1. Theory of Operation

Nios® V/m Processor-based Helloworld example design on the Intel Arria® 10 FPGA.

a. Block Diagram

b. IP Cores used

The following IPs are used in this design.

- NIOSV/m soft processor core
- On Chip RAM
- JTAG UART

2. Executing the Design on Devkit

a. Creating the Design

Note: Please refer to the readme.txt file in the package for the steps to create the design, application and generate the programming files.

- Unpackage/extract the design in your working directory
- Locate the “ready_to_test” folder within the package
- The folder contains the necessary files for executing the application on the board. Refer to the readme file for the steps to program the application files on the board.
- Validate the design by observing the prints on the terminal

b. Expected Results

The following is the output as observed on the JTAG UART terminal. The output is analogous to the logic from the application code. Users should be able to observe same output on their terminal/setup.

HAL OS:
