RW	**Data Length Select (DLS):** This read/write field determines the number of bytes to serialize on GPIO 00: Serialize bits 7:0 of GP_GB_DATA (1 byte) 01: Serialize bits 15:0 of GP_GB_DATA (2 bytes) 10: Undefined - Software must not write this value 11: Serialize bits 31:0 of GP_GB_DATA (4 bytes) Software should not modify the value in this register unless the Busy bit is clear
21:16	08h RW	**Data Rate Select (DRS):** This read/write field selects the number of 166.64ns (4 clock periods GPIO clock - if GPIO clock is 24MHz) time intervals to count between Manchester data transitions. The default of 8h results in a 1333.33 ns minimum time between transitions. A value of 0h in this register produces undefined behavior. Software should not modify the value in this register unless the Busy bit is clear.
15:9	0h RO	**Reserved**
8	0h RO/V	**BUSY:** This read-only status bit is the hardware indication that a serialization is in progress. Hardware sets this bit to 1 based on the Go bit being set. Hardware clears this bit when the Go bit is cleared by the hardware.
7:1	0h RO	**Reserved**
0	0h RW	**GO:** This bit is set to 1 by software to start the serialization process. Hardware clears the bit after the serialized data is sent. Writes of 0 to this register have no effect. Software should not write this bit to 1 unless the Busy status bit is cleared.

33.2.61 GPIO Serial Blink Data (GP_SER_DATA) — Offset 214h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 214h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GP Serial Blink Data (GP_GB_DATA):** This read-write register contains the data serialized out. The number of bits shifted out is selected through the DLS field in the GP_GB_CMDSTS register. This register should not be modified by software when the Busy bit is set.

33.2.62 Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_0) — Offset 700h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 700h	44000300h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	0h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

33.2.63 Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_0) — Offset 704h

17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0100: 5k PD 1100: 5k PU 1111: Native controller selected by Pad Mode controls the Termination. This field should be set to 1111b for the selected native function that supports dynamic termination override. Refer to Vol1, GPIO chapter, for more info. Others: Reserved. NOTES: 1. The 5K pull-up/pull-down can only be enabled as long as the toggle rate on the signal is no more than 300KHz. 2. If a reserved value is programmed, pad may malfunction. 3. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, PU/PD settings should be programmed first to ensure the input does not float momentarily
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	6Ch RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

33.2.64 Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_0) — Offset 708h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 708h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:25	0h RW	**SoundWire Slew Control (sndwslewctrl) (SNDWSLEWCTRL):** 00 = Slow Slew Rate 01 = Middle Slew Rate 10 = Fast Slew Rate 11 = Fastest Slew Rate For iCDG buffers, this field is used to control the slew configuration, but extends beyond SoundWire to I2C, SDMMC and other applicable buffers. The setting may vary from one platform to another.
24	0h RW	**Bus Hold Enable (BUSHLDEN):** This feature uses the same build in pull-up/down resistor. In such, BIOS/FW needs to disable all pull-up/down to 'None' before enabling this feature. 1 = enable bus hold 0 = disable bus hold
23	0h RO	**Data Dependent Weak PU Control (DDPUCTRL):** 0 = normal I/O transmission mode. 1 = weak pull up configuration is overridden to disabled, when the raw RX pad state is 0 in output mode. During DFx mode like BSCAN, SCAN, HVM and etc, the DDPUCRTL shall be constrained to 0.
22	0h RO	**Analog Glitch Filter RX Pad State Select (ANALOGGFRXSEL):** Determine if the internal RX pad state should be subjected to analog glitch filter (implemented within the buffer) or not. This field only make sense when the buffer is configured as an input and is not disabled. 0 = Select non filtered RX pad state 1= Select filtered RX pad state. The mux to select filtered or non filtered RX pad state is implemented within the HIP family. During DFx mode like BSCAN, SCAN, HVM and etc, the AnalogGFRxSel shall be constrained to 0.
21:9	0h RO	**Reserved**
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: high voltage 1: low voltage

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved**
4:1	0h RO	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RO	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.74 Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_3) — Offset 730h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.75 Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_3) — Offset 734h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_S_0, offset 704h.

33.2.76 Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_3) — Offset 738h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.77 Pad Configuration DW3 (PAD_CFG_DW3_GPP_S_3) — Offset 73Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.78 Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_4) — Offset 740h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.79 Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_4) — Offset 744h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_S_0, offset 704h.

33.2.80 Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_4) — Offset 748h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.81 Pad Configuration DW3 (PAD_CFG_DW3_GPP_S_4) — Offset 74Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.82 Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_5) — Offset 750h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.83 Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_5) — Offset 754h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_S_0, offset 704h.

33.2.84 Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_5) — Offset 758h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.85 Pad Configuration DW3 (PAD_CFG_DW3_GPP_S_5) — Offset 75Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.86 Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_6) — Offset 760h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.87 Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_6) — Offset 764h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_S_0, offset 704h.

33.2.88 Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_6) — Offset 768h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.89 Pad Configuration DW3 (PAD_CFG_DW3_GPP_S_6) — Offset 76Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.90 Pad Configuration DW0 (PAD_CFG_DW0_GPP_S_7) — Offset 770h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.91 Pad Configuration DW1 (PAD_CFG_DW1_GPP_S_7) — Offset 774h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_S_0, offset 704h.

33.2.92 Pad Configuration DW2 (PAD_CFG_DW2_GPP_S_7) — Offset 778h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.93 Pad Configuration DW3 (PAD_CFG_DW3_GPP_S_7) — Offset 77Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.94 Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_5) — Offset 7D0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.95 Pad Configuration DW1 (PAD_CFG_DW1_GPP_I_5) — Offset 7D4h

Refer to Register Field for detail

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.135 Pad Configuration DW1 (PAD_CFG_DW1_GPP_I_16) — Offset 884h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.136 Pad Configuration DW2 (PAD_CFG_DW2_GPP_I_16) — Offset 888h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.137 Pad Configuration DW3 (PAD_CFG_DW3_GPP_I_16) — Offset 88Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.138 Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_17) — Offset 890h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.139 Pad Configuration DW1 (PAD_CFG_DW1_GPP_I_17) — Offset 894h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.140 Pad Configuration DW2 (PAD_CFG_DW2_GPP_I_17) — Offset 898h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.141 Pad Configuration DW3 (PAD_CFG_DW3_GPP_I_17) — Offset 89Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.142 Pad Configuration DW0 (PAD_CFG_DW0_GPP_I_18) — Offset 8A0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.143 Pad Configuration DW1 (PAD_CFG_DW1_GPP_I_18) — Offset 8A4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.144 Pad Configuration DW2 (PAD_CFG_DW2_GPP_I_18) — Offset 8A8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.145 Pad Configuration DW3 (PAD_CFG_DW3_GPP_I_18) — Offset 8ACh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.146 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_0) — Offset 8C0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.147 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_0) — Offset 8C4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4hPAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.148 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_0) — Offset 8C8h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6D0000h + 8C8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:25	0h RO	**SoundWire Slew Control (sndwslewctrl) (SNDWSLEWCTRL):** 00 = Slow Slew Rate 01 = Middle Slew Rate 10 = Fast Slew Rate 11 = Fastest Slew Rate For iCDG buffers, this field is used to control the slew configuration, but extends beyond SoundWire to I2C, SDMMC and other applicable buffers. The setting may vary from one platform to another.
24	0h RO	**Bus Hold Enable (BUSHLDEN):** This feature uses the same build in pull-up/down resistor. In such, BIOS/FW needs to disable all pull-up/down to 'None' before enabling this feature. 1 = enable bus hold 0 = disable bus hold
23	0h RO	**Data Dependent Weak PU Control (DDPUCTRL):** 0 = normal I/O transmission mode. 1 = weak pull up configuration is overridden to disabled, when the raw RX pad state is 0 in output mode. During DFx mode like BSCAN, SCAN, HVM and etc, the DDPUCRTL shall be constrained to 0.
22	0h RO	**Analog Glitch Filter RX Pad State Select (ANALOGGFRXSEL):** Determine if the internal RX pad state should be subjected to analog glitch filter (implemented within the buffer) or not. This field only make sense when the buffer is configured as an input and is not disabled. 0 = Select non filtered RX pad state 1= Select filtered RX pad state. The mux to select filtered or non filtered RX pad state is implemented within the HIP family. During DFx mode like BSCAN, SCAN, HVM and etc, the AnalogGFRxSel shall be constrained to 0.
21:12	0h RO	**Reserved**
11	0h RO/V	**Pin-strap value (PINSTRAPVAL):** This bit reflects the pin-strap value.
10:9	0h RO	**Reserved**
8	0h RO/V	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: high voltage 1: low voltage

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved**
4:1	0h RO	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RO	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

33.2.149 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_0) — Offset 8CCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.150 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_1) — Offset 8D0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.151 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_1) — Offset 8D4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.152 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_1) — Offset 8D8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_H_0, offset 8C8h.

33.2.153 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_1) — Offset 8DCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.154 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_2) — Offset 8E0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.155 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_2) — Offset 8E4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.156 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_2) — Offset 8E8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_H_0, offset 8C8h.

33.2.157 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_2) — Offset 8ECh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.158 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_3) — Offset 8F0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.159 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_3) — Offset 8F4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.160 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_3) — Offset 8F8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.161 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_3) — Offset 8FCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.162 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_4) — Offset 900h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.163 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_4) — Offset 904h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.164 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_4) — Offset 908h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.165 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_4) — Offset 90Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.166 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_5) — Offset 910h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.167 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_5) — Offset 914h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.168 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_5) — Offset 918h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.169 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_5) — Offset 91Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.170 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_6) — Offset 920h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.171 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_6) — Offset 924h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.172 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_6) — Offset 928h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.173 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_6) — Offset 92Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.174 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_7) — Offset 930h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.175 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_7) — Offset 934h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.176 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_7) — Offset 938h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.177 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_7) — Offset 93Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.178 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_8) — Offset 940h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.179 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_8) — Offset 944h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.180 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_8) — Offset 948h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.181 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_8) — Offset 94Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.182 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_9) — Offset 950h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.183 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_9) — Offset 954h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.184 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_9) — Offset 958h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.185 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_9) — Offset 95Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.186 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_10) — Offset 960h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.187 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_10) — Offset 964h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.188 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_10) — Offset 968h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.189 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_10) — Offset 96Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.190 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_11) — Offset 970h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.191 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_11) — Offset 974h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.192 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_11) — Offset 978h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.193 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_11) — Offset 97Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.194 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_12) — Offset 980h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.195 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_12) — Offset 984h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.196 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_12) — Offset 988h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.197 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_12) — Offset 98Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.198 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_13) — Offset 990h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.199 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_13) — Offset 994h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.200 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_13) — Offset 998h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.201 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_13) — Offset 99Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.202 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_15) — Offset 9B0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.203 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_15) — Offset 9B4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.204 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_15) — Offset 9B8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.205 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_15) — Offset 9BCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.206 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_17) — Offset 9D0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.207 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_17) — Offset 9D4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.208 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_17) — Offset 9D8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.209 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_17) — Offset 9DCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.210 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_18) — Offset 9E0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.211 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_18) — Offset 9E4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.212 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_18) — Offset 9E8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.213 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_18) — Offset 9ECh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.214 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_19) — Offset 9F0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.215 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_19) — Offset 9F4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.216 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_19) — Offset 9F8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.217 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_19) — Offset 9FCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.218 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_20) — Offset A00h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.219 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_20) — Offset A04h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.220 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_20) — Offset A08h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.221 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_20) — Offset A0Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.222 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_21) — Offset A10h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.223 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_21) — Offset A14h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.224 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_21) — Offset A18h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.225 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_21) — Offset A1Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.226 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_22) — Offset A20h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.227 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_22) — Offset A24h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.228 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_22) — Offset A28h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.229 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_22) — Offset A2Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.230 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_H_23) — Offset A30h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.231 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_H_23) — Offset A34h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.232 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_H_23) — Offset A38h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.233 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_H_23) — Offset A3Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.234 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_0) — Offset A40h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.235 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_0) — Offset A44h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.236 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_0) — Offset A48h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.237 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_0) — Offset A4Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.238 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_1) — Offset A50h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.239 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_1) — Offset A54h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.240 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_1) — Offset A58h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.241 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_1) — Offset A5Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.242 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_2) — Offset A60h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.243 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_2) — Offset A64h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.244 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_2) — Offset A68h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.245 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_2) — Offset A6Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.246 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_3) — Offset A70h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.247 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_3) — Offset A74h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.248 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_3) — Offset A78h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.249 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_3) — Offset A7Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.250 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_4) — Offset A80h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.251 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_4) — Offset A84h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.252 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_4) — Offset A88h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.253 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_4) — Offset A8Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.254 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_5) — Offset A90h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.255 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_5) — Offset A94h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.256 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_5) — Offset A98h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.257 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_5) — Offset A9Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.258 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_6) — Offset AA0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.259 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_6) — Offset AA4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.260 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_6) — Offset AA8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.261 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_6) — Offset AACh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.262 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_7) — Offset AB0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.263 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_7) — Offset AB4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.264 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_7) — Offset AB8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.265 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_7) — Offset ABCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.266 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_8) — Offset AC0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.267 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_8) — Offset AC4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.268 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_8) — Offset AC8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.269 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_8) — Offset ACCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.270 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_9) — Offset AD0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.271 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_9) — Offset AD4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.272 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_9) — Offset AD8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.273 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_9) — Offset ADCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.274 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_10) — Offset AE0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.275 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_10) — Offset AE4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.276 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_10) — Offset AE8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_H_0, offset 8C8h.

33.2.277 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_10) — Offset AECh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.278 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_11) — Offset AF0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.279 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_11) — Offset AF4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.280 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_11) — Offset AF8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.281 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_11) — Offset AFCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.282 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_12) — Offset B00h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.283 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_12) — Offset B04h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.284 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_12) — Offset B08h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_H_0, offset 8C8h.

33.2.285 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_12) — Offset B0Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.286 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_13) — Offset B10h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.287 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_13) — Offset B14h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.288 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_13) — Offset B18h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.289 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_13) — Offset B1Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.290 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_14) — Offset B20h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.291 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_14) — Offset B24h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.292 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_14) — Offset B28h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.293 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_14) — Offset B2Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.294 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_15) — Offset B30h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.295 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_15) — Offset B34h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.296 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_15) — Offset B38h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.297 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_15) — Offset B3Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.298 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_16) — Offset B40h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.299 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_16) — Offset B44h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.300 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_16) — Offset B48h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.301 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_16) — Offset B4Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.302 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_17) — Offset B50h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.303 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_17) — Offset B54h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.304 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_17) — Offset B58h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.305 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_17) — Offset B5Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.306 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_18) — Offset B60h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.307 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_18) — Offset B64h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.308 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_18) — Offset B68h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.309 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_18) — Offset B6Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.2.310 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_D_19) — Offset B70h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_S_0, offset 700h.

33.2.311 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_D_19) — Offset B74h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_I_5, offset 7D4h

33.2.312 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_D_19) — Offset B78h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_S_0, offset 708h.

33.2.313 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_D_19) — Offset B7Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_S_0, offset 70Ch.

33.3 GPIO Community 2 Registers

This Section contains the GPIO registers of Community 2- 0x6C section.

Table 33-3. Summary of GPIO Community 2 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
8h	4	Family Base Address (FAMBAR)	00000300h
Ch	4	Pad Base Address (PADBAR)	00000700h
10h	4	Miscellaneous Configuration (MISCCFG)	34043200h
20h	4	Pad Ownership (PAD_OWN_DSW_0)	00000000h
24h	4	Pad Ownership (PAD_OWN_DSW_1)	00000000h
28h	4	Pad Ownership (PAD_OWN_DSW_2)	00000000h
80h	4	Pad Configuration Lock (PADCFGLOCK_DSW_0)	00000000h
84h	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_DSW_0)	00000000h
B0h	4	Host Software Pad Ownership (HOSTSW_OWN_DSW_0)	00000000h
100h	4	GPI Interrupt Status (GPI_IS_DSW_0)	00000000h
120h	4	GPI Interrupt Enable (GPI_IE_DSW_0)	00000000h
140h	4	GPI General Purpose Events Status (GPI_GPE_STS_DSW_0)	00000000h
160h	4	GPI General Purpose Events Enable (GPI_GPE_EN_DSW_0)	00000000h
180h	4	SMI Status (GPI_SMI_STS_DSW_0)	00000000h
1A0h	4	SMI Enable (GPI_SMI_EN_DSW_0)	00000000h
1C0h	4	NMI Status (GPI_NMI_STS_DSW_0)	00000000h
1E0h	4	NMI Enable (GPI_NMI_EN_DSW_0)	00000000h
250h	4	Event Trigger Output Enable (EVOUTEN_0)	00000000h
260h	8	Event Trigger Mapping (EVMAP_0)	0000000000000000h
700h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_0)	04000700h
704h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_0)	00003060h
708h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPD_0)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
70Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPD_0)	00000000h
710h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_1)	04000700h
714h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_1)	00003C61h
718h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPD_1)	00000000h
71Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPD_1)	00000000h
720h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_2)	04000700h
724h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_2)	00003C62h
728h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPD_2)	00000000h
72Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPD_2)	00000000h
730h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_3)	04000700h
734h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_3)	00003063h
738h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPD_3)	00000010h
73Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPD_3)	00000000h
740h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_4)	04000600h
744h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_4)	00000064h
748h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPD_4)	00000000h
74Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPD_4)	00000000h
750h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_5)	04000600h
754h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_5)	00000065h
758h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPD_5)	00000000h
75Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPD_5)	00000000h
760h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_6)	04000600h
764h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_6)	00000066h
768h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPD_6)	00000000h
76Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPD_6)	00000000h
770h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_7)	04000200h
774h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_7)	00000067h
778h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPD_7)	00000000h
77Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPD_7)	00000000h
780h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_8)	04000700h
784h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_8)	00000068h
788h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPD_8)	00000000h
78Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPD_8)	00000000h
790h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_9)	04000600h
794h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_9)	00000069h
798h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPD_9)	00000000h
79Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPD_9)	00000000h
7A0h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_10)	04000600h
7A4h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_10)	0000006Ah
7A8h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPD_10)	00000000h
7ACh	4	Pad Configuration DW3 (PAD_CFG_DW3_GPD_10)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
7B0h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPD_11)	04000600h
7B4h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPD_11)	0000006Bh
7B8h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPD_11)	00000000h
7BCh	4	Pad Configuration DW3 (PAD_CFG_DW3_GPD_11)	00000000h
7C0h	4	Pad Configuration DW0 (PAD_CFG_DW0_INPUT3VSEL)	00000700h

The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.
5	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPD_5):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

0	0h RSV	**GPI SMI Status (GPI_SMI_STS_GPD_0):** This bit is set to '1' by hardware when a level event (See RxEdCfg, RxInv) is detected, and all the following conditions are true: The corresponding pad is used in GPIO input mode (PMode) The corresponding PAD_OWN[2:0] is '000' (i.e. ACPI GPIO Mode). If the following conditions are true, then an SMI will be generated if the GPI_SMI_STS bit is set: 1. The corresponding bit in the GPI_SMI_EN register is set 2. The corresponding pad's GPIROUTSMI is set Writing a value of '1' will clear the bit while writing a value of '0' has no effect. 0 = There is no SMI event 1 = There is an SMI event The state of GPI_SMI_EN[x] does not prevent the setting of GPI_SMI_STS[x]. Bit assignment: Bit0 = Pad 0 Bit1 = Pad 1 Bit2 = Pad 2 ... Bit N-1 = Pad N-1 Defaults for these bits are dependent on the state of the GPI pads.

33.3.15 SMI Enable (GPI_SMI_EN_DSW_0) — Offset 1A0h

33.3.20 Pad Configuration DW0 (PAD_CFG_DW0_GPD_0) — Offset 700h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 700h	04000700h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:11	0h RO	**Reserved**
10	1h RO/V	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

33.3.21 Pad Configuration DW1 (PAD_CFG_DW1_GPD_0) — Offset 704h

Refer to Register Field for detail

Type	Size	Offset	Default

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RO	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	Ch RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0100: 20k PD 1100: 20k PU 1111: Native controller selected by Pad Mode controls the Termination. This field should be set to 1111b for the selected native function that supports dynamic termination override. Refer to Vol1, GPIO chapter, for more info. Others: Reserved **Notes**: 1. The 20K pull-up/pull-down can only be enabled as long as the toggle rate on the signal is no more than 300KHz. 2. If a reserved value is programmed, pad may malfunction. 3. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, PU/PD settings should be programmed first to ensure the input does not float momentarily
9:8	0h RO	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	60h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

33.3.22 Pad Configuration DW2 (PAD_CFG_DW2_GPD_0) — Offset 708h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6C0000h + 708h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:25	0h RO	**SoundWire Slew Control (sndwslewctrl) (SNDWSLEWCTRL):** 00 = Slow Slew Rate 01 = Middle Slew Rate 10 = Fast Slew Rate 11 = Fastest Slew Rate For iCDG buffers, this field is used to control the slew configuration, but extends beyond SoundWire to I2C, SDMMC and other applicable buffers. The setting may vary from one platform to another.
24	0h RO	**Bus Hold Enable (BUSHLDEN):** This feature uses the same build in pull-up/down resistor. In such, BIOS/FW needs to disable all pull-up/down to 'None' before enabling this feature. 1 = enable bus hold 0 = disable bus hold
23	0h RO	**Data Dependent Weak PU Control (DDPUCTRL):** 0 = normal I/O transmission mode. 1 = weak pull up configuration is overridden to disabled, when the raw RX pad state is 0 in output mode. During DFx mode like BSCAN, SCAN, HVM and etc, the DDPUCRTL shall be constrained to 0.
22	0h RO	**Analog Glitch Filter RX Pad State Select (ANALOGGFRXSEL):** Determine if the internal RX pad state should be subjected to analog glitch filter (implemented within the buffer) or not. This field only make sense when the buffer is configured as an input and is not disabled. 0 = Select non filtered RX pad state 1= Select filtered RX pad state. The mux to select filtered or non filtered RX pad state is implemented within the HIP family. During DFx mode like BSCAN, SCAN, HVM and etc, the AnalogGFRxSel shall be constrained to 0.
21:9	0h RO	**Reserved**
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: high voltage 1: low voltage

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved**
4:1	0h RO	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RO	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

33.3.76 Pad Configuration DW0 (PAD_CFG_DW0_SLP_SUSB) — Offset 7E0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPD_0, offset 700h.

33.3.77 Pad Configuration DW1 (PAD_CFG_DW1_SLP_SUSB) — Offset 7E4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPD_0, offset 704h.

33.3.78 Pad Configuration DW2 (PAD_CFG_DW2_SLP_SUSB) — Offset 7E8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPD_0, offset 708h.

33.3.79 Pad Configuration DW3 (PAD_CFG_DW3_SLP_SUSB) — Offset 7ECh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPD_0, offset 70Ch.

33.3.80 Pad Configuration DW0 (PAD_CFG_DW0_WAKEB) — Offset 7F0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPD_0, offset 700h.

33.3.81 Pad Configuration DW1 (PAD_CFG_DW1_WAKEB) — Offset 7F4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPD_0, offset 704h.

33.3.82 Pad Configuration DW2 (PAD_CFG_DW2_WAKEB) — Offset 7F8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPD_0, offset 708h.

33.3.83 Pad Configuration DW3 (PAD_CFG_DW3_WAKEB) — Offset 7FCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPD_0, offset 70Ch.

33.3.84 Pad Configuration DW0 (PAD_CFG_DW0_DRAM_RESETB) — Offset 800h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPD_0, offset 700h.

33.3.85 Pad Configuration DW1 (PAD_CFG_DW1_DRAM_RESETB) — Offset 804h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPD_0, offset 704h.

33.3.86 Pad Configuration DW2 (PAD_CFG_DW2_DRAM_RESETB) — Offset 808h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPD_0, offset 708h.

33.3.87 Pad Configuration DW3 (PAD_CFG_DW3_DRAM_RESETB) — Offset 80Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPD_0, offset 70Ch.

33.4 GPIO Community 4 Registers

This Section contains the GPIO registers of Community 4- 0x6A section.

Table 33-4. Summary of GPIO Community 4 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
8h	4	Family Base Address (FAMBAR)	00000300h
Ch	4	Pad Base Address (PADBAR)	00000700h
10h	4	Miscellaneous Configuration (MISCCFG)	36043200h
20h	4	Pad Ownership (PAD_OWN_GPP_C_0)	00000000h
24h	4	Pad Ownership (PAD_OWN_GPP_C_1)	00000000h
28h	4	Pad Ownership (PAD_OWN_GPP_C_2)	00000000h
2Ch	4	Pad Ownership (PAD_OWN_GPP_F_0)	00000000h
30h	4	Pad Ownership (PAD_OWN_GPP_F_1)	00000000h
34h	4	Pad Ownership (PAD_OWN_GPP_F_2)	00000000h
38h	4	Pad Ownership (PAD_OWN_GPP_F_3)	00000000h
3Ch	4	Pad Ownership (PAD_OWN_HVCMOS_0)	00000000h
40h	4	Pad Ownership (PAD_OWN_GPP_E_0)	00000000h
44h	4	Pad Ownership (PAD_OWN_GPP_E_1)	00000000h
48h	4	Pad Ownership (PAD_OWN_GPP_E_2)	00000000h
4Ch	4	Pad Ownership (PAD_OWN_GPP_E_3)	00000000h
50h	4	Pad Ownership (PAD_OWN_JTAG_0)	00000000h
54h	4	Pad Ownership (PAD_OWN_JTAG_1)	00000000h
80h	4	Pad Configuration Lock (PADCFGLOCK_GPP_C_0)	00000000h
84h	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_C_0)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
88h	4	Pad Configuration Lock (PADCFGLOCK_GPP_F_0)	00000000h
8Ch	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_F_0)	00000000h
90h	4	Pad Configuration Lock (PADCFGLOCK_HVCMOS_0)	00000000h
94h	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_HVCMOS_0)	00000000h
98h	4	Pad Configuration Lock (PADCFGLOCK_GPP_E_0)	00000000h
9Ch	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_E_0)	00000000h
A0h	4	Pad Configuration Lock (PADCFGLOCK_JTAG_0)	00000000h
A4h	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_JTAG_0)	00000000h
B0h	4	Host Software Pad Ownership (HOSTSW_OWN_GPP_C_0)	00000000h
B4h	4	Host Software Pad Ownership (HOSTSW_OWN_GPP_F_0)	00000000h
B8h	4	Host Software Pad Ownership (HOSTSW_OWN_HVCMOS_0)	00000000h
BCh	4	Host Software Pad Ownership (HOSTSW_OWN_GPP_E_0)	00000000h
C0h	4	Host Software Pad Ownership (HOSTSW_OWN_JTAG_0)	00000000h
100h	4	GPI Interrupt Status (GPI_IS_GPP_C_0)	00000000h
104h	4	GPI Interrupt Status (GPI_IS_GPP_F_0)	00000000h
108h	4	GPI Interrupt Status (GPI_IS_HVCMOS_0)	00000000h
10Ch	4	GPI Interrupt Status (GPI_IS_GPP_E_0)	00000000h
110h	4	GPI Interrupt Status (GPI_IS_JTAG_0)	00000000h
120h	4	GPI Interrupt Enable (GPI_IE_GPP_C_0)	00000000h
124h	4	GPI Interrupt Enable (GPI_IE_GPP_F_0)	00000000h
128h	4	GPI Interrupt Enable (GPI_IE_HVCMOS_0)	00000000h
12Ch	4	GPI Interrupt Enable (GPI_IE_GPP_E_0)	00000000h
130h	4	GPI Interrupt Enable (GPI_IE_JTAG_0)	00000000h
140h	4	GPI General Purpose Events Status (GPI_GPE_STS_GPP_C_0)	00000000h
144h	4	GPI General Purpose Events Status (GPI_GPE_STS_GPP_F_0)	00000000h
148h	4	GPI General Purpose Events Status (GPI_GPE_STS_HVCMOS_0)	00000000h
14Ch	4	GPI General Purpose Events Status (GPI_GPE_STS_GPP_E_0)	00000000h
150h	4	GPI General Purpose Events Status (GPI_GPE_STS_JTAG_0)	00000000h
160h	4	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_C_0)	00000000h
164h	4	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_F_0)	00000000h
168h	4	GPI General Purpose Events Enable (GPI_GPE_EN_HVCMOS_0)	00000000h
16Ch	4	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_E_0)	00000000h
170h	4	GPI General Purpose Events Enable (GPI_GPE_EN_JTAG_0)	00000000h
180h	4	SMI Status (GPI_SMI_STS_GPP_C_0)	00000000h
184h	4	SMI Status (GPI_SMI_STS_GPP_F_0)	00000000h
188h	4	SMI Status (GPI_SMI_STS_HVCMOS_0)	00000000h
18Ch	4	SMI Status (GPI_SMI_STS_GPP_E_0)	00000000h
190h	4	SMI Status (GPI_SMI_STS_JTAG_0)	00000000h
1A0h	4	SMI Enable (GPI_SMI_EN_GPP_C_0)	00000000h

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
1A4h	4	SMI Enable (GPI_SMI_EN_GPP_F_0)	00000000h
1A8h	4	SMI Enable (GPI_SMI_EN_HVCMOS_0)	00000000h
1ACh	4	SMI Enable (GPI_SMI_EN_GPP_E_0)	00000000h
1B0h	4	SMI Enable (GPI_SMI_EN_JTAG_0)	00000000h
1C0h	4	NMI Status (GPI_NMI_STS_GPP_C_0)	00000000h
1C4h	4	NMI Status (GPI_NMI_STS_GPP_F_0)	00000000h
1C8h	4	NMI Status (GPI_NMI_STS_HVCMOS_0)	00000000h
1CCh	4	NMI Status (GPI_NMI_STS_GPP_E_0)	00000000h
1D0h	4	NMI Status (GPI_NMI_STS_JTAG_0)	00000000h
1E0h	4	NMI Enable (GPI_NMI_EN_GPP_C_0)	00000000h
1E4h	4	NMI Enable (GPI_NMI_EN_GPP_F_0)	00000000h
1E8h	4	NMI Enable (GPI_NMI_EN_HVCMOS_0)	00000000h
1ECh	4	NMI Enable (GPI_NMI_EN_GPP_E_0)	00000000h
1F0h	4	NMI Enable (GPI_NMI_EN_JTAG_0)	00000000h
21Ch	4	GSX Controller Capabilities (GSX_CAP)	00000000h
220h	4	GSX Channel-0 Capabilities DW0 (GSX_C0CAP_DW0)	00000000h
224h	4	GSX Channel-0 Capabilities DW1 (GSX_C0CAP_DW1)	00012000h
228h	4	GSX Channel-0 GP Input Level DW0 (GSX_C0GPILVL_DW0)	00000000h
22Ch	4	GSX Channel-0 GP Input Level DW1 (GSX_C0GPILVL_DW1)	00000000h
230h	4	GSX Channel-0 GP Output Level DW0 (GSX_C0GPOLVL_DW0)	00000000h
234h	4	GSX Channel-0 GP Output Level DW1 (GSX_C0GPOLVL_DW1)	00000000h
238h	4	GSX Channel-0 Command (GSX_C0CMD)	00000000h
23Ch	4	GSX Channel-0 Test Mode (GSX_C0TM)	00000000h
700h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPPC_C_0)	44000700h

33.4.1 Family Base Address (FAMBAR) — Offset 8h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 8h	00000300h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0300h RO	**Family Base Address (FAMBAR):** This field provides the starting byte-align address of Family0 register sets within a Community. It is meant for software to discover from where the very first Family register (i.e. Family0 register) starts to compute the next Families address offsets.

33.4.2 Pad Base Address (PADBAR) — Offset Ch

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + Ch	00000700h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0700h RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets within a Community. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

33.4.3 Miscellaneous Configuration (MISCCFG) — Offset 10h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 10h	36043200h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:24	36h RW	**GPIO Driver Mode Interrupt Select (GPDMINTSEL):** IRQ globally for all pads (GPI_IS with corresponding GPI_IE enable). 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255
23:20	0h RO	**Reserved**
19:16	4h RW	**GPIO Group to GPE_DW2 assignment encoding (GPE0_DW2):** This register assigns a specific GPIO Group to the ACPI GPE0[95:64]. The setting is SoC specific.
15:12	3h RW	**GPIO Group to GPE_DW1 assignment encoding (GPE0_DW1):** This register assigns a specific GPIO Group to the ACPI GPE0[63:32]. The setting is SoC specific.
11:8	2h RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** This register assigns a specific GPIO Group to the ACPI GPE0[31:0]. The setting is SoC specific.
7	0h RW	**GPIO IOSF Sideband VNNREQ Enable (GPVNNREQEN):** Specify whether the GPIO Community should take part in IOSFSB VNNREQ/ACK handshake 0 = Disable participation in IOSF SB VNNREQ and VNNACK handshake 1 = Enable participation in IOSF SB VNNREQ and VNNACK handshake When this bit set to 1, GPIO controller will de-assert the VNNREQ when there is no outstanding IOSF SB upstream cycle from GPIO controller. When this bit set to 1 and MISCSECCFG.SBTRIGDIS is 0, GPIO controller will assert the VNNREQ to request for the following list of IOSF-SB Message initiation. Event list: IRQ NMI SMI SSMI VNNREQ shall de-assert when MISCSECCFG.SBTRIGDIS is set to 1. As VNNAON IP, GPIO controller will assert the VNNREQ when in reset. The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pwrgate_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this power gating, this register always default to 1.
6	0h RW	**GPIO PGCB Clock Dynamic Partition Clock Gating Enable (GPPGCBDPCGEN):** Specify whether the GPIO Community PGCB clock should take part in partition clock gating 0 = Disable participation in PGCB clock dynamic partition clock gating 1 = Enable participation in PGCB clock dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**GPIO IOSF Sideband Dynamic Partition Clock Gating Enable (GPSIDEDPCGEN):** Specify whether the GPIO Community IOSF sideband clock should take part in partition clock gating 0 = Disable participation in IOSF sideband clock dynamic partition clock gating 1 = Enable participation in IOSF sideband clock dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
4	0h RW	**GPIO RCOMP clock Dynamic Local Clock Gating (GPRCOMPCDLCGEN):** Specify whether the GPIO Community should perform local clock gating on RCOMP clock 0 = Disable dynamic RCOMP clock local clock gating 1 = Enable dynamic RCOMP clock local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
3	0h RW	**GPIO RTC clock Dynamic Local Clock Gating (GPRTCDLCGEN):** Specify whether the GPIO Community should perform local clock gating on RTC clock 0 = Disable dynamic RTC clock local clock gating 1 = Enable dynamic RTC clock local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
2	0h RW	**GSX Static Local Clock Gating (GSXSLCGEN):** Specify whether the GSX controller should be statically clock gated for power saving if it is not enabled (even though the capability is available). 0 = Disable static local clock gating 1 = Enable static local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
1	0h RW	**GPIO Dynamic Partition Clock Gating Enable (GPDPCGEN):** Specify whether the GPIO Community should take part in partition clock gating 0 = Disable participation in dynamic partition clock gating 1 = Enable participation in dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
0	0h RW	**GPIO Dynamic Local Clock Gating Enable (GPDLCGEN):** Specify whether the GPIO Community should perform local clock gating 0 = Disable dynamic local clock gating 1 = Enable dynamic local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0

33.4.4 Pad Ownership (PAD_OWN_GPP_C_0) — Offset 20h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 20h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29:28	0h RW	**Pad Ownership (PAD_OWN_GPPC_C_7):** This register can be written by CSME GPIO Function** only. Write access without CSME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Status update: GPIO input event notification (if enabled) to embedded system owner via IOSF-SB Virtual Wire message, or Host SMI (if implemented), NMI (if implemented), SCI/GPE or GPI_INT status update All subsequent read/write accesses to the corresponding pad's Pad Configuration Register are verified with the owner's GPIO Function SAI. PAD_OWN[1:0] encoding: '00' = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. During host ownership, CSME, IE and ISH do not own this pad and are not notified of the GPIO input event. '01' = CSME GPIO Mode. CSME has ownership of the pad. All accesses to Pad Configuration register set must be verified with CSME GPIO Function SAI **. Non-posted cycle access without CSME SAI shall result into successful Completion status. Posted cycle access without CSME SAI shall be dropped. In CSME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to CSME GPIO Function. Only CSME GPIO Function is notified of the GPIO input event. '10' = ISH GPIO Mode. Same description as CSME GPIO Mode above except verifying ISH GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the ISH GPIO Function. '11' = IE GPIO Mode. Same description as CSME GPIO Mode above except verifying IE GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the ISH GPIO Function. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_F_11):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.
1	0h RSV	**Pad Config Lock TXState (PADCFGLOCKTX_L_BKLTCTL):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'.
5	0h RW	**Pad Config Lock (PADCFGLOCK_GPPC_E_5):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Lock the following register fields as read-only (RO): Pad Configuration registers (exclude GPIOTXState) GPI_NMI_EN Register (if implemented) GPI_SMI_EN Register (if implemented) GPI_GPE_EN Register (if implemented) Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted cycle that is end point specific to GPIO Community. The Opcode shall be 13h. Posted access has no effect and shall be dropped internally. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific register access message PIO_PadCfg_Unlockwith Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h and Posted='0'.

The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_E_8):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.
7	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_E_7):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_E_6):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.
5	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPPC_E_5):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.
3	0h RSV	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
2	0h RSV	**Reserved**
1	0h RSV	**Pad Config Lock TXState (PADCFGLOCKTX_JTAGX):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. If the system is in an S0 state (or upon waking back to an S0 state), an SCI will be caused, depending on the GPIRoutSCI bit for the corresponding pad. These bits are sticky bits and are cleared by writing a 1 back to this bit position. The state of GPI_GPE_EN[i] does not prevent the setting of GPI_GPE_STS[i]. Each bit position correspond to 1 pad in the Community: Bit0 = Pad0 Bit1 = Pad1 Bit2 = Pad2 ... Bit N-1= Pad N-1

This field is 1-based ('00001' means 1 output expander which produces 8 bits of CxGPO). If this channel does not have output, this register shall be written with value of '00000'.
4:0	00h RW/O	**Number of Input Expanders (NIN):** BIOS programs this field to indicate number of input expander components which corresponds to multiple of CxGPO. This field is 1-based ('00001' means 1 input expander which produces 8 bits of CxGPI). If this channel does not have input, this register shall be written with value of '00000'. Typically, the combine total value of supported NOUT+NIN <= 8.

33.4.75 GSX Channel-0 Capabilities DW1 (GSX_C0CAP_DW1) — Offset 224h

Refer to Register Field for detail

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GPO Level DW1[31:0] (GPOLVL_DW1):** Refer to CxGPOLVL_DW0 register description. GPOLVL_DW1[y] corresponds to CxGPO[y] where y is within CxGPO[63:32] range.

33.4.80 GSX Channel-0 Command (GSX_C0CMD) — Offset 238h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 238h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**
3	0h RW/1S/V	**Input and Output Expander Reset Sequence (IOERST):** Software writes '1' to this bit to cause a reset sequence that brings both input and output expander into a default state. Serialization process will be able to begin at default bit position again. Specifically: GSXSRESET# going to output expanders is asserted while GSXSLOAD shall be held in '0' logic state such that any stale pin state previously latched into input expanders is being reloaded. The serialization thereafter can start from default bit position. Hardware automatically clears the bit to zero after the process above has been completed. Software shall have both ST and RUN bit equal to '0' when setting IOERST to '1'.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO/V	**RUN:** This bit reflects the status of the serialization process. A '1' indicates that the serialization process is in progress. When software clears the ST bit, software shall poll on RUN bit to be '0' before software can write '1' to ST bit again.
1	0h RO/V	**BSY:** Software reads this field to determine if the serialization of most recently updated GPOLVL_DW1 and/or GPOLVL_DW0 content has been completely serialized out on the GSX. H/w sets this bit when either GPOLVL_DW1 or GPOLVL_DW0 is written to. Hardware will automatically clear the bit to'0' after all of the newly written value of GPOLVL_DW1 and/or GPOLVL_DW0 bits have been serialized out at least once. This allows software a method to ensure no collapsing of any particular CxGPO[y] bit during a back to back software update of GPOLVL_DW0 or GPOLVL_DW1. Software may reprogram the GPOLVL_DW1 and/or GPOLVL_DW0 at any time irrespective of state of BSY bit if intermediate software update being collapsed is not a concern. Irrespective of the state of BSY bit, hardware serialization process walks thru each bit of GPOLVL_DW1 & GPOLVL_DW0 from bit[63] to bit[0] in descending order. Example: if hardware serialization is in the midst of serializing out CxGPO[3] and software updates GPOLVL_DW0, hardware serialization will serialize out the updated value of GPOLVL_DW0[2 to 0] as CxGPO[2:0]. Then hardware will serialize out the updated value of GPOLVL_DW1[MSB to 0] and so on (assuming >4 output expanders case).
0	0h RW	**ST:** This bit is set to 1 by software to start the serialization process. Software should not write this bit to 1 unless: the Busy status bit is cleared, and the CxCAP has been programmed. Also refer to the CxGPILVL(U) description if default input value is desired. Once this bit is set to 1, the serialization processes for input and output are running continuously. If software clears the ST bit to '0', hardware shall stop the serialization process at a convenient time but at atomic boundary. Note: Clearing Start bit does not trigger GSXSRESET# to be asserted.

33.4.81 GSX Channel-0 Test Mode (GSX_C0TM) — Offset 23Ch

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 23Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	**Reserved**
12	0h RW	**Bit-bang GSXSRESET# (BBGSXSRESETB):** This bit allows software to directly bit bang the GSXSRESET#.
11	0h RW	**Bit-bang GSXSLOAD (BBGSXSLOAD):** This bit allows software to directly bit bang the GSXSLOAD.
10	0h RW	**Bit-bang GSXSDOUT (BBGSXSDOUT):** This bit allows software to directly bit bang the GSXSDOUT.

Bit Range	Default & Access	Field Name (ID): Description
9	0h RW	**Bit-bang GSXSCLK (BBGSCLK):** This bit allows software to directly bit bang the GSXSCLK.
8	0h RW	**Bit-bang Enable (BBE):** When this bit is '1', the bit-bang mode is enable and the CxTM.BBGSXS* register bits are directly controlling the GSX pins.
7:1	0h RO	**Reserved**
0	0h RW	**Alternate SCLK Rate (ALTSCLK):** This test mode allows slower toggle rate of the GSX channel. '0' - default value of SCLKR.SCLKR_D '1' - default value of SCLKR.SCLKR_D divide by 4

33.4.82 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_C_0) — Offset 700h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 700h	44000700h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Reserved**

33.4.86 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_C_1) — Offset 710h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.87 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_C_1) — Offset 714h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.88 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_C_1) — Offset 718h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.89 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_C_1) — Offset 71Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.90 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_C_2) — Offset 720h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.91 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_C_2) — Offset 724h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.92 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_C_2) — Offset 728h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD6A0000h + 728h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:25	0h RO	**SoundWire Slew Control (sndwslewctrl) (SNDWSLEWCTRL):** 00 = Slow Slew Rate 01 = Middle Slew Rate 10 = Fast Slew Rate 11 = Fastest Slew Rate For iCDG buffers, this field is used to control the slew configuration, but extends beyond SoundWire to I2C, SDMMC and other applicable buffers. The setting may vary from one platform to another.
24	0h RO	**Bus Hold Enable (BUSHLDEN):** This feature uses the same build in pull-up/down resistor. In such, BIOS/FW needs to disable all pull-up/down to 'None' before enabling this feature. 1 = enable bus hold 0 = disable bus hold
23	0h RO	**Data Dependent Weak PU Control (DDPUCTRL):** 0 = normal I/O transmission mode. 1 = weak pull up configuration is overridden to disabled, when the raw RX pad state is 0 in output mode. During DFx mode like BSCAN, SCAN, HVM and etc, the DDPUCRTL shall be constrained to 0.
22	0h RO	**Analog Glitch Filter RX Pad State Select (ANALOGGFRXSEL):** Determine if the internal RX pad state should be subjected to analog glitch filter (implemented within the buffer) or not. This field only make sense when the buffer is configured as an input and is not disabled. 0 = Select non filtered RX pad state 1= Select filtered RX pad state. The mux to select filtered or non filtered RX pad state is implemented within the HIP family. During DFx mode like BSCAN, SCAN, HVM and etc, the AnalogGFRxSel shall be constrained to 0.
21:12	0h RO	**Reserved**
11	0h RO/V	**Pin-strap value (PINSTRAPVAL):** This bit reflects the pin-strap value.
10:9	0h RO	**Reserved**
8	0h RO/V	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: high voltage 1: low voltage

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved**
4:1	0h RO	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RO	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

33.4.93 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_C_2) — Offset 72Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.94 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_C_3) — Offset 730h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.95 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_C_3) — Offset 734h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.96 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_C_3) — Offset 738h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.97 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_C_3) — Offset 73Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.98 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_C_4) — Offset 740h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.99 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_C_4) — Offset 744h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.100 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_C_4) — Offset 748h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.101 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_C_4) — Offset 74Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.102 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_C_5) — Offset 750h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.103 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_C_5) — Offset 754h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.104 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_C_5) — Offset 758h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_2, offset 728h.

33.4.105 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_C_5) — Offset 75Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.106 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_C_6) — Offset 760h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.107 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_C_6) — Offset 764h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.108 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_C_6) — Offset 768h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.109 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_C_6) — Offset 76Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.110 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_C_7) — Offset 770h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.111 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_C_7) — Offset 774h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.112 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_C_7) — Offset 778h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.113 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_C_7) — Offset 77Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.113.1 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_0) — Offset 880h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.114 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_0) — Offset 884h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.115 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_0) — Offset 888h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_2, offset 728h.

33.4.116 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_0) — Offset 88Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.117 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_1) — Offset 890h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.118 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_1) — Offset 894h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.119 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_1) — Offset 898h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.120 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_1) — Offset 89Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.121 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_2) — Offset 8A0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.122 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_2) — Offset 8A4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.123 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_2) — Offset 8A8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_2, offset 728h.

33.4.124 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_2) — Offset 8ACh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.125 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_3) — Offset 8B0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.126 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_3) — Offset 8B4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.127 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_3) — Offset 8B8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.128 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_3) — Offset 8BCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.129 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_4) — Offset 8C0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.130 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_4) — Offset 8C4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.131 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_4) — Offset 8C8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.132 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_4) — Offset 8CCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.133 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_5) — Offset 8D0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.134 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_5) — Offset 8D4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.135 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_5) — Offset 8D8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.136 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_5) — Offset 8DCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.137 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_6) — Offset 8E0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.138 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_6) — Offset 8E4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.139 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_6) — Offset 8E8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.140 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_6) — Offset 8ECh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.141 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_7) — Offset 8F0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.142 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_7) — Offset 8F4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.143 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_7) — Offset 8F8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_2, offset 728h.

33.4.144 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_7) — Offset 8FCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.145 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_10) — Offset 920h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.146 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_10) — Offset 924h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.147 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_10) — Offset 928h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_2, offset 728h.

33.4.148 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_10) — Offset 92Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.149 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_11) — Offset 930h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.150 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_11) — Offset 934h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.151 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_11) — Offset 938h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.152 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_11) — Offset 93Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.153 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_12) — Offset 940h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.154 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_12) — Offset 944h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.155 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_12) — Offset 948h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.156 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_12) — Offset 94Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.157 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_13) — Offset 950h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.158 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_13) — Offset 954h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.159 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_13) — Offset 958h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.160 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_13) — Offset 95Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.161 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_14) — Offset 960h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.162 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_14) — Offset 964h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.163 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_14) — Offset 968h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.164 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_14) — Offset 96Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.165 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_15) — Offset 970h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.166 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_15) — Offset 974h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.167 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_15) — Offset 978h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.168 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_15) — Offset 97Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.169 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_16) — Offset 980h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.170 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_16) — Offset 984h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.171 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_16) — Offset 988h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.172 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_16) — Offset 98Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.173 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_17) — Offset 990h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.174 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_17) — Offset 994h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.175 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_17) — Offset 998h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.176 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_17) — Offset 99Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.177 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_18) — Offset 9A0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.178 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_18) — Offset 9A4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.179 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_18) — Offset 9A8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.180 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_18) — Offset 9ACh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.181 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_22) — Offset 9E0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.182 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_22) — Offset 9E4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.183 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_22) — Offset 9E8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.184 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_22) — Offset 9ECh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.185 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_F_23) — Offset 9F0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.186 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_F_23) — Offset 9F4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.187 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_F_23) — Offset 9F8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.188 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_F_23) — Offset 9FCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.189 Pad Configuration DW0 (PAD_CFG_DW0_L_BKLTEN) — Offset A10h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.190 Pad Configuration DW1 (PAD_CFG_DW1_L_BKLTEN) — Offset A14h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.191 Pad Configuration DW2 (PAD_CFG_DW2_L_BKLTEN) — Offset A18h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.192 Pad Configuration DW3 (PAD_CFG_DW3_L_BKLTEN) — Offset A1Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.193 Pad Configuration DW0 (PAD_CFG_DW0_L_BKLTCTL) — Offset A20h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.194 Pad Configuration DW1 (PAD_CFG_DW1_L_BKLTCTL) — Offset A24h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.195 Pad Configuration DW2 (PAD_CFG_DW2_L_BKLTCTL) — Offset A28h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.196 Pad Configuration DW3 (PAD_CFG_DW3_L_BKLTCTL) — Offset A2Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.197 Pad Configuration DW0 (PAD_CFG_DW0_L_VDDEN) — Offset A30h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.198 Pad Configuration DW1 (PAD_CFG_DW1_L_VDDEN) — Offset A34h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.199 Pad Configuration DW2 (PAD_CFG_DW2_L_VDDEN) — Offset A38h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.200 Pad Configuration DW3 (PAD_CFG_DW3_L_VDDEN) — Offset A3Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.201 Pad Configuration DW0 (PAD_CFG_DW0_SYS_PWROK) — Offset A40h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.202 Pad Configuration DW1 (PAD_CFG_DW1_SYS_PWROK) — Offset A44h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.203 Pad Configuration DW2 (PAD_CFG_DW2_SYS_PWROK) — Offset A48h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.204 Pad Configuration DW3 (PAD_CFG_DW3_SYS_PWROK) — Offset A4Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.205 Pad Configuration DW0 (PAD_CFG_DW0_SYS_RESETB) — Offset A50h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.206 Pad Configuration DW1 (PAD_CFG_DW1_SYS_RESETB) — Offset A54h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.207 Pad Configuration DW2 (PAD_CFG_DW2_SYS_RESETB) — Offset A58h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.208 Pad Configuration DW3 (PAD_CFG_DW3_SYS_RESETB) — Offset A5Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.209 Pad Configuration DW0 (PAD_CFG_DW0_MLK_RSTB) — Offset A60h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.210 Pad Configuration DW1 (PAD_CFG_DW1_MLK_RSTB) — Offset A64h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.211 Pad Configuration DW2 (PAD_CFG_DW2_MLK_RSTB) — Offset A68h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.212 Pad Configuration DW3 (PAD_CFG_DW3_MLK_RSTB) — Offset A6Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.213 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_0) — Offset A70h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.214 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_0) — Offset A74h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.215 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_0) — Offset A78h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.216 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_0) — Offset A7Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.217 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_1) — Offset A80h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.218 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_1) — Offset A84h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.219 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_1) — Offset A88h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.220 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_1) — Offset A8Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.221 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_2) — Offset A90h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.222 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_2) — Offset A94h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.223 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_2) — Offset A98h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.224 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_2) — Offset A9Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.225 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_3) — Offset AA0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.226 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_3) — Offset AA4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.227 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_3) — Offset AA8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.228 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_3) — Offset AACh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.229 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_4) — Offset AB0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.230 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_4) — Offset AB4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.231 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_4) — Offset AB8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.232 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_4) — Offset ABCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.233 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_5) — Offset AC0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.234 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_5) — Offset AC4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.235 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_5) — Offset AC8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.236 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_5) — Offset ACCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.237 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_6) — Offset AD0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.238 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_6) — Offset AD4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.239 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_6) — Offset AD8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_2, offset 728h.

33.4.240 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_6) — Offset ADCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.241 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_7) — Offset AE0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.242 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_7) — Offset AE4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.243 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_7) — Offset AE8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.244 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_7) — Offset AECh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.245 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_8) — Offset AF0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.246 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_8) — Offset AF4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.247 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_8) — Offset AF8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.248 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_8) — Offset AFCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.249 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_9) — Offset B00h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.250 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_9) — Offset B04h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.251 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_9) — Offset B08h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_2, offset 728h.

33.4.252 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_9) — Offset B0Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.253 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_10) — Offset B10h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.254 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_10) — Offset B14h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.255 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_10) — Offset B18h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_2, offset 728h.

33.4.256 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_10) — Offset B1Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.257 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_11) — Offset B20h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.258 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_11) — Offset B24h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.259 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_11) — Offset B28h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_2, offset 728h.

33.4.260 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_11) — Offset B2Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.261 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_12) — Offset B30h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.262 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_12) — Offset B34h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.263 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_12) — Offset B38h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.264 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_12) — Offset B3Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.265 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_13) — Offset B40h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.266 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_13) — Offset B44h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.267 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_13) — Offset B48h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.268 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_13) — Offset B4Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.269 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_14) — Offset B50h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.270 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_14) — Offset B54h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.271 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_14) — Offset B58h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.272 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_14) — Offset B5Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.273 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_15) — Offset B60h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.274 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_15) — Offset B64h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.275 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_15) — Offset B68h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.276 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_15) — Offset B6Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.277 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_16) — Offset B70h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.278 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_16) — Offset B74h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.279 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_16) — Offset B78h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.280 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_16) — Offset B7Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.281 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_17) — Offset B80h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.282 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_17) — Offset B84h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.283 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_17) — Offset B88h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.284 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_17) — Offset B8Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.285 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_18) — Offset B90h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.286 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_18) — Offset B94h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.287 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_18) — Offset B98h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.288 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_18) — Offset B9Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.289 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_19) — Offset BA0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.290 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_19) — Offset BA4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.291 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_19) — Offset BA8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_2, offset 728h.

33.4.292 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_19) — Offset BACh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.293 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_20) — Offset BB0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.294 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_20) — Offset BB4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.295 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_20) — Offset BB8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.296 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_20) — Offset BBCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.297 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_21) — Offset BC0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.298 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_21) — Offset BC4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.299 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_21) — Offset BC8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_2, offset 728h.

33.4.300 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_21) — Offset BCCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.301 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_22) — Offset BD0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.302 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_22) — Offset BD4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.303 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_22) — Offset BD8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.304 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_22) — Offset BDCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.305 Pad Configuration DW0 (PAD_CFG_DW0_GPPC_E_23) — Offset BE0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.306 Pad Configuration DW1 (PAD_CFG_DW1_GPPC_E_23) — Offset BE4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.307 Pad Configuration DW2 (PAD_CFG_DW2_GPPC_E_23) — Offset BE8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.308 Pad Configuration DW3 (PAD_CFG_DW3_GPPC_E_23) — Offset BECh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.309 Pad Configuration DW0 (PAD_CFG_DW0_JTAG_TDO) — Offset C00h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.310 Pad Configuration DW1 (PAD_CFG_DW1_JTAG_TDO) — Offset C04h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.311 Pad Configuration DW2 (PAD_CFG_DW2_JTAG_TDO) — Offset C08h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.312 Pad Configuration DW3 (PAD_CFG_DW3_JTAG_TDO) — Offset C0Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.313 Pad Configuration DW0 (PAD_CFG_DW0_JTAGX) — Offset C10h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.314 Pad Configuration DW1 (PAD_CFG_DW1_JTAGX) — Offset C14h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.315 Pad Configuration DW2 (PAD_CFG_DW2_JTAGX) — Offset C18h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.316 Pad Configuration DW3 (PAD_CFG_DW3_JTAGX) — Offset C1Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.317 Pad Configuration DW0 (PAD_CFG_DW0_CPU_TRSTB) — Offset C40h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.318 Pad Configuration DW1 (PAD_CFG_DW1_CPU_TRSTB) — Offset C44h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.319 Pad Configuration DW2 (PAD_CFG_DW2_CPU_TRSTB) — Offset C48h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.320 Pad Configuration DW3 (PAD_CFG_DW3_CPU_TRSTB) — Offset C4Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.321 Pad Configuration DW0 (PAD_CFG_DW0_JTAG_TDI) — Offset C50h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.322 Pad Configuration DW1 (PAD_CFG_DW1_JTAG_TDI) — Offset C54h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.323 Pad Configuration DW2 (PAD_CFG_DW2_JTAG_TDI) — Offset C58h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.324 Pad Configuration DW3 (PAD_CFG_DW3_JTAG_TDI) — Offset C5Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.325 Pad Configuration DW0 (PAD_CFG_DW0_JTAG_TMS) — Offset C60h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.326 Pad Configuration DW1 (PAD_CFG_DW1_JTAG_TMS) — Offset C64h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.327 Pad Configuration DW2 (PAD_CFG_DW2_JTAG_TMS) — Offset C68h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.328 Pad Configuration DW3 (PAD_CFG_DW3_JTAG_TMS) — Offset C6Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.329 Pad Configuration DW0 (PAD_CFG_DW0_JTAG_TCK) — Offset C70h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.330 Pad Configuration DW1 (PAD_CFG_DW1_JTAG_TCK) — Offset C74h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.331 Pad Configuration DW2 (PAD_CFG_DW2_JTAG_TCK) — Offset C78h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_0, offset 708h.

33.4.332 Pad Configuration DW3 (PAD_CFG_DW3_JTAG_TCK) — Offset C7Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.4.333 Pad Configuration DW0 (PAD_CFG_DW0_DBG_PMODE) — Offset C80h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPPC_C_0, offset 700h.

33.4.334 Pad Configuration DW1 (PAD_CFG_DW1_DBG_PMODE) — Offset C84h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPPC_C_0, offset 704h.

33.4.335 Pad Configuration DW2 (PAD_CFG_DW2_DBG_PMODE) — Offset C88h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPPC_C_2, offset 728h.

33.4.336 Pad Configuration DW3 (PAD_CFG_DW3_DBG_PMODE) — Offset C8Ch

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPPC_C_0, offset 70Ch.

33.5 GPIO Community 5 Registers

This Section contains the GPIO Community 5 - 0x69h Registers.

Table 33-5. Summary of GPIO Community 5 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
8h	4	Family Base Address (FAMBAR)	00000300h
Ch	4	Pad Base Address (PADBAR)	00000700h
10h	4	Miscellaneous Configuration (MISCCFG)	37043200h
20h	4	Pad Ownership (PAD_OWN_GPP_R_0)	00000000h
24h	4	Pad Ownership (PAD_OWN_SPI_0)	00000000h
28h	4	Pad Ownership (PAD_OWN_SPI_1)	00000000h
80h	4	Pad Configuration Lock (PADCFGLOCK_GPP_R_0)	00000000h
84h	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_GPP_R_0)	00000000h
88h	4	Pad Configuration Lock (PADCFGLOCK_SPI_0)	00000000h
8Ch	4	Pad Configuration Lock GPIO TxState Register (PADCFGLOCKTX_SPI_0)	00000000h
B0h	4	Host Software Pad Ownership (HOSTSW_OWN_GPP_R_0)	00000000h
B4h	4	Host Software Pad Ownership (HOSTSW_OWN_SPI_0)	00000000h
100h	4	GPI Interrupt Status (GPI_IS_GPP_R_0)	00000000h
104h	4	GPI Interrupt Status (GPI_IS_SPI_0)	00000000h
120h	4	GPI Interrupt Enable (GPI_IE_GPP_R_0)	00000000h
124h	4	GPI Interrupt Enable (GPI_IE_SPI_0)	00000000h
140h	4	GPI General Purpose Events Status (GPI_GPE_STS_GPP_R_0)	00000000h
144h	4	GPI General Purpose Events Status (GPI_GPE_STS_SPI_0)	00000000h
160h	4	GPI General Purpose Events Enable (GPI_GPE_EN_GPP_R_0)	00000000h
164h	4	GPI General Purpose Events Enable (GPI_GPE_EN_SPI_0)	00000000h
180h	4	SMI Status (GPI_SMI_STS_GPP_R_0)	00000000h
184h	4	SMI Status (GPI_SMI_STS_SPI_0)	00000000h
1A0h	4	SMI Enable (GPI_SMI_EN_GPP_R_0)	00000000h
1A4h	4	SMI Enable (GPI_SMI_EN_SPI_0)	00000000h
1C0h	4	NMI Status (GPI_NMI_STS_GPP_R_0)	00000000h
1C4h	4	NMI Status (GPI_NMI_STS_SPI_0)	00000000h
1E0h	4	NMI Enable (GPI_NMI_EN_GPP_R_0)	00000000h
1E4h	4	NMI Enable (GPI_NMI_EN_SPI_0)	00000000h
700h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_0)	44000700h
704h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_0)	00000058h
708h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_R_0)	00000000h
70Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_R_0)	00000000h
710h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_1)	44000700h
714h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_1)	00003C59h
718h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_R_1)	00000000h
71Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_R_1)	00000000h

Table 33-5. Summary of GPIO Community 5 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
720h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_2)	44000600h
724h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_2)	00003C5Ah
728h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_R_2)	00000000h
72Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_R_2)	00000000h
730h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_3)	44000700h
734h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_3)	00003C5Bh
738h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_R_3)	00000000h
73Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_R_3)	00000000h
740h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_4)	44000700h
744h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_4)	0000005Ch
748h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_R_4)	00000000h
74Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_R_4)	00000000h
750h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_5)	44000300h
754h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_5)	0000005Dh
758h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_R_5)	00000000h
75Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_R_5)	00000000h
760h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_6)	44000300h
764h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_6)	0000005Eh
768h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_R_6)	00000000h
76Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_R_6)	00000000h
770h	4	Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_7)	44000300h
774h	4	Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_7)	0000005Fh
778h	4	Pad Configuration DW2 (PAD_CFG_DW2_GPP_R_7)	00000000h
77Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_GPP_R_7)	00000000h
780h	4	Pad Configuration DW0 (PAD_CFG_DW0_SPI0_IO_2)	40000700h
784h	4	Pad Configuration DW1 (PAD_CFG_DW1_SPI0_IO_2)	00003C00h
788h	4	Pad Configuration DW2 (PAD_CFG_DW2_SPI0_IO_2)	00000000h
78Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_SPI0_IO_2)	00000000h
790h	4	Pad Configuration DW0 (PAD_CFG_DW0_SPI0_IO_3)	40000700h
794h	4	Pad Configuration DW1 (PAD_CFG_DW1_SPI0_IO_3)	00003C00h
798h	4	Pad Configuration DW2 (PAD_CFG_DW2_SPI0_IO_3)	00000000h
79Ch	4	Pad Configuration DW3 (PAD_CFG_DW3_SPI0_IO_3)	00000000h
7A0h	4	Pad Configuration DW0 (PAD_CFG_DW0_SPI0_MOSI_IO_0)	40000700h
7A4h	4	Pad Configuration DW1 (PAD_CFG_DW1_SPI0_MOSI_IO_0)	00003C00h
7A8h	4	Pad Configuration DW2 (PAD_CFG_DW2_SPI0_MOSI_IO_0)	00000000h
7ACh	4	Pad Configuration DW3 (PAD_CFG_DW3_SPI0_MOSI_IO_0)	00000000h
7B0h	4	Pad Configuration DW0 (PAD_CFG_DW0_SPI0_MISO_IO_1)	40000700h
7B4h	4	Pad Configuration DW1 (PAD_CFG_DW1_SPI0_MISO_IO_1)	00003C00h
7B8h	4	Pad Configuration DW2 (PAD_CFG_DW2_SPI0_MISO_IO_1)	00000000h
7BCh	4	Pad Configuration DW3 (PAD_CFG_DW3_SPI0_MISO_IO_1)	00000000h

Table 33-5. Summary of GPIO Community 5 Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
7C0h	4	Pad Configuration DW0 (PAD_CFG_DW0_SPI0_TPM_CSB)	40000700h
7C4h	4	Pad Configuration DW1 (PAD_CFG_DW1_SPI0_TPM_CSB)	00003C00h
7C8h	4	Pad Configuration DW2 (PAD_CFG_DW2_SPI0_TPM_CSB)	00000000h
7CCh	4	Pad Configuration DW3 (PAD_CFG_DW3_SPI0_TPM_CSB)	00000000h
7D0h	4	Pad Configuration DW0 (PAD_CFG_DW0_SPI0_FLASH_0_CSB)	40000700h
7D4h	4	Pad Configuration DW1 (PAD_CFG_DW1_SPI0_FLASH_0_CSB)	00003C00h
7D8h	4	Pad Configuration DW2 (PAD_CFG_DW2_SPI0_FLASH_0_CSB)	00000000h
7DCh	4	Pad Configuration DW3 (PAD_CFG_DW3_SPI0_FLASH_0_CSB)	00000000h
7E0h	4	Pad Configuration DW0 (PAD_CFG_DW0_SPI0_FLASH_1_CSB)	40000700h
7E4h	4	Pad Configuration DW1 (PAD_CFG_DW1_SPI0_FLASH_1_CSB)	00003C00h
7E8h	4	Pad Configuration DW2 (PAD_CFG_DW2_SPI0_FLASH_1_CSB)	00000000h
7ECh	4	Pad Configuration DW3 (PAD_CFG_DW3_SPI0_FLASH_1_CSB)	00000000h
7F0h	4	Pad Configuration DW0 (PAD_CFG_DW0_SPI0_CLK)	40000700h
7F4h	4	Pad Configuration DW1 (PAD_CFG_DW1_SPI0_CLK)	00003C00h
7F8h	4	Pad Configuration DW2 (PAD_CFG_DW2_SPI0_CLK)	00000000h
7FCh	4	Pad Configuration DW3 (PAD_CFG_DW3_SPI0_CLK)	00000000h

33.5.1 Family Base Address (FAMBAR) — Offset 8h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 8h	00000300h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0300h RO	**Family Base Address (FAMBAR):** This field provides the starting byte-align address of Family0 register sets within a Community. It is meant for software to discover from where the very first Family register (i.e. Family0 register) starts to compute the next Families address offsets.

33.5.2 Pad Base Address (PADBAR) — Offset Ch

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + Ch	00000700h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15:0	0700h RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets within a Community. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

33.5.3 Miscellaneous Configuration (MISCCFG) — Offset 10h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 10h	37043200h

Register Level Access:

BIOS Access	SMM Access	OS Access
None	None	None

Bit Range	Default & Access	Field Name (ID): Description
31:24	37h RW	**GPIO Driver Mode Interrupt Select (GPDMINTSEL):** IRQ globally for all pads (GPI_IS with corresponding GPI_IE enable). 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255
23:20	0h RO	**Reserved**
19:16	4h RW	**GPIO Group to GPE_DW2 assignment encoding (GPE0_DW2):** This register assigns a specific GPIO Group to the ACPI GPE0[95:64]. The setting is SoC specific.
15:12	3h RW	**GPIO Group to GPE_DW1 assignment encoding (GPE0_DW1):** This register assigns a specific GPIO Group to the ACPI GPE0[63:32]. The setting is SoC specific.
11:8	2h RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** This register assigns a specific GPIO Group to the ACPI GPE0[31:0]. The setting is SoC specific.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**GPIO IOSF Sideband VNNREQ Enable (GPVNNREQEN):** Specify whether the GPIO Community should take part in IOSFSB VNNREQ/ACK handshake 0 = Disable participation in IOSF SB VNNREQ and VNNACK handshake 1 = Enable participation in IOSF SB VNNREQ and VNNACK handshake When this bit set to 1, GPIO controller will de-assert the VNNREQ when there is no outstanding IOSF SB upstream cycle from GPIO controller. When this bit set to 1 and MISCSECCFG.SBTRIGDIS is 0, GPIO controller will assert the VNNREQ to request for the following list of IOSF-SB Message initiation. Event list: IRQ NMI SMI SSMI VNNREQ shall de-assert when MISCSECCFG.SBTRIGDIS is set to 1. As VNNAON IP, GPIO controller will assert the VNNREQ when in reset. The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pwrgate_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this power gating, this register always default to 1.
6	0h RW	**GPIO PGCB Clock Dynamic Partition Clock Gating Enable (GPPGCBDPCGEN):** Specify whether the GPIO Community PGCB clock should take part in partition clock gating 0 = Disable participation in PGCB clock dynamic partition clock gating 1 = Enable participation in PGCB clock dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
5	0h RW	**GPIO IOSF Sideband Dynamic Partition Clock Gating Enable (GPSIDEDPCGEN):** Specify whether the GPIO Community IOSF sideband clock should take part in partition clock gating 0 = Disable participation in IOSF sideband clock dynamic partition clock gating 1 = Enable participation in IOSF sideband clock dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
4	0h RW	**GPIO RCOMP clock Dynamic Local Clock Gating (GPRCOMPCDLCGEN):** Specify whether the GPIO Community should perform local clock gating on RCOMP clock 0 = Disable dynamic RCOMP clock local clock gating 1 = Enable dynamic RCOMP clock local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
3	0h RW	**GPIO RTC clock Dynamic Local Clock Gating (GPRTCDLCGEN):** Specify whether the GPIO Community should perform local clock gating on RTC clock 0 = Disable dynamic RTC clock local clock gating 1 = Enable dynamic RTC clock local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**GSX Static Local Clock Gating (GSXSLCGEN):** Specify whether the GSX controller should be statically clock gated for power saving if it is not enabled (even though the capability is available). 0 = Disable static local clock gating 1 = Enable static local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
1	0h RW	**GPIO Dynamic Partition Clock Gating Enable (GPDPCGEN):** Specify whether the GPIO Community should take part in partition clock gating 0 = Disable participation in dynamic partition clock gating 1 = Enable participation in dynamic partition clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0
0	0h RW	**GPIO Dynamic Local Clock Gating Enable (GPDLCGEN):** Specify whether the GPIO Community should perform local clock gating 0 = Disable dynamic local clock gating 1 = Enable dynamic local clock gating The default value for this register field is controlled by internal power gating soft strap signal gpio_sstrap_pmmode_def_gpcom<community name>. The soft strap is pulled by the GPIO community soft strap puller. For SOC that does not have the soft strap defined for this clock gating, this register always default to 0

33.5.4 Pad Ownership (PAD_OWN_GPP_R_0) — Offset 20h

The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.
0	0h RW	**Pad Config Lock TXState (PADCFGLOCKTX_GPP_R_0):** PadCfgLockTx locks the GPIOTxState bit from being configured. The GPIOTxState register becomes Read-Only and software writes to the register have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1 = Locks the Pad Configuration GPIOTXState field as read-only (RO) : Bit assignment: Bit0 = pad 0 Bit1 = pad 1 Bit2 = pad 2 ... Bit N-1 = pad N-1 When PadCfgLockTx[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown. In order to support this optional mechanism, this register access type has to be RW and access with non-posted write cycle that is end point specific to GPIO Community. The Opcode for the write shall be 13h. Write cycle with any other opcode has no effect on the PadCfgLockTx register value. The non-posted write cycle can be generated using the P2SB bridge's ideband Message Interface Accessmethod in order to trigger a GPIO end point specific IOSF-SB message PIO_PadCfg_Unlock with Opcode of 13h. This can be achieved by programming the P2SB configuration register SBISTAT.Opcode to 13h.

33.5.9 Pad Configuration Lock (PADCFGLOCK_SPI_0) — Offset 88h

33.5.29 Pad Configuration DW0 (PAD_CFG_DW0_GPP_R_0) — Offset 700h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 700h	44000700h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	1h RW	**Pad Reset Config (PADRSTCFG):** This register controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: 00 = Powergood (i.e. sticky reset) 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) 10 = GPIO Reset (i.e. host reset: host_rst_b) 11 = Global Reset (i.e global_rst_b) For DSW well pads, this register default value should configured as 00b. For Primary well GPIO pads, this register's default value should be configured as 01b. Note 1: The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. Note 2: The terms 'Powergood', 'Deep GPIO Reset', 'DSW', etc. are PCH-centric and are just examples. Different terms may be used in different projects. The point here is that these terms convey the nature of these resets. For example, any reset that cannot be asserted again unless power is removed (a sticky reset) may be a 'Powergood'.
29	0h RW	**RX Pad State Select (RXPADSTSEL):** Determine from which node the RX pad state for native function should be source from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). 0 = Raw RX pad state directly from CFIO RX buffer 1 = Syncronized Internal RX pad state (subject to RXINV , hardware debouncer (if any) and PreGfRXSel settings)
28	0h RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. 0 = No Override 1 = RX drive 1 internally
27	0h RO	**Native Function Virtual Wire Message Enable (NAF_VWE):** This bit enables Native Function IOSF-SB Virtual wire message generation. Upon the enabling of this bit, the virtual wire message is sent to the appropriate destination enabled by pad mode selection whenever the value is different than the predefined function default value. Prior to enabling this bit, the pad mode must be set to a function where communication is done by message. When a change is detected on the pad and this bit is set, VW message is generated and delivered to the destination. 0 = Disable pad input event sampling and VW message generation. 1 = Enable pad input event sampling and VW message generation. This bit is read only 0 for pads without Native Function Virtual Wire messages enabled (e.g. GPIO Mode only pads or physical wire muxing only pads.)

Bit Range	Default & Access	Field Name (ID): Description
26:25	2h RW	**RX Level/Edge Configuration (RXEVCFG):** Determine if the internal RX pad state (RXPadStSel=1) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. 0h = Level 1h = Edge 2h = Disable 3h = Either rising edge or failing edge
24	0h RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determine if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. 0 = Select synchronized, non filtered RX pad state 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0h RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. 0 = No inversion 1 = Inversion
22:21	0h RW	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. 0 = Function defined in Pad Mode controls TX and RX Enables 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally 3 = Function controls TX Enabled and RX is always enabled
20	0h RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determine if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause peripheral IRQ 1 = Routing can cause peripheral IRQ Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0h RW	**GPIO Input Route SCI (GPIROUTSCI):** Determine if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SCI 1 = Routing can cause SCI Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.

Bit Range	Default & Access	Field Name (ID): Description
18	0h RO	**GPIO Input Route SMI (GPIROUTSMI):** Determine if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause SMI. 1 = Routing can cause SMI. Note: This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0h RO	**GPIO Input Route NMI (GPIROUTNMI):** Determine if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. 0 = Routing does not cause NMI. 1 = Routing can cause NMI. Note: This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0h RO	**Reserved**
12:10	1h RW	**Pad Mode (PMODE):** This field determines whether the Pad is controlled by GPIO controller logic or one of the native functions muxed onto the Pad. 0h = GPIO control the Pad 1h = Function 1, if applicable, control the Pad ... 15 = Function 15, if applicable, control the Pad
9	1h RW	**GPIO RX Disable (GPIORXDIS):** RX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the input buffer (active low enable) of the pad 1 = Disable the input buffer of the pad. Notes: When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	1h RW	**GPIO TX Disable (GPIOTXDIS):** TX buffer enable control when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Enable the output buffer (active low enable) of the pad 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0h RO	**Reserved**
1	0h RO/V	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV, hardware debouncer (if any) settings. When read, this bit returns a 0 if GPIORxDis is 1.
0	0h RW	**GPIO TX State (GPIOTXSTATE):** TX state in when PMode = 0 ONLY. No effect when the pad in native mode. 0 = Drive a level '0' to the TX output pad 1 = Drive a level '1' to the TX output pad

33.5.30 Pad Configuration DW1 (PAD_CFG_DW1_GPP_R_0) — Offset 704h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 704h	00000058h

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**CFIO Pad Configuration I2CEN (CFIOPADCFG_I2CEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
29	0h RW	**CFIO Pad Configuration CSEN (CFIOPADCFG_CSEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
28	0h RO	**CFIO Pad Configuration PARKMODEEN_B (CFIOPADCFG_PARKMODEEN_B):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
27:26	0h RO	**CFIO Pad Configuration HYSCTL (CFIOPADCFG_HYSCTL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
25	0h RO	**CFIO Pad Configuration PADTOL (CFIOPADCFG_PADTOL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
24:22	0h RO	**CFIO Pad Configuration STRSEL (CFIOPADCFG_STRSEL):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
21	0h RO	**CFIO Pad Configuration HSMODE (CFIOPADCFG_HSMODE):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.

Bit Range	Default & Access	Field Name (ID): Description
20	0h RO	**CFIO Pad Configuration ODTUPDN (CFIOPADCFG_ODTUPDN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
19	0h RO	**CFIO Pad Configuration ODTEN (CFIOPADCFG_ODTEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
18	0h RO	**CFIO Pad Configuration ANALOGMUXEN (CFIOPADCFG_ANALOGMUXEN):** See CFIO HIP Interface for details on these control bit descriptions. These may be duplicates in the family settings register since these can be either Family or Pad signals and this is SoC specific. The superset is described here and register bits are implemented only for those configurations that are pad specific. Bits that aren't implemented or output of the CFIO are read only.
17:14	0h RW	**IO Standby State (IOSSTATE):** The I/O Standby State defines which state the pad should be parked in when the I/O is in a standby state. 0 = Latch last value driven on TX, TX Enable and RX Enable 1 = Drive 0 with RX disabled and RX drive 0 internally 2 = Drive 0 with RX disabled and RX drive 1 internally 3 = Drive 1 with RX disabled and RX drive 0 internally 4 = Drive 1 with RX disabled and RX drive 1 internally 5 = Drive 0 with RX enabled 6 = Drive 1 with RX enabled 7 = Hi-Z with RX drive 0 internally 8 = Hi-Z with RX drive 1 internally 9 = TX Disabled and RX Enabled (i.e. wake or interrupt) 15 = IO Standby signal is masked for this pad. In this mode, a pad operates as if IOStandby has not been asserted. Others = Reserved

Bit Range	Default & Access	Field Name (ID): Description
13:10	0h RW	**TERM:** The Pad Termination state defines the different weak pull-up and pull-down settings that are supported by the buffer. The settings for [13:10] correspond to: 0000: none 0100: 20k PD 1100: 20k PU 1111: Native controller selected by Pad Mode controls the Termination. This field should be set to 1111b for the selected native function that supports dynamic termination override. Refer to Vol1, GPIO chapter, for more info. Others: Reserved **Notes**: 1. The 20K pull-up/pull-down can only be enabled as long as the toggle rate on the signal is no more than 300KHz. 2. If a reserved value is programmed, pad may malfunction. 3. The setting of this field is applicable in all Pad Mode including GPIO. As each Pad Mode may require different termination and isolation, care must be taken in SW in the transition with appropriate register programming. The actual transition sequence requirement may vary on case by case basis depending on the native functions involved. For example, before changing the pad from output to input direction, PU/PD settings should be programmed first to ensure the input does not float momentarily
9:8	0h RW	**IO Standby Termination (IOSTERM):** IOSTerm defines the behaviour of the termination logic when the IO Standby state has been triggered. The value of the termination is determined in Term[2:0]. 0 = Same as state specified in Term. 1 = Disable Pullup and Pulldown 2 = Enable Pulldown 3 = Enable Pullup
7:0	58h RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Community Controller toggles when an interrupt is detected on this pad. 0 = Interrupt Line 0 1 = Interrupt Line 1 ... 255 = Interrupt Line 255

33.5.31 Pad Configuration DW2 (PAD_CFG_DW2_GPP_R_0) — Offset 708h

Refer to Register Field for detail

Type	Size	Offset	Default
MMIO	32 bit	FD690000h + 708h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Reserved**
26:25	0h RO	**SoundWire Slew Control (sndwslewctrl) (SNDWSLEWCTRL):** 00 = Slow Slew Rate 01 = Middle Slew Rate 10 = Fast Slew Rate 11 = Fastest Slew Rate For iCDG buffers, this field is used to control the slew configuration, but extends beyond SoundWire to I2C, SDMMC and other applicable buffers. The setting may vary from one platform to another.
24	0h RO	**Bus Hold Enable (BUSHLDEN):** This feature uses the same build in pull-up/down resistor. In such, BIOS/FW needs to disable all pull-up/down to 'None' before enabling this feature. 1 = enable bus hold 0 = disable bus hold
23	0h RO	**Data Dependent Weak PU Control (DDPUCTRL):** 0 = normal I/O transmission mode. 1 = weak pull up configuration is overridden to disabled, when the raw RX pad state is 0 in output mode. During DFx mode like BSCAN, SCAN, HVM and etc, the DDPUCRTL shall be constrained to 0.
22	0h RO	**Analog Glitch Filter RX Pad State Select (ANALOGGFRXSEL):** Determine if the internal RX pad state should be subjected to analog glitch filter (implemented within the buffer) or not. This field only make sense when the buffer is configured as an input and is not disabled. 0 = Select non filtered RX pad state 1= Select filtered RX pad state. The mux to select filtered or non filtered RX pad state is implemented within the HIP family. During DFx mode like BSCAN, SCAN, HVM and etc, the AnalogGFRxSel shall be constrained to 0.
21:9	0h RO	**Reserved**
8	0h RO	**VCCIO selection (VCCIOSEL):** This bits is used to select VCCIO If the pad supports programmable VCCIO. The definition of high and low are implementation specific. 0: high voltage 1: low voltage

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	**Reserved**
4:1	0h RO	**Debounce duration (DEBOUNCE):** The debounce duration of value should be not less than 3. In other words, the value should not be any of 0, 1 and 2. The debounce time should be calculated as (2^debounce) * (glitch filter clock period) For example, when RTC clock (32 KHz) is used for glitch filter and debounce duration is set to 4b1011, the debounce time is (2 ^ 11) * (31.25 us) = 64ms
0	0h RO	**Debounce Enable (DEBEN):** This bit enables or disables the debouncer with the pad. 1 = Enable the debouncer of the pad 0 = Disable the debouncer of the pad

Bit definitions are the same as PAD_CFG_DW0_GPP_R_0, offset 700h.

33.5.74 Pad Configuration DW1 (PAD_CFG_DW1_SPI0_MISO_IO_1) — Offset 7B4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_R_0, offset 704h.

33.5.75 Pad Configuration DW2 (PAD_CFG_DW2_SPI0_MISO_IO_1) — Offset 7B8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_R_0, offset 708h.

33.5.76 Pad Configuration DW3 (PAD_CFG_DW3_SPI0_MISO_IO_1) — Offset 7BCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_R_0, offset 70Ch.

33.5.77 Pad Configuration DW0 (PAD_CFG_DW0_SPI0_TPM_CSB) — Offset 7C0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_R_0, offset 700h.

33.5.78 Pad Configuration DW1 (PAD_CFG_DW1_SPI0_TPM_CSB) — Offset 7C4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_R_0, offset 704h.

33.5.79 Pad Configuration DW2 (PAD_CFG_DW2_SPI0_TPM_CSB) — Offset 7C8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_R_0, offset 708h.

33.5.80 Pad Configuration DW3 (PAD_CFG_DW3_SPI0_TPM_CSB) — Offset 7CCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_R_0, offset 70Ch.

33.5.81 Pad Configuration DW0 (PAD_CFG_DW0_SPI0_FLASH_0_CSB) — Offset 7D0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_R_0, offset 700h.

33.5.82 Pad Configuration DW1 (PAD_CFG_DW1_SPI0_FLASH_0_CSB) — Offset 7D4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_R_0, offset 704h.

33.5.83 Pad Configuration DW2 (PAD_CFG_DW2_SPI0_FLASH_0_CSB) — Offset 7D8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_R_0, offset 708h.

33.5.84 Pad Configuration DW3 (PAD_CFG_DW3_SPI0_FLASH_0_CSB) — Offset 7DCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_R_0, offset 70Ch.

33.5.85 Pad Configuration DW0 (PAD_CFG_DW0_SPI0_FLASH_1_CSB) — Offset 7E0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_R_0, offset 700h.

33.5.86 Pad Configuration DW1 (PAD_CFG_DW1_SPI0_FLASH_1_CSB) — Offset 7E4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_R_0, offset 704h.

33.5.87 Pad Configuration DW2 (PAD_CFG_DW2_SPI0_FLASH_1_CSB) — Offset 7E8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_R_0, offset 708h.

33.5.88 Pad Configuration DW3 (PAD_CFG_DW3_SPI0_FLASH_1_CSB) — Offset 7ECh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_R_0, offset 70Ch.

33.5.89 Pad Configuration DW0 (PAD_CFG_DW0_SPI0_CLK) — Offset 7F0h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW0_GPP_R_0, offset 700h.

33.5.90 Pad Configuration DW1 (PAD_CFG_DW1_SPI0_CLK) — Offset 7F4h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW1_GPP_R_0, offset 704h.

33.5.91 Pad Configuration DW2 (PAD_CFG_DW2_SPI0_CLK) — Offset 7F8h

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW2_GPP_R_0, offset 708h.

33.5.92 Pad Configuration DW3 (PAD_CFG_DW3_SPI0_CLK) — Offset 7FCh

Refer to Register Field for detail

Bit definitions are the same as PAD_CFG_DW3_GPP_R_0, offset 70Ch.

§ §

34 High Precision Event Timer (HPET)

34.1 HPET Memory Mapped Registers

The timer registers are memory mapped directly (rather than indexed) to allow the CPU to access each register without having to use an index register. This ensures accesses are safe for multi-threaded environments. The timer register space is 1024 bytes. The registers are generally aligned on 64-bit boundaries to simplify implementation with IA64 processors. In the PCH, there are 4 possible memory address ranges beginning at 1) FED0_0000h, 2) FED0_1000h, 3) FED0_2000h, 4) FED0_3000h. The choice of address range should be selected by assigning the High Performance Event Timer Configuration (HPTC) register fields in the configuration space of the Primary to Sideband Bridge. All registers are implemented in the Primary power well, and all bits are reset by PLTRST#. Reads to reserved registers or bits will return a value of 0.
Behavorial Rules:
1. Software can read or write the various bytes in these registers using 32-bit or 64-bit accesses. Software must not attempt to read or write across register boundaries. For example, a 32-bit access should be to offset x0h, x4h, x8h, or xCh. 32-bit accesses should not be to 01h, 02h, 03h, 05h, 06h, 07h, 09h, 0Ah, 0Bh, 0Dh, 0Eh, or 0Fh. Any accesses to these offsets will result in an unexpected behavior, and may result in a Initiator abort. However, these accesses should not result in system hangs. 64-bit accesses can only be to x0h and must not cross 64-bit boundaries.
2. Software should not write to read-only registers.
3. Software should not expect any particular or consistent value when reading reserved registers or bits.

Table 34-1. Summary of HPET Memory Mapped Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
FED000 00h	FED000 07h	General Capabilities and ID Register (GEN_CAP_ID)—Offset FED00000h	27BC86B8086A701h
FED000 10h	FED000 17h	General Config Register (GEN_CFG)—Offset FED00010h	0h
FED000 20h	FED000 27h	General Interrupt Status Register (GEN_INT_STS)—Offset FED00020h	0h
FED000F 0h	FED000F 7h	Main Counter Value (MAIN_CNTR)—Offset FED000F0h	0h
FED001 00h	FED001 07h	Timer n Config and Capabilities (TMRn_CNF_CAP)—Offset FED00100h	0h
FED001 08h	FED001 0Fh	Timer n Comparator Value (TMRn_CMP_VAL)—Offset FED00108h	FFFFFFFFFFFFFFFFh

34.1.1 General Capabilities and ID Register (GEN_CAP_ID)—Offset FED00000h

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 27BC86B8086A701h

Bit Range	Default and Access	Field Name (ID): Description
63:32	27BC86Bh RO	**Main Counter Tick Period (COUNTER_CLK_PER_CAP):** This read-only field indicates the period at which the counter increments in femtoseconds (10^-15 seconds). The PCH HPET timers use a 24 MHz clock, which has a period of 41,666,667 femtoseconds. Therefore this register will always return 027BC86Bh when read.
31:16	8086h RO	**Vendor ID (VENDOR_ID_CAP):** These bits will return 8086h when read to reflect Intel as the vendor.
15	1h RO	**Legacy Rout Capable (LEG_RT_CAP):** This bit will always be 1 when read, indicating support for the Legacy Interrupt Rout.
14	0h RO	Reserved.
13	1h RO	**Counter Size (COUNT_SIZE_CAP):** This bit will return 1 when read to indicate support for 64-bit counters allowing 64 or 32-bit mode operation.
12:8	7h RO	**Number of Timers (NUM_TIM_CAP):** This value in this field will be 07h to indicate support for 8 timers in the timer block.
7:0	1h RO	**Revision ID (REV_ID):** This field indicates which revision of the function is implemented. Default value will be 01h.

34.1.2 General Config Register (GEN_CFG)—Offset FED00010h

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
63:2	0h RO	Reserved.
1	0h RW	**Legacy Rout (LEG_RT_CNF):** If the ENABLE_CNF bit and the LEG_RT_CNF bit are both set, the interrupts will be routed as follows: • Timer 0 is routed to IRQ0 in 8259 or IRQ2 in the I/O APIC • Timer 1 is routed to IRQ8 in 8259 or IRQ8 in the I/O APIC • Timer 2-n is routed as per the routing in the timer n Configuration registers. • If the Legacy Replacement Rout bit is set, the individual routing bits for Timers 0 and 1 (APIC) will have no impact. • If the Legacy Replacement Rout bit is not set, the individual routing bits for each of the timers are used. • This bit will default to 0. BIOS can set it to 1 to enable the legacy replacement routing, or 0 to disable the legacy replacement routing.
0	0h RW	**Overall Enable (ENABLE_CNF):** This bit must be set to enable any of the timers to generate interrupts. If this bit is 0, then the main counter will halt (will not increment) and no interrupts will be caused by any of these timers. For level-triggered interrupts, if an interrupt is pending when the ENABLE_CNF bit is changed from 1 to 0, the interrupt status indications (in the various Txx_INT_STS bits) will not be cleared. Software must write to the Txx_INT_STS bits to clear the interrupts. NOTE: This bit will default to 0. BIOS can set it to 1 or 0.

34.1.3 General Interrupt Status Register (GEN_INT_STS)—Offset FED00020h

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
63:8	0h RO	Reserved.
7	0h RW/1C	**Timer 7 Interrupt Active (T07_INT_STS):** Same functionality as Timer 0.
6	0h RW/1C	**Timer 6 Interrupt Active (T06_INT_STS):** Same functionality as Timer 0.
5	0h RW/1C	**Timer 5 Interrupt Active (T05_INT_STS):** Same functionality as Timer 0.
4	0h RW/1C	**Timer 4 Interrupt Active (T04_INT_STS):** Same functionality as Timer 0.
3	0h RW/1C	**Timer 3 Interrupt Active (T03_INT_STS):** Same functionality as Timer 0.

Bit Range	Default and Access	Field Name (ID): Description
2	0h RW/1C	**Timer 2 Interrupt Active (T02_INT_STS):** Same functionality as Timer 0.
1	0h RW/1C	**Timer 1 Interrupt Active (T01_INT_STS):** Same functionality as Timer 0.
0	0h RW/1C	**Timer 0 Interrupt Active (T00_INT_STS):** The functionality of this bit depends on whether the edge or level-triggered mode is used for this timer. (default = 0) If set to level-triggered mode: This bit will be set by hardware if the corresponding timer interrupt is active. Once the bit is set, it can be cleared by software writing a 1 to the same bit position. Writes of 0 to this bit will have no effect. If set to edge-triggered mode: This bit should be ignored by software. Software should always write 0 to this bit. NOTE: Defaults to 0. In edge triggered mode, this bit will always read as 0 and writes will have no effect.

34.1.4 Main Counter Value (MAIN_CNTR)—Offset FED000F0h

Software can read the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 0F0h or 0F4h. 64-bit accesses may only be done to 0F0h. Writes to this register should only be done while the counter is halted. Reads to this register return the current value of the main counter. If 32-bit software attempts to read a 64-bit counter, it should first halt the counter. Since this will delay the interrupts for all of the timers, this should be done only if the consequences are understood. It is strongly recommended that 32-bit software only operate the timer in 32-bit mode. Reads to this register are monotonic. No two consecutive reads will return the same value. The second of two reads will always return a larger value (unless the timer has rolled over to 0)

Access Method

Type: MEM Register (Size: 64 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
63:0	0h RW/V	**Counter Value (COUNTER_VAL):** Reads return the current value of the counter. Writes load the new value to the counter. NOTES: 1. Writes to this register should only be done while the counter is halted. 2. Reads to this register return the current value of the main counter. 3. 32-bit counters will always return 0 for the upper 32-bits of this register. 4. If 32-bit software attempts to read a 64-bit counter, it should first halt the counter. Since this will delay the interrupts for all of the timers, this should be done only if the consequences are understood. It is strongly recommended that 32-bit software only operate the timer in 32-bit mode. 5. Reads to this register are monotonic. No two consecutive reads will return the same value. The second of two reads will always return a larger value (unless the timer has rolled over to 0)

34.1.5 Timer n Config and Capabilities (TMRn_CNF_CAP)—Offset FED00100h

Timer 0: 100–107h,
Timer 1: 120–127h,
Timer 2: 140–147h,
Timer 3: 160–167h,
Timer 4: 180–187h,
Timer 5: 1A0–1A7h,
Timer 6: 1C0–1C7h,
Timer 7: 1E0–1E7h,
The letter n can be 0, 1, 2, 3, 4, 5, 6, or 7 referring to Timer 0, 1, 2, 3, 4, 5, 6, or 7.

Access Method

Type: MEM Register (Size: 64 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
63:4	0h RO	Reserved.
3	0h RW	**Timer 0 Type (TIMER0_TYPE_CNF):** Setting this bit to 1 enables the timer to generate a periodic interrupt if it is capable of doing so. If the TIMERn_PER_INT_CAP bit is 0, then this bit will always return 0 when read and writes will have no impact. For timer 0, this bit will be read/write, with default of 0. For timers 1-7, this bit will be read-only, with a fixed value of 0.
2:0	0h RO	Reserved.

34.1.6 Timer n Comparator Value (TMRn_CMP_VAL)—Offset FED00108h

Timer 0: 108h – 10Fh
Timer 1: 128h – 12Fh
Timer 2: 148h – 14Fh
Timer 3: 168h – 16Fh
Timer 4: 188h – 18Fh
Timer 5: 1A8h – 1AFh
Timer 6: 1C8h – 1CFh
Timer 7: 1E8h – 1EFh

Access Method

Type: MEM Register (Size: 64 bits)
Device:
Function:

Default: FFFFFFFFFFFFFFFFh

Bit Range	Default and Access	Field Name (ID): Description
63:0	FFFFFFFFF FFFFFFFh RW/V	**Timer 0 Comparator Value (TMR0_CMP_VAL):** If the timer is configured to non-periodic mode, when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). The value in this register does not change based on the interrupt being generated. If the timer is configured to periodic mode (supported only for Timer 0), when the main counter equals the value last written to this register, the corresponding interrupt can be generated (if so enabled). When this time out occurs, the value in this register is increased by the value last written to the register. For example, in periodic mode if the value written to the register is 0000123h: 1. An interrupt will be generated when the main counter reaches 00000123h. 2. The value in this register will then be adjusted by the hardware to 00000246h. 3. Another interrupt will be generated when the main counter reaches 00000246h. 4. The value in this register will then be adjusted by the hardware to 00000369h. As each periodic interrupt occurs, the value in this register will increment. When the incremented value is greater than the maximum value possible for this register (FFFFFFFFh for a 32-bit timer or FFFFFFFFFFFFFFFFh for a 64-bit timer), the value will wrap around through 0. For example, if the current value in a 32-bit timer is FFFF0000h and the last value written to this register is 20000, then after the next interrupt the value will change to 00010000h The default value for each timer is all 1s for the bits that are implemented. For example, a 32-bit timer will have a default value of 00000000FFFFFFFFh. A 64-bit timer will have a default value of FFFFFFFFFFFFFFFFh. Software can read or write the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 1x8h or 1xCh. 64-bit accesses may only be done to 1x8h. Comparator value. Timer 0 is 64-bits wide. Timers 1-7 are 32-bits wide.

§ §

35 Integrated Clock

35.1 Integrated Clock Configuration Registers

Table 35-1. Summary of Integrated Clock Configuration Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value

§ §

36 Interrupt

36.1 Interrupt Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
20h	20h	Initiator Initialization Command Word 1 (MICW1)—Offset 20h	11h
20h	20h	Initiator Operational Control Word 2 (MOCW2)—Offset 20h	0h
20h	20h	Initiator Operational Control Word 3 (MOCW3)—Offset 20h	8h
21h	21h	Initiator Initialization Command Word 2 (MICW2)—Offset 21h	0h
21h	21h	Initiator Initialization Command Word 3 (MICW3)—Offset 21h	7h
21h	21h	Initiator Initialization Command Word 4 (MICW4)—Offset 21h	0h
21h	21h	Initiator Operational Control Word 1 (MOCW1)—Offset 21h	0h
A0h	A0h	Target Initialization Command Word 1 (SICW1)—Offset A0h	11h
A0h	A0h	Target Operational Control Word 2 (SOCW2)—Offset A0h	0h
A0h	A0h	Target Operational Control Word 3 (SOCW3)—Offset A0h	8h
A1h	A1h	Target Initialization Command Word 2 (SICW2)—Offset A1h	0h
A1h	A1h	Target Initialization Command Word 3 (SICW3)—Offset A1h	7h
A1h	A1h	Target Initialization Command Word 4 (SICW4)—Offset A1h	0h
A1h	A1h	Target Operational Control Word 1 (SOCW1)—Offset A1h	0h
4D0h	4D0h	Initiator Edge/Level Control (ELCR1)—Offset 4D0h	0h
4D1h	4D1h	Target Edge/Level Control (ELCR2)—Offset 4D1h	0h

36.1.1 Initiator Initialization Command Word 1 (MICW1)—Offset 20h

A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs:
1. The Interrupt Mask register is cleared.
2. IRQ7 input is assigned priority 7.
3. The Target mode address is set to 7.
4. Special Mask Mode is cleared and Status Read is set to IRR.

Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Access Method

Type: IO Register (Size: 8 bits)

Device:
Function:

Default: 11h

Bit Range	Default and Access	Field Name (ID): Description
7:5	0h WO	**ICW/OCW select (ICW_OCW_SLT1):** These bits are MCS-85 specific, and not needed. Should be programmed to 000
4	1h WO	**ICW/OCW select (ICW_OCW_SLT2):** This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence.
3	0h WO	**Edge/Level Bank Select (LTIM):** Disabled. Replaced by the edge/level triggered control registers (ELCR).
2	0h WO	**ADI-IGNORED (ADI):** Ignored for PCH. Should be programmed to 0.
1	0h WO	**Single or Cascade (SNGL):** Must be programmed to a 0 to indicate two controllers operating in cascade mode.
0	1h WO	**ICW4 Write Required (IC4):** This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed.

36.1.2 Initiator Operational Control Word 2 (MOCW2)—Offset 20h

*address should be 20h
Following a part reset or ICW initialization, the controller enters the fully nested mode of operation. Non-specific EOI without rotation is the default. Both rotation mode and specific EOI mode are disabled following initialization.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:5	0h WO	**Rotate and EOI Codes (REOI):** R, SL, EOI - These three bits control the Rotate and End of Interrupt modes and combinations of the two. A chart of these combinations is listed above under the bit definition. 000 Rotate in Auto EOI Mode (Clear) 001 Non-specific EOI command 010 No Operation 011 *Specific EOI Command 100 Rotate in Auto EOI Mode (Set) 101 Rotate on Non-Specific EOI Command 110 *Set Priority Command 111 *Rotate on Specific EOI Command *L0 - L2 Are Used
4:3	0h WO	**OCW2 Select (O2S):** When selecting OCW2, bits 4:3 = 00
2:0	0h WO	**Interrupt Level Select (L2, L1, L0) (ILSLT):** L2, L1, and L0 determine the interrupt level acted upon when the SL bit is active. A simple binary code, outlined above, selects the channel for the command to act upon. When the SL bit is inactive, these bits do not have a defined function, programming L2, L1 and L0 to 0 is sufficient in this case.

36.1.3 Initiator Operational Control Word 3 (MOCW3)—Offset 20h

*address should be 20h

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 8h

Bit Range	Default and Access	Field Name (ID): Description
7	0h RO	Reserved.
6	0h WO	**Special Mask Mode (SMM):** If this bit is set, the Special Mask Mode can be used by an interrupt service routine to dynamically alter the system priority structure while the routine is executing, through selective enabling/ disabling of the other channel's mask bits. Bit 6, the ESMM bit, must be set for this bit to have any meaning.
5	0h WO	**Enable Special Mask Mode (ESMM):** When set, the SMM bit is enabled to set or reset the Special Mask Mode. When cleared, the SMM bit becomes a "do not care".
4:3	1h WO	**OCW3 Select (O3S):** When selecting OCW3, bits 4:3 = 01
2	0h WO	**Poll Mode Command (PMC):** When cleared, poll command is not issued. When set, the next I/O read to the interrupt controller is treated as an interrupt acknowledge cycle. An encoded byte is driven onto the data bus, representing the highest priority level requesting service.
1:0	0h WO	**Register Read Command (RRC):** These bits provide control for reading the ISR and Interrupt IRR. When bit 1=0, bit 0 will not affect the register read selection. Following ICW initialization, the default OCW3 port address read will be "read IRR". To retain the current selection (read ISR or read IRR), always write a 0 to bit 1 when programming this register. The selected register can be read repeatedly without reprogramming OCW3. To select a new status register, OCW3 must be reprogrammed prior to attempting the read. Value Command 00 No Action 01 No Action 10 Read IRQ Register 11 Read IS Register

36.1.4 Initiator Initialization Command Word 2 (MICW2)—Offset 21h

ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the Initiator controller and 70h for the Target controller.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:3	0h WO	**Interrupt Vector Base Address (IVBA):** Bits [7:3] define the base address in the interrupt vector table for the interrupt routines associated with each interrupt request level input.
2:0	0h WO	**Interrupt Request Level (IRL):** When writing ICW2, these bits should all be 0. During an interrupt acknowledge cycle, these bits are programmed by the interrupt controller with the interrupt to be serviced. This is combined with bits [7:3] to form the interrupt vector driven onto the data bus during the second INTA# cycle. The code is a three bit binary code: Code Initiator Interrupt Target Interrupt 000 IRQ0 IRQ8 001 IRQ1 IRQ9 010 IRQ2 IRQ10 011 IRQ3 IRQ11 100 IRQ4 IRQ12 101 IRQ5 IRQ13 110 IRQ6 IRQ14 111 IRQ7 IRQ15

36.1.5 Initiator Initialization Command Word 3 (MICW3)—Offset 21h

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 7h

Bit Range	Default and Access	Field Name (ID): Description
7:3	0h WO	**MICW3 [7:3] (MICW3_7_3):** These bits must be programmed to zero.
2	1h WO	**Cascaded Controller Connection (CCC):** This bit must always be programmed to a 1 to indicate the Target controller for interrupts 8 - 15 is cascaded on IRQ2.
1:0	3h WO	**MICW [1:0] (MICW3_1_0):** These bits must be programmed to zero.

36.1.6 Initiator Initialization Command Word 4 (MICW4)—Offset 21h

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:5	0h RO	Reserved.
4	0h WO	**Special Fully Nested Mode (SFNM):** Should normally be disabled by writing a 0 to this bit. If SFNM=1, the special fully nested mode is programmed.
3	0h WO	**Buffered Mode (BUF):** Must be cleared for non-buffered mode. Writing 1 will result in undefined behavior.
2	0h WO	**Initiator/Target in Buffered Mode (MSBM):** Not used. Should always be programmed to 0.
1	0h WO	**Automatic End of Interrupt (AEOI):** This bit should normally be programmed to 0. This is the normal end of interrupt. If this bit is 1, the automatic end of interrupt mode is programmed.
0	0h WO	**Microprocessor Mode (MM):** This bit must be written to 1 to indicate that the controller is operating in an Intel Architecture-based system. Writing 0 will result in undefined behavior.1

36.1.7 Initiator Operational Control Word 1 (MOCW1)—Offset 21h

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Request Mask (IRM):** When a 1 is written to any bit in this register, the corresponding IRQ line is masked. When a 0 is written to any bit in this register, the corresponding IRQ mask bit is cleared, and interrupt requests will again be accepted by the controller. Masking IRQ2 on the Initiator controller will also mask the interrupt requests from the Target controller.

36.1.8 Target Initialization Command Word 1 (SICW1)—Offset A0h

A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs:
1. The Interrupt Mask register is cleared.
2. IRQ7 input is assigned priority 7.
3. The Target mode address is set to 7.
4. Special Mask Mode is cleared and Status Read is set to IRR.
Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 11h

Bit Range	Default and Access	Field Name (ID): Description
7:5	0h WO	**ICW/OCW select (ICW_OCW_SLT1):** These bits are MCS-85 specific, and not needed. Should be programmed to 000
4	1h WO	**ICW/OCW select (ICW_OCW_SLT2):** This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence.
3	0h WO	**Edge/Level Bank Select (LTIM):** Disabled. Replaced by the edge/level triggered control registers (ELCR).
2	0h WO	**ADI-IGNORED (ADI):** Ignored for PCH. Should be programmed to 0.
1	0h WO	**Single or Cascade (SNGL):** Must be programmed to a 0 to indicate two controllers operating in cascade mode.
0	1h WO	**ICW4 Write Required (IC4):** This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed.

36.1.9 Target Operational Control Word 2 (SOCW2)—Offset A0h

*address should be A0h
Following a part reset or ICW initialization, the controller enters the fully nested mode of operation. Non-specific EOI without rotation is the default. Both rotation mode and specific EOI mode are disabled following initialization.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:5	0h WO	**Rotate and EOI Codes (REOI):** R, SL, EOI - These three bits control the Rotate and End of Interrupt modes and combinations of the two. (Size: 8 bits)

Device:
Function:

Default: 7h

Bit Range	Default and Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2:0	7h WO	**Target Identification Code (SIC):** This field must be programmed to 02h to match the code broadcast by the Initiator controller during the INTA# sequence.

36.1.13 Target Initialization Command Word 4 (SICW4)—Offset A1h

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:5	0h RO	Reserved.
4	0h WO	**Special Fully Nested Mode (SFNM):** Should normally be disabled by writing a 0 to this bit. If SFNM=1, the special fully nested mode is programmed.
3	0h WO	**Buffered Mode (BUF):** Must be cleared for non-buffered mode. Writing 1 will result in undefined behavior.
2	0h WO	**Initiator/Target in Buffered Mode (MSBM):** Not used. Should always be programmed to 0.
1	0h WO	**Automatic End of Interrupt (AEOI):** This bit should normally be programmed to 0. This is the normal end of interrupt. If this bit is 1, the automatic end of interrupt mode is programmed.
0	0h WO	**Microprocessor Mode (MM):** This bit must be written to 1 to indicate that the controller is operating in an Intel Architecture-based system. Writing 0 will result in undefined behavior.1

36.1.14 Target Operational Control Word 1 (SOCW1)—Offset A1h

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Interrupt Request Mask (IRM):** When a 1 is written to any bit in this register, the corresponding IRQ line is masked. When a 0 is written to any bit in this register, the corresponding IRQ mask bit is cleared, and interrupt requests will again be accepted by the controller. Masking IRQ2 on the Initiator controller will also mask the interrupt requests from the Target controller.

36.1.15 Initiator Edge/Level Control (ELCR1)—Offset 4D0h

Initiator Edge/Level Control Register

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:3	0h RW	**Edge Level Control (ELC_7_3):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level.
2:0	0h RO	Reserved.

36.1.16 Target Edge/Level Control (ELCR2)—Offset 4D1h

Target Edge/Level Control Register

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:6	0h RW	**Edge Level Control (ELC_15_14):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. Bit 7 applies to IRQ15, and bit 6 to IRQ14.
5	0h RW	**Edge Level Control (ELC_13):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. This bit applies to IRQ13.
4:1	0h RW	**Edge Level Control (ELC_12_9):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. Bit 4 applies to IRQ12, bit 3 to IRQ11, bit 2 to IRQ10, and bit 1 to IRQ9.
0	0h RO	Reserved.

36.2 Interrupt PCR Registers

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Offset Start	Offset End	Register Name (ID)—Offset	Default Value

36.2.10 PCI Interrupt Route 1 (PIR1)—Offset 3142h

Same definition as PIR0, except this register applies to Device 29 functions.

36.2.11 PCI Interrupt Route 2 (PIR2)—Offset 3144h

Same definition as PIR0, except this register applies to Device 28 functions.

36.2.12 PCI Interrupt Route 3 (PIR3)—Offset 3146h

Same definition as PIR0, except this register applies to Device 23 functions.

36.2.13 PCI Interrupt Route 4 (PIR4)—Offset 3148h

Same definition as PIR0, except this register applies to Device 22 functions.

36.2.14 PCI Interrupt Route 5 (PIR5)—Offset 314Ah

Same definition as PIR0, except this register applies to Device 20 and 18 functions.

36.2.15 General Interrupt Control (GIC)—Offset 31FCh

Note: FEC10000h - FEC3FFFFh is allocated to PCIe when Port I/OxApic Enable (PAE) bit is set.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW	**Alternate Access Mode Enable (AME):** When set, read only registers can be written, and write only registers can be read.
16	0h RW	**Shutdown Policy Select (SDPS):** When cleared (default) the PCH will update INIT# in response to the shutdown Vendor Defined Message (VDM). When set to 1, PCH will treat the shutdown VDM similar to receiving a CF9h I/O write, and will drive PLTRST# active. This register is reset any time PLTRST# asserts.
15:9	0h RW	**MAX_IRQ_ENTRY_SIZE (MAXIRQSIZE):** This field indicates the size of the IOAPIC entry. The default size is 120 entries. 0000000: 120 entry size 0000001: 24 entry size (Legacy mode) 0000010 - 1111111: Reserved
8:1	0h RO	Reserved.
0	0h RO/P	**CPU Shutdown Status (CPUSDSTS):** This bit is set to 1 if the CPU sends the Shutdown Special cycle message. The Shutdown Message is recognized as an INIT# event if the Shutdown Policy Select = 0, else PCH shall treat the Shutodwn Special cycle as a request for CF9 Hard Reset. This is a sticky Read Only bit that is only reset by a loss of core power.

36.2.16 Interrupt Polarity Control 0 (IPC0)—Offset 3200h

Interrupt Polarity Control 0 Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: FF0000h

Bit Range	Default and Access	Field Name (ID): Description
31:0	FF0000h RW	**IRQ 31-0 Active High Polarity Disable (IPC0_IRQxAHPOLDIS):** When set to 1, the interrupt polarity associated with IRQ31 down to IRQ0 is inverted to appear as Active Low to IOAPIC. When set to 0, the interrupt is appears as Active High to IOAPIC.

36.2.17 Interrupt Polarity Control 1 (IPC1)—Offset 3204h

Interrupt Polarity Control 1 Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**IRQ 63-32 Active High Polarity Disable (IPC1_IRQAHPOLDIS):** When set to 1, the interrupt polarity associated with IRQ63 down to IRQ32 is inverted to appear as Active Low to IOAPIC. When set to 0, the interrupt is appears as Active High to IOAPIC.

36.2.18 Interrupt Polarity Control 2 (IPC2)—Offset 3208h

Interrupt Polarity Control 2 Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RW	**IRQ 95-64 Active High Polarity Disable (IPC2_IRQAHPOLDIS):** When set to 1, the interrupt polarity associated with IRQ95 down to IRQ64 is inverted to appear as Active Low to IOAPIC. When set to 0, the interrupt is appears as Active High to IOAPIC.

36.2.19 Interrupt Polarity Control 3 (IPC3)—Offset 320Ch

Interrupt Polarity Control 3 Register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:0	0h RW	**IRQ 119-96 Active High Polarity Disable (IPC3_IRQAHPOLDIS):** When set to 1, the interrupt polarity associated with IRQ119 down to IRQ96 is inverted to appear as Active Low to IOAPIC. When set to 0, the interrupt is appears as Active High to IOAPIC.

36.2.20 ITSS Power Reduction Control (ITSSPRC)—Offset 3300h

Power controls for the entire interrupt and timer subsystem.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3	0h RW	**HPET Dynamic Clock Gating Enable (HPETDCGE):** When set, the HPET enables dynamic clock gating.
2	0h RW	**8254 Static Clock Gating Enable (CGE8254):** When set, the 8254 timer is disabled statically. This bit shall be set by BIOS if the 8254 feature is not needed in the system or before BIOS hands off the system that supports C11. Normal operation of 8254 requires this bit to 0.
1	0h RW	**Sideband Dynamic Clock Gating Enable (SBDCGE):** Setting this bit will enable all dynamic clock gating of the Sideband Clock domain.
0	0h RW	**PCI Dynamic Clock Gating Enable (PCIDCGE):** Setting this bit will enable dynamic clock gating for the Interrupt and Timer Sub System Core Logic.

36.2.21 Initiator Message Control (MMC)—Offset 3334h

Initiator Message Control Register

Access Method

Type: MSG Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
15:1	0h RO	Reserved.
0	0h RW/V	**Initiator Message Enable (MSTRMSG_EN):** When set, allows Interrupt and Timer Subsystem (ITSS) to release any pending/in progress IOAPIC memory write, HPET memory write, virtual wire event or error messages to the IO frabic. When cleared, ITSS prevents these messages from being issued to the IO frabic.

§ §

37 Real Time Clock (RTC)

37.1 FRTC IO INDEX REG Registers

RTC IO Index Registers Port 70 and 71h

Table 37-1. Summary of RTC IO INDEX REG Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
70h	70h	RTC Index Register (INDEX)—Offset 70h	0h
71h	71h	RTC Target Register (TARGET)—Offset 71h	0h

37.1.1 RTC Index Register (INDEX)—Offset 70h

This 8-bit register selects which indirect register appears in the target register to be manipulated by software. Software will program this register to select the desired RTC indexed register.

Access Method

Type: MSG Register (Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**Index Register (INDEX):** Index Register for RTC

37.1.2 RTC Target Register (TARGET)—Offset 71h

This 8-bit register specifies the data to be read or written to the register pointed to by the INDEX register.

Access Method

Type: MSG Register (Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW/V	**RTC Target Register (TARGET):** RTC Target Register for RTC

37.2 RTC Indexed Registers Summary

The RTC contains two sets of indexed registers that are accessed using the two separate Index and Target registers (70h/71h or 72h/73h), as shown in the following table:

RTC (Standard) RAM Bank
Index Name
00h Seconds
01h Seconds Alarm
02h Minutes
03h Minutes Alarm
04h Hours
05h Hours Alarm
06h Day of Week
07h Day of Month
08h Month
09h Year
0Ah Register A
0Bh Register B
0Ch Register C
0Dh Register D
0Eh – 7Fh 114 Bytes of User RAM

Table 37-2. Summary of RTC Indexed Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	0h	Seconds Value (Sec)—Offset 0h	Xh
1h	1h	Seconds Alarm (Sec_Alarm)—Offset 1h	Xh
2h	2h	Minutes Value (Minutes)—Offset 2h	Xh
3h	3h	Minutes Alarm (Minutes_Alarm)—Offset 3h	Xh
4h	4h	Hours Value (Hours)—Offset 4h	Xh
5h	5h	Hours Alarm (Hours_Alarm)—Offset 5h	Xh
6h	6h	Day Of Week (Day_of_Week)—Offset 6h	Xh
7h	7h	Day Of Month (Day_of_Month)—Offset 7h	Xh
8h	8h	Month Value (Month)—Offset 8h	Xh
9h	9h	Year Value (Year)—Offset 9h	Xh
Ah	Ah	Register A (RTC_REGA)—Offset Ah	0h
Bh	Bh	Register B General Configuration (Register_B)—Offset Bh	10000XXX
Ch	Ch	Register C Flag Register (Register_C)—Offset Ch	0h
Dh	Dh	Register D Flag Register (Register_D)—Offset Dh	10XXXXXX
Eh	Eh	114 Bytes Of Lower User RAM (Register_E)—Offset Eh	Xh
80h	80h	128 Bytes Of Upper User RAM (Register_80)—Offset 80h	Xh

37.2.1 Seconds Value (Sec)—Offset 0h

RTC Index: 00h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time second

37.2.2 Seconds Alarm (Sec_Alarm)—Offset 1h

RTC Index: 01h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Seconds Alarm

37.2.3 Minutes Value (Minutes)—Offset 2h

RTC Index: 02h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time Minutes

37.2.4 Minutes Alarm (Minutes_Alarm)—Offset 3h

RTC Index: 03h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Alarm Minutes

37.2.5 Hours Value (Hours)—Offset 4h

RTC Index: 04h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time Hours

37.2.6 Hours Alarm (Hours_Alarm)—Offset 5h

RTC Index: 05h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Alarm Hours

37.2.7 Day Of Week (Day_of_Week)—Offset 6h

RTC Index: 06h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Day of Week

37.2.8 Day Of Month (Day_of_Month)—Offset 7h

RTC Index: 07h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Day of Month

37.2.9 Month Value (Month)—Offset 8h

RTC Index: 08h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Month

37.2.10 Year Value (Year)—Offset 9h

RTC Index: 09h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Year

37.2.11 Register A (RTC_REGA)—Offset Ah

This register is used for general configuration of the RTC functions. None of the bits are affected by RSMRST# or any other reset signal.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7	0h RO/V	**UPDATE IN PROGRESS (UIP):** This bit may be monitored as a status flag. 0 = Update cycle will not start for at least 488 micro-seconds. The time, calendar, and alarm information in RAM is always available when the UIP bit is 0. 1 = The update is soon to occur or is in progress.
6:0	0h RO	Reserved.

37.2.12 Register B General Configuration (Register_B)—Offset Bh

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 80h

Bit Range	Default and Access	Field Name (ID): Description
7	1h RW	**Update Cycle Inhibit (SET):** Enables/Inhibits the update cycles. 0 = Update cycle occurs normally once each second. 1 = A current update cycle will abort and subsequent update cycles will not occur until SET is returned to zero. When set is one, the BIOS may initialize time and calendar bytes safely. This bit is not affected by RSMRST# nor any other reset signal. Note: Software must ensure this bit is at least transitioned from '1' to '0' once whenever the RTC coin battery is inserted. This is to ensure that the internal RTC time updates occur properly.
6	0h RW	**Periodic Interrupt Enable (PIE):** 0 = Disabled. 1 = Enabled. Allows an interrupt to occur with a time base set with the RS bits of register A. This bit is cleared by RSMRST# assertion, but not on any other reset.
5	0h RW	**Alarm Interrupt Enable (AIE):** 0 = Disabled. 1 = Enabled. Allows an interrupt to occur when the AF is set from an alarm match from the update cycle. An alarm can occur once a second, one an hour, once a day, or once a month. This bit is cleared by RTCRST# assertion, but not on any other reset.
4	0h RW	**Update-ended Interrupt Enable: (UIE):** 0 = Disabled. 1 = Enabled. Allows an interrupt to occur when the update cycle ends. This bit is cleared by RSMRST# assertion, but not on any other reset.
3	0h RW	**Square Wave Enable (SQWE):** The Square Wave Enable bit serves no function in this device. There is not SQW pin on this device. This bit is cleared by RSMRST# assertion, but not on any other reset.

Bit Range	Default and Access	Field Name (ID): Description
2	Xh RW	**Data Mode (DM):** This bit specifies either binary or BCD data representation. 0 = BCD. 1 = Binary. This bit is not affected by RSMRST# nor any other reset signal.
1	Xh RW	**Hour Format (HOURFORM):** This bit indicates the hour byte format. 0 = Twelve-hour mode is selected.In twelve hour mode, the seventh bit represents AM as zero and PM as one. 1 = Twenty-four hour mode is selected. This bit is not affected by RSMRST# nor any other reset signal.
0	Xh RW	**Daylight Savings Enable (DSE):** The Daylight Savings Enable bit triggers two special hour updates per year when set to one. One is on the first Sunday in April, where time increments from 1:59:59 AM to 3:00:00 AM. The other is the last Sunday in October when the time first reaches 1:59:59 AM, it is changed to 1:00:00 AM. The time mustincrement normally for at least two update cycles (seconds) previous to these conditions for the time change to occur properly. These special update conditions do not occur when the DSE bit is set to zero. The days for the hour adjustment are those specified in United States federal law as of 1987, which is different than previous years. If BUC.DSO bit is set, the DSE bit continues to be a R/W bit, but Daylight Saving is disabled regardless of the DSE bit. This bit is not affected by RSMRST# nor any other reset signal.

37.2.13 Register C Flag Register (Register_C)—Offset Ch

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7	0h RO/V	**Interrupt Request Flag (IRQF):** Interrupt Request Flag = (PF * PIE) + (AF * AIE) + (UF * UFE). This also causes the RTC Interrupt to be asserted. This bit is cleared upon RSMRST# assertion or a read of Register C.
6	0h RO/V	**Periodic Interrupt Flag (PF):** Periodic interrupt Flag will be one when the tap as specified by the RS bits of register A is one. If no taps are specified, this flag bit will remain at zero. This bit is cleared upon RSMRST# assertion or a read of Register C.
5	0h RO/V	**Alarm Flag (AF):** Alarm Flag will be high after all Alarm values match the current time. This bit is cleared upon RTCRST# assertion or a read of Register C.
4	0h RO/V	**Update-ended Flag (UF):** Updated-ended flag will be high immediately following an update cycle for each second. The bit is cleared upon RSMRST# assertion or a read of Register C.
3:0	0h RO	Reserved.

37.2.14 Register D Flag Register (Register_D)—Offset Dh

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 80h

Bit Range	Default and Access	Field Name (ID): Description
7	1h RO	**Valid RAM and Time Bit (VRT):** This bit is hard-wired to 1 in the RTC power well. This bit should always be written as a 0 for write cycle, however it will return a 1 for read cycles.
6	0h RO	Reserved.
5:0	Xh RW	**Date Alarm (Date_Alarm):** These bits store the date of month alarm value. If set to 000000, then a dont care state is assumed. The host must configure the dates alarm for these bits to do anything, yet they can be written at any time. If the date alarm is not enabled, these bits will return zeros. These bits are not affected by any reset assertion.

37.2.15 114 Bytes Of Lower User RAM (Register_E)—Offset Eh

Remaining 114 Bytes of Lower User RAM. Each byte in this bank share the same description as shown below. RAM default values are undetermined and the last written value will be retained until RTC power is removed.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:0	Xh RW	**Lower User RAM (LOWER_USER_RAM):** RTC RAM lower unused range

37.2.16 128 Bytes Of Upper User RAM (Register_80)—Offset 80h

128 Bytes of Upper User RAM. Each byte in this bank share the same description as shown below. RAM default values are undetermined and the last written value will be retained until RTC power is removed.

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:0	Xh RW	**Upper User RAM (UPPER_USER_RAM):** RTC RAM upper unused range

37.3 RTC PCR Registers

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 37-3. Summary of RTC PCR Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
3400h	3403h	RTC Configuration (RC)—Offset 3400h	0h
3414h	3417h	Backed Up Control (BUC)—Offset 3414h	0h
3F04h	3F07h	RTC Update In Progress SMI Control (UIPSMI)—Offset 3F04h	0h

37.3.1 RTC Configuration (RC)—Offset 3400h

All bits in this register are in the Primary Well.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31	0h RW/1L	**Bios Interface Lock-Down (BILD):** When set, prevents RTC version of TS (BUC.TS) from being changed. This bit can only be written from 0 to 1 once. This BILD bit has different function compared SPI and eSPI version but BIOS should set all the corresponding bits after reset in order to lock down the BIOS interface correctly.
30:7	0h RO	Reserved.
6	0h RW	**RTC High Power Mode HW Disable (HPM_HW_DIS):** When set to 1 the internal VRM that generates the rtc well supply voltage in SUS mode is disabled when SLP_S0# is asserted to '0'. (via irtcdswen pin to RTC EBB). When 0, HW control of the RTC internal VRM is disabled.
5	0h RW	**RTC High Power Mode SW Disable (HPM_SW_DIS):** When set to 1 the internal VRM that generates the rtc well supply voltage in SUS mode is disabled (via irtcdswen pin to RTC EBB). When 0 the internal VRM powers the rtc well when RSMRST# is '1'. (default)
4	0h RW/1L	**Partial Range Lock in Upper 128 Bytes (UL):** When set, bytes 38h-3Fh in the upper 128 byte bank of RTC RAM are locked and cannot be accessed. Writes will be dropped and reads will not return any guaranteed data. Bit reset on system reset.

Bit Range	Default and Access	Field Name (ID): Description
3	0h RW/1L	**Partial Range Lock in Lower 128 Bytes (LL):** When set, bytes 38h-3Fh in the lower 128 byte bank of RTC RAM are locked and cannot be accessed. Writes will be dropped and reads will not return any guaranteed data. Bit reset on system reset.
2	0h RW	**Upper 128 Byte Enable (UE):** When set, the upper 128 byte bank of RTC RAM can be accessed.
1:0	0h RO	Reserved.

37.3.2 Backed Up Control (BUC)—Offset 3414h

All bits in this register are in the RTC well and only cleared by RTCRST#.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4	0h RW	**Daylight Savings Override (SDO):** When this bit is a '1', the DSE bit in the RTC Register B bit(0) is a RW bit but has no effect where daylight savings is hard-disabled internally. When this bit is a '0', the DSE bit in the RTC register B bit(0) is a RW bit that is configurable by software to enable the daylight savings. System BIOS shall configure this bit accordingly during the boot process before RTC time is initialized.
3:1	0h RO	Reserved.
0	0h RW/L	**Top Swap (TS):** *If PCH is strapped for Top-Swap (GNT(3)# is low at rising edge of PWROK), then this bit cannot be cleared by software. The strap jumper should be removed and the system rebooted.

37.3.3 RTC Update In Progress SMI Control (UIPSMI)—Offset 3F04h

This register exists in the Core well.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW/1C/V	**RTC UIP Low-to-High (UIP_L2H):** This sticky status bit is set whenever the RTC Update-In-Progress signal transitions from low to high (i.e., at the start of an update).
16	0h RW/1C/V	**RTC UIP High-to-Low (UIP_H2L):** This sticky status bit is set whenever the RTC Update-In-Progress signal transitions from high to low (i.e., at the start of an update).
15:2	0h RO	Reserved.
1	0h RW	**RTC UIP Low-to-High SMI Enable (UIP_L2H_SMI_en):** When this bit is set, a '1' in bit 17 will assert the internal SMI signal to the Power Management SMI logic
0	0h RW	**RTC UIP High-to-Low SMI Enable (UIP_H2L_SMI_en):** When this BIOS is set, a '1' in bit 16 will assert the internal SMI signal to the Power Management SMI logic

§ §

38 System Management TCO

38.1 SMBus TCO I/O Registers

The TCO I/O registers reside in a 32-byte range that starts from the IO Base Address described in the TCOBAR register in the SMBus PCI Configuration space.

Table 38-1. Summary of SMBus TCO I/O Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	1h	TCO_RLD Register (TRLD)—Offset 0h	4h
2h	2h	TCO_DAT_IN Register (TDI)—Offset 2h	0h
3h	3h	TCO_DAT_OUT Register (TDO)—Offset 3h	0h
4h	5h	TCO1_STS Register (TSTS1)—Offset 4h	0h
6h	7h	TCO2_STS Register (TSTS2)—Offset 6h	0h
8h	9h	TCO1_CNT Register (TCTL1)—Offset 8h	0h
Ah	Bh	TCO2_CNT Register (TCTL2)—Offset Ah	8h
Ch	Dh	TCO Message Registers (TMSG)—Offset Ch	0h
Eh	Eh	TCO_WDSTATUS Register (TWDS)—Offset Eh	0h
10h	10h	LEGACY_ELIM Register (LE)—Offset 10h	3h
12h	13h	TCO_TMR Register (TTMR)—Offset 12h	4h

38.1.1 TCO_RLD Register (TRLD)—Offset 0h

TCO_RLD Register

Access Method

Type: IO Register
(Size: 16 bits)

Device:
Function:

Default: 4h

Bit Range	Default and Access	Field Name (ID): Description
15:10	0h RO	Reserved.
9:0	4h RW	**TCORLD (TCORLD):** Reading this register will return the current count of the TCO timer. Writing any value to this register will reload the timer to prevent the timeout.

38.1.2 TCO_DAT_IN Register (TDI)—Offset 2h

TCO_DAT_IN Register

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**TCO_DAT_IN (TDI):** Data Register for passing commands from the OS to the SMI handler. Writes to this register will cause an SMI and set the OS_TCO_SMI bit in the TCO_STS register.

38.1.3 TCO_DAT_OUT Register (TDO)—Offset 3h

TCO_DAT_OUT Register

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**TCO_DAT_OUT (TDO):** Data Register for passing commands from the SMI handler to the OS. Writes to this register will set the TCO_INT_STS bit in the TCO_STS register. It also causes an interrupt, as selected by the TCO_IRQ_SEL bits.

38.1.4 TCO1_STS Register (TSTS1)—Offset 4h

Unless otherwise indicated, these bits are sticky and are cleared by writing a 1 to the corresponding bit position.

Access Method

Type: IO Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
15:14	0h RO	Reserved.
13	0h RO	**TCO Target Select (TCO_SLVSEL):** This register bit indicates the value of TCO Target Select Soft Strap.
12	0h RW/1C	**CPUSERR_STS (CPUSERR_STS):** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SERR#. The software must read the MCH to find out why it wanted the SERR#. Software must write a 1 back to this bit to clear it.
11	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
10	0h RW/1C	**CPUSMI_STS (CPUSMI_STS):** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SMI. The software must read the CPU to find out why it wanted the SMI. Software must write a 1 back to this bit to clear it.
9	0h RW/1C	**CPUSCI_STS (CPUSCI_STS):** This bit is set to 1 if the CPU complex sends a DMI special cycle message indicating that it wants to cause an SCI. The software must read the CPU to find out why it wanted the SCI. Software must write a 1 back to this bit to clear it.
8	0h RW/1C	**BIOSWR_STS (BIOSWR_STS):** PCH sets this bit to 1 and generates an SMI# to indicate an unsupported attempt to write to the BIOS located in the FWH. This occurs when either: a) The BIOSWP bit is changed from 0 to 1 and the LE bit is also set, or b) Any write is attempted to the BIOS and the BIOSWP bit is also set. This bit does not get set to 1 when: 1) a or b above occurs on eSPI controller. 2) a or b above occurs on SPI Flash controller. Note: On write cycles attempted to the 4MB lower alias to the BIOS space, the BIOSWR_STS bit will not be set.
7	0h RW/1C	**NEWCENTURY_STS (NEWCENTURY_STS):** This bit will be set when the year rolls over from 1999 to 2000. If the bit is already 1, it will remain 1. This bit can be cleared either by software writing a 1 back to the bit position, or by RTCRST# going active. When this bit is set, an SMI# will be generated. However, this will not be a wake event (i.e. if the system is in a sleeping state when the NEWCENTURY_STS bit is set, the system will not wake up). Note: This bit 7 is not valid when the RTC battery is first put in (or if the RTC battery does not provide sufficient power when the system is unplugged). Software can determine that the RTC well was not maintained by checking the RTC_PWR_STS bit (GEN_PMCON_3 register in the Power Management Controller, D31:F2:A4, bit 2) or by other means (such as doing a checksum on the RTC RAM array). If the RTC well is determined to not have been maintained, the BIOS should set the time to a legal value and then clear the NEWCENTURY_STS bit. Note: This bit may take up to 3 RTCCLKs for the bit to be cleared when a 1 is written to the bit to clear it. After writing a 1 to the NEWCENTURY_STS bit, software should also not exit the SMI handler until after the bit has been cleared. This is to make sure the SMI is not re-entered. BIOS Assumption: When booting, the BIOS checks the NEWCENTURY_STS bit. If set, the BIOS should increment the value in the RTC RAM register associated with the century. The BIOS should then clear the NEWCENTURY_STS bit. This scenario would occur if the system was asleep when the century rolls over. If the system is in an S0 state (not sleeping) and the SMI# occurs with the NEWCENTURY_STS bit sets, the SMI handler should increment the value in the RTC RAM register and clear the NEWCENTURY_STS bit.
6:4	0h RO	Reserved.
3	0h RW/1C	**TIMEOUT (TIMEOUT):** Bit set to 1 by PCH to indicate that the SMI was caused by TCO timer reaching 0. Note: The SMI handler should clear this bit to prevent an immediate re-entry to the SMI handler.
2	0h RW/1C	**TCO_INT_STS (TCO_INT_STS):** Bit set to 1 when SMI handler caused the interrupt by writing to the TCO_DAT_OUT register.
1	0h RW/1C	**OS_TCO_SMI (OS_TCO_SMI):** Bit set to 1 when OS code caused an SMI# by writing to the TCO_DAT_IN register.
0	0h RO/V	**NMI2SMI_STS (NMI2SMI_STS):** The PCH sets this bit when an SMI# occurs because an event occurred that would otherwise have caused an NMI.

38.1.5 TCO2_STS Register (TSTS2)—Offset 6h

TCO2_STS Register

Access Method

Type: IO Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
15:5	0h RO	Reserved.
4	0h RW/1C	**SMLINK_Target_SMI_STS (SMLINK_Target_SMI_STS):** The PCH will set this bit to 1 when it receives the SMI message (encoding 08h in the command type) on the SMLinks Target Interface. Software clears the bit by writing a 1 to this bit position. This bit is in the resume well. It is reset by RSMRST#, but not by the PCI Reset associated with exit from S3-S5 states. This allows the software (presumably BIOS) to get the interrupt, refer this new bit set, and decidedly go into the pre-determined (by local policy) sleep state.
3	0h RO	Reserved.
2	0h RO/V	**NO_REBOOT_PIN_STRAP_STATUS (NRSTRAP_STS):** This bit reflects the state of the No_Reboot strap that is sampled on PWROK rise.
1	0h RW/1C	**SECOND_TO_STS (SECOND_TO_STS):** PCH sets this bit to 1 to indicate that the TIMEOUT bit had been (or is currently) set and a second timeout occurred before the TCO_RLD register was written. If this bit is set and the NO_REBOOT config bit is 0, then the PCH will reboot the system after the second timeout. The reboot is done by asserting PLTRST#. This bit is only cleared by writing a 1 to this bit or by a RSMRST#.
0	0h RW/1C	**INTRD_DET (INTRD_DET):** The bit is set to 1 by the PCH to indicate that an intrusion was detected. This bit is cleared by writing a 1 to this bit or by RTCRST#. Note: This bit has a recovery time. After writing a 1 to this bit position (to clear it), the bit may be read back as a 1 for up 65 microseconds before it is read as a 0. Software must be aware of this recovery time when reading this bit after clearing it. Note: If the INTRUDER# signal is active when the software attempts to clear the INTRD_DET bit, the bit will remain as a 1, and the SMI# will be generated again immediately. The SMI handler can clear the INTRD_SEL bits to avoid further SMIs. However, if the INTRUDER# signals goes inactive and then active again, there will not be further SMIs. If the INTRUDER# signal goes inactive some point after the INTRD_DET bit is written as a 1, then the INTRD_DET signal will go to a 0 when INTRUDER# input signal goes inactive. Note that this is slightly different than a classic sticky bit, since most sticky bits would remain active indefinitely when the signal goes active and would immediately go inactive when a 1 is written to the bit.

38.1.6 TCO1_CNT Register (TCTL1)—Offset 8h

TCO1_CNT Register

Access Method

Type: IO Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h RW	**TCO_LOCK (TCO_LOCK):** When set to 1, this bit prevents writes from changing the TCO_EN bit (in offset 30h of Power Management I/O space). Once this bit is set to 1, it can not be cleared by software writing a 0 to this bit location. A core-well reset is required to change this bit from 1 to 0. This bit defaults to 0.
11	0h RW	**TCO_TMR_HALT (TCO_TMR_HALT):** 1 = The TCO timer will halt. It will not count, and thus cannot reach a value that would cause an SMI# or to cause the SECOND_TO_STS bit to be set. This will also prevent rebooting. 0 = The TCO timer is enabled to count. This is the default.
10	0h RO	Reserved.
9	0h RW	**NMI2SMI_EN (NMI2SMI_EN):** Setting this bit 1 forces all NMIs to instead cause an SMI#, and will be reported in the TCO1_STS register. NMI2SMI_EN bit is set AND the NMI_EN# bit is set to 0, the NMI# will be routed to cause an SMI#. No NMI will be caused. However, if the GBL_SMI_EN bit is not set, then no SMI# will be generated, either. If NMI2SMI_EN is set but the NMI_EN# bit is set to 1, then no NMI or SMI# will be generated. The following table shows the possible combinations: NMI_EN#, GBL_SMI_EN 00: No SMI# based on NMI events (since no SMI# at all because SMI_EN = 0) 01: SMI# will be caused based on NMI events 10: No SMI# at all because SMI_EN is 0 11: No SMI# based on NMI events because NMI_EN#=1
8	0h RW	**NMI_NOW (NMI_NOW):** Writing a 1 to this bit causes an NMI. This allows the BIOS or SMI handler to force entry to the NMI handler. The NMI handler is expected to clear this bit. Another NMI will not be generated until the bit is cleared by writing a 1 back to the same bit position.
7:1	0h RO	Reserved.
0	0h RW	**NO_REBOOT_MSUS (NR_MSUS):** This bit reflects the No Reboot pin strap state. It is sampled high on PWROK. This bit may be set or cleared by software if the strap is sampled low but may not override the strap when the it indicates No Reboot. When set, the TCO timer will count down and generate the SMI# on the first timeout, but will not reboot on the second timeout.

38.1.7 TCO2_CNT Register (TCTL2)—Offset Ah

TCO2_CNT Register

Access Method

Type: IO Register
(Size: 16 bits)

Device:
Function:

Default: 8h

Bit Range	Default and Access	Field Name (ID): Description
15:6	0h RO	Reserved.
5:4	0h RW	**OS_POLICY (OS_POLICY):** OS-based software writes to these bits to select the policy that the BIOS will use after the platform resets due the WDT. The following convention is recommended for the BIOS and OS: 00 Boot normally 01 Shut down 10 Dont load OS. Hold in pre-boot state and use LAN to determine next step 11 Reserved Implementation note: These are just scratch pad bits. They should not be reset when the TCO logic resets the platform due to Watchdog Timer.
3	1h RW	**SMB_ALERT_DISABLE (SMB_ALERT_DISABLE):** Disables muxed GPIO/ SMBALERT# signal as an alert source for the heartbeats and the SMBus Target. At reset (RSMRST# pin assertion only), this bit is set and the muxed GPIO/SMBALERT# alerts are disabled.
2:1	0h RW	**INTRD_SEL (INTRD_SEL):** Selects the action to take if the INTRUDER# signal goes active. 11: Reserved 01: Interrupt (as selected by TCO_INT_SEL). 10: SMI# 00 INTRUDER# does not cause SMI# or interrupt
0	0h RO	Reserved.

38.1.8 TCO Message Registers (TMSG)—Offset Ch

TCOBASE+0Ch (MSG1) TCOBASE+0Dh (MSG2) BIOS can write into these registers to indicate its boot progress. The external microcontroller can read these registers to monitor the boot progress

Access Method

Type: IO Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
15:8	0h RW	**TCO Message2 (MSG2):** TCO Message2
7:0	0h RW	**TCO Message1 (MSG1):** TCO Message1

38.1.9 TCO_WDSTATUS Register (TWDS)—Offset Eh

TCO_WDSTATUS Register

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
7:0	0h RW	**TCO_WDSTATUS Register (TWDS):** The BIOS or system management software can write into this register to indicate more details on the boot progress. The register will rest to 00h based on a RSMRST# (but not PCI Reset). The external microcontroller can read this register to monitor boot progress.

38.1.10 LEGACY_ELIM Register (LE)—Offset 10h

LEGACY_ELIM Register

Access Method

Type: IO Register
(Size: 8 bits)

Device:
Function:

Default: 3h

Bit Range	Default and Access	Field Name (ID): Description
7:2	0h RO	Reserved.
1	1h RW	**IRQ12_CAUSE (IRQ12_CAUSE):** When software sets the bit to 1, IRQ12 will be high (asserted). When software sets the bit to 0, IRQ12 will be low (not asserted). Default for this bit is 1.
0	1h RW	**IRQ1_CAUSE (IRQ1_CAUSE):** When software sets the bit to 1, IRQ1 will be high (asserted). When software sets the bit to 0, IRQ1 will be low (not asserted). Default for this bit is 1.

38.1.11 TCO_TMR Register (TTMR)—Offset 12h

TCO_TMR Register

Access Method

Type: IO Register
(Size: 16 bits)

Device:
Function:

Default: 4h

Bit Range	Default and Access	Field Name (ID): Description
15:10	0h RO	Reserved.
9:0	4h RW	**TCOTMR (TCOTMR):** Value that is loaded into the timer each time the TCO_RLD register is written. Values of 0000h or 0001h will be ignored and should not be attempted. The timer is clocked at approximately 0.6 seconds, and thus allows timeouts ranging from 1.2 second to 613.8 seconds. Note: The timer has an error of +/- 1 tick (0.6s).

40.1.1 Virtual Channel 0 Resource Control (V0CTL)—Offset 2014h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 80000000h

Bit Range	Default & Access	Field Name (ID): Description
31	1h RO	**Virtual Channel Enable (EN):** Enables the VC when set. Disables the VC when cleared.
30:27	0h RO	Reserved.
26:24	0h RO	**Virtual Channel Identifier (ID):** Indicates the ID to use for this virtual channel
23:16	0h RO	Reserved.
15:10	0h RW/L	**Extended TC/VC Map (ETVM):** Defines the upper 8-bits of the VC0 16-bit TC/VC mapping registers. These registers use the PCI Express reserved TC[3] traffic class bit.This register is Read-Only if DMIC.SRL field is set.
9:7	0h RO	Reserved.
6:1	0h RW/L	**Transaction Class / Virtual Channel Map (TVM):** Indicates which transaction classes are mapped to this virtual channel. When a bit is set, this transaction class is mapped to the virtual channel. This register is Read-Only if DMIC.SRL field is set.
0	0h RO	Reserved.

40.1.2 Virtual Channel 0 Resource Status (V0STS)—Offset 201Ah

Access Method

Type: MSG Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	Reserved.
1	0h RO/V	**VC Negotiation Pending (NP):** When set, indicates the virtual channel is still being negotiated with ingress ports.
0	0h RO	Reserved.

40.1.3 Virtual Channel 1 Resource Control (V1CTL)—Offset 2020h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Virtual Channel Enable (EN):** Enables the VC when set. Disables the VC when cleared.
30:28	0h RO	Reserved.
27:24	0h RW/L	**Virtual Channel Identifier (ID):** Indicates the ID to use for this virtual channel. This register is Read-Only if the DMIC.SRL field is set.
23:16	0h RO	Reserved.
15:10	0h RW/L	**Extended TC/VC Map (ETVM):** Defines the upper 8-bits of the VC1 16-bit TC/VC mapping registers. These registers use the PCI Express reserved TC[3] traffic class bit. This register is Read-Only if the DMIC.SRL field is set. If VC1 is not enabled, the register output sent to the users of this register is forced to 0.
9:8	0h RO	Reserved.
7:1	0h RW/L	**Transaction Class / Virtual Channel Map (TVM):** Indicates which transaction classes are mapped to this virtual channel. When a bit is set, this transaction class is mapped to the virtual channel. This register is Read-Only if the DMIC.SRL field is set. If VC1 is not enabled, the register output sent to the users of this register is forced to 0.
0	0h RO	Reserved.

40.1.4 Virtual Channel 1 Resource Status (V1STS)—Offset 2026h

Virtual Channel 1 Resource Status

Access Method

Type: MSG Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	Reserved.
1	0h RO/V	**VC Negotiation Pending (NP):** When set, indicates the virtual channel is still being negotiated with ingress ports.
0	0h RO	Reserved.

40.1.5 ME Virtual Channel (VCm) Resource Control (VMCTL)—Offset 2040h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Virtual Channel Enable (EN):** Enables the VC when set. Disables the VC when cleared. This register is Read-Only if the DMIC.SRL field is set.
30:28	0h RO	Reserved.
27:24	0h RW/L	**Virtual Channel Identifier (ID):** Indicates the ID to use for this virtual channel. This register is Read-Only if the DMIC.SRL field is set.
23:16	0h RO	Reserved.
15:10	0h RW/L	**Extended TC/VC Map (ETVM):** Defines the upper 8-bits of the VCm 16-bit TC/VC mapping registers. These registers use the PCIe reserved TC[3] traffic class bit. This register is Read-Only if the DMIC.SRL field is set. If VCm is not enabled, the register output sent to the users of this register is forced to 0. This register is Read-Only if DMIC.SRL field is set
9:8	0h RO	Reserved.
7:1	0h RW/L	**Transaction Class / Virtual Channel Map (TVM):** Indicates which transaction classes are mapped to this virtual channel. When a bit is set, this transaction class is mapped to the virtual channel. This register is Read-Only if the DMIC.SRL field is set. If VCm is not enabled, the register output sent to the users of this register is forced to 0. This register is Read-Only if DMIC.SRL field is set
0	0h RO	Reserved.

40.1.6 ME Virtual Channel Resource Status (VMSTS)—Offset 2046h

Access Method

Type: MSG Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:2	0h RO	Reserved.
1	0h RO/V	**VC Negotiation Pending (NP):** When set, indicates the virtual channel is still being negotiated with ingress ports.
0	0h RO	Reserved.

40.1.7 Uncorrectable Error Status (UES)—Offset 2084h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	Reserved.
20	0h RW/1C/V/P	**Unsupported Request Error Status (URE):** Indicates an unsupported request was received.
19	0h RO	**ECRC Error Status (EE):** ECRC is not supported.
18	0h RW/1C/V/P	**Malformed TLP Status (MT):** Indicates a malformed TLP was received.
17	0h RW/1C/V/P	**Receiver Overflow Status (RO):** Indicates a receiver overflow occurred.
16	0h RO	**Unexpected Completion Status (UC):** Reserved, not supported.
15	0h RW/1C/V/P	**Completer Abort Status (CA):** Indicates a completer abort was received.
14	0h RO	**Completion Timeout Status (CT):** Reserved, not supported.

Bit Range	Default & Access	Field Name (ID): Description
13	0h RO	**Flow Control Protocol Error Status (FCPE):** Reserved, not supported.
12	0h RW/1C/V/P	**Poisoned TLP Status (PT):** Indicates a poisoned TLP was received.
11:5	0h RO	Reserved.
4	0h RW/1C/V/P	**Data Link Protocol Error Status (DLPE):** Indicates a data link protocol error occurred.
3:1	0h RO	Reserved.
0	0h RO	**Training Error Status (TE):** Not supported

40.1.8 Uncorrectable Error Mask (UEM)—Offset 2088h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	Reserved.
20	0h RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors.
19	0h RO	**ECRC Error Mask (EE):** ECRC is not supported.
18	0h RW/P	**Malformed TLP Mask (MT):** Mask for malformed TLPs.
17	0h RW/P	**Receiver Overflow Mask (RO):** Mask for receiver overflows.
16	0h RO	**Unexpected Completion Mask (UC):** Reserved, Not supported.
15	0h RW/P	**Completer Abort Mask (CM):** Mask for completer abort.
14	0h RO	**Completion Timeout Mask (CT):** Reserved, not supported.
13	0h RO	**Flow Control Protocol Error Mask (FCPE)**
12	0h RW/P	**Poisoned TLP Mask (PT):** Mask for poisoned TLPs.
11:5	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW/P	**Data Link Protocol Error Mask (DLPE):** Mask for data link protocol errors.
3:1	0h RO	Reserved.
0	0h RO	**Training Error Mask (TE):** Not supported.

40.1.9 Uncorrectable Error Severity (UEV)—Offset 208Ch

These registers are reset by core PWROK

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0h RO	Reserved.
20	0h RW/P	**Unsupported Request Error Severity (URE):** Severity for unsupported request reception.
19	0h RO	**ECRC Error Severity (EE):** Not Supported.
18	0h RW/P	**Malformed TLP Severity (MT):** Severity for malformed TLP reception.
17	0h RW/P	**Receiver Overflow Severity (RO):** Severity for receiver overflow occurrences.
16	0h RO	**Unexpected Completion Severity (UC):** Not supported.
15	0h RW/P	**Completer Abort Severity (CA):** Severity for completer.
14	0h RO	**Completion Timeout Severity (CT):** Not supported.
13	0h RO	**Flow Control Protocol Error Severity (FCPE):** Not supported.
12	0h RW/P	**Poisoned TLP Severity (PT):** Severity for poisoned TLP reception.
11:5	0h RO	Reserved.
4	0h RW/P	**Data Link Protocol Error Severity (DLPE):** Severity for data link protocol errors.
3:1	0h RO	Reserved.
0	0h RW/P	**Training Error Severity (TE):** TE not supported. This bit is RW for ease of implementation.

40.1.10 Correctable Error Status (CES)—Offset 2090h

These registers are reset by core PWROK

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.
13	0h RW/1C/V/P	**Advisory Non-Fatal Error Status (ANFES):** When set, indicates that a Advisory Non-Fatal Error occurred.
12	0h RW/1C/V/P	**Replay Timer Timeout Status (RTT):** Indicates the replay timer timed out.
11:9	0h RO	Reserved.
8	0h RW/1C/V/P	**Replay Number Rollover Status (RNR):** Indicates the replay number rolled over.
7	0h RW/1C/V/P	**Bad DLLP Status (BD):** Indicates a bad DLLP was received.
6	0h RW/1C/V/P	**Bad TLP Status (BT):** Indicates a bad TLP was received.
5:1	0h RO	Reserved.
0	0h RW/1C/V/P	**Receiver Error Status (RE):** Indicates a receiver error occurred.

40.1.11 Correctable Error Mask (CEM)—Offset 2094h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
13	1h RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from (a) signaling ERR_COR to the device control register and (b) updating the Uncorrectable Error Status register. This register is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0h RW/P	**Replay Timer Timeout Mask (RTT):** Mask for replay timer timeout.
11:9	0h RO	Reserved.
8	0h RW/P	**Replay Number Rollover Mask (RNR):** Mask for replay number rollover.
7	0h RW/P	**Bad DLLP Mask (BD):** Mask for bad DLLP reception.
6	0h RW/P	**Bad TLP Mask (BT):** Mask for bad TLP reception.
5:1	0h RO	Reserved.
0	0h RW/P	**Receiver Error Mask (RE):** Mask for receiver errors.

40.1.12 Root Error Command (REC)—Offset 20ACh

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Drop Poisoned Downstream Packets (DPDP):** When set to a '1': if downstream packet on OPI is received with the EP bit set, this packet and all subsquent packets with data received on DMI for any VC will have their Unsupported Transaction (UT) field set causing them to be forwarded to the Error Handler. When cleared to a '0', downstream packets from OPI with the EP bit set are forwarded onto the downstream backbone normally.
30	0h RW	**Unsupported Transaction Policy Bit (UTPB):** When set to 1, the Unsupported Transactions detected on OPI will not set the UES.URE bit. This subsequently ensures that SERR will never be signaled in response to Unsupported Transactions regardless of UEV.URE. When set to 0, the Unsupported Transactions detected on OPI will set the UES.URE bit.
29:3	0h RO	Reserved.
2	0h RO	**Fatal Error Reporting Enable (FERE):** When set, the root port will generate an interrupt when a fatal error is reported by the attached device. Not implemented by PCH.
1	0h RO	**Non-fatal Error Reporting Enable (NERE):** When set, the root port will generate an interrupt when a non-fatal error is reported by the attached device. Not implemented in PCH.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	Reserved.

40.1.13 Root Error Status (RES)—Offset 20B0h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	**Advanced Error Interrupt Message Number (AEMN):** There is only one error interrupt allocated.
26:4	0h RO	Reserved.
3	0h RO	**Multiple ERR_FATAL/NONFATAL Recvieved (MENR):** Set when either a fatal or a non-fatal error is received and the ENR bit is already set. This is not supported in PCH.
2	0h RW/1C/V	**ERR_FATAL/NONFATAL Received (ENR):** Set when either a fatal or a non-fatal error message is received or an internal fatal error is detected (all internal uncorrectable errors are fatal).
1	0h RO	**Multiple ERR_COR Received (MCR):** Set when a correctable error message is received and the CR bit is already set. This is not supported in PCH
0	0h RW/1C/V	**ERR_COR Received (CR):** Set when a correctable error message is received or an internal correctable error is detected.

40.1.14 Error Source Identification (ESID)—Offset 20B4h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO/V	**ERR_FATAL/NONFATAL Source Identification (EFNFSID):** Loaded with the requester ID indicated in the received ERR_FATAL or ERR_NONFATAL message when RES.ENR is first set, or the internal requestor ID if an internally detected error.
15:0	0h RO/V	**ERR_COR Source Identification (ECSID):** Loaded with the requester ID indicated in the received ERR_COR message when RES.CR is first set, or the internal requester ID if an internally detected error

40.1.15 DMI Control Register (Common) (DMIC)—Offset 2234h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**Secured Register Lock (SRL):** When this bit is set, all the secured registers will be locked and will be Read-Only.
30:5	0h RO	Reserved.
4	0h RW	**Partition/Trunk Oscillator Clock Gate Enable (PTOCGE):** When set, this bit allows the oscillator clock to be gated at the partition/trunk level when the conditions are met. When cleared, the oscillator clock gating at the partition/trunk level is disabled.
3	0h RW	**DMI Link CLKREQ Enable (DMILCLKREQEN):** When set, this bit enables DMI to de-assert the DMI link CLKREQ. When cleared, DMI link CLKREQ is not allowed to de-assert.
2	0h RW	**DMI Backbone CLKREQ Enable (DMIBBCLKREQEN):** When set, this bit enables DMI to de-assert the Primary backbone CLKREQ. When cleared, DMI Primary backbone CLKREQ is not allowed to de-assert.
1	0h RW	**DMI Link Dynamic Clock Gate Enable (DMILCGEN):** When set, this bit enables dynamic clock gating on the DMI Link clock domain logic. When cleared, dynamic clock gating on the DMI Link clock domain is disabled.
0	0h RW	**DMI Backbone Dynamic Clock Gate Enable (DMIBCGEN):** When set, this bit enables dynamic clock gating on the DMI backbone domain logic. When cleared, dynamic clock gating on the DMI backbone clock domain is disabled.

40.1.16 IOSF Primary Control And Status (IPCS_IOSFSBCS)—Offset 223Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:12	0h RW	**IOSF Primary ISM Idle Counter (PRIC):** BIOS may need to program this register field.
11:0	0h RO	Reserved.

40.1.17 DMI Port Link Control (DMILINKC)—Offset 2304h

BIOS may need to program this register.

40.1.18 DMI PLL Shutdown (Common) (DMIPLLDOWN)—Offset 2320h

BIOS may need to program this register.

40.1.19 Target Link Speed (TLS)—Offset 2608h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 2h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	2h RO/V	**Target Link Speed (TLS):** Specifies the Target link speed that should be used if speed change is supported. Bit | Description 0000 | SPEED0: 100 Mb/s per-lane 0001 | SPEED1: 1 Gb/s per-lane 0010 | SPEED2: 2 Gb/s per-lane 0011 | SPEED3: 4 GT/s per-lane 0100-1111 | Reserved Note: The default value of bit[1:0] is defined by soft strap. Bit[3:2] are hardwired to '00'. This field is Read-only (RO) in with TLS value defined by soft-strap. Only static speed configuration is supported.

40.1.20 Link Configuration (LCFG)—Offset 2618h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0h RO	Reserved.
25	0h RW/L	**Secure Register Lock (SRL):** When set, the secured register will be locked.
24:0	0h RO	Reserved.

40.1.21 eSPI Generic I/O Range 1 (LPCLGIR1)—Offset 2730h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW/L	**Address[7:2] Mask (ADDRMASK):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set
17:16	0h RO	Reserved.
15:2	0h RW/L	**Address[15:2] DWord-aligned address (ADDR):** Address[15:2]: DWord-aligned address. PCH does not provide decode down to the word or byte level. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set
1	0h RW/L	**ISH Decode Enable (ISHDE):** When this bit is set to '1', then the range specified in this register is enabled for decoding to ISH. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set
0	0h RW/L	**eSPI Decode Enable (LPCDEN):** When this bit is set to 1 and ISHDE=0, then the range specified in this register is enabled for decoding to eSPI. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.

40.1.22 eSPI Generic I/O Range 2 (LPCLGIR2)—Offset 2734h

Same description as LPCLGIR1 register.

40.1.23 eSPI Generic I/O Range 3 (LPCLGIR3)—Offset 2738h

Same description as LPCLGIR1 register.

40.1.24 eSPI Generic I/O Range 4 (LPCLGIR4)—Offset 273Ch

Same description as LPCLGIR1 register.

40.1.25 eSPI Generic Memory Range (LPCGMR)—Offset 2740h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/L	**Memory Address[31:16] (MEMADDR):** This field specifies a 64KB memory block anywhere in the 4GB memory space that will be decoded to eSPI as standard eSPI Memory Cycle if enabled. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
15:1	0h RO	Reserved.
0	0h RW/L	**eSPI Memory Range Decode Enable (LPCMRDEN):** When this bit is set to '1', then the range specified in this register is enabled for decoding to eSPI. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.

40.1.26 eSPI BIOS Decode Enable (LPCBDE)—Offset 2744h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: FFCFh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15	1h RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS range: Data space: FFF80000h – FFFFFFFFh Feature space: FFB80000h – FFBFFFFFh Register Attribute: Static.
14	1h RW/L	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS range: Data space: FFF00000h – FFF7FFFFh Feature space: FFB00000h – FFB7FFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
13	1h RW/L	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS range: Data space: FFE80000h – FFEFFFFFh Feature space: FFA80000h – FFAFFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
12	1h RW/L	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS range: Data space: FFE00000h – FFE7FFFFh Feature Space: FFA00000h – FFA7FFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
11	1h RW/L	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS range: Data space: FFD80000h – FFDFFFFFh Feature space: FF980000h – FF9FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.

Bit Range	Default & Access	Field Name (ID): Description
10	1h RW/L	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS range: Data space: FFD00000h – FFD7FFFFh Feature space: FF900000h – FF97FFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
9	1h RW/L	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS range: Data space: FFC80000h – FFCFFFFFh Feature space: FF880000h – FF8FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
8	1h RW/L	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS range: Data space: FFC00000h – FFC7FFFFh Feature space: FF800000h – FF87FFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
7	1h RW/L	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h – FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
6	1h RW/L	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h – EFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
5:4	0h RO	Reserved.
3	1h RW/L	**70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS range: Data space: FF700000h – FF7FFFFFh Feature space: FF300000h – FF3FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
2	1h RW/L	**60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS range: Data space: FF600000h – FF6FFFFFh Feature Space: FF200000h – FF2FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
1	1h RW/L	**50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS range: Data space: FF500000h – FF5FFFFFh Feature Space: FF100000h – FF1FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
0	1h RW/L	**40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS range: Data space: FF400000h – FF4FFFFFh Feature space: FF000000h – FF0FFFFFh This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.

40.1.27 General Control and Status (GCS)—Offset 274Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/L	**RPR Destination ID (RPRDID):** This field specifies the PCIe port Destination ID that is the target of the I/O ranges specified in the RPR field. Only one PCIe root port at a time can be enabled for Port 8xh support. This field is only valid when GCS.RPR field is set. BIOS must program the bits which are not used to zeros. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set
15:12	0h RO	Reserved.
11	0h RW/L	**Reserved Page Route (RPR):** Determines where to send the reserved page registers. These addresses are sent to PCIe Root Port or eSPI for the purpose of generating POST codes. The I/O addresses modified by this field are: 80h - 8Fh.When cleared, DMI will not perform source decode on the I/O ranges specified above. The cycles hitting these ranges will end up in P2SB which will then forward the cycle to eSPI through IOSF Sideband. When set, access to the I/O ranges specified above will be forwarded to PCIe Root Port with the destination ID specified in GCS.RPRDID using DMI source decode.The aliases for these registers, at 90h, 94h, 95h, 96h, 98h, 9Ch, 9Dh, and 9Eh, are never source decoded by DMI. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static.
10	0h RW/V/L	**Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. 0 = SPI 1 = eSPI When SPI or eSPI is selected, the range that is decoded is further qualified by other configuration bits described in the respective sections.The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down (bit 0) and DMIC.SRL are not set. Register Attribute: Static.
9:1	0h RO	Reserved.
0	0h RW/O	**BIOS Interface Lock-Down (BILD):** When set, prevents GCS.BBS from being changed. This bit can only be written from 0 to 1 once. Register Attribute: Static.

40.1.28 I/O Trap Register 1 - Lower DW (IOT1_LOW)—Offset 2750h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW	**Address[7:2] Mask (ADDRMASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.

Bit Range	Default & Access	Field Name (ID): Description
17:16	0h RO	Reserved.
15:2	0h RW	**Address[15:2] DWord-aligned address (ADDR):** DWord-aligned address.
1	0h RO	Reserved.
0	0h RW	**Trap Enable (TNSMIEN):** When this bit is set to 1, then the trapping logic specified in this register is enabled.

40.1.29 I/O Trap Register 1 - Upper DW (IOT1_HIGH)—Offset 2754h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW	**Read/Write Mask (RWMASK):** When this bit is 1, the trapping logic will operate on both read and write cycles. When this bit is 0, the cycle must match the type specified in bit 16.
16	0h RW	**Read/Write# (RW):** 1 = Read 0 = Write The value in this field does not matter if bit 17 is set.
15:8	0h RO	Reserved.
7:4	0h RW	**Byte Enable Mask (BEMASK):** A 1 in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enable (BE):** Active-high, DWord-aligned byte enables.

40.1.30 eSPI I/O Decode Range (LPCIOD)—Offset 2770h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0h RO	Reserved.
12	0h RW/L	**FDD Range (FDD):** The following table describes which range to decode for the FDD Port. Bits | Decode Range 0 | 3F0h 3F5h, 3F7h | (Primary) 1 | 370h 375h, 377h (Secondary) This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set
11:10	0h RO	Reserved.
9:8	0h RW/L	**LPT Range (LPT):** The following table describes which range to decode for the LPT Port. Bits | Decode Range 00 | 378h 37Fh and 778h 77Fh 01 | 278h 27Fh (port 279h is read only) and 678h 67Fh 10 | 3BCh 3BEh and 7BCh 7BEh 11 | Reserved. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set
7	0h RO	Reserved.
6:4	0h RW/L	**ComB Range (CB):** The following table describes which range to decode for the COMB Port. Bits | Decode Range 000 | 3F8h 3FFh (COM1) 001 | 2F8h 2FFh (COM2) 010 | 220h 227h 011 | 228h 22Fh 100 | 238h 23Fh 101 | 2E8h 2EFh | (COM 4) 110 | 338h 33Fh 111 | 3E8h 3EFh (COM 3) This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set
3	0h RO	Reserved.
2:0	0h RW/L	**ComA Range (CA):** The following table describes which range to decode for the COMA Port. Bits | Decode Range 000 | 3F8h 3FFh (COM1) 001 | 2F8h 2FFh (COM2) 010 | 220h 227h 011 | 228h 22Fh 100 | 238h 23Fh 101 | 2E8h 2EFh (COM 4) 110 | 338h 33Fh 111 | 3E8h 3EFh (COM 3) This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set

40.1.31 eSPI I/O Enable (LPCIOE)—Offset 2774h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0h RO	Reserved.
9	0h RW/L	**High Gameport Enable (HGE):** Enables decoding of the I/O locations 208h to 20Fh to eSPI. This register is Read-Only if the DMIC.SRL field is set.
8	0h RW/L	**Low Gameport Enable (LGE):** Enables decoding of the I/O locations 200h to 207h to eSPI. This register is Read-Only if the DMIC.SRL field is set.
7:4	0h RO	Reserved.
3	0h RW/L	**Floppy Drive Enable (FDE):** Enables decoding of the FDD range to eSPI. Range is selected by LIOD.FDE. This register is Read-Only if the DMIC.SRL field is set.
2	0h RW/L	**Parallel Port Enable (PPE):** Enables decoding of the LPT range to eSPI. Range is selected by LIOD.LPT. This register is Read-Only if the DMIC.SRL field is set.
1	0h RW/L	**Com Port B Enable (CBE):** Enables decoding of the COMB range to eSPI. Range is selected by LIOD.CB. This register is Read-Only if the DMIC.SRL field is set.
0	0h RW/L	**Com Port A Enable (CAE):** Enables decoding of the COMA range to eSPI. Range is selected by LIOD.CA. This register is Read-Only if the DMIC.SRL field is set.

40.1.32 TCO Base Address (TCOBASE)—Offset 2778h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	Reserved.
15:5	0h RW/L	**TCO Base Address (TCOBA):** Provides the 32 bytes of I/O space for TCO logic, that can be map anywhere in the 64k I/O space on 32-byte boundaries. This register is Read-Only if the DMIC.SRL field is set.
4:2	0h RO	Reserved.
1	0h RW/L	**TCO Enable (TCOEN):** When set, decode of the I/O range specified by the TCO base address. This register is Read-Only if the DMIC.SRL field is set.
0	0h RO	Reserved.

40.1.33 General Purpose Memory Range 1 (GPMR1)—Offset 277Ch

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/L	**General Purpose Memory Range Limit 1 (GPMRL1):** This field specifies limit address bits[31:16] for the General Purpose Memory Range 1. Bits [15:0] are assumed to be 'FFFFh'. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set
15:0	0h RW/L	**General Purpose Memory Range Base 1 (GPMRB1):** This field specifies base address bits[31:16] for the General Purpose Memory Range 1. Bits [15:0] are assumed to be '0000h'. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set

40.1.34 General Purpose Memory Range 1 Destination ID (GPMR1DID)—Offset 2780h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**General Purpose Memory Range 1 Decode Enable (GPMR1DE):** When enabled, memory cycles that falls within the GPMR1.GPMRL1 and GPMR1.GPMRB1 range inclusive will be forwarded using source decode to the destination ID specified in GPMR1DID.GPMR1DID field. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set
30:0	0h RW/L	**General Purpose Memory Range 1 Destination ID (GPMR1DID):** The destination ID to be used to forward the cycle decoded to hit the General Purpose Memory Range 1. BIOS must program the bits which are not used to zeros. Hardware will ignore the unused bits. This register is Read-Only if the DMIC.SRL field is set. Register Attribute: Static. This register is Read-Only if DMIC.SRL field is set

40.1.35 PM Base Address (PMBASEA)—Offset 27ACh

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RW/L	**PM Base Address Memory Range Limit (PMBAMRL):** This field specifies limit address bits[31:16] for the PM Base Address memory range. Bits [15:0] are assumed to be FFFFh. This register is Read-Only if the DMIC.SRL field is set.
15:0	0h RW/L	**PM Base Address Memory Range Base (PMBAMRB):** This field specifies base address bits[31:16] for the PM Base Address memory range. Bits [15:0] are assumed to be 0000h. This register is Read-Only if the DMIC.SRL field is set.

40.1.36 PM Base Control (PMBASEC)—Offset 27B0h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RW/L	**PM Base Address Memory Range Decode Enable (PMBAMRDE):** When enabled, memory cycles that falls within the PMBASEADDR.PMBAMRB and PMBASEADDR.PMBAMRL range inclusive will be forwarded using source decode to the destination ID specified in PMBASEC.PMBDID field. This register is Read-Only if the DMIC.SRL field is set.
30:0	0h RW/L	**PM Base Destination ID (PMBDID):** The destination ID to be used to forward the cycle decoded to hit the PM Base Address range. BIOS must program the bits which are not used to zeros. Hardware will ignore the unused bits. This register is Read-Only if the DMIC.SRL field is set.

40.1.37 ACPI Base Address (ACPIBA)—Offset 27B4h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
23:18	0h RW/L	**Address[7:2] Mask (ADDR72MASK):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size. This register is Read-Only if the DMIC.SRL field is set.
17:16	0h RO	Reserved.
15:2	0h RW/L	**Address[15:2] DWord-aligned address (ADDR):** DWord-aligned address. Note that PCH does not provide decode down to the word or byte level. This register is Read-Only if the DMIC.SRL field is set.
1	0h RO	Reserved.
0	0h RW/L	**ACPI I/O Base Address Decode Enable (ACPIBADE):** When this bit is set to 1, then the range specified in this register is enabled for decoding to the destination ID specified in ACPIBDID register. This register is Read-Only if the DMIC.SRL field is set.

40.1.38 ACPI Base Destination ID (ACPIBDID)—Offset 27B8h

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW/L	**ACPI Base Destination ID (ACPIBDID):** The destination ID to be used to forward the cycle decoded to hit the ACPI Base Address range. BIOS must program the bits which are not used to zeros. Hardware will ignore the unused bits. This register is Read-Only if the DMIC.SRL field is set.

41 IO Strap

41.1 IO Trap Registers

These registers are within the PCH Private Configuration Space which is accessible through the PCH Sideband Interface. They can be accessed via (SBREG_BAR + PortID + Register Offset).

Table 41-1. Summary of IO Trap Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
1D00h	1D03h	PSTH Control Register (PSTHCTL)—Offset 1D00h	0h
1E00h	1E03h	Trap Status Register (TRPSTS)—Offset 1E00h	0h
1E10h	1E13h	Trapped Cycle Register (TRPCYC1)—Offset 1E10h	0h
1E18h	1E1Bh	Trapped Write Data Register (TRPWRDATA1)—Offset 1E18h	0h
1E80h	1E83h	I/O Trap Registers 1 (IOTRP1_1)—Offset 1E80h	0h
1E84h	1E87h	I/O Trap Registers 1 (IOTRP1_2)—Offset 1E84h	0h
1E88h	1E8Bh	I/O Trap Registers 2 (IOTRP2_1)—Offset 1E88h	0h
1E8Ch	1E8Fh	I/O Trap Registers 2 (IOTRP2_2)—Offset 1E8Ch	0h
1E90h	1E93h	I/O Trap Registers 3 (IOTRP3_1)—Offset 1E90h	0h
1E94h	1E97h	I/O Trap Registers 3 (IOTRP3_2)—Offset 1E94h	0h
1E98h	1E9Bh	I/O Trap Registers 4 (IOTRP4_1)—Offset 1E98h	0h
1E9Ch	1E9Fh	I/O Trap Registers 4 (IOTRP4_2)—Offset 1E9Ch	0h

41.1.1 PSTH Control Register (PSTHCTL)—Offset 1D00h

PSTH control register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:3	0h RO	Reserved.
2	0h RW	**PSTH IOSF Primary Trunk Clock Gating Enable (PSTHIOSFPTCGE):** 0 = Disable 1 = Enable
1	0h RW	**PSTH IOSF Sideband Trunk Clock Gating Enable (PSTHIOSFSTCGE):** 0 = Disable 1 = Enable
0	0h RW	**PSTH Dynamic Clock Gating Enable (PSTHDCGE):** 0 = Disable 1 = Enable

41.1.2 Trap Status Register (TRPSTS)—Offset 1E00h

Trap status register

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:4	0h RO	Reserved.
3:0	0h RW/1C/V	**Cycle Trap SMI# Status (SMISTAT):** These bits are set by hardware when the corresponding Cycle Trap register is enabled and a matching cycle is received (and trapped). These bits are OR'ed together to create a single status bit in the Power Management register space.Note that the SMI# and trapping must be enabled in order to set these bits. This is because, in order to do the cycle comparison, packets must be delayed by several clocks from the DMI pins to the internal receiver. This delay is only enabled when at least one of the trap ranges is enabled. These bits are set before the completion is generated for the trapped cycle, thereby guaranteeing that the processor can enter the SMI# handler when the instruction completes. Each status bit is cleared by writing a '1' to the corresponding bit location in this register.

41.1.3 Trapped Cycle Register (TRPCYC1)—Offset 1E10h

This register saves information about the I/O Cycle that was trapped and generated the SMI# for software to read.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RO/V	**Read-Write (TRPRWR):** 1 = Read, 0 = Write
23:20	0h RO	Reserved.
19:16	0h RO/V	**Active-High Byte Enables (TRPBE):** This is the DWord-aligned byte enables associated with the trapped cycle. A 1 in any bit location indicates that the corresponding byte is enabled in the cycle.
15:2	0h RO/V	**IO Address (TRPADDR):** This is the DWord-aligned address of the trapped cycle.
1:0	0h RO	Reserved.

41.1.4 Trapped Write Data Register (TRPWRDATA1)—Offset 1E18h

This register saves the data from I/O write cycles that are trapped for software to read

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:0	0h RO/V	**Data (TRPDATA):** DWord of I/O write data. This field is undefined after trapping a read cycle.

41.1.5 I/O Trap Registers 1 (IOTRP1_1)—Offset 1E80h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW	**Address Mask (TRP1ADDRM):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.
17:16	0h RO	Reserved.
15:2	0h RW	**Address (TRP1ADDR):** DWord-aligned address
1	0h RO	Reserved.
0	0h RW	**Trap and SMI Enable (TRP1EN):** When this bit is set to 1, then the trapping logic specified in this register is enabled.

41.1.6 I/O Trap Registers 1 (IOTRP1_2)—Offset 1E84h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW	**Read-Write Mask (TRP1RWM):** When this bit is '1', the trapping logic will operate on both read and write cycles. When this bit is '0', the cycle must match the type specified in bit 48.
16	0h RW	**Read/Write (TRP1RW):** 1 = Read, 0 = Write, the value in this field does not matter if bit 49 is set.
15:8	0h RO	Reserved.
7:4	0h RW	**Byte Enable Mask (TRP1BEM):** A '1' in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enables (TRP1BE):** Active-high, DWord-aligned byte enables

41.1.7 I/O Trap Registers 2 (IOTRP2_1)—Offset 1E88h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW	**Address Mask (TRP2ADDRM):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.
17:16	0h RO	Reserved.
15:2	0h RW	**Address (TRP2ADDR):** DWord-aligned address
1	0h RO	Reserved.
0	0h RW	**Trap and SMI Enable (TRP2EN):** When this bit is set to 1, then the trapping logic specified in this register is enabled.

41.1.8 I/O Trap Registers 2 (IOTRP2_2)—Offset 1E8Ch

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW	**Read-Write Mask (TRP2RWM):** When this bit is '1', the trapping logic will operate on both read and write cycles. When this bit is '0', the cycle must match the type specified in bit 48.
16	0h RW	**Read/Write (TRP2RW):** 1 = Read, 0 = Write, the value in this field does not matter if bit 49 is set.
15:8	0h RO	Reserved.
7:4	0h RW	**Byte Enable Mask (TRP2BEM):** A '1' in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enables (TRP2BE):** Active-high, DWord-aligned byte enables

41.1.9 I/O Trap Registers 3 (IOTRP3_1)—Offset 1E90h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW	**Address Mask (TRP3ADDRM):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.
17:16	0h RO	Reserved.

Bit Range	Default and Access	Field Name (ID): Description
15:2	0h RW	**Address (TRP3ADDR):** DWord-aligned address
1	0h RO	Reserved.
0	0h RW	**Trap and SMI Enable (TRP3EN):** When this bit is set to 1, then the trapping logic specified in this register is enabled.

41.1.10 I/O Trap Registers 3 (IOTRP3_2)—Offset 1E94h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW	**Read-Write Mask (TRP3RWM):** When this bit is '1', the trapping logic will operate on both read and write cycles. When this bit is '0', the cycle must match the type specified in bit 48.
16	0h RW	**Read/Write (TRP3RW):** 1 = Read, 0 = Write, the value in this field does not matter if bit 49 is set.
15:8	0h RO	Reserved.
7:4	0h RW	**Byte Enable Mask (TRP3BEM):** A '1' in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enables (TRP3BE):** Active-high, DWord-aligned byte enables

41.1.11 I/O Trap Registers 4 (IOTRP4_1)—Offset 1E98h

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:24	0h RO	Reserved.
23:18	0h RW	**Address Mask (TRP4ADDRM):** A '1' in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for traps on address ranges up to 256 bytes in size.
17:16	0h RO	Reserved.
15:2	0h RW	**Reserved (TRP4ADDR):** DWord-aligned address
1	0h RO	Reserved.
0	0h RW	**Trap and SMI Enable (TRP4EN):** When this bit is set to 1, then the trapping logic specified in this register is enabled.

41.1.12 I/O Trap Registers 4 (IOTRP4_2)—Offset 1E9Ch

These registers are used to specify the set of I/O cycles to be trapped and to enable this functionality.

Access Method

Type: MSG Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default and Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17	0h RW	**Read-Write Mask (TRP4RWM):** When this bit is '1', the trapping logic will operate on both read and write cycles. When this bit is '0', the cycle must match the type specified in bit 48.
16	0h RW	**Read/Write (TRP4RW):** 1 = Read, 0 = Write, the value in this field does not matter if bit 49 is set.
15:8	0h RO	Reserved.
7:4	0h RW	**Byte Enable Mask (TRP4BEM):** A '1' in any bit position indicates that any value in the corresponding byte enable bit in a received cycle will be treated as a match. The corresponding bit in the Byte Enables field, below, is ignored.
3:0	0h RW	**Byte Enables (TRP4BE):** Active-high, DWord-aligned byte enables

C0h	4	GEN_INPUT_REG - Offset C0h	00000000h

42.1.1 DEVVENDID - Offset 0h

Vendor ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 0h	00008086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**DEVICEID:** DEVICEID
15:0	8086h RO	**VENDORID:** VENDORID

42.1.2 STATUSCOMMAND - Offset 4h

PCI Command Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 4h	00100000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29	0h RW/1C	**RMA:** RMA
28	0h RW/1C	**RTA:** RTA
27:21	0h RO	**Reserved**
20	1h RO	**CAPLIST:** CAPLIST
19	0h RO	**INTR_STATUS:** INTR_STATUS
18:11	0h RO	**Reserved**
10	0h RW	**INTR_DISABLE:** INTR_DISABLE
9	0h RO	**Reserved**
8	0h RW	**SERR_ENABLE:** SERR_ENABLE
7:3	0h RO	**Reserved**
2	0h RW	**BME:** BME
1	0h RW	**MSE:** MSE
0	0h RO	**Reserved**

42.1.3 REVCLASSCODE - Offset 8h

Revision ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 8h	08050100h

Bit Range	Default & Access	Field Name (ID): Description
31:8	080501h RO	**CLASS_CODES:** CLASS_CODES
7:0	00h RO	**RID:** RID

42.1.4 CLLATHEADERBIST - Offset Ch

Cache Line Latency Header and BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**MULFNDEV:** MULFNDEV
22:16	00h RO	**HEADERTYPE:** HEADERTYPE
15:8	00h RO	**LATTIMER:** LATTIMER
7:0	00h RW	**CACHELINE_SIZE:** CACHELINE_SIZE

42.1.5 BAR - Offset 10h

BAR -Base Address Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 10h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**BASEADDR:** BASEADDR
11:4	00h RO	**SIZEINDICATOR:** SIZEINDICATOR
3	0h RO	**PREFETCHABLE:** PREFETCHABLE

Bit Range	Default & Access	Field Name (ID): Description
2:1	2h RO	**TYPE:** TYPE
0	0h RO	**MESSAGE_SPACE:** MESSAGE_SPACE

42.1.6 BAR_HIGH - Offset 14h

BAR -Base Address Register High

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 14h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**BASEADDR_HIGH:** BASEADDR_HIGH

42.1.7 BAR1 - Offset 18h

BAR1 -Base Address Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 18h	00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**BASEADDR1:** BASEADDR1
11:4	00h RO	**SIZEINDICATOR1:** SIZEINDICATOR1
3	0h RO	**PREFETCHABLE1:** PREFETCHABLE1
2:1	2h RO	**TYPE1:** TYPE1
0	0h RO	**MESSAGE_SPACE1:** MESSAGE_SPACE1

42.1.8 BAR1_HIGH - Offset 1Ch

BAR1 -Base Address Register1 High

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 1Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**BASEADDR1_HIGH:** BASEADDR1_HIGH

42.1.9 SUBSYSTEMID - Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 2Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O	**SUBSYSTEMID:** SUBSYSTEMID
15:0	0000h RW/O	**SUBSYSTEMVENDORID:** SUBSYSTEMVENDORID

42.1.10 EXPANSION_ROM_BASEADDR - Offset 30h

Expansion ROM Base Address Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 30h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**EXPANSION_ROM_BASE:** EXPANSION_ROM_BASE

42.1.11 CAPABILITYPTR - Offset 34h

Capabilities Pointer Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 34h	00000080h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**CAPPTR_POWER:** CAPPTR_POWER

42.1.12 INTERRUPTREG - Offset 3Ch

Interrupt Line Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 3Ch	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**MAX_LAT:** MAX_LAT
23:16	00h RO	**MIN_GNT:** MIN_GNT
15:12	0h RO	**Reserved**
11:8	0h RO	**INTPIN:** INTPIN
7:0	00h RW	**INTLINE:** INTLINE

42.1.13 POWERCAPID - Offset 80h

Power Management Capability ID Regsiter

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 80h	00039001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	**PMESUPPORT:** PMESUPPORT
26:19	0h RO	**Reserved**
18:16	3h RO	**VERSION:** VERSION
15:8	90h RO	**NXTCAP:** NXTCAP
7:0	01h RO	**POWER_CAP:** POWER_CAP

42.1.14 PMECTRLSTATUS - Offset 84h

Power Management Control and Status Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 84h	00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C	**PMESTATUS:** PMESTATUS
14:9	0h RO	**Reserved**
8	0h RW	**PMEENABLE:** PMEENABLE
7:4	0h RO	**Reserved**
3	1h RO	**NO_SOFT_RESET:** NO_SOFT_RESET
2	0h RO	**Reserved**
1:0	0h RW	**POWERSTATE:** POWERSTATE

42.1.15 PCIDEVIDLE_CAP_RECORD - Offset 90h

PCI Device Idle Capability Record Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 90h	F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** VEND_CAP
27:24	0h RO	**REVID:** REVID
23:16	14h RO	**CAP_LENGTH:** CAP_LENGTH
15:8	00h RO	**NEXT_CAP:** NEXT_CAP
7:0	09h RO	**CAPID:** CAPID

42.1.16 DEVID_VEND_SPECIFIC_REG - Offset 94h

Device ID Vendor Specific Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 94h	01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**VSEC_LENGTH:** VSEC_LENGTH
19:16	0h RO	**VSEC_REV:** VSEC_REV
15:0	0010h RO	**VSECID:** VSECID

42.1.17 D0I3_CONTROL_SW_LTR_MMIO_REG - Offset 98h

SW LTR Update MMIO Location Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 98h	00008041h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000804h RO	**SW_LAT_DWORD_OFFSET:** SW_LAT_DWORD_OFFSET
3:1	0h RO	**SW_LAT_BAR_NUM:** SW_LAT_BAR_NUM
0	1h RO	**SW_LAT_VALID:** SW_LAT_VALID

42.1.18 DEVICE_IDLE_POINTER_REG - Offset 9Ch

Device IDLE Pointer Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + 9Ch	000081C1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	000081Ch RO	**DWORD_OFFSET:** DWORD_OFFSET
3:1	0h RO	**BAR_NUM:** BAR_NUM
0	1h RO	**VALID:** VALID

42.1.19 D0I3_MAX_POW_LAT_PG_CONFIG - Offset A0h

Doi3 Max Power On Latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + A0h	00290800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	1h RW	**HAE:** HAE
20	0h RO	**Reserved**
19	1h RW	**SLEEP_EN:** SLEEP_EN
18	0h RW	**PGE:** PGE
17	0h RW	**I3_ENABLE:** I3_ENABLE
16	1h RW	**PMCRE:** PMCRE
15:13	0h RO	**Reserved**
12:10	2h RW/O	**POW_LAT_SCALE:** POW_LAT_SCALE
9:0	000h RW/O	**POW_LAT_VALUE:** POW_LAT_VALUE

42.1.20 GEN_REGRW1 - Offset B0h

General Purpose PCI RW Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + B0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW1:** GEN_REG_RW1

42.1.21 GEN_REGRW2 - Offset B4h

General Purpose PCI RW Register2

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + B4h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW2:** GEN_REG_RW2

42.1.22 GEN_REGRW3 - Offset B8h

General Purpose PCI RW Register3

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + B8h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW3:** GEN_REG_RW3

42.1.23 GEN_REGRW4 - Offset BCh

General Purpose PCI RW Register4

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + BCh	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW4:** GEN_REG_RW4

42.1.24 GEN_INPUT_REG - Offset C0h

General Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:26, F:0] + C0h	00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**GEN_REG_INPUT_RW:** GEN_REG_INPUT_RW

42.2 EMMC Memory Mapped Registers

These registers are memory mapped based on BAR0 defined in PCI configuration space.

Table 42-2. Summary of EMMC Memory Mapped Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
0h	3h	SDMA System Address (sdmasysaddr)—Offset 0h	0h
4h	5h	Block Size (blocksize)—Offset 4h	0h
6h	7h	Block Count Register (blockcount)—Offset 6h	0h
8h	Bh	Argument 1 (argument1)—Offset 8h	0h
Ch	Dh	Transfer Mode Register (transfermode)—Offset Ch	0h
Eh	Fh	Command (command)—Offset Eh	0h
10h	13h	Response (Response 0 And 1)—Offset 10h	0h
14h	15h	Response 2 (response2)—Offset 14h	0h
16h	17h	Response 3 (response3)—Offset 16h	0h
18h	19h	Response 4 (response4)—Offset 18h	0h
1Ah	1Bh	Response 5 (response5)—Offset 1Ah	0h
1Ch	1Dh	Response 6 (response6)—Offset 1Ch	0h
1Eh	1Fh	Response 7 (response7)—Offset 1Eh	0h
20h	23h	Buffer Data Port Register (dataport)—Offset 20h	0h
24h	27h	Present State (PRESENTSTATE)—Offset 24h	1FF00000h
28h	28h	Host Control 1 (hostcontrol1)—Offset 28h	0h
29h	29h	Power Control Register (powercontrol)—Offset 29h	0h
2Ah	2Ah	Block Gap Control Register (blockgapcontrol)—Offset 2Ah	80h
2Bh	2Bh	Wakeup Control (wakeupcontrol)—Offset 2Bh	0h
2Ch	2Dh	Clock Control (clockcontrol)—Offset 2Ch	0h
2Eh	2Eh	Timeout Control (timeoutcontrol)—Offset 2Eh	0h
2Fh	2Fh	Software Reset (softwarereset)—Offset 2Fh	0h
30h	31h	Normal Interrupt Status (normalintrsts)—Offset 30h	0h
32h	33h	Error Interrupt Status (errorintrsts)—Offset 32h	0h
34h	35h	Normal Interrupt Status Enable (normalintrstsena)—Offset 34h	0h
36h	37h	Error Interrupt Status Enable (errorintrstsena)—Offset 36h	0h
38h	39h	Normal Interrupt Signal Enable (normalintrsigena)—Offset 38h	0h
3Ah	3Bh	(errorintrsigena)—Offset 3Ah	0h
3Ch	3Dh	Auto CMD12 Error Status (autocmderrsts)—Offset 3Ch	0h
3Eh	3Fh	Host Control 2 (hostcontrol2)—Offset 3Eh	0h
40h	47h	(capabilities)—Offset 40h	74462C881h
48h	4Fh	(maxcurrentcap)—Offset 48h	0h
50h	51h	(ForceEventforAUTOCMDErrorStatus)—Offset 50h	0h
52h	53h	Force Event Register for Error Interrupt Status (forceeventforerrintsts)—Offset 52h	0h
54h	54h	ADMA Error Status (admaerrsts)—Offset 54h	0h

Table 42-2. Summary of EMMC Memory Mapped Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
58h	5Bh	ADMA System Address Register 1 (admasysaddr01)—Offset 58h	0h
5Ch	5Dh	ADMA System Address Register2 (admasysaddr2)—Offset 5Ch	0h
60h	61h	Preset Value for Initialization (presetvalue0)—Offset 60h	4h
62h	63h	Preset Preset Value for Default Speed (presetvalue1)—Offset 62h	0h
64h	65h	Preset Value for High Speed (presetvalue2)—Offset 64h	0h
66h	67h	Preset Value for SDR12 (presetvalue3)—Offset 66h	0h
68h	69h	Preset Value for SDR25 (presetvalue4)—Offset 68h	0h
6Ah	6Bh	Preset Value for SDR50 (presetvalue5)—Offset 6Ah	0h
6Ch	6Dh	Preset Value for SDR104 (presetvalue6)—Offset 6Ch	0h
6Eh	6Fh	Preset Value for DDR50 (presetvalue7)—Offset 6Eh	0h
70h	73h	Boot Timeout Control (boottimeoutcnt)—Offset 70h	0h
74h	75h	PRESETVALUE8 Reg (PRESETVALUE8) — Offset 74h	0h
78h	79h	VENDREG Reg (VENDREG) — Offset 78h	0h
FCh	FDh	Slot Interrupt Status (slotintrsts)—Offset FCh	0h
FEh	FFh	HOSTCONTROLLERVER Reg (HOSTCONTROLLERVER) — Offset FEh	1002h

42.2.1 SDMA System Address (sdmasysaddr)—Offset 0h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**SDMA System Address Register/Argument2 Register (sdma_sysaddress):** This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23. 1) SDMA System Address: This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. 2) Argument 2: This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23.

42.2.2 Block Size (blocksize)—Offset 4h

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	Reserved.
14:12	0h RW	**Host DMA Buffer Size (host_sdma_buf_size):** To perform long DMA transfer, System Address register shall be updated at every system boundary during DMA transfer. These bits specify the size of contiguous buffer in the system memory. The DMA transfer shall wait at the every boundary specified by these fields and the HC generates the DMA Interrupt to request the HD to update the System Address register. These bits shall support when the DMA Support in the Capabilities register is set to 1 and this function is active when the DMA Enable in the Transfer Mode register is set to 1. 000b - 4KB(Detects A11 Carry out) 001b - 8KB(Detects A12 Carry out) 010b - 16KB(Detects A13 Carry out) 011b - 32KB(Detects A14 Carry out) 100b - 64KB(Detects A15 Carry out) 101b -128KB(Detects A16 Carry out) 110b - 256KB(Detects A17 Carry out) 111b - 512KB(Detects A18 Carry out)
11:0	0h RW	**Transfer Block Size (xfer_blocksize):** This register specifies the block size for block data transfers for CMD17, CMD18, CMD24, CMD25, and CMD53. It can be accessed only if no transaction is executing. Read operations during transfer return an invalid value and write operations shall be ignored. 0000h - No Data Transfer 0001h - 1 Byte 0002h - 2 Bytes 0003h - 3 Bytes 0004h - 4 Bytes 01FFh - 511 Bytes 0200h - 512 Bytes 0800h - 2048 Bytes

42.2.3 Block Count Register (blockcount)—Offset 6h

This register is enabled when Block Count Enable in the Transfer Mode register is set to 1 and is valid only for multiple block transfers. The HC decrements the block count after each block transfer and stops when the count reaches zero.
0000h - Stop Count
0001h - 1 block
0002h - 2 blocks
FFFFh - 65535 blocks.

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**Block Count (block_cnt_16bit)**

42.2.4 Argument 1 (argument1)—Offset 8h

The SD/eMMC Command Argument is specified as bit39- 8 of Command-Format.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Command Argument 1 (command_argument1):** The Command Argument is specified as bit [39:8] of Command-Format

42.2.5 Transfer Mode Register (transfermode)—Offset Ch

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0h RO	Reserved.
5	0h RW	**Multi / Single Block Select (xfermode_multiblksel):** This bit enables multiple block data transfers. 0 - Single Block 1 - Multiple Block.
4	0h RW	**Data Transfer Direction Select (xfermode_dataxferdir):** This bit defines the direction of data transfers. 0 - Write (Host to Card) 1 - Read (Card to Host)
3:2	0h RW	**Auto CMD Enable (xfermode_autocmdena):** This field determines use of auto command functions 00b - Auto Command Disabled 01b - Auto CMD12 Enable 10b - Auto CMD23 Enable.
1	0h RW	**Block Count Enable (xfermode_blkcntena):** This bit is used to enable the Block count register, which is only relevant for multiple block transfers. When this bit is 0, the Block Count register is disabled, which is useful in executing an infinite transfer. 0 - Disable 1 - Enable.
0	0h RW	**DMA Enable (xfermode_dmaenable):** If this bit is set to 1, a DMA operation shall begin when the HD writes to the upper byte of Command register (00Fh). 0 - Disable 1 - Enable.

42.2.6 Command (command)—Offset Eh

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	Reserved.
13:8	0h RW	**Command Index (command_cmdindex):** This bit shall be set to the command number (CMD0-63, ACMD0-63).
7:6	0h RW	**Command Type (command_cmdtype):** There are three types of special commands. Suspend, Resume and Abort. These bits shall be set to 00b for all other commands. 00b - Normal 01b - Suspend 10b - Resume 11b - Abort
5	0h RW	**Data Present Select (command_datapresent):** This bit is set to 1 to indicate that data is present and shall be transferred using the DAT line. If is set to 0 for the following: 1. Commands using only CMD line(ex. CMD52) 2. Commands with no data transfer but using busy signal on DAT[0] line (R1b or R5b ex. CMD38) 3. Resume Command 0 - No Data Present 1 - Data Present
4	0h RW	**Command Index Check Enable (command_indexchkena):** If this bit is set to 1, the HC shall check the index field in the response to see if it has the same value as the command index.
3	0h RW	**Command CRC Check Enable (command_crcchkena):** If this bit is set to 1, the HC shall check the CRC field in the response. If an error is detected, it is reported as a Command CRC Error. If this bit is set to 0, the CRC field is not checked. 0 - Disable 1 – Enable
2	0h RO	Reserved.
1:0	0h RW	**Response Type Select (command_responsetype):** 00 - No Response 01 - Response length 136 10 - Response length 48 11 - Response length 48 check Busy after response

42.2.7 Response (Response 0 And 1)—Offset 10h

The response registers contains the 128 bit response received from the External Device.
There are 8 response registers:
Response 0: offset 10h
Response 1: offset 12h
Response 2: offset 14h
Response 3: offset 16h
Response 4: offset 18h
Response 5: offset 1Ah
Response 6: offset 1Ch
Response 7: offset 1Eh

Register details:
Response Register 0 and 1 = Response [31:0]
Response Register 2 and 3 = Response [63:32]
Response Register 4 and 5 = Response [95:64]
Response Register 6 and 7 = Response [127:96]

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RO	**Command Response 31_0 (command_response_31_0):** Response bits [31:0]

42.2.8 Response 2 (response2)—Offset 14h

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**Command Response 47_32 (command_response_47_32):** Response bits [47:32]

42.2.9 Response 3 (response3)—Offset 16h

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**command Response 63_48 (command_response_63_48):** Response bits [63:48]

42.2.10 Response 4 (response4)—Offset 18h

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**Command Response 79_64 (command_response_79_64):** Response bits [79:64]

42.2.11 Response 5 (response5)—Offset 1Ah

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**Command Response 95_80 (command_response_95_80):** Response bits [95:80]

42.2.12 Response 6 (response6)—Offset 1Ch

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**Command Response 111_96 (command_response_111_96):** Response bits [111:96]

42.2.13 Response 7 (response7)—Offset 1Eh

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RO	**Command Response 127_112 (command_response_127_112):** Response bits [127:112]

42.2.14 Buffer Data Port Register (dataport)—Offset 20h

The Host Controller Buffer can be accessed through this 32-bit Data Port Register.

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Data Port (sdhcdmactrl_piobufrddata):** The Host Controller Buffer can be accessed through this 32-bit Data Port Register.

42.2.15 Present State (PRESENTSTATE)—Offset 24h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1FF00000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0h RO	Reserved.
28:25	Fh RO	**DAT4 Line Signal Level (sdif_dat4in_dsync):** sdif_dat4in_dsync
24	1h RO	**CMD Line Signal Level (sdif_cmdin_dsync):** This status is used to check CMD line level to recover from errors, and for debugging
23:20	Fh RO	**DAT0 Line Signal Level (sdif_dat0in_dsync):** This status is used to check DAT line level to recover from errors, and for debugging.
19	0h RO	**Write Protect Switch Pin Level (sdif_wp_dsync):** The Write Protect Switch is supported for memory and combo cards. This bit reflects the SDWP# pin. 0 - Write protected (SDWP# = 0) 1 - Write enabled (SDWP# = 1).
18	0h RO	**Card Level Detect (sdif_cd_n_dsync):** This bit reflects the inverse value of the SDCD# pin. 0 - No Card present (SDCD# = 1) 1 - Card present (SDCD# = 0).
17	0h RO	**Card State Stable (sdhccarddet_statestable_dsync):** This bit is used for testing. If it is 0, the Card Detect Pin Level is not stable. If this bit is set to 1, it means the Card Detect Pin Level is stable. The Software Reset For All in the Software Reset Register shall not affect this bit. 0 - Reset of Debouncing 1 - No Card or Inserted.
16	0h RO	**Card Inserted (sdhccarddet_inserted_dsync):** This bit indicates whether a card has been inserted. Changing from 0 to 1 generates a Card Insertion Interrupt in the Normal Interrupt Status register and changing from 1 to 0 generates a Card Removal Interrupt in the Normal Interrupt Status register.
15:12	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
11	0h RO	**Buffer Read Enable (sdhcdmactrl_piobufrdena):** This status is used for non-DMA read transfers. This read only flag indicates that valid data exists in the host side buffer status. If this bit is 1, readable data exists in the buffer. A change of this bit from 1 to 0 occurs when all the block data is read from the buffer. A change of this bit from 0 to 1 occurs when all the block data is ready in the buffer and generates the Buffer Read Ready Interrupt. 0 - Read Disable 1 - Read Enable
10	0h RO	**Buffer Write Enable (sdhcdmactrl_piobufwrena):** This status is used for non-DMA write transfers. This read only flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer. A change of this bit from 1 to 0 occurs when all the block data is written to the buffer.
9	0h RO	**Read Transfer Active (sdhcdmactrl_rdxferactive):** This status is used for detecting completion of a read transfer. This bit is set to 1 for either of the following conditions: • After the end bit of the read command • When writing a 1 to continue Request in the Block Gap Control register to restart a read transfer. This bit is cleared to 0 for either of the following conditions: • When the last data block as specified by block length is transferred to the system. • When all valid data blocks have been transferred to the system and no current block transfers are being sent as a result of the Stop At Block Gap Request set to 1. A transfer complete interrupt is generated when this bit changes to 0. 1 - Transferring data 0 - No valid data
8	0h RO	**Write Transfer Active (sdhcdmactrl_wrxferactive):** This status indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the HC. This bit is set in either of the following cases: • After the end bit of the write command. • When writing a 1 to Continue Request in the Block Gap Control register to restart a write transfer. This bit is cleared in either of the following cases: • After getting the CRC status of the last data block as specified by the transfer count (Single or Multiple) • After getting a CRC status of any block where data transmission is about to be stopped by a Stop At Block Gap Request. During a write transaction, a Block Gap Event interrupt is generated when this bit is changed to 0, as a result of the Stop At Block Gap Request being set. This status is useful for the HD in determining when to issue commands during write busy. 1 - transferring data 0 - No valid data
7:4	0h RO	Reserved.
3	0h RO	**Re-Tuning Request (Re-Tune):** Host Controller may request Host Driver to execute re-tuning sequence by setting this bit when the data window is shifted by temperature drift and any issue receiving the correct data. This bit is cleared when a command is issued with setting Execute Tuning in the Host Control 2 register. Changing of this bit from 0 to 1 generates Re-Tuning Event. This bit is cleared when a command is issued with setting Execute Tuning in the Host Control 2 register. Changing of this bit from 0 to 1 generates Re-Tuning Event. Refer to Normal Interrupt registers for more detail. This bit isn't set to 1 if Sampling Clock Select in the Host Control 2 register is set to 0 (using fixed sampling clock). 1: Sampling clock needs re-tuning 0: Fixed or well tuned sampling clock
2	0h RO	**DATA line Active (Data Activity):** This bit indicates whether one of the DAT line on SD bus is in use. 1 - DAT line active 0 - DAT line inactive
1	0h RO	**Command Inhibit (DAT) (presentstate_inhibitdat):** This status bit is generated if either the DAT Line Active or the Read transfer Active is set to 1. If this bit is 0, it indicates the HC can issue the next SD command. Commands with busy signal belong to Command Inhibit (DAT). Changing from 1 to 0 generates a Transfer Complete interrupt in the Normal interrupt status register.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RO	**Command Inhibit (CMD) (presentstate_inhibitcmd):** If this bit is 0, it indicates the CMD line is not in use and the HC can issue a SD command using the CMD line. This bit is set immediately after the Command register (00Fh) is written. This bit is cleared when the command response is received. Even if the Command Inhibit (DAT) is set to 1, Commands using only the CMD line can be issued if this bit is 0. Changing from 1 to 0 generates a Command complete interrupt in the Normal Interrupt Status register. If the HC cannot issue the command because of a command conflict error or because of Command Not Issued By Auto CMD12 Error, this bit shall remain 1 and the Command Complete is not set. Status issuing Auto CMD12 is not read from this bit. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the response of CMD12 or CMD23 but cleared by the response of a read/ write command. Status issuing Auto CMD12 is not read from this bit. So if a command is issued during Auto CMD12 operation, Host Controller shall manage to issue two commands: CMD12 and a command set by Command register.

42.2.16 Host Control 1 (hostcontrol1)—Offset 28h

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW	**Card Detect Signal Detection (hostctrl1_cdsigselect):** This bit selects source for card detection. 1- The card detect test level is selected 0- SDCD# is selected (for normal use).
6	0h RW	**Card Detect Test Level (hostctrl1_cdtestlevel):** This bit is enabled while the Card Detect Signal Selection is set to 1 and it indicates card inserted or not. Generates (card ins or card removal) interrupt when the normal int sts enable bit is set. 1 - Card Inserted 0 - No Card.
5	0h RW	**Extended Data Transfer Width (hostctrl1_extdatawidth):** This bit controls 8-bit bus width mode for embedded device. Support of this function is indicated in 8-bit Support for Embedded Device in the Capabilities register. If a device supports 8-bit bus mode, this bit may be set to 1. If this bit is 0, bus width is controlled by Data Transfer Width in the Host Control 1 register.
4:3	0h RW	**DMA Select (hostctrl1_dmaselect):** One of supported DMA modes can be selected. The host driver shall check support of DMA modes by referring the Capabilities register. 00 - SDMA is selected 01 - 32-bit Address ADMA1 is selected 10 - 32-bit Address ADMA2 is selected 11 - 64-bit Address ADMA2 is selected.
2	0h RW	**High Speed Enable (hostctrl1_highspeedena):** This bit is optional. Before setting this bit, the HD shall check the High Speed Support in the capabilities register. If this bit is set to 0 (default), the HC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz/ 20MHz for MMC). If this bit is set to 1, the HC outputs CMD line and DAT lines at the rising edge of the SD clock (up to 50 MHz for SD/52MHz for MMC)/ 208Mhz.
1	0h RW	**Data Transfer Width (hostctrl1_datawidth):** This bit selects the data width of the HC. The HD shall select it to match the data width of the SD card. 1 - 4 bit mode 0 - 1 bit mode.
0	0h RW	**LED Control (hostctrl1_ledcontrol):** This bit is used to caution the user not to remove the card while the SD card is being accessed. If the software is going to issue multiple SD commands, this bit can be set during all transactions. It is not necessary to change for each transaction. 1 - LED on 0 - LED off.

42.2.17 Power Control Register (powercontrol)—Offset 29h

This register is used to program the Bus power and voltage level

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0h RO	Reserved.
4	0h RW	**eMMC HW Reset (emmc_hwreset):** Hardware reset signal is generated for eMMC card when this bit is set 1 - Drives the hardware reset pin as ZERO (Active LOW to eMMC card) 0 - Deassert the hardware reset pin.
3:1	0h RW	**SD Bus Voltage Select (pwrctrl_sdbusvoltage):** By setting these bits, the HC selects the voltage level for the SD card. Before setting this register, the HC shall check the voltage support bits in the capabilities register. If unsupported voltage is selected, the Host System shall not supply SD bus voltage 111b - 3.3 V 110b - 3.0 V 101b - 1.8 V.
0	0h RW	**Bus Power (pwrctrl_sdbuspower):** Before setting this bit, the SD host driver shall set SD Bus Voltage Select. If the HC detects the No Card State, this bit shall be cleared. 1 - Power on 0 - Power off.

42.2.18 Block Gap Control Register (blockgapcontrol)—Offset 2Ah

This register is used to program the block gap request, read wait control and interrupt at block gap.

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	1h RW	**Boot Acknowledge Check (boot_ack_chk):** To check for the boot acknowledge in boot operation. 1 - wait for boot ack from eMMC card 0 - Will not wait for boot ack from eMMC card.
6	0h RW	**Alternate Boot Enable (alt_boot_en):** To start boot code access in alternative mode. 1- To start alternate boot mode access 0 - To stop alternate boot mode access.
5	0h RW	**Boot Code Access (BOOT_EN):** To start boot code access 1- To start boot code access 0 - To stop boot code access
4	0h RW	**SPI mode enable (spi_mode):** SPI mode enable bit. 1- SPI mode 0 - SD mode

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	Reserved.
2	0h RW	**Read Wait Control (rd_wait_ctrl):** The read wait function is optional for SDIO cards. If the card supports read wait, set this bit to enable use of the read wait protocol to stop read data using DAT[2] line. Otherwise the HC has to stop the SD clock to hold read data, which restricts commands generation. When the HD detects a card insertion, it shall set this bit according to the CCCR of the card. If the card does not support read wait, this bit shall never be set to 1 otherwise DAT line conflict may occur. If this bit is set to 0, Suspend / Resume cannot be supported 1 - Enable Read Wait Control 0 - Disable Read Wait Control
1	0h RW	**Continue Request (continue_req):** This bit is used to restart a transaction which was stopped using the Stop At Block Gap Request. To cancel stop at the block gap, set Stop At block Gap Request to 0 and set this bit to restart the transfer. The HC automatically clears this bit in either of the following cases: 1) In the case of a read transaction, the DAT Line Active changes from 0 to 1 as a read transaction restarts. 2) In the case of a write transaction, the Write transfer active changes from 0 to 1 as the write transaction restarts.
0	0h RW	**Stop At Block Gap Request (stopatblkgap_req):** This bit is used to stop executing a transaction at the next block gap for non- DMA,SDMA and ADMA transfers. Until the transfer complete is set to 1, indicating a transfer completion the HD shall leave this bit set to 1. Clearing both the Stop At Block Gap Request and Continue Request shall not cause the transaction to restart.

42.2.19 Wakeup Control (wakeupcontrol)—Offset 2Bh

This register is used to program the wakeup functionality.

Access Method

Type: MEM Register (Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h RW	**Wakeup Event On SD Card Removal (wkupctrl_cardremoval):** This bit enables wakeup event via Card Removal assertion in the Normal Interrupt Status register. FN_WUS (Wake up Support) in CIS does not affect this bit. 1 - Enable 0 – Disable.
1	0h RW	**Wakeup On Card Insertion (wkupctrl_cardinsertion):** This bit enables wakeup event via Card Insertion assertion in the Normal Interrupt Status register. FN_WUS (Wake up Support) in CIS does not affect this bit. 1 - Enable 0 – Disable
0	0h RW	**Wakeup Event Enable On Card Interrupt (wkupctrl_cardinterrupt):** This bit enables wakeup event via Card Interrupt assertion in the Normal Interrupt Status register. This bit can be set to 1 if FN_WUS (Wake Up Support) in CIS is set to 1. 1 - Enable 0 - Disable.

42.2.20 Clock Control (clockcontrol)—Offset 2Ch

This register is used to program the Clock frequency select, generator select, Clock enable,Internal Clock state fields.

Access Method

Type: MEM Register (Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RW	**SDCLK Frequency Select (clkctrl_sdclkfreqsel):** This register is used to select the frequency of the SDCLK pin. The frequency is not programmed directly; rather this register holds the divisor of the Base Clock Frequency For SD clock in the capabilities register. Only the following settings are allowed. 80h - base clock divided by 256 40h - base clock divided by 128 20h - base clock divided by 64 10h - base clock divided by 32 08h - base clock divided by 16 04h - base clock divided by 8 02h - base clock divided by 4 01h - base clock divided by 2 00h - base clock(10MHz-63MHz) Setting 00h specifies the highest frequency of the SD Clock.
7:6	0h RW	**Upper Bits of SDCLK Frequency Select (clkctrl_sdclkfreqsel_upperbits):** Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select.
5	0h RW	**Clock Generator Select (clkctrl_clkgensel):** This bit is used to select the clock generator mode in SDCLK Frequency Select. If the Programmable Clock Mode is supported (non-zero value is set to Clock Multiplier in the Capabilities register), this bit attribute is RW, and if not supported,this bit attribute is RO and zero is read. This bit depends on the setting of Preset Value Enable in the Host Control 2 register. If the Preset Value Enable = 0, this bit is set by Host Driver. If the Preset Value Enable = 1, this bit is automatically set to a value specified in one of Preset Value registers. 1: Programmable Clock Mode 0: Divided Clock Mode.
4:3	0h RO	Reserved.
2	0h RW	**SD Clock Enable (clkctrl_sdclkena):** The HC shall stop SDCLK when writing this bit to 0. SDCLK frequency Select can be changed when this bit is 0.
1	0h RO	**Internal Clock Stable (sdhcclkgen_intclkstable_dsync):** This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1. The SD Host Driver shall wait to set SD Clock Enable until this bit is set to 1.
0	0h RW	**Internal Clock Enable (clkctrl_intclkena):** This bit is set to 0 when the HD is not using the HC or the HC awaits a wakeup event. The HC should stop its internal clock to go very low power state. 1 - Oscillate 0 - Stop.

42.2.21 Timeout Control (timeoutcontrol)—Offset 2Eh

This value determines the interval by which DAT line time-outs are detected. Refer to the Data Time-out Error in the Error Interrupt Status register for information on factors that dictate time-out generation. Time-out clock frequency will be generated by dividing the sd clock TMCLK by this value. When setting this register, prevent inadvertent time-out events by clearing the Data Time-out Error Status Enable (in the Error Interrupt Status Enable register)
1110 - TMCLK * 2^27
0001 - TMCLK * 2^14
0000 - TMCLK * 2^13.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0h RO	Reserved.
3:0	0h RW	**Data Timeout Counter Value (timeout_ctrvalue):** This value determines the interval by which DAT line time-outs are detected. Refer to the Data Time-out Error in the Error Interrupt Status register for information on factors that dictate time-out generation. Time-out clock frequency will be generated by dividing the sd clock TMCLK by this value. When setting this register, prevent inadvertent time-out events by clearing the Data Time-out Error Status Enable (in the Error Interrupt Status Enable register) 1111 - Reserved 1110 - TMCLK * 2^27 ---------- ---------- 0001 - TMCLK * 2^14 0000 - TMCLK * 2^13

42.2.22 Software Reset (softwarereset)—Offset 2Fh

This register is used to program the software reset for data, command and for all.

Access Method

Type: MEM Register (Size: 8 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.
2	0h RW	**Software Reset for DAT Line (swreset_for_dat):** Only part of data circuit is reset. The following registers and bits are cleared by this bit: Buffer Data Port Register - Buffer is cleared and initialized. Present State register - Buffer read Enable - Buffer write Enable - Read Transfer Active - Write Transfer Active - DAT Line Active - Command Inhibit (DAT) Block Gap Control register - Continue Request - Stop At Block Gap Request Normal Interrupt Status register - Buffer Read Ready - Buffer Write Ready - Block Gap Event - Transfer Complete 1 - Reset 0 - Work.
1	0h RW	**Software Reset for CMD Line (swreset_for_cmd):** Only part of command circuit is reset. The following registers and bits are cleared by this bit: Present State register - Command Inhibit (CMD) Normal Interrupt Status register - Command Complete 1 - Reset 0 - Work.

Bit Range	Default & Access	Field Name (ID): Description
0	0h RW	**Software Reset for All (swreset_for_all):** This reset affects the entire HC except for the card detection circuit. Register bits of type ROC, RW, RW1C, RWAC are cleared to 0. During its initialization, the HD shall set this bit to 1 to reset the HC. The HC shall reset this bit to 0 when capabilities registers are valid and the HD can read them. Additional use of Software Reset For All may not affect the value of the Capabilities registers. If this bit is set to 1, the SD card shall reset itself and must be re initialized by the HD. 1 - Reset 0 - Work

42.2.23 Normal Interrupt Status (normalintrsts)—Offset 30h

This register gives the status of all the interrupts

Access Method

Type: MEM Register (Size: 16 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	**Error Interrupt (reg_errorintrsts):** If any of the bits in the Error Interrupt Status Register are set, then this bit is set. Therefore the HD can test for an error by checking this bit first. 0 - No Error 1 – Error.
14	0h RW1C	**Boot terminate Interrupt (normalintrsts_bootcomplete):** This status is set if the boot operation get terminated 0 - Boot operation is not terminated 1 - Boot operation is terminated.
13	0h RW1C	**Boot Acknowledge Rcv (normalintrsts_rcvbootack):** This status is set if the boot acknowledge is received from device. 0 - Boot ack is not received 1 - Boot ack is received.
12	0h RO	**Re-Tuning Event (normalintrsts_retuningevent):** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1. Host Controller requests Host Driver to perform re-tuning for next data transfer. Current data transfer (not large block count) can be completed without retuning. 1 Re-Tuning should be performed 0 Re-Tuning is not required.
11	0h RO	**INT_C_ Status (normalintrsts_intc):** This status is set if INT_C is enabled and INT_C# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_C interrupt factor.
10	0h RO	**INT_B_Status (normalintrsts_intb):** This status is set if INT_B is enabled and INT_B# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_B interrupt factor.
9	0h RO	**INT_A Status (normalintrsts_inta):** This status is set if INT_A is enabled and INT_A# pin is in low level. Writing this bit to 1 does not clear this bit. It is cleared by resetting the INT_A interrupt factor.
8	0h RO	**Card Interrupt (normalintrsts_cardintsts):** In 1-bit mode, the HC shall detect the Card Interrupt without SD Clock to support wakeup. In 4-bit mode, the card interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the card and the interrupt to the Host system. 0 - No Card Interrupt 1 - Generate Card Interrupt.

Bit Range	Default & Access	Field Name (ID): Description
7	0h RW1C	**Card Removal (normalintrsts_cardremsts):** This status is set if the Card Inserted in the Present State register changes from 1 to 0. When the HD writes this bit to 1 to clear this status the status of the Card Inserted in the Present State register should be confirmed. 0 - Card State Stable or Debouncing 1 - Card Removed.
6	0h RW1C	**Card Insertion (normalintrsts_cardinssts):** This status is set if the Card Inserted in the Present State register changes from 0 to 1.
5	0h RW/1C	**Buffer Read Ready (normalintrsts_bufrdready):** This status is set if the Buffer Read Enable changes from 0 to 1.
4	0h RW1C	**Buffer Write Ready (normalintrsts_bufwrready):** This status is set if the Buffer Write Enable changes from 0 to 1.
3	0h RW1C	**DMA Interrupt (normalintrsts_dmainterrupt):** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size Register.
2	0h RW1C	**Block Gap Event (normalintrsts_blkgapevent):** If the Stop At Block Gap Request in the Block Gap Control Register is set, this bit is set.
1	0h RW1C	**Transfer Complete (normalintrsts_xfercomplete):** This bit is set when a read / write transaction is completed.
0	0h RW1C	**Command Complete (normalintrsts_cmdcomplete):** This bit is set when we get the end bit of the command response (Except Auto CMD12 and Auto CMD23). 0 - No Command Complete 1 - Command Complete

42.2.24 Error Interrupt Status (errorintrsts)—Offset 32h

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h RW/1C	**Target Response Error (errorintrsts_hosterror):** Occurs when detecting ERROR in DMA transaction 0 - no error 1 – error.
11:10	0h RO	Reserved.
9	0h RW	**ADMA Error (errorintrsts_admaerror):** This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the ADMA Error Status Register. 1- Error 0- No error.
8	0h RW	**Auto CMD Error (errorintrsts_autocmderror):** This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1.
7	0h RW	**Current Limit Error (errorintrsts_currlimiterror):** By setting the SD Bus Power bit in the Power Control Register, the HC is requested to supply power for the SD Bus.

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Data End Bit Error (errorintrsts_dataendbiterror):** Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status. 0 - No Error 1 – Error.
5	0h RW	**Data CRC Error (errorintrsts_datacrcerror):** Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than "010". 0 - No Error 1 – Error.
4	0h RW	**Data Timeout Error (errorintrsts_datatimeouterror):** Occurs when detecting one of following timeout conditions. 1. Busy Timeout for R1b, R5b type. 2. Busy Timeout after Write CRC status 3. Write CRC status Timeout 4. Read Data Timeout 0 - No Error 1 – Timeout.
3	0h RW	**Command Index Error (errorintrsts_cmdindexerror):** Occurs if a Command Index error occurs in the Command Response. 0 - No Error 1 – Error.
2	0h RW	**Command End Bit Error (errorintrsts_cmdendbiterror):** Occurs when detecting that the end bit of a command response is 0. 0 - No Error 1 - End Bit Error Generated.
1	0h RW	**Command CRC Error (errorintrsts_cmdcrcerror):** 0 - No Error 1 - CRC Error Generated.
0	0h RW	**Command Timeout Error (errorintrsts_cmdtimeouterror):** Occurs only if the no response is returned within 64 SDCLK cycles from the end bit of the command. 0 - No Error 1 – Timeout.

42.2.25 Normal Interrupt Status Enable (normalintrstsena)—Offset 34h

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:10	0h RO	Reserved.
9	0h RW	**INT_A Status Enable (int_a_stsena):** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System. The Host Driver may clear this bit before servicing the INT_A and may set this bit again after all interrupt requests to INT_A pin are cleared to prevent inadvertent interrupts.
8	0h RW	**Card Interrupt Status Enable (sdhcregset_cardintstsena):** If this bit is set to 0, the HC shall clear Interrupt request to the System. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1.
7	0h RW	**Card Removal Status Enable (sdhcregset_cardremstsena):** This status is set if the Card Inserted in the Present State register changes from 1 to 0.
6	0h RW	**Card Insertion Status Enable (sdhcregset_cardinsstsena):** This status is set if the Card Inserted in the Present State register changes from 0 to 1.

Bit Range	Default & Access	Field Name (ID): Description
5	0h RW	**Buffer Read Ready Status Enable (buffrd_readtstsena):** This status is set if the Buffer Read Enable changes from 0 to 1.
4	0h RW	**Buffer Write Ready Status Enable (buffwr_readtstsena):** This status is set if the Buffer Write Enable changes from 0 to 1.
3	0h RW	**DMA Interrupt Status Enable (dmaintrstsena):** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size register.
2	0h RW	**Block Gap Event Status Enable (blockgap_eventstsena):** If the Stop At Block Gap Request in the BlockGap Control Register is set, this bit is set.
1	0h RW	**Transfer Complete Status Enable (xfrcmpltstsena):** This bit is set when a read / write transaction is completed.
0	0h RW	**Command Complete Status Enable (cmdcmpltstsena):** This bit is set when we get the end bit of the command response.

42.2.26 Error Interrupt Status Enable (errorintrstsena)—Offset 36h

This register is used to enable the Error Interrupt Status register fields.

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0h RO	Reserved.
12	0h RO	**Transfer Response Error (xfrresponce_err):** xfrresponce_err
11	0h RO	Reserved.
10	0h RW	**Tuning error status enable (tune_errstsena):** 0 - Masked 1 - Enabled
9	0h RW	**ADMA Error Status Enable (adma_errstsena):** 0 - Masked 1 - Enabled
8	0h RW	**Auto CMD12 Error Status Enable (autocmd12_errstsena):** 0 - Masked 1 - Enabled
7	0h RW	**Current Limit Error Status Enable (currentlim_errstsena):** 0 - Masked 1 - Enabled
6	0h RW	**Data End Bit Error Status Enable (dataendbit_errstsena):** 0 - Masked 1 - Enabled
5	0h RW	**Data CRC Error Status Enable (datacrc_errstsena):** 0 - Masked 1 - Enabled

Bit Range	Default & Access	Field Name (ID): Description
4	0h RW	**Data Timeout Error Status Enable (datatimeout_errstsena):** 0 - Masked 1 - Enabled
3	0h RW	**Command Index Error Status Enable (cmdindex_errstsena):** 0 - Masked 1 - Enabled
2	0h RW	**Command End Bit Error Status Enable (cmdendbit_errstsena):** 0 - Masked 1 - Enabled
1	0h RW	**Command CRC Error Status Enable (cmdcrc_errstsena):** 0 - Masked 1 - Enabled
0	0h RW	**Command Timeout Error Status Enable (cmdtimeout_errstsena):** 0 - Masked 1 - Enabled

42.2.27 Normal Interrupt Signal Enable (normalintrsigena)—Offset 38h

This register is used to enable the Normal Interrupt Signal register. All the bits are RW, except for Reserved bits, and defined as follows:
0 - Masked
1 - Enabled.

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RO	Reserved.
14	0h RW	**Boot Terminate Interrupt Signal Enable (bootintr_sigena):** bootintr_sigena
13	0h RW	**Boot ack rcv Signal Enable (bootack_rcvsigena):** bootack_rcvsigena
12	0h RW	**Re-Tuning Event Signal Enable (retune_eventsigena):** retune_eventsigena
11	0h RW	**INT_C Signal Enable (int_c_sigena):** int_c_sigena
10	0h RW	**INT_B Signal Enable (int_b_sigena):** int_b_sigena
9	0h RW	**INT_A Signal Enable (int_a_sigena):** int_a_sigena
8	0h RW	**Card Interrupt Signal Enable (sdhcregset_cardintstsena):** sdhcregset_cardintstsena
7	0h RW	**Card Removal Signal Enable (sdhcregset_cardremstsena):** sdhcregset_cardremstsena

Bit Range	Default & Access	Field Name (ID): Description
6	0h RW	**Card Insertion Signal Enable (sdhcregset_cardinsstsena):** sdhcregset_cardinsstsena
5	0h RW	**Buffer Read Ready Signal Enable (buffrd_readtsigena):** buffrd_readtsigena
4	0h RW	**Buffer Write Ready Signal Enable (buffwr_readtsigena):** buffwr_readtsigena
3	0h RW	**DMA Interrupt Signal Enable (dmaintrsigena)**

1	0h RW	**Transfer Complete Signal Enable (xfrcmpltsigena)**
0	0h RW	**Command Complete Signal Enable (cmdcmpltsigena)**

42.2.28 (errorintrsigena)—Offset 3Ah

This register is used to enable the Normal Interrupt Signal register. All the bits are RW, except for Reserved bits, and defined as follows:
0 - Masked
1 - Enabled.

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RW	**Tuning Error Signal Enable (tune_errsigena):** tune_errsigena
9	0h RW	**ADMA Error Signal Enable (adma_errsigena):** adma_errsigena
8	0h RW	**Auto CMD Error Signal Enable (autocmd12_errsigena):** autocmd12_errsigena
7	0h RW	**Current Limit Error Signal Enable (currentlim_errsigena):** currentlim_errsigena
6	0h RW	**Data End Bit Error Signal Enable (dataendbit_errsigena):** dataendbit_errsigena
5	0h RW	**Data CRC Error Signal Enable (datacrc_errsigena):** datacrc_errsigena
4	0h RW	**Data Timeout Error Signal Enable (datatimeout_errsigena):** datatimeout_errsigena
3	0h RW	**Command Index Error Signal Enable (cmdindex_errsigena):** cmdindex_errsigena

Bit Range	Default & Access	Field Name (ID): Description
2	0h RW	**Command End Bit Error Signal Enable (cmdendbit_errsigena):** cmdendbit_errsigena
1	0h RW	**Command CRC Error Signal Enable (cmdcrc_errsigena):** cmdcrc_errsigena
0	0h RW	**Command Timeout Error Signal Enable (cmdtimeout_errsigena):** cmdtimeout_errsigena

42.2.29 Auto CMD12 Error Status (autocmderrsts)—Offset 3Ch

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h RO	**Command Not Issued By Auto CMD12 Error (autocmderrsts_nexterror):** Setting this bit to 1 means CMD_wo_DAT is not executed due to an Auto CMD12 error(D04- D01) in this register. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23 0 – No Error 1 – Not Issued.
6:5	0h RO	Reserved.
4	0h RO	**Auto CMD Index Error (autocmderrsts_indexerror):** Occurs if the Command Index error occurs in response to a command. 0 – No Error 1 – Error
3	0h RO	**Auto CMD End Bit Error (autocmderrsts_endbiterror):** Occurs when detecting that the end bit of command response is 0. 0 – No Error 1 – End Bit Error Generated.
2	0h RO	**Auto CMD CRC Error (autocmderrsts_crcerror):** Occurs when detecting a CRC error in the command response. 0 – No Error 1 – CRC Error Generated.
1	0h RO	**Auto CMD Timeout Error (autocmderrsts_timeouterror):** Occurs if the no response is returned within 64 SDCLK cycles from the end bit of the command. If this bit is set to 1, the other error status bits (D04 - D02) are meaningless. 0 - No Error 1 - Timeout.
0	0h RO	**Auto CMD12 not Executed (autocmderrsts_notexecerror):** If memory multiple block data transfer is not started due to command error, this bit is not set because it is not necessary to issue Auto CMD12. Setting this bit to 1 means the HC cannot issue Auto CMD12 to stop memory multiple block transfer due to some error. 0 - Executed 1 - Not Executed.

42.2.30 Host Control 2 (hostcontrol2)—Offset 3Eh

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Preset Value Enable (hostctrl2_presetvalueenable):** Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set to automatic. This bit enables the functions defined in the Preset Value registers. 1 Automatic Selection by Preset Value are Enabled 0 SDCLK and Driver Strength are controlled by Host Driver.
14	0h RW	**Asynchronous Interrupt Enable (hostctrl2_asynchintrenable):** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. 0 – Disabled 1 – Enabled.
13:10	0h RO	Reserved.
9	0h RW	**Driver Strength Select (hostctrl2_driverstrength):** Host Controller output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective.
8	0h RO	Reserved.
7	0h RW	**Sampling Clock Select (hostctrl2_samplingclkselect):** This bit is set by tuning procedure when Execute Tuning is cleared. Writing 1 to this bit is meaningless and ignored. Setting 1 means that tuning is completed successfully and setting 0 means that tuning is failed. Controller is receiving response or a read data block. 0 - Fixed clock is used to sample data 1 - Tuned clock is used to sample data
6	0h RW	**Execute Tuning (hostctrl2_executetuning):** This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select. Tuning procedure is aborted by writing 0 for more detail about tuning procedure. 0 - Not Tuned or Tuning Completed 1 - Execute Tuning.
5:4	0h RO	Reserved.
3	0h RW	**1.8V Signaling Enable (hostctrl2_1p8vsignallingena):** This bit controls voltage regulator for I/O cell. 3.3V is supplied to the card regardless of signaling voltage. Setting this bit from 0 to 1 starts changing signal voltage from 3.3V to 1.8V.
2:0	0h RW	**UHS Mode Select (hostctrl2_uhsmodeselect):** This field is used to select one of UHS-I modes and effective when 1.8V Signaling Enable is set to 1. Select in the Clock Control register and Driver Strength Select according to Preset Value registers. In this case, one of preset value registers is selected by this field. Host Driver needs to reset SD Clock Enable before changing this field to avoid generating clock glitch. After setting this field, Host Driver sets SD Clock Enable again. 000b - SDR12 001b - SDR25 010b - SDR50 011b - SDR104 100b - DDR50 101b - HS400

42.2.31 (capabilities)—Offset 40h

This register provides the host driver with information specific to the host controller implementation. Please note, that the default values shown here assume no bypass of the capabilities register. In case software decides to bypass the default capabilities register values the reset values will present the bypassed value.

Access Method

Type: MEM Register
(Size: 64 bits)

Device:
Function:

Default: 74462C881h

Bit Range	Default & Access	Field Name (ID): Description
63:35	0h RO	Reserved.
34	1h RO	**DDR50 Support (corecfg_ddr50support):** This bit indicates whether DDR50 is supported. 0 –Not Supported 1 –Supported.
33	1h RO	**SDR104 Support (corecfg_sdr104support):** This bit indicates whether SDR104 is supported.SDR104 requires tuning. 0 –Not Supported 1 –Supported.
32	1h RO	**SDR50 Support (corecfg_sdr50support):** This bit indicates whether SDR50 is supported. 0 –Not Supported 1 –Supported.
31:30	1h RO	**Slot Type (corecfg_slottype):** This field indicates usage of a slot by a specific Host System. (A host controller register set is defined per slot.) Embedded slot for one device (01b) means that only one on-removable device is connected to a SD bus slot. Shared Bus Slot (10b) can be set if Host Controller supports Shared Bus Control register. The Standard Host Driver controls only a removable card or one embedded device is connected to a SD bus slot.
29	0h RO	**Asynchronous Interrupt Support (corecfg_asynchintrsupport):** This bit indicates whether the HC supports Asynchronous Interrupt 0 –Not Supported 1 –Supported.
28:27	0h RO	Reserved.
26	1h RO	**Voltage Support 1.8V (corecfg_1p8voltsupport):** This bit indicates whether the HC supports 1.8V. 0 –Not Supported 1 –Supported.
25	0h RO	**Voltage Support 3.0V (corecfg_3p0voltsupport):** This bit indicates whether the HC supports 3.0V. 0 –Not Supported 1 –Supported.
24	0h RO	**Voltage Support 3.3V (corecfg_3p3voltsupport):** This bit indicates whether the HC supports 3.3V. 0 –Not Supported 1 –Supported.
23	0h RO	Reserved.
22	1h RO	**SDMA Support (corecfg_sdmasupport):** This bit indicates whether the HC is capable of using DMA to transfer data between system memory and the HC directly. (SDMA Mode) 0 –Not Supported 1 –Supported
21	1h RO	**High Speed Support (corecfg_highspeedsupport):** This bit indicates whether the HC and the Host System support High Speed mode. 0 –Not Supported 1 –Supported
20:18	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
17:16	2h RO	**Max Block Length (corecfg_maxblklength):** This value indicates the maximum block size that the HD can read and write to the buffer in the HC. The buffer shall transfer this block size without wait cycles. Sizes can be defined as indicated below. 00 - 512 byte 01 - 1024 byte 10 - 2048 byte 11 - 4096 byte.
15:8	C8h RO	**Base Clock Frequency for SD Clock (corecfg_baseclkfreq):** (1) 6-bit Base Clock Frequency This mode is supported by the Host Controller Version 1.00 and 2.00. Upper 2- bit is not effective and always 0. Unit values are1MHz. The supported clock range is 10MHz to 63MHz. 0011 1111b 63MHz 0000 0010b 2MHz 0000 0001b 1MHz (2) 8-bit Base Clock Frequency This mode is supported by the Host Controller Version 3.00. Unit values are 1MHz. The supported clock range is 10MHz to 255MHz. FFh 255MHz 02h 2MHz 01h 1MHz.
7	1h RO	**Timeout Clock Unit (corecfg_timeoutclkunit):** This bit shows the unit of base clock frequency used to detect Data Timeout Error. 0 - KHz 1 - MHz.
6	0h RO	Reserved.
5:0	1h RO	**Timeout Clock Frequency (corecfg_timeoutclkfreq):** This bit shows the base clock frequency used to detect Data Timeout Error. Not 0 - 1Khz to 63Khz or 1Mhz to 63Mhz.

42.2.32 (maxcurrentcap)—Offset 48h

Maximum Current Capabilities

Access Method

Type: MEM Register (Size: 64 bits)

Device:

Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
63:24	0h RO	Reserved.
23:16	0h WO	**Maximum Current for 1.8V (corecfg_maxcurrent1p8v):** 0 – Get value via another method 1 – 4mA 2 – 8mA 3 – 12mA ... 255 – 1020mA
15:8	0h WO	**Maximum Current for 3.0V (corecfg_maxcurrent3p0v):** 0 – Get value via another method 1 – 4mA 2 – 8mA 3 – 12mA ... 255 – 1020mA

Bit Range	Default & Access	Field Name (ID): Description
7:0	0h WO	**corecfg_maxcurrent3p3v:** 0 – Get value via another method 1 – 4mA 2 – 8mA 3 – 12mA ... 255 – 1020mA

42.2.33 (ForceEventforAUTOCMDErrorStatus)—Offset 50h

Force Event REGISTER for AUTO CMD Error Status

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0h RO	Reserved.
7	0h RO	**forcecmdnotissuedbyautocmd12err:** Force Event for Command Not Issued by AUTO CMD12 Error 1 – Interrupt is generated 0 – No Interrupt
6:5	0h RO	Reserved.
4	0h RO	**forceautocmdindexerr:** Force Event for AUTO CMD Index Error 1 – Interrupt is generated 0 – No Interrupt
3	0h RO	**forceautocmdendbiterr:** Force Event for AUTO CMD End Bit Error 1 – Interrupt is generated 0 – No Interrupt
2	0h RO	**forceautocmdcrcerr:** Force Event for AUTO CMD Timeout Error 1 – Interrupt is generated 0 – No Interrupt
1	0h RO	**forceautocmdtimeouterr:** Force Event for AUTO CMD Timeout Error 1 – Interrupt is generated 0 – No Interrupt
0	0h WO	**forceautocmdnotexec:** Force Event for AUTO CMD12 Not Executed 1 – Interrupt is generated 0 – No Interrupt

42.2.34 Force Event Register for Error Interrupt Status (forceeventforerrintsts)—Offset 52h

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0h RO	Reserved.
10	0h RO	**Force Event for Tuning Error (forcetuningerr):** 1 – Interrupt is generated 0 – No Interrupt
9	0h RO	**forceadmaerr:** forceadmaerr
8	0h RO	**Force Event for Auto CMD Error (forceautocmderr):** 1 – Interrupt is generated 0 – No Interrupt
7	0h RO	**Force Event for Current Limit (forcecurrlimerr):** 1 – Interrupt is generated 0 – No Interrupt
6	0h WO	**Force Event for Data End Bit Error (forcedatendbiterr):** 1 – Interrupt is generated 0 – No Interrupt
5	0h RO	**Force Event for Data CRC Error (forcedatcrcerr):** 1 – Interrupt is generated 0 – No Interrupt
4	0h RO	**Force Event for Data Timeout Error (forcedattimeouterr):** 1 – Interrupt is generated 0 – No Interrupt
3	0h RO	**Force Event for Command Index Error (forcecmdindexerr):** 1 – Interrupt is generated 0 – No Interrupt
2	0h RO	**Force Event for Command CRC Error (forcecmdendbiterr):** 1 – Interrupt is generated 0 – No Interrupt
1	0h RO	**Force Event for Command CRC Error (forcecmdcrcerr):** 1 – Interrupt is generated 0 – No Interrupt
0	0h RO	**Force Event for CMD Timeout Error (forcecmdtimeouterr):** 1 – Interrupt is generated 0 – No Interrupt

42.2.35 ADMA Error Status (admaerrsts)—Offset 54h

When the ADMA Error interrupt occur, this register holds the ADMA State in ADMA Error States field and ADMA System Address holds address around the error descriptor

Access Method

Type: MEM Register
(Size: 8 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
2	0h RO	**ADMA Length Mismatch Error (admaerrsts_admalenmismatcherr):** ADMA Length Mismatch Error This error occurs in the following 2 cases. While Block Count Enable being set, the total data length specified by the Descriptor table is different from that specified by the Block Count and Block Length. Total data length can not be divided by the block length. 1 - Error 0 - No error
1:0	0h RO	**ADMA Error State (admaerrsts_admaerrorstate):** This field indicates the state of ADMA when error is occurred during ADMA data transfer. This field never indicates "10" because ADMA never stops in this state. D01 – D00 : ADMA Error State when error occurred Contents of SYS_SDR register. 00 - ST_STOP (Stop DMA) Points to next of the error descriptor. 01 - ST_FDS (Fetch Descriptor) Points to the error descriptor 10 - Never set this state (Not used). 11 - ST_TFR (Transfer Data) Points to the next of the error descriptor

42.2.36 ADMA System Address Register 1 (admasysaddr01)—Offset 58h

This register contains the physical address used for ADMA data transfer.

Access Method

Type: MEM Register (Size: 32 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**ADMA 32 bit System Address (adma_32bit_sysaddress):** This register holds byte address of executing command of the Descriptor table.

42.2.37 ADMA System Address Register2 (admasysaddr2)—Offset 5Ch

Access Method

Type: MEM Register (Size: 16 bits)
Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0h RW	**ADMA System Address (adma_64bit_sysaddress2):** This register holds byte address of executing command of the Descriptor table. 64-bit Address Descriptor uses Upper 32-bit of this register.

42.2.38 Preset Value for Initialization (presetvalue0)—Offset 60h

Access Method

Type: MEM Register (Size: 16 bits)

Device:
Function:

Default: 4h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0h RO	**Driver Strength Select Value (DriverStrengthSelectValue):** Driver Strength is supported by 1.8V signaling bus speed modes. This field is meaningless for 3.3V signaling. 11b Driver Type D is Selected 10b Driver Type C is Selected 01b Driver Type A is Selected 00b Driver Type B is Selected
13:11	0h RO	Reserved.
10	0h RO	**Clock Generator Select Value (ClockGeneratorSelectValue):** This bit is effective when Host Controller supports programmable clock generator. 1: Programmable Clock Generator 0: Host Controller Ver2.00 Compatible Clock Generator
9:0	4h RO	**SDCLK Frequency Select Value (SDCLKFrequencySelectValue):** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

42.2.39 Preset Preset Value for Default Speed (presetvalue1)—Offset 62h

Same description as Preset Value 0 register.

42.2.40 Preset Value for High Speed (presetvalue2)—Offset 64h

Same description as Preset Value 0 register.

42.2.41 Preset Value for SDR12 (presetvalue3)—Offset 66h

Same description as Preset Value 0 register.

42.2.42 Preset Value for SDR25 (presetvalue4)—Offset 68h

Same description as Preset Value 0 register.

42.2.43 Preset Value for SDR50 (presetvalue5)—Offset 6Ah

Same description as Preset Value 0 register.

42.2.44 Preset Value for SDR104 (presetvalue6)—Offset 6Ch

Same description as Preset Value 0 register.

42.2.45 Preset Value for DDR50 (presetvalue7)—Offset 6Eh

Same description as Preset Value 0 register.

42.2.46 Boot Timeout Control (boottimeoutcnt)—Offset 70h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0h RW	**Boot Timeout Control (boot_timeoutcnt):** This value determines the interval by which DAT line time-outs are detected during boot operation for eMMC card.

42.2.47 PRESETVALUE8 Reg (PRESETVALUE8) — Offset 74h

DriverStrengthSelectValue

Note: Bit definitions are the same as PRESETVALUE0, offset 60h.

42.2.48 VENDREG Reg (VENDREG) — Offset 78h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:1	0h RO	Reserved.
0	0h RW	VENDOR_ENHANCEDSTROBE: VENDOR_ENHANCEDSTROBE

42.2.49 Slot Interrupt Status (slotintrsts)—Offset FCh

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:1	0h RO	Reserved.
0	0h RO	**Slot 0 Interrupt Status (sdhchostif_slotintrstsslot0):** sdhchostif_slotintrstsslot0

42.2.50 HOSTCONTROLLERVER Reg (HOSTCONTROLLERVER) — Offset FEh

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
15:8	10h RO	SDHC_VENVERNUM: SDHC_VENVERNUM
7:0	02h RO	SPECIFICATIONVERSIONNUMBER: SPECIFICATIONVERSIONNUMBER

42.3 EMMC Additional Registers

These registers are memory mapped based on BAR0 defined in PCI configuration space.

Table 42-3. Summary of EMMC Additional Registers

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
804h	805h	Software LTR Value (SW_LTR_val)—Offset 804h	800h
808h	809h	Auto LTR Value (Auto_LTR_val)—Offset 808h	800h
810h	813h	Capabilities Bypass (Cap_byps)—Offset 810h	0h
814h	817h	Capabilities Bypass 1 (Cap_byps_reg1)—Offset 814h	3040EF3Ch
818h	81Bh	Capabilities Bypass Register II (Cap_byps_reg2)—Offset 818h	40040C8h
81Ch	81Fh	Device Idle D0i3 (reg_D0i3)—Offset 81Ch	8h
820h	823h	Tx CMD Delay Control (Tx_CMD_dly)—Offset 820h	400h
824h	827h	Tx Delay Control 1 (Tx_DATA_dly_1)—Offset 824h	A18h
828h	82Bh	Tx Delay Control 2 (Tx_DATA_dly_2)—Offset 828h	1C1C1C00h
82Ch	82Fh	Rx CMD Data Delay Control 1 (Rx_CMD_Data_dly_1)—Offset 82Ch	1C1C1C00h
830h	833h	Rx Strobe Delay Control (Rx_Strobe_Ctrl_Path)—Offset 830h	500h
834h	837h	Rx CMD Data Path Delay Control 2 (Rx_CMD_Data_dly_2)—Offset 834h	181Ch
838h	83Bh	Initiator DLL Software Control (Initiator_Dll)—Offset 838h	1h

Table 42-3. Summary of EMMC Additional Registers (Continued)

Offset Start	Offset End	Register Name (ID)—Offset	Default Value
840h	843h	Auto Tuning Value (Auto_tuning)—Offset 840h	0h

42.3.1 Software LTR Value (SW_LTR_val)—Offset 804h

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Snoop_Requirment:** Snoop_Requirment
14:13	0h RO	Reserved.
12:10	2h RW	**Snoop Latency Scale (Snoop_latency_scale):** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -) 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**Snoop Value (Snoop_value):** 10-bit latency value

42.3.2 Auto LTR Value (Auto_LTR_val)—Offset 808h

Access Method

Type: MEM Register
(Size: 16 bits)

Device:
Function:

Default: 800h

Bit Range	Default & Access	Field Name (ID): Description
15	0h RW	**Snoop Requirment (Snoop_Requirment):** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	Reserved.
12:10	2h RW	**Snoop Latency Scale (Snoop_latency_scale):** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -) 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	0h RW	**Snoop Value (Snoop_value):** 10-bit latency value

42.3.3 Capabilities Bypass (Cap_byps)—Offset 810h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	Reserved.
7:0	0h RW	**Enable Capabilities Bypass (Enable_Cap_Bypass):** 5Ah: Enable Capabilities Bypass Others: Capabilities Bypass disabled (using default values)

42.3.4 Capabilities Bypass 1 (Cap_byps_reg1)—Offset 814h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 3040EF3Ch

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	Reserved.
29	1h RW	**hs400_support:** 1 – HS400 Mode Supported 0 – HS400 Mode NOT Supported
28	1h RW	**Timeout Clock Unit (timeout_clock_unit):** 1 - to Select MHz Clock 0 - to Select KHz Clock
27:22	1h RW	**Timeout Clock Frequency (timeout_clock_freq)**
21	0h RW	**SPI Mode Support (SPI_mode_support):** 1: SPI Mode Supported 0: SPI Mode Not Supported
20:17	0h RW	**Timer Count for Re-Tuning (timer_count):** This is the Timer Count for Re-Tuning Timer for Re-Tuning Mode 1 to 3. Setting to 0h disables Re-Tuning Timer.
16	0h RW	**Use Tuning for SDR50 (tuning_for_SDR50):** 1 = Use Tuning 0 = Don't use Tuning
15	1h RW	**DDR50 Support (ddr50_support):** 1'b1 – DDR50 Mode Supported 1'b0 – DDR50 Mode NOT Supported
14	1h RW	**SDR104 Support (sdr104_support):** 1'b1 – SDR104 Mode Supported 1'b0 – SDR104 Mode NOT Supported
13	1h RW	**SDR50 Support (sdr50_support):** 1'b1 – SDR50 Mode Supported 1'b0 – SDR50 Mode NOT Supported

Bit Range	Default & Access	Field Name (ID): Description
12:11	1h RW	**Slot Type (Slot_Type):** 00 - Removable Card Slot 01 - Embedded Slot for One Device 10 - Shared Bus Slot 11 - Reserved
10	1h RW	**Asynchronous Interrupt Support (Asynchronus_Interrupt_Support):** 1'b1 – Asynchronous Interrupt Supported 1'b0 – Asynchronous Interrupt NOT Supported
9	1h RW	**64 Bit System Address Support (Sys_Addr_64bit_Support):** 1 - Core supports 64-bit System Address Bus 0 - Core supports only 32-bit System Address Bus
8	1h RW	**Voltage Support 1.8V (Voltage_Support_1_8V):** 1'b1 – 1.8V Supported 1'b0 – 1.8V NOT Supported
7	0h RW	**Voltage Support 3.0V (Voltage_Support_3V):** 1'b1 – 3.0V Supported 1'b0 – 3.0V NOT Supported
6	0h RW	**Voltage Support 3.3V (Voltage_Support_3_3V):** 1'b1 – 3.3V Supported 1'b0 – 3.3V NOT Supported
5	1h RW	**Suspend / Resume Support (Suspend_Resume_Support):** 1'b1 – Suspend/Resume Supported 1'b0 – Suspend/Resume NOT Supported
4	1h RW	**SDMA Support (SDMA_Support):** 1'b1 – SDMA Mode Supported 1'b0 – SDMA Mode NOT Supported
3	1h RW	**High Speed Support (High_Speed_Support):** 1'b1 – High Speed Mode Supported 1'b0 – High Speed Mode NOT Supported
2	1h RW	**ADMA2 Support (ADMA2_Support):** 1'b1 – ADMA2 Mode Supported 1'b0 – ADAM2 Mode NOT Supported
1:0	0h RW	**Max Burst Length (Max_Burst_Length):** Maximum Block Length supported by the Core/Device 00: 512 (Bytes) 01: 1024 10: 2048 11: Reserved

42.3.5 Capabilities Bypass Register II (Cap_byps_reg2)—Offset 818h

Access Method

Type: MEM Register (Size: 32 bits)

Device:

Function:

Default: 40040C8h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0h RO	Reserved.
26:21	20h RW	**Tuning Count Value (tuning_count_val):** Configures the Number of Taps (Phases) of the rxclk_in that is supported. The Tuning State machine uses this information to select one of the Taps (Phases) of the rxclk_in during the Tuning Procedure

Bit Range	Default & Access	Field Name (ID): Description
20	0h RW	**Tuning Disable (tuning_dis):** Disable the 1.5x Tuning count when calculating total tuning count.
19	0h RW	**Driver Type 4 Support (driver_type_4):** 1: Supported 0: NOT Supported
18	0h RW	**Driver Type D Support (driver_type_D):** 1: Supported 0: NOT Supported
17	0h RW	**Driver Type C Support (driver_type_C):** 1: Supported 0: NOT Supported
16	0h RW	**Driver Type A Support (driver_type_A):** 1: Supported 0: NOT Supported
15	0h RO	Reserved.
14	1h RW	**8-bit Support for Embedded Device (support_8_bit_embedded):** 1: Supported 0: NOT Supported
13:8	0h RO	Reserved.
7:0	C8h RW	**Base Clock Frequency (base_sd_clock)**

42.3.6 Device Idle D0i3 (reg_D0i3)—Offset 81Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 8h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4	0h RO	**Interrupt Request Capable (Interrupt_Request_Capable):** 0 – HW not capable to issue in interrupt on command completion 1 – HW capable to issue an interrupt on command completion
3	1h RW/1C	**Restore Required (RestoreRequired):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0h RW	**D0i3 (D0i3):** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RO	Reserved.
0	0h RO	**Command In Progress (Cmd_In_Progress):** HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit. If Interrupt Request bit [1] was set for the current command, HW may clear this bit before the interrupt has been made visible to SW.

42.3.7 Tx CMD Delay Control (Tx_CMD_dly)—Offset 820h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 400h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:8	4h RW	**Tx CMD Delay (DDR Mode) (ddr_mode):** Tx CMD Delay (DDR Mode). 0 - 39: Select number of active delay elements. Each = 125pSec. 40 - 127: Reserved
7	0h RO	Reserved.
6:0	0h RW	**Tx CMD Delay (SDR Mode) (sdr_mode):** Tx CMD Delay (SDR Mode). 0 - 39: Select number of active delay elements. Each = 125pSec. 40 - 127 - Reserved

42.3.8 Tx Delay Control 1 (Tx_DATA_dly_1)—Offset 824h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: A18h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0h RO	Reserved.
14:8	Ah RW	**Tx Data Delay (HS400 Mode) (hs400_mode):** Tx Data Delay (HS400 Mode). 0 - 78: Select number of active delay elements. Each = 125pSec. 79 - 127: Reserved
7	0h RO	Reserved.
6:0	18h RW	**Tx Data Delay (SDR104/HS200 Mode) (sdr104_hs200_mode):** 0-79 - Select the required delay, as a multiple of 125pSec. 80 – 127 – Reserved

42.3.9 Tx Delay Control 2 (Tx_DATA_dly_2)—Offset 828h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1C1C1C00h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	1Ch RW	**Tx Data Delay (SDR50 Mode) (sdr50_mode):** 0 - 79: Select the required delay, as a multiple of 125pSec. 80 - 127: Reserved
23	0h RO	Reserved.
22:16	1Ch RW	**Tx Data Delay (DDR50 Mode) (ddr50_mode):** 0 - 78: Select number of active delay elements. Each = 125pSec. 79 - 127: Reserved
15	0h RO	Reserved.
14:8	1Ch RW	**Tx Data Delay (SDR25/HS50 Mode) (sdr25_hs50_mode):** 0 - 79: Select the required delay, as a multiple of 125pSec. 80 - 127: Reserved
7	0h RO	Reserved.
6:0	0h RW	**Tx Data Delay (SDR12/Compatibility Mode) (sdr12_comp_mode):** 0 - 79: Select the required delay, as a multiple of 125pSec. 80 - 127: Reserved

42.3.10 Rx CMD Data Delay Control 1 (Rx_CMD_Data_dly_1)—Offset 82Ch

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1C1C1C00h

Bit Range	Default & Access	Field Name (ID): Description
31	0h RO	Reserved.
30:24	1Ch RW	**Rx CMD + Data Delay (SDR50 Mode) (sdr50_mode):** 0-119 - Select the required delay, as a multiple of 125pSec. 120 – 127 – Reserved
23	0h RO	Reserved.
22:16	1Ch RW	**Rx CMD + Data Delay (DDR50 Mode) (ddr50_mode):** 0-78: Select number of active delay elements. Each = 125 pSec. 79-127: Reserved
15	0h RO	Reserved.
14:8	1Ch RW	**Rx CMD + Data Delay (SDR25/HS50 Mode) (sdr25_hs50_mode):** 0-119 - Select the required delay, as a multiple of 125pSec. 120 – 127 – Reserved
7	0h RO	Reserved.
6:0	0h RW	**Rx CMD + Data Delay (SDR12/Compatibility Mode) (sdr12_comp_mode):** 0-119 - Select the required delay, as a multiple of 125pSec. 120 – 127 – Reserved

42.3.11 Rx Strobe Delay Control (Rx_Strobe_Ctrl_Path)—Offset 830h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 500h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	Reserved.
16	0h RW	**Auto Tuning (auto_tuning):** Enable Auto Tuning for HS400 Strobe Path. 0: Auto Tuning Disabled 1: Auto Tuning Enabled
15	0h RO	Reserved.
14:8	5h RW	**Rx Strobe Delay DLL 1(HS400 Mode) (hs400_mode1):** 0-39: Select number of active delay elements. Each = 125 pSec. 0-63: Reserved
7	0h RO	Reserved.
6:0	0h RW	**Rx Strobe Delay DLL 2(HS400 Mode) (hs400_mode2):** 0-39: Select number of active delay elements. Each = 125 pSec. 40-63: Reserved

42.3.12 Rx CMD Data Path Delay Control 2 (Rx_CMD_Data_dly_2)—Offset 834h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 181Ch

Bit Range	Default & Access	Field Name (ID): Description
31:18	0h RO	Reserved.
17:16	0h RW	**Clock Source (clk_source):** Clock Source for Rx Path. 00: Rx Clock after Output Buffer 01: Rx Clock before Output Buffer 10: Automatic Selection based on Working mode (HS 200 before buffer, all others after buffer) 11 - Reserved
15:14	0h RO	Reserved.
13:8	18h RW	**Rx Path PLL (path_pll):** Rx Path PLL #3 Delay value For Auto Tuning Mode. 0-39: Select the required delay, as a multiple of 125 pSec. 40-63: Reserved
7	0h RO	Reserved.

Bit Range	Default & Access	Field Name (ID): Description
6:0	1Ch RW	**Rx CMD + Data Delay (SDR104/HS200 Mode) (cmd_data_sdr104_hs200):** 0-79: Select the required delay, as a multiple of 125 pSec. 80-127: Reserved

42.3.13 Initiator DLL Software Control (Initiator_Dll)—Offset 838h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 1h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0h RO	Reserved.
24	0h RW	**SW reset for Initiator DLL (SW_reset_dll):** 0: No SW Reset for Initiator DLL 1: Force Reset for Initiator DLL
23	0h RO/V	**Initiator DLL Lock Indication (DLL_lock)**
22:2	0h RO	Reserved.
1	0h RW	**Initiator DLL Software Control (Initiator_DLL_Software_Ctrl):** 0: Initiator DLL Automatic Control (SW Control Disabled). 1: Initiator DLL Software Control Enabled
0	1h RW	**Control of Initiator DLL Ref Clock (Ctrl_of_Mst_DLL_Ref_Clk):** 0: Clock is Disabled. 1: Clock is Enabled

42.3.14 Auto Tuning Value (Auto_tuning)—Offset 840h

Access Method

Type: MEM Register
(Size: 32 bits)

Device:
Function:

Default: 0h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0h RO	Reserved.
4:0	0h RO/V	**Auto Tuning Value (auto_tuning_val):** Auto Tuning Value found by host controller.

§ §

43 UFS Registers (D18:F7)

This chapter documents the registers in Bus: 0, Device 18, Function 7.

Note: These registers do not apply to S/H processors.

43.1 UFS Configuration Registers

Table 43-1. Summary of UFS Configuration Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
0h	4	DEVICEID Ufs (DEVICEID)	00008086h
4h	4	STATUSCOMMAND Ufs (STATUSCOMMAND)	00100000h
8h	4	REVCLASSCODE Ufs (REVCLASSCODE)	01090100h
Ch	4	CLLATHEADERBIST Ufs (CLLATHEADERBIST)	00000000h
10h	4	BAR Ufs (BAR)	00000004h
14h	4	BAR_HIGH Ufs (BAR_HIGH)	00000000h
18h	4	BAR1 Ufs (BAR1)	00000004h
1Ch	4	BAR1_HIGH Ufs (BAR1_HIGH)	00000000h
2Ch	4	SUBSYSTEMID Ufs (SUBSYSTEMID)	00000000h
30h	4	EXPANSION_ROM_BASEADDR Ufs (EXPANSION_ROM_BASEADDR)	00000000h
34h	4	CAPABILITYPTR Ufs (CAPABILITYPTR)	00000080h
3Ch	4	INTERRUPTREG Ufs (INTERRUPTREG)	00000000h
80h	4	POWERCAPID Ufs (POWERCAPID)	00039001h
84h	4	PMECTRLSTATUS Ufs (PMECTRLSTATUS)	00000008h
90h	4	PCIDEVIDLE_CAP_RECORD Ufs (PCIDEVIDLE_CAP_RECORD)	F0140009h
94h	4	DEVID_VEND_SPECIFIC_REG Ufs (DEVID_VEND_SPECIFIC_REG)	01400010h
98h	4	D0I3_CONTROL_SW_LTR_MMIO_REG Ufs (D0I3_CONTROL_SW_LTR_MMIO_REG)	00008041h
9Ch	4	DEVICE_IDLE_POINTER_REG Ufs (DEVICE_IDLE_POINTER_REG)	000081C1h
A0h	4	D0I3_MAX_POW_LAT_PG_CONFIG Ufs (D0I3_MAX_POW_LAT_PG_CONFIG)	00290800h
B0h	4	GEN_REGRW1 Ufs (GEN_REGRW1)	00000000h
B4h	4	GEN_REGRW2 Ufs (GEN_REGRW2)	00000000h
B8h	4	GEN_REGRW3 Ufs (GEN_REGRW3)	00000000h
BCh	4	GEN_REGRW4 Ufs (GEN_REGRW4)	00000000h
C0h	4	GEN_INPUT_REG Ufs (GEN_INPUT_REG)	00000000h

43.1.1 DEVICEID Ufs (DEVICEID) — Offset 0h

Vendor ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 0h	00008086h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO/P	**DEVICEID:** Device ID identifies the particular PCI device
15:0	8086h RO	**VENDORID:** Vendor ID is a unique ID provided by the PCI SIG which identifies the manufacturer of the device

43.1.2 STATUSCOMMAND Ufs (STATUSCOMMAND) — Offset 4h

PCI Command Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 4h	00100000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:30	0h RO	**Reserved**
29	0h RW/1C	**RMA:** Received Initiator Abort
28	0h RW/1C	**RTA:** Received Target Abort
27:21	0h RO	**Reserved**
20	1h RO	**CAPLIST:** Capabilities List: Indicates that the controller contains a capabilities pointer list
19	0h RO	**INTR_STATUS:** Interrupt Status: This bit reflects state of interrupt in the device
18:11	0h RO	**Reserved**
10	0h RW	**INTR_DISABLE:** Interrupt Disable
9	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
8	0h RW	**SERR_ENABLE:** SERR Enable Not implemented
7:3	0h RO	**Reserved**
2	0h RW	**BME:** Bus Initiator Enable
1	0h RW	**MSE:** Memory Space Enable
0	0h RO	**Reserved**

43.1.3 REVCLASSCODE Ufs (REVCLASSCODE) — Offset 8h

Revision ID Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 8h	01090100h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	010901h RO	**CLASS_CODES:** Class Code register is read-only and is used to identify the generic function of the device and in some cases a specific register-level programming interface
7:0	00h RO/P	**RID:** Revision ID identifies the revision of particular PCI device.

43.1.4 CLLATHEADERBIST Ufs (CLLATHEADERBIST) — Offset Ch

Cache Line Latency Header and BIST Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	0h RO	**Reserved**
23	0h RO	**MULFNDEV:** Multi-Function Device
22:16	00h RO	**HEADERTYPE:** Header Type: Implements Type 0 Configuration header
15:8	00h RO	**LATTIMER:** Latency Timer:. This register is implemented as RO with default as 0
7:0	00h RW/P	**CACHELINE_SIZE:** Cacheline Size

43.1.5 BAR Ufs (BAR) — Offset 10h

BAR -Base Address Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 10h	00000004h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**BASEADDR:** Base Address Register Low Base address of the OCP fabric memory space. Taken from Strap values as ones
11:4	00h RO	**SIZEINDICATOR:** Size Indicator RO Always returns 0 The size of this register depends on the size of the memory space
3	0h RO	**PREFETCHCHABLE:** Prefetchable: Indicates that this BAR is not prefetchable
2:1	2h RO	**TYPE:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE:** Memory Space Indicator: 0 indicates this BAR is present in the memory space.

43.1.6 BAR_HIGH Ufs (BAR_HIGH) — Offset 14h

BAR -Base Address Register High

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 14h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**BASEADDR_HIGH:** Base Address high - MSB

43.1.7 BAR1 Ufs (BAR1) — Offset 18h

BAR1 -Base Address Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 18h	00000004h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:12	00000h RW	**BASEADDR1:** Base Address1 This field is present if BAR1 is enabled through private configuration space.
11:4	00h RO	**SIZEINDICATOR1:** Always is 0 as minimum size is 4K
3	0h RO	**PREFETCHCHABLE1:** Prefetchable: Indicates that this BAR is not prefetchable.
2:1	2h RO	**TYPE1:** If BAR_64b_EN is 0 then 00 indicates BAR lies in 32bit address range If BAR_64b_EN is 1 then 10 Indicates BAR lies in 64 bit address range
0	0h RO	**MESSAGE_SPACE1:** Memory Space Indicator: 0 Indicates this BAR is present in the memory space

43.1.8 BAR1_HIGH Ufs (BAR1_HIGH) — Offset 1Ch

BAR1 -Base Address Register1 High

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 1Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**BAR1_HIGH:** Base Address: Base address of the OCP fabric memory space. Taken from Strap values as ones

43.1.9 SUBSYSTEMID Ufs (SUBSYSTEMID) — Offset 2Ch

SUBSYSTEMID -Subsystem Vendor and Subsystem ID

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 2Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RW/O/P	**SUBSYSTEMID:** Subsystem ID: This register is implemented for any function that can be instantiated more than once in a given system.
15:0	0000h RW/O/P	**SUBSYSTEMVENDORID:** Subsystem Vendor ID: This register must be implemented for any function that can be instantiated more than once in a given system

43.1.10 EXPANSION_ROM_BASEADDR Ufs (EXPANSION_ROM_BASEADDR) — Offset 30h

Expansion ROM Base Address Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 30h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:11	000000h RO	**EXPANSION_ROM_BASE:** Expansion ROM Base Address: Value of all zeros indicates no support for Expansion ROM
10:1	0h RO	**Reserved**
0	0h RO	**EXPANSION_ROM_ENABLE:** EXPANSION_ROM_ENABLE

43.1.11 CAPABILITYPTR Ufs (CAPABILITYPTR) — Offset 34h

Capabilities Pointer Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 34h	00000080h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:8	0h RO	**Reserved**
7:0	80h RO	**CAPPTR_POWER:** Capabilities Pointer: Indicates what the next capability is.

43.1.12 INTERRUPTREG Ufs (INTERRUPTREG) — Offset 3Ch

Interrupt Line Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 3Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:24	00h RO	**MAX_LAT:** Value of 0 indicates device has no major requirements for the settings of latency timers
23:16	00h RO	**MIN_GNT:** MIN_GNT
15:12	0h RO	**Reserved**
11:8	0h RO	**INTPIN:** Interrupt Pin: Value in this register is reflected from the IPIN value in the private configuration space.
7:0	00h RW/P	**INTLINE:** Interrupt Line: It is used to communicate to software the interrupt line to which the interrupt pin is connected

43.1.13 POWERCAPID Ufs (POWERCAPID) — Offset 80h

Power Management Capability ID Regsiter

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 80h	00039001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:27	00h RO	**PMESUPPORT:** This 5-bit field indicates the power states in which the function can assert the PME#
26:19	0h RO	**Reserved**
18:16	3h RO	**VERSION:** Indicates support for Revision 1.2 of the PCI Power Management Specification
15:8	90h RO	**NXTCAP:** Next Capability: Points to the next capability structure.
7:0	01h RO	**POWER_CAP:** Power Management Capability: Indicates this is power management capability

43.1.14 PMECTRLSTATUS Ufs (PMECTRLSTATUS) — Offset 84h

Power Management Control and Status Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 84h	00000008h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW/1C/P	**PMESTATUS:** PME Status
14:9	0h RO	**Reserved**
8	0h RW/P	**PMEENABLE:** PME Enable
7:4	0h RO	**Reserved**
3	1h RO	**NO_SOFT_RESET:** This bit indicates that devices transitioning from D3hot to D0 because of Powerstate commands do not perform an internal reset
2	0h RO	**Reserved**
1:0	0h RW	**POWERSTATE:** Power State: This field is used both to determine the current power state and to set a new power state

43.1.15 PCIDEVIDLE_CAP_RECORD Ufs (PCIDEVIDLE_CAP_RECORD) — Offset 90h

PCI Device Idle Capability Record Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 90h	F0140009h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:28	Fh RO	**VEND_CAP:** Vendor Specific Capability ID
27:24	0h RO	**REVID:** Revision ID of capability structure
23:16	14h RO	**CAP_LENGTH:** Vendor Specific Capability Length
15:8	00h RO	**NEXT_CAP:** Next Capability
7:0	09h RO	**CAPID:** Capability ID

43.1.16 DEVID_VEND_SPECIFIC_REG Ufs (DEVID_VEND_SPECIFIC_REG) — Offset 94h

Device ID Vendor Specific Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 94h	01400010h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:20	014h RO	**VSEC_LENGTH:** Vendor Specific Extended Capability Length
19:16	0h RO	**VSEC_REV:** Vendor specific Extended Capability revision
15:0	0010h RO	**VSECID:** Vendor Specific Extended Capability ID

43.1.17 D0I3_CONTROL_SW_LTR_MMIO_REG Ufs (D0I3_CONTROL_SW_LTR_MMIO_REG) — Offset 98h

SW LTR Update MMIO Location Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 98h	00008041h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0000804h RO	**SW_LAT_DWORD_OFFSET:** SW LTR Update MMIO Offset Location (SWLTRLOC)
3:1	0h RO	**SW_LAT_BAR_NUM:** Indicates that the SW LTR update MMIO location is always at BAR0
0	1h RO	**SW_LAT_VALID:** This value is reflected from the SW LTR valid strap at the top level

43.1.18 DEVICE_IDLE_POINTER_REG Ufs (DEVICE_IDLE_POINTER_REG) — Offset 9Ch

Device IDLE Pointer Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + 9Ch	000081C1h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	000081Ch RO	**DWORD_OFFSET:** contains the location pointer to the SW LTR register in MMIO space as an offset from the specified BAR
3:1	0h RO	**BAR_NUM1:** Bar num: Indicates that the D0i3 MMIO location is always at BAR0
0	1h RO	**VALID:** Valid: This value is reflected from the D0i3 valid strap at the top level.

43.1.19 D0I3_MAX_POW_LAT_PG_CONFIG Ufs (D0I3_MAX_POW_LAT_PG_CONFIG) — Offset A0h

Doi3 Max Power On Latency

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + A0h	00290800h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:22	0h RO	**Reserved**
21	1h RW/P	**HAE:** Hardware Autonomous Enable
20	0h RO	**Reserved**
19	1h RW/P	**SLEEP_EN:** Sleep Enable
18	0h RW	**PGE:** DEVIDLE Enable (DEVIDLEN): If ?1? then the function will power gate when idle and the DevIdle register (DevIdleC[2] = ?1?) is set.
17	0h RW	**I3_ENABLE:** I3_ENABLE
16	1h RW/P	**PMCRE:** PMCRE
15:13	0h RO	**Reserved**
12:10	2h RW/O/P	**POW_LAT_SCALE:** Power On Latency Scale
9:0	000h RW/O/P	**POW_LAT_VALUE:** Power On Latency value

43.1.20 GEN_REGRW1 Ufs (GEN_REGRW1) — Offset B0h

General Purpose PCI RW Register1

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + B0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW1:** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg1 Out of Band signal

43.1.21 GEN_REGRW2 Ufs (GEN_REGRW2) — Offset B4h

General Purpose PCI RW Register2

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + B4h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW2:** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg2 Out of Band signal

43.1.22 GEN_REGRW3 Ufs (GEN_REGRW3) — Offset B8h

General Purpose PCI RW Register3

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + B8h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW3:** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg3 Out of Band signal

43.1.23 GEN_REGRW4 Ufs (GEN_REGRW4) — Offset BCh

General Purpose PCI RW Register4

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + BCh	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RW	**GEN_REG_RW4:** General Purpose PCI Register: This register value is brought out as oob_gen_pci_reg4 Out of Band signal

43.1.24 GEN_INPUT_REG Ufs (GEN_INPUT_REG) — Offset C0h

General Input Register

Type	Size	Offset	Default
PCI	32 bit	[B:0, D:18, F:7] + C0h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:0	00000000h RO	**GEN_INPUT_REG:** General Purpose Input Register: This register value reflects the value of oob_gen_input_pci Out of Band signal

43.2 UFS MMIO Registers

This section lists the registers of Universal Flash Storage interface for MMIO registers.

Table 43-2. Summary of UFS MMIO Registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
804h	4	UFS_SW_LTR_VAL_REG Ufs (SW_LTR_VAL)	00000800h
808h	4	UFS_AUTO_LTR_VAL_REG Ufs (AUTO_LTR_VAL)	00000800h
81Ch	4	UFS_D0I3_CTRL Ufs (REG_D0I3)	00000000h
854h	4	UFS_PWM_DIV Ufs (PWM_DIV)	0000003Bh
858h	4	UFS_CRU_XFSM_CTRL Ufs (CRU_XFSM)	00000249h
85Ch	4	UFS_REF_CLOCK Ufs (REF_CLK)	00000002h
860h	4	UFS_HS_CLOCK_CTRL Ufs (HS_RX_CLK)	00000000h
864h	4	UFS_HBP_OBS0 Ufs (UFS_HBP_OBS0)	FFFFFFFFh
868h	4	UFS_HBP_OBS1 Ufs (UFS_HBP_OBS1)	FFFFFFFFh
86Ch	4	UFS_HBP_OBS2 Ufs (UFS_HBP_OBS2)	FFFFFFFFh
870h	4	UFS_HBP_OBS3 Ufs (UFS_HBP_OBS3)	FFFF0000h
874h	4	UFS_HBP_OBS4 Ufs (UFS_HBP_OBS4)	00000000h
878h	4	UFS_HBP_OBS5 Ufs (UFS_HBP_OBS5)	00000000h
87Ch	4	UFS_HBP_OBS6 Ufs (UFS_HBP_OBS6)	00000000h
880h	4	NEW_REQACK_EN Ufs (UFS_NEW_REQACK_EN)	00000001h
900h	4	UFS_ROOT_SPACE Ufs (ROOT_SPACE)	00000000h
904h	4	UFS_IDLE_INDICATION Ufs (UFS_IDLE_INDICATION)	00000001h

43.2.1 UFS_SW_LTR_VAL_REG Ufs (SW_LTR_VAL) — Offset 804h

Software LTR VAL_REG Register

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 804h	00000800h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0h RO	**Reserved**
15	0h RW	**SNOOP_REQUIRMENT:** Snoop_Requirment (snoop_requirment) If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0h RO	**Reserved**
12:10	2h RW	**SNOOP_LATENCY_SCALE:** Snoop_latency_scale (snoop_latency_scale) Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale(1us -) 32ms total span) only. Writes to this CSR which dont match those values will be dropped completely, next read will return previous value.
9:0	000h RW	**SNOOP_VALUE:** Snoop_value (snoop_value) 10-bit latency value

43.2.2 UFS_AUTO_LTR_VAL_REG Ufs (AUTO_LTR_VAL) — Offset 808h

Auto LTR VAL_REG Register

Note: Bit definitions are the same as SW_LTR_VAL, offset 804h.

43.2.3 UFS_D0I3_CTRL Ufs (REG_D0I3) — Offset 81Ch

Device Idle D0i3 Register

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 81Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:4	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
3	0h RO	**RESTORE_REQUIRED:** Restore Required When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing 1. This bit will be set on initial power up.
2	0h RW	**D0I3:** D0i3 SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0h RO	**INTERRUPT_REQUEST:** Interrupt Request SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register. Not supported in SCS
0	0h RO	**CMD_IN_PROGRESS:** Command-In-Progress HW sets this bit on a 1->0 or 0->1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit. If Interrupt Request bit [1] was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles

43.2.4 UFS_PWM_DIV Ufs (PWM_DIV) — Offset 854h

PWM Clock Divider Register

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 854h	0000003Bh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:9	0h RO	**Reserved**
8	0h RW	**PWM_CLK_SOURCE_SEL:** pwm_clk_source_sel
7:6	0h RW	**PWM_HVM_PRE_DIV:** PWM_HVM_pre_div
5:0	3Bh RW	**PWM_DIV_VAL:** pwm_div_val

43.2.5 UFS_CRU_XFSM_CTRL Ufs (CRU_XFSM) — Offset 858h

Internal Clokc Unit XFSM

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 858h	00000249h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:17	0h RO	**Reserved**
16	0h RW	**MMP_LFPS_PULL_EN_BYP:** MMP_LFPS_pull_en_byp
15:12	0h RO	**Reserved**
11:9	1h RW	**CCU_XFSM:** ccu_xfsm
8:6	1h RW	**PLL_XFSM:** pll_xfsm
5:3	1h RW	**RX_XFSM:** rx_xfsm
2:0	1h RW	**TX_XFSM:** tx_xfsm

43.2.6 UFS_REF_CLOCK Ufs (REF_CLK) — Offset 85Ch

Ref Clock Register

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 85Ch	00000002h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:2	0h RO	**Reserved**
1	1h RW	**REF_CLK_EN:** ref_clk_en
0	0h RW	**REF_CLK_CTRL:** ref_clk_ctrl

43.2.7 UFS_HS_CLOCK_CTRL Ufs (HS_RX_CLK) — Offset 860h

HS Clock Control Register

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 860h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RW	**HS_RX_CLK_CTRL:** HS_Rx_clk_ctrl

43.2.8 UFS_HBP_OBS0 Ufs (UFS_HBP_OBS0) — Offset 864h

Observation for HBP0

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 864h	FFFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	FFFFh RO	**UFS_HBP_MISR_DFX_1:** ufs_hbp_misr_dfx_1
15:0	FFFFh RO	**UFS_HBP_MISR_DFX_0:** ufs_hbp_misr_dfx_0

43.2.9 UFS_HBP_OBS1 Ufs (UFS_HBP_OBS1) — Offset 868h

Observation for HBP1

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 868h	FFFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	FFFFh RO	**UFS_HBP_MISR_DFX_3:** ufs_hbp_misr_dfx_3
15:0	FFFFh RO	**UFS_HBP_MISR_DFX_2:** ufs_hbp_misr_dfx_2

43.2.10 UFS_HBP_OBS2 Ufs (UFS_HBP_OBS2) — Offset 86Ch

Observation for HBP2

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 86Ch	FFFFFFFFh

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	FFFFh RO	**UFS_HBP_MISR_DFX_4:** ufs_hbp_misr_dfx_4
15:0	FFFFh RO	**UFS_HBP_MISR_DFX_L2DATA:** ufs_hbp_misr_dfx_l2data

43.2.11 UFS_HBP_OBS3 Ufs (UFS_HBP_OBS3) — Offset 870h

Observation for HBP3

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 870h	FFFF0000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	FFFFh RO	**UFS_HBP_MISR_DFX_AFCNAC:** ufs_hbp_misr_dfx_afcnac
15:0	0000h RO	**L2_DATA_MISR_CNT:** l2_data_misr_cnt

43.2.12 UFS_HBP_OBS4 Ufs (UFS_HBP_OBS4) — Offset 874h

Observation for HBP4

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 874h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**AFC_NAC_MISR_CNT:** afc_nac_misr_cnt
15:0	0000h RO	**PA_CP_MISR_CNT:** pa_cp_misr_cnt

43.2.13 UFS_HBP_OBS5 Ufs (UFS_HBP_OBS5) — Offset 878h

Observation for HBP5

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 878h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**TXCFG_MISR_CNT:** txcfg_misr_cnt
15:0	0000h RO	**RXCFG_MISR_CNT:** rxcfg_misr_cnt

43.2.14 UFS_HBP_OBS6 Ufs (UFS_HBP_OBS6) — Offset 87Ch

Observation for HBP6

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 87Ch	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:16	0000h RO	**L2_DATA_X2_MISR_CNT:** l2_data_x2_misr_cnt
15:0	0000h RO	**AFC_NAC_X2_MISR_CNT:** afc_nac_x2_misr_cnt

43.2.15 NEW_REQACK_EN Ufs (UFS_NEW_REQACK_EN) — Offset 880h

Enable for New clkreq-ack features

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 880h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	00000000h RO	**CNP_REQACK_EN_RESERVED_31_1:** CNP_REQACK_EN_RESERVED_31_1
0	1h RW	**NEW_CLKREQ_ACK_EN:** NEW_clkreq_ack_en

43.2.16 UFS_ROOT_SPACE Ufs (ROOT_SPACE) — Offset 900h

Root Space Register

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 900h	00000000h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	0h RO	**ROOT_SPACE:** root_space

43.2.17 UFS_IDLE_INDICATION Ufs (UFS_IDLE_INDICATION) — Offset 904h

ufs idle indication

Type	Size	Offset	Default
MMIO	32 bit	FDAA0000h + 904h	00000001h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
31:1	0h RO	**Reserved**
0	1h RO	**UFS_IDLE_INDICATION:** ufs_idle_indication

43.3 UFS IO Fabric Registers

This Section of documents UFS IO Converge configuration registers

Offset	Size (Bytes)	Register Name (Register Symbol)	Default Value
1078h	8	rt5_rt_network_control UFS (RT5_RT_NETWORK_CONTROL)	0h
4020h	8	main2scc_i0_ia_agent_control UFS (MAIN2SCC_I0_IA_AGENT_CONTROL)	0h
4820h	8	scc2main_t0_ta_agent_control UFS (SCC2MAIN_T0_TA_AGENT_CONTROL)	0h
5820h	8	ufs_i0_ia_agent_control UFS (UFS_I0_IA_AGENT_CONTROL)	0h
5C20h	8	ufs_t0_ta_agent_control UFS (UFS_T0_TA_AGENT_CONTROL)	0h

43.3.1 t5_rt_network_control UFS (RT5_RT_NETWORK_CONTROL) — Offset 1078h

Control over interconnect-wide functions

Type	Size	Offset	Default
MMIO	64 bit	FDAA0000h + 1078h	0h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
63:57	0h RO	**Reserved**

Bit Range	Default & Access	Field Name (ID): Description
56	0h RO	**CLOCK_GATE_DISABLE:** Overrides fine-grained hardware clock gating
55:11	0h RO	**Reserved**
10:8	0h RW	**RT_NETWORK_CONTROL_TIMEOUT_BASE_4:** 212 cycles
7:0	0h RO	**Reserved**

43.3.2 main2scc_i0_ia_agent_control UFS (MAIN2SCC_I0_IA_AGENT_CONTROL) — Offset 4020h

Control over agent functions

Type	Size	Offset	Default
MMIO	64 bit	FDAA0000h + 4020h	0h

Register Level Access:

BIOS Access	SMM Access	OS Access
RW	RW	RW

Bit Range	Default & Access	Field Name (ID): Description
63:29	0h RO	**Reserved**
28	0h RO	**INBAND_ERROR_PRIMARY_REP:** Reporting of in-band errors with MErrSteer indicating a primary error (or if error steering is not enabled)
27	0h RO	**ALL_INBAND_ERROR_REP:** Reporting of all in-band errors as out-of-band errors
26	0h RW	**BURST_TIMEOUT_REP:** Open burst and ReadEx/Write timeout reporting
25	0h RW	**RESP_TIMEOUT_REP:** Response timeout reporting
24:19	0h RO	**Reserved**
18:16	0h RW	**IA_AGENT_CONTROL_BURST_TIMEOUT_4:** 64 base cycles
15:11	0h RO	**Reserved**
10:8	0h RW	**IA_AGENT_CONTROL_RESP_TIMEOUT_4:** 64 base cycles
7:5	0h RO	**Reserved**
4	0h RW	**REJECT:** Request rejection control
